most notable achievements of Greek commerce were the opening up of the Black Sea trade and the improved intercourse with Central Asia and India, which followed the conquests of Alexander. The Greeks succeeded, however, in distancing their older rivals; the political annihilation of Tyre left the maintenance of Phœnician reputation and interests to its greatest colony, Carthage. But the Carthaginians, though they checked the advance of Greek colonisation, and almost monopolised the trade with Spain, were unable to recover the eastern trade of the mother city. Their maritime ascendancy was almost wholly confined to the western part of the Mediterranean.

Carthage and Greece succumbed in turn to Rome. But the Romans never were a mercantile people. Their original occupations were agriculture and war, and they learned no new ones. Trade they always left to foreigners, as in their decline they entrusted the defence of the empire to the barbarians. Roman colonies, in contrast to those of the Greeks and Phœnicians, were military strongholds. The extension of the Roman empire increased geographical knowledge, and facilitated commercial intercourse. The growing population and wealth of the capital made the supply of its wants a lucrative and necessary business. But Rome lived on the spoils of the provinces. It could never be a great mart; it had hardly any products of its own to exchange for the imports which it received. The chief commercial cities in the Roman period were Palmyra, Ephesus, Alexandria, in the east, Marseilles and Cadiz in the west. Maritime enterprise was checked rather than encouraged in the Roman period. It was no longer necessary to pass the straits of Gibraltar when intercourse with Britain could be conducted through Gaul and across the Channel. The Romans were great makers of roads, and overland trade became more usual and important than in the days of Phœnician and Greek ascendancy. The gradual disruption of the empire by German invaders proved a direct blow to commerce, the extent and security of which had been seriously diminished by the 5th century A.D.

B. *The Middle Ages*.—The fall of Rome led to a separation between east and west unknown in earlier times. Western Europe was occupied for centuries with almost incessant wars. The invasion of the Germans was followed by the advance of the Slavs, who spread over the whole of northern Germany, and of the Huns, whose attack was still more destructive, though ultimately less successful. The Germans, who succeeded in keeping the upper hand in the west, were not a town-loving people. Like the early Romans, they devoted themselves to arms and agriculture. The social system they developed in contact with Roman influences was FEUDALISM (*q.v.*), by which the occupants of the soil were bound to render military or agri-

cultural services. Nations were non-existent; international trade unknown. Maritime enterprise partook of the prevalent military character. The sailors of the early Middle Ages were the hardy Northmen, whose aims were plunder and conquest, not a peaceful exchange of commodities. The temporary union of western Christendom under Charles the Great promised to revive commercial intercourse, but his empire broke up under his sons. Trade relapsed again into insignificance.

Meanwhile the East had a separate life of its own. Roman law and traditions were preserved at Constantinople, which for a time took the place of Rome as the great receptacle of imported commodities. Greek merchants brought thither the products of Asia and Africa from Syria and Egypt, and those of eastern Europe from the shores of the Black Sea. But the trade of Constantinople suffered from the short-sighted regulations of an arbitrary government, and was soon seriously curtailed by Arab conquests. Under the mighty impulse given by the teaching of Mohammed, the Arabs reduced in rapid succession the interior of Asia, the northern shores of Africa, and distant Spain. Everywhere they carried with them their Koran and their trade. The Arabs, the earliest, became in the early Middle Ages the greatest merchants in the then world. The chief centres of their trade were Mecca, Bagdad, Damascus, and Alexandria. There they collected and exchanged the products of China, of India, and of northern Africa. Arab ships traversed the Red Sea and the Persian Gulf, where their most notable ports were Yemen, Aden, and Basra. But maritime enterprise had been prohibited by Omar; it was never regarded with favour by the caliphs. The chief routes of Arab commerce were overland; their caravans journeyed through Central Asia and the north of Africa. At Trebizond they collected the products of the Black Sea and eastern Europe, and thus diverted much of the trade which would otherwise have gone to Constantinople. Spain alone of the Arab conquests was compelled, from its position, to use the sea as a means of transit. For some time Spanish Arabs and Moors monopolised the trade of the western Mediterranean. Their most important harbours were Cadiz, Malaga, and Almeria.

The Crusades (*v. CRUSADES, Economic effect of*)—the most important event in mediæval history—had the effect of reuniting the east and west, which had been severed since the irruption of the Germans, and of reviving the supreme maritime importance of the Mediterranean. Constantinople declined; the great Italian republics, —Venice, Pisa, and Genoa,—founded factories in Greece, on the coasts of Syria, and the Black Sea. There they collected oriental products brought by Arab caravans, and thence conveyed them to western Europe. From Italy the chief

commercial routes ran overland to southern Germany. From Venice the most frequented road proceeded by Verona and across the Brenner to Ulm, Augsburg, and Ratisbon. From Genoa and Pisa merchants travelled to Lake Como and across the St. Gothard to Lucerne and Strasbourg. All the goods not retained by the south German towns passed on to Bruges, the great emporium of the Middle Ages, where the products of the north were exchanged for those of the south and east. The only serious competitors of the Italian towns for the Levant trade were the bold sailors of Catalonia, but their market was limited to the Spanish kingdoms and the south of France.

The chief carriers of goods in Europe at this date were the Germans. While trade between Italy and Flanders founded the prosperity and political importance of the great towns of southern Germany, their fellow-countrymen in the north found another means of acquiring wealth. The famous HANSEATIC LEAGUE (*q.v.*), formed 13th century, undertook the task of conducting commerce between the east and west of northern Europe. Their leading towns, Lübeck and Hamburg, commanded the land route connecting the Baltic with the North Sea. The task of defending their trade against the aggressions of the Scandinavian peoples, who could block the maritime entrances to the Baltic, forced on the north German towns a unity and an organisation to which the less threatened cities of the south never attained. The chief depots of the Hanse towns were at Novgorod, Wisby, Bergen, London, and Bruges. At Bruges they met the southern merchants, and received from them the products of their native industry and those which they brought from Italy. The nations who in later times won maritime supremacy had not yet turned their attention to mercantile adventure. England was mainly an agricultural country; its chief product, wool, was exported to be made up by Flemish looms. The people of Holland and the adjacent provinces procured a scanty subsistence by fishing and cultivating the soil. France, not yet emerged from the condition of feudalism, found its energies absorbed in internal struggles and the great war with England. Its oldest port, Marseilles, had lost the importance it had once possessed, and did not recover any notable share in the Mediterranean trade till the 15th century.

C. Modern History.—It is no arbitrary choice which has fixed on the fall of Constantinople as the dividing line between mediæval and modern times. The Turkish conquests threatened to bring about the same result as had been achieved by the German migrations of the 5th century—to break off once more the connection between Asia and western Europe. One after another the Italian factories in Greece and Asia Minor were taken and destroyed. The closing of the

Levant was not completed until the conquest of Egypt by Selim I. in 1519, but, for seventy years before, eastern trade had gradually been becoming more difficult and precarious. The great problem created by these conditions was the discovery of another route to the east. It is true that the chief instrument of maritime discovery, the compass, had been invented some time before, and the Portuguese had already commenced their famous voyages along the western coast of Africa. They had discovered Madeira 1419, they found the first of the Azores 1447, they reached the Cape de Verd islands 1455. But it was the Turkish conquests which gave the great impulse to maritime enterprise outside the Mediterranean. Bartholomew Diaz commanded, 1486, an exploring expedition, which had passed the mouth of the Congo when a storm blew the ships out to sea. When calms returned they steered westwards; at last, suspecting that they had missed the southern point of the continent, they turned northwards and found themselves in Algoa Bay. Compelled to return by his sailors, Diaz left the completion of his work to Vasco da Gama, who, starting July 1497, found his way round the Cape of Good Hope to India. The Portuguese were not slow to profit by his great discovery; for nearly a century they monopolised the trade between India and Europe. The great Albuquerque made himself master of the Red Sea and the Persian Gulf, and thus closed the ancient routes to the Mediterranean. He also gave a capital to the Portuguese settlements by the capture of Goa on the Malabar coast. The trade of Portugal soon extended to the islands of the eastern Archipelago, and even to China and Japan.

Meanwhile, the Spaniards had also attempted to solve the great problem of the age. Christopher Columbus, a Genoese by birth, had conceived the scheme of reaching India by sailing westwards. Under the patronage of Isabella of Castile he set out on his great expedition of 1492, which resulted in the discovery of America. Ignorant of the existence of this intervening continent, his contemporaries, believing he had really reached India, gave the islands where he first landed the name of the West Indies, which they have kept ever since. Columbus himself believed that the islands connected with Asia "stretched out so far to the eastward that their distance from Europe could not be great." The exact position of America was not appreciated until 1513, when Balboa crossed the Isthmus of Darien and discovered the Pacific, of which he took formal possession in the name of the Spanish crown.

There is no need to speak of the further progress of discovery, of the conquest of Mexico and Peru, of the famous papal bull which divided the world between Spain and Portugal, and which enabled the latter to claim possession of Brazil (BULL OF BORGIA, *q.v.*) It is sufficient

to point out here that these discoveries revolutionised the commercial routes of the world. The Mediterranean lost its importance, the Italian cities were ruined. Trade lost its old unity and concentration, and fell into the hands of new peoples. The Portuguese and Spaniards preserved the ascendancy which their precedence in the work of discovery assured them. The great routes of commerce ran to the west and to the east. But the central point to which trade converged was still the Netherlands. Antwerp, at that time a possession of the Spanish king, took the place which Bruges had lost owing to the silting up of its canal and the increased size of vessels necessary for oceanic trade. The overland routes in southern Germany ceased to be employed for anything beyond local exchange. The Baltic was no longer a great commercial highway, and the Hanse Towns steadily declined until their league perished in the turmoil of the Thirty Years' War (see HANSEATIC LEAGUE).

But the later part of the 16th century witnessed another great mercantile revolution. Antwerp was ruined by the reckless oppression of Alva and the long war which followed the revolt of the Netherlands. Two countries, England and Holland, hitherto unknown in the history of commerce, began to pose as the maritime rivals of Spain and Portugal. The trade which Antwerp lost was gradually diverted to London and Amsterdam. Philip II. annexed, 1580, Portugal and its dependencies to the Spanish crown. The defeat of the Spanish Armada, 1588, annihilated the maritime ascendancy of Spain. These events led to the collapse of the monopoly of the eastern trade so long preserved by Lisbon. The Dutch were the first to seize the opportunity thus offered. Dutch vessels first reached an Indian port 1595; within a few years Dutch settlements were formed in Java and Sumatra. The great Dutch East India Company was formed 1602; it founded a capital for its vast possessions at Batavia 1618. England was not slow to follow in the footsteps of the Dutch, and in 1600 the first of the English EAST INDIA COMPANIES (*q.v.*), received its charter. Though the massacre of Amboyna excluded them from the spice trade, the English succeeded in establishing a lucrative commerce with Hindostan. From this time the eastern trade was open to every European country; France, Sweden, Denmark, endeavoured to obtain a share in it. But these countries each entrusted the trade to an exclusive company, and thus checked the progress which private enterprise might have effected.

Meanwhile the decline of Spain led to a similar extension of western commerce. John Cabot had discovered, 1496, Newfoundland for Henry VII.; Jacques Cartier sailed, 1534, up the St. Lawrence and gave the name of New France to what is now the province of Quebec.

But it was not till the 17th century that the Spanish ascendancy in America was seriously threatened. Quebec was founded, 1603, as the capital of the great French colony of Canada; by the end of the century the French had also established themselves in Louisiana at the mouth of the Mississippi. Between Canada and the Spanish settlement in Florida the whole of the western coast was successively occupied by the English, who absorbed the Dutch province of the New Netherlands, and the Swedish colony on the Delaware. At the same time France, England, and Spain shared the West Indian islands among them, and their incessant rivalry proved the cause of numerous wars. The Dutch for a time took Brazil from the Portuguese, but they abandoned it, 1661, and from this time confined their attention mainly to the eastern trade, their control over which was strengthened by the establishment of a colony at the Cape of Good Hope. The loss of their position in America was fatal to the commercial greatness of the Dutch. The eastern trade, trammelled by the system of exclusive companies, made comparatively little progress, while the commerce with America, where the European settlements were real colonies instead of mere mercantile depots, became every year more important and lucrative. In America, too, unlike the East Indies, trade was open to any subject of the colonising countries.

It is impossible and unnecessary to trace here the history of European colonies in the 18th century. Its main characteristic is the steady growth of the colonial power of England at the expense of France and Spain. In the history of commercial routes it is only important to remember that each country set itself to monopolise the trade with its own colonies. It was the age of the MERCANTILE SYSTEM (*q.v.*), and colonies were regarded as one of the chief means by which a country could secure for itself a favourable balance of trade. Thus the inter-colonial trade was of small proportions, and was of the character of a smuggling trade, carried on in defiance of restrictive laws. The attempt to enforce these laws, which regarded colonies as existing merely for the benefit of the mother-country, led, quite as much as the stamp act or the tea duty, to the revolt of the American colonies.

From the 15th to the 18th centuries, therefore, an enormous extension of European commerce was effected by the opening up of the Atlantic and Pacific. The old routes of the Middle Ages were abandoned, the Italian and German cities lost their mercantile importance, trade followed a vast number of complicated routes across the ocean. But of this trade the Atlantic coasts of Europe were still the centre, and as long as the system of monopoly was upheld, this condition of things would be maintained. But in the later part of the 18th

century a fatal blow was dealt to the old colonial system by the American revolt and the French Revolution. From this time it became impossible to treat colonies merely as markets for the goods of the mother country. Former restrictions were disregarded or abolished, a new era of colonial independence and self-government set in, completed when England, raised through the results of the revolutionary wars to being beyond all question the greatest of colonial powers, adopted a policy of free trade. From this time the trade of the world has lost even the semblance of unity which was preserved as long as the routes from the colonies led of necessity to the mother country in Europe.

Two great commercial changes have taken place in our own century which must be briefly alluded to. The first, the rapid and almost unparalleled development of Australia and New Zealand. In the 18th century Australia was only known as a convict settlement, whereas Sydney and Melbourne are now among the greatest ports of the world. The second, the opening of the Suez Canal, effected primarily by French enterprise and capital, but of which the chief benefit has hitherto been reaped by England. It is not too much to say that the Suez Canal has revolutionised the commercial routes to the east. It has restored much of their old importance to the Mediterranean and the Red Sea. It has effected at least a partial revival of the commercial prosperity of Italy and Egypt. The overland route to Brindisi has taken the place of the old roads through southern Germany to Venice and Genoa. The return of eastern trade to its mediæval direction has been one of the most notable events of 19th century history. Its political consequences have been still more far-reaching, and it is yet too early to appreciate them. Whether equally important results may be achieved by the Canadian Pacific Railway or by the opening of a naval passage through the Isthmus of Panama, are questions which belong to the domain rather of the future than of history.

COMMERCIAL SCIENCE (*Handelswissenschaft*). Strictly speaking the term commercial science should be applied to that branch of political economy which treats of the increase of wealth and the economy of labour by the operations of commerce, it being assumed that the state does not interfere, and that every individual is instigated by economic motives, and

by economic motives alone. In this way a distinction may be clearly drawn between *Staatswissenschaft* and *Handelswissenschaft*. But in practice this subject of commerce has been treated much more from the view of an *art* than of a *science* (e.g. cp. *Traité théorique et pratique des opérations commerciales et financières*, by N. Merten; *Handelswissenschaft*, by C. F. Findeisen. In the former of these two works the theoretical treatment is really confined to that part of the subject concerned with banking and exchange operations, while the latter is practical in nearly every sense). Viewed in this way commerce is treated with reference to the facts of business, and thus affords a continued series of illustrations of many points in ordinary economic theory. Thus exchange is viewed with a special regard to the various classes of middlemen and the services rendered by each to the rapid circulation of the commodities. Again, instead of speaking of a producer or a seller without explanation, an attempt is made to classify producers or sellers in their various actual forms, whether as individual operators, as partners in a firm, or as members of a company. The function of each is described. As there is considerable approximation to the character of a handbook of commerce, a certain attention is of necessity paid to the legal standing and obligations of the various parties involved. The intensely practical nature of this treatment is, however, relieved when we come to questions of money and exchange, for here the theoretical principles are clearly and definitely laid down. This latter branch of the subject it is which has attracted most attention of recent years both on the Continent and in England, as we may see from the labours of such writers, for instance, as Jevons (*Investigations in Currency and Finance*), Giffen, Goschen, R. H. Inglis Palgrave, Ellis, Bagehot, J. G. Courcelle-Seneuil, and others.

E. C. K. G.

COMMERCIAL SYSTEM. The fourth book of the *Wealth of Nations* is devoted to an examination of "systems of political economy," considered, as Adam Smith explains, as a branch of the science of a statesman or legislator. With his accustomed sense of the due proportion of theory to historical facts, the writer devotes almost the whole of the book to an examination of the commercial or mercantile system which had reached its full maturity as part of the policy of Europe, whilst the agricultural system of his friend Quesnay is dismissed in a single chapter on the ground that it "at present exists only in the speculations of a few men of great learning and ingenuity in France." Any account of the commercial system by a modern writer must be in the main a repetition of Adam Smith with indications of the principal criticisms to which his work has been subjected. The chief fault to be found with Adam Smith's treatment, as a whole, is that he was so much

concerned to destroy the system as part of the practical policy of the day and as altogether unfitted for the stage of industrial development already attained, that he sometimes overlooks and sometimes mistakes the conditions under which the system arose, and under which it answered the wants of the time. Subsequent writers (in Germany, *e.g.* List, Schanz, Roscher, and in this country W. Cunningham) have shown that the mercantilists at any rate as represented by their chief writers, were not guilty of the childish sophism that money only was wealth and that the only thing at which the commercial legislator should aim was the acquisition by the country of the greatest possible sum of money by its foreign trades. In many respects they regarded a favourable balance of trade merely as a good symptom of other more important national interests, such as the full employment of labour and capital at home, a point on which Adam Smith himself lays much stress in his second book. In other aspects of their system, the political power of the nation was considered as fundamental, as in the navigation laws, of which again, including the motives at their basis, Adam Smith strongly approves (compare Seeley's *Expansion of England*). At the same time, however, it must be admitted that before the last quarter of the 18th century the system had ripened to decay, the ideas which had given it vitality at an earlier stage had been lost sight of, and the mere symptom, *i.e.* the favourable balance, had come to be considered as itself the essence of well-being.

The following is a brief critical summary of Adam Smith's treatment as given in book iv. of the *Wealth of Nations*. He begins by an explanation of the true functions of money in trade, and its relation to other forms of wealth, and shows that no particular political attention should be directed towards the accumulation of money, either on account of its durability or because it is thought to be useful in foreign wars. The argument is decisive against the case as it is represented; but it may be objected that if we substitute for durability the idea of a store of value, and if we remember that at the end of the 17th century Pope's father, on retiring from business, carried his wealth in actual guineas, and recall the graphic account of Pepys hiding his money, we may arrive at a juster view of this mercantilist point. And the further we go back towards the mediæval period, this peculiar importance of money as a store of value becomes more prominent. Again, as regards the foreign wars, there was a close connection between the balance of trade and the balance of power, and even in our own day we find Bismarck and other foreign statesmen attaching importance to a full supply of gold in their "war chests." The ostensible object of the mercantilists being to obtain a favourable

balance (see BALANCE OF TRADE, HISTORY OF) we have next to consider the methods by which this end was promoted. Speaking generally, the aim of their policy was to diminish as much as possible the importation of foreign goods for home consumption and to increase as much as possible the exportation of the produce of domestic industry. The restraints on importation were of two kinds: (1) restraints on any foreign goods which could be produced at home from whatever country they were imported; and (2) special restraints on imports from countries with which the balance of trade was generally unfavourable. As regards (1) Adam Smith gives the most general arguments in favour of free trade as against prohibition (see FREE TRADE). The principal point to observe is that Adam Smith was not in a position to state the free trade theory with the dogmatic simplicity of some modern writers, as he was obliged to take into account the opinions expressed in book ii., on the comparative advantages of employing capital in different ways, *e.g.* the superiority of home to foreign trade and of agriculture to manufactures, especially as regards the labour of a country. If from this point of view his case is not so strongly put as at present, on the other hand logically we must take into account his optimistic views on nature and his references to the "invisible hand," which directs private interest so as to increase the public good. The dangers of prophecy are incidentally illustrated in the assertion that even the free importation of foreign corn could very little affect the interest of the farmers of Great Britain, and the free importation of cattle or meat still less. The chapter is also noteworthy for the famous exceptions to free trade, admitted by Adam Smith as generally advantageous or at least worthy of deliberation, and in which the older and more rational mercantilists would recognise much of their own teaching. Thus on the ground that defence is of much more importance than opulence, "the act of navigation" is described as "perhaps the wisest of all the commercial regulations of England." The taxation of foreign commodities which come into competition with those which are produced and taxed at home is approved, though the possible extension of the doctrine to substitutes, and to the general as distinct from the special taxes of the foreigner, so far as it is taken account of, is repudiated. The cases worthy of deliberation are retaliation with the view of obtaining better terms for our exports and the regard for vested interests on the ground of humanity. (2) The restraints upon imports from countries with which we have an unfavourable balance are much more strongly condemned. It was easy to show that even on mercantilist principles, that is, taking the favourable balance as fundamental, the rest of the world should be considered simply as one

great market, and that we should buy in the cheapest and sell in the dearest country, independently of the particular balance. Simple, however, as this doctrine seems, it is still often lost sight of, and forgetful of the indirect settlement of international debts, so-called fair trade writers compare the exports and imports between two particular countries, e.g. France and England. Adam Smith at this stage shows clearly that it is for the interest of a nation to have rich neighbours, and that anything which injures a foreign nation indirectly injures the home country. He points out also that the "favourable balance of the annual produce and the consumption" is very different from the balance of trade and "necessarily occasions the prosperity or decay of every nation," to which the mercantilists might rejoin that the one balance properly understood, i.e. as referring to a growing export trade compared with consumption of foreign luxuries, is one of the best signs of the other balance.

Passing now to encouragements given to exports, we notice first of all (1) *drawbacks*. These, as the name suggests, are duties drawn back on exportation or re-exportation, and as they tend to restore the natural course of trade, they are strongly approved of by Adam Smith. The chief dangers of drawbacks are that the commodity may be re-imported and the revenue suffer from smuggling, and that, as abundant proof has been given lately, the drawback may really be a bounty in disguise (see *DRAWBACKS*; *BOUNTIES*). (2) *Bounties* are next examined, and receive the strongest condemnation of any expedient of the mercantile system (see *BOUNTIES*). Incidentally the whole subject of the Corn Laws is examined and it will be seen from the different species of laws discussed that the commercial system as a whole was much more varied in its aims than is generally supposed. The laws, for example, against engrossing and forestalling were plainly drawn up in the interests of the consumer, and the same object was apparent in the attempt to abolish the middlemen and, to quote a favourite position of Adam Smith, to bring the produce as near as possible to the consumer. (3) The next expedient of the system to encourage exports was the negotiation of treaties of commerce giving special advantages to those countries with which we had or were supposed to have a favourable balance. Again it may be said that Adam Smith takes a rather narrow view of the real objects of many of these treaties. The reader may compare List's account, in *National Systems of Political Economy*, of the celebrated Methuen treaty with Portugal. In recent times much controversy has taken place on the advantages and disadvantages of commercial treaties; they were approved of by Cobden, and have been adopted to a large extent practically even by this country, but they are objected to by extreme free traders

(see *COMMERCIAL TREATIES*). (4) The last device of the system to encourage exportation was the monopoly, total or partial, of the colonial trade. This question is discussed by Adam Smith at great length, as was only natural, since his work appeared in the same year as the declaration of American independence. The argument, however, of the chapter is involved and rather obscure. The principal difficulty is caused by the constant reference to the writer's peculiar views on the relative advantages of employing capital in different ways—such as that the near trade is more advantageous than the distant. It is noteworthy also that one of the cardinal objections of Adam Smith to this monopoly is that thereby the general rate of profits in the country is *raised*, and that this element in the cost of production being increased, we are undersold in other commodities, thus sacrificing an absolute for a relative advantage. If a country is so wealthy that it is naturally exporting capital, this argument falls to the ground. Another objection to Adam Smith's line of treatment is that perhaps he does not pay sufficient attention to the idea of political power historically involved in the acquisition or colonisation of new territory. Although the East India Company was never a commercial success, it laid the foundation of our Indian empire. At the same time, however, he was the first to propose a wide-reaching scheme of what would now be called imperial federation.

There remain to be noticed two other expedients of the mercantile system. As regards raw materials and the instruments of manufactures, the usual policy, described above, was apparently reversed and importation was encouraged and exportation discouraged or prohibited. The explanation is to be found in the idea that if raw material were worked up before being exported it would be more valuable, and that a nation should keep for its own benefit any peculiar advantages of production. The history of the woollen trade is most instructive on this point. Wool in the early Middle Ages was the principal export and source of England's supply of money, whilst later on the export was forbidden and the prohibition was extended to sheep. As regards "instruments" of production, the living instrument—the artisan, was placed under the same restrictions as dead capital. The idea that the exportation of raw material and instruments shall be discouraged has recently been revived in this country as regards our coal supplies, and one of the favourite modern protectionist arguments is that for the higher forms of work a nation should rely on its own members and not let them become mere "hewers of wood and drawers of water."

[The principal interest of the mercantile system is historical, though many of its expedients are still advocated under the name of fair trade. Besides

the works alluded to, the reader may consult the books mentioned under the particular articles referred to, e.g. FREE TRADE, BOUNTIES, etc.]

J. S. N.

COMMERCIAL TREATIES. Treaties of commerce seem to have been of very early origin. Sir H. Maine (*Village Communities* p. 192) has pointed out the close connection in the most rudimentary societies between neutrality and markets; and in times when the same word (e.g. *hostis*) was often used both for enemy and stranger, it is plain that commerce was hardly possible without some more or less formal agreement. The earliest commercial treaty extant was that made between Rome and Carthage, B.C. 508 (cp. Macpherson's *Annals of Carthage*, vol. i. p. 60). [iii. 22, 23 Polybius.] The earliest treaty that occurs in the history of England is that between Charlemagne and Offa, A.D. 796. Throughout the mediæval period the foreigner was regarded as a highly suspicious character. In Saxon times foreign traders were only allowed to come to the country on the occasion of four great fairs, and were obliged to leave the kingdom within forty days. Attempts were made to keep in force this forty-days regulation down to the time of the Tudors (cp. Schanz, *op. cit. inf.* vol. i. p. 380). For a considerable period aliens were liable for the debts contracted by members of the same town or country, and even for crimes the same mutual obligation prevailed. One of the clauses of Magna Charta (§ 41) refers to the protection given to foreign merchants. More than a hundred years later (1325) it was stipulated by Edward II. that the merchants of Venice should have power to come to England for ten years with liberty to sell their merchandise and to return home in safety "without having either their persons or goods stopped on account of other people's crimes or debts." It may be said generally that the principal object of commercial treaties for many centuries was simply to afford security to traders. In process of time, however, as the mercantile system (see **BALANCE OF TRADE; COMMERCIAL SYSTEM**) was developed and this rudimentary security had been attained, commercial treaties became the great agents by which a nation tried to secure for itself the advantages supposed to follow from this system. Treaties of this kind were severely attacked by Adam Smith (*Wealth of Nations*, bk. iv. ch. vi.), who takes as his principal example the famous Methuen Treaty concluded with Portugal in 1703. The reader, however, should compare with Adam Smith's remarks the account of the benefits conferred by this treaty upon English traders as stated by List (*National System of Political Economy*, p. 62, Eng. trans.) The root idea of modern commercial treaties is reciprocity. A list of the treaties of commerce and navigation still in force between the United Kingdom and foreign countries is to be

found in Leone Levi's *History of British Commerce*, 2d ed. p. 565. The treaty which has excited most controversy is that negotiated with France by Richard Cobden in 1860 (cp. *Finance and Politics*, by Mr. Sydney Buxton, vol. i. ch. xi.; and Mr. John Morley's *Life of Cobden*, vol. ii. ch. xi.) In the negotiation of the treaty the emperor of the French, by whom alone the matter on the French side was practically settled, was influenced largely by purely political considerations. It was, however, in this treaty that the notion of the reciprocal advantages rather than the balance of losses by mutual concessions first found due prominence. The principal provisions were as follows: On the side of France prohibitive duties were to give way to protective duties of moderate amount. On all the staples and material articles of British manufacture—woollen, cotton, silk, flax, jute, hemp, hair, and manufactures of iron and other metals, tools and machinery, manufactures of leather, wood, glass and earthenware, as well as on yarns, coal and coke, and other raw materials, etc.—the duties were to be so much reduced that the maximum *ad valorem* charge was not to exceed 30 per cent, which was to be reduced within three years to 25 per cent, and the duties, when practicable, were to be changed into specific duties. Thirty per cent was to be the maximum, but the actual amount of duty to be paid on each article was left to separate negotiation, and in the result in most cases it was fixed much below the maximum. According to Cobden the average did not actually exceed 15 per cent. (Buxton, *Finance and Politics*, vol. i. p. 230.) England, on her part, engaged to abolish at once all the remaining import duties on manufactured goods. She agreed not to levy a duty on, or prohibit the export of, coal; and—the most important practical concession to France—she agreed to make great reductions on wine and brandy; other nations, however, being of course placed on the same footing. Both parties engaged to insert in the treaty a "most favoured nation clause." The treaty was to remain in force for ten years and then to continue from year to year unless "denounced" by either party, in which case, unless definitely renewed, it would lapse in twelve months. In 1872 the treaty was "denounced" by France at the instance of Thiers, the government being in great financial difficulties at the time owing to the German indemnity. The treaty was, however, renewed next year. After a series of attempts for a definite renewal on an improved basis from the free trade point of view, the treaty was practically abandoned in 1882, when as a substitute the French government passed a law, giving to England the benefits of the "most favoured nation" treatment. France was thus left free to raise the duties on any article at once, and by simple repeal of the law to treat England less advantageously than other nations.

The French treaty of 1860 has been described at some length, because in connection with it the whole question of the principles of commercial treaties has been raised and discussed. The principal arguments for and against may be enumerated under five headings.

(1) The opponents of commercial treaties appeal to their failure in the past to secure the advantages for which they were ostensibly negotiated. So long as the Navigation Acts remained in force, they naturally gave rise to retaliation by other nations, and the retaliation was met by reciprocity treaties with various countries on various conditions. The complications which ensued were so great that they had much to do with the ultimate repeal of the acts. This is truly one example of the alleged failure of treaties in the past, but it is maintained that on the whole they have produced more harm than good. To this it is replied by the advocates of the system that the old ideas on which such treaties were based were economically unsound, being survivals of the mercantile system; but that the French treaty and others drawn on similar lines have proved beneficial in recent times, and that the appeal to the past can only be fairly made when all the circumstances of the case are considered.

(2) It is objected to commercial treaties that, in appearance at least, if not in reality, they are opposed to the principles of free trade. Even although no differential duties are imposed, and all nations are ostensibly treated with equal favour, still it is said that if a free trade nation arranges its tariff out of consideration to the revenue of another country, so far that nation is "favoured" relatively to others, and that this amounts to an infringement of free-trade principles. To this it is replied that commercial treaties afford a middle way between protection and free trade, and that if other nations, by means of a treaty, are brought to see the advantages of a reduction of tariffs, they may ultimately follow the example of England (see FAVOURED NATION CLAUSE) and repeal many of these duties altogether, and eventually adopt free trade. Such was the opinion of Cobden, and it is supported by Mr. John Morley, Cliffe Leslie, and many other free-traders.

(3) It is alleged that it may prove inconvenient to a government to have its hands tied for a definite term of years on fiscal matters, as England was bound, for example, not to increase the wine duties nor to impose an export duty on coal. To this it is replied that the utility of a tariff is advantageous for the stability of trade.

(4) This reply leads to the further objection that, as the time of the treaty approaches fulfilment, there will be a great disturbance in trade whilst the new negotiations are in progress, and again an appeal is made to the experience with France after the first ten years

had been completed. The obvious answer is that the disturbance is only temporary, and in any case that a treaty subject to the possible failure of renewal is better than none at all, so far as the convenience of traders is concerned.

(5) The objection made by the extreme advocates of free trade, which, if valid, would be the strongest possible, is that there is really no use in such treaties; that a nation should rely simply upon free imports to fight foreign tariffs, and that the exports can be left to take care of themselves. Suppose, it is said, that England of her own accord, and without any equivalent treaty, reduces the duties on French wines and silks, and thus encourages importation; still these imports must in the end, directly or indirectly, be paid for by exports; if France excludes our goods directly, then she must accept payment from other nations which do accept our goods. The best answer to this argument is perhaps that given by Mr. John Morley (*Life of Cobden*, vol. ii. p. 343). "The decisive consideration is that we can only procure imports from other countries on the cheapest possible terms on condition that the producers in those countries are able to receive our exports on the cheapest possible terms." This opinion may also be supported by the authority of Adam Smith, who always maintained that the near trade was more advantageous than the remote, and the direct than the roundabout trade.

J. S. N.

COMMISSARY. See SUCCESSION, SCOTLAND.

COMMISSION AGENT. A person entrusted by a principal with the sale or purchase of goods and receiving a commission for his remuneration. Commission agents generally sell or buy in their own name, and therefore deal as principals with the buyers or sellers; but, as regards the mutual relations between them and their principals, they are bound by the ordinary rules of the law of agency. E. S.

COMMISSIONS OF ENQUIRY. It has long been the practice in the United Kingdom to appoint, under a royal warrant, commissions to institute enquiries, to collect information, and to report concerning matters of special public interest as to which it is felt to be necessary to obtain the assistance of well-informed persons whose services are not ordinarily at the disposal of the government. The scope of such enquiries is carefully defined in the warrant constituting the commission, usually described as the

"reference," and the commission is invested with power to summon witnesses and to call for such records, books, and papers as in its judgment may serve to throw light on the subject of the enquiry. The first person named in the reference is usually considered to be nominated as the chairman of the committee, and a secretary, not himself a member of the commission, is also appointed. The commission itself decides the course which its proceedings shall take. It frequently arranges, in the first instance, for the issue of such circular letters as may appear calculated to elicit general information, and it then proceeds to hear oral evidence. The first witnesses called are ordinarily those government officers who, from the position they occupy, may be presumed to have a special knowledge of the subject in hand. The examination in chief is conducted by the chairman, each member of the commission in turn having an opportunity of questioning the witness. In some cases, additional or assistant commissioners are appointed to prosecute subordinate enquiries in distant places and even in foreign countries. These usually receive payment for their services, as does also the secretary, unless he be in the permanent employment of the government, in which case it is customary to award him a bonus when the work of the commission is at an end. The commissioners themselves are ordinarily unpaid. When the commission has obtained all the evidence it considers necessary, it prepares and presents its report, which, with an exact transcript of the evidence and the documents forthcoming in the course of the enquiry, are then laid before both houses of parliament and sold to the public. Commissions of enquiry obtain and arrange in a convenient form a vast amount of information of great value, and in this their main utility exists. Parliamentary and political reasons frequently prevent the carrying out of the recommendations of commissions, it being impossible to dissociate from the government of the day the final responsibility for any action taken on the basis of their reports.

The following are the principal commissions of enquiry which have been appointed since 1830, to consider subjects of economic interest:—

- 1832. Poor Laws.
- 1833. Employment of Children in Factories.
- 1836. Irish Railways.
- 1840. Employment of Children in Mines.
- 1843. Scotch Poor Laws.
- 1843. Irish Land Laws.
- 1853. Shipping Dues.
- 1855. Decimal Coinage.
- 1863. Fisheries.
- 1866. Duration of Coal Supply.
- 1867. Trades Unions.
- 1868. International Coinage.
- 1875. Labour Laws.
- 1876. Factory and Workshops Acts.
- 1881. Agricultural Interests.

- 1885. Housing of the Working Classes.
- 1886. Depression of Trade and Industry.
- 1887. Gold and Silver.
- 1889. Mining Royalties.
- 1891. Labour.

T. H. E.

COMMISSIONS, JUDICIAL. The general tendency of English legislation has been to reserve all judicial business for the courts of justice. But in modern times certain important functions of a judicial character have been entrusted to commissions differing in many respects from the ordinary courts. The motives for establishing such commissions instead of increasing the regular judicial staff have been various. A particular class of cases may demand such a technical knowledge of subjects not legal as cannot reasonably be expected from a professional judge. Thus the class of cases which comes before the Railway Commission requires an exceptional acquaintance with the principles of railway organisation and management. Or again, the judicial function to be performed may be one which the law has never contemplated, and for which the principles of jurisprudence afford no guidance. Thus the principal function of the Irish Land Commission and the Scotch Crofters' Commission is to set aside existing contracts of land-tenure and to determine what is called a "fair rent." In these cases the function of the commissions is rather political than legal; it is to reduce that resistance to the fulfilment of legal obligations which is never recognised by a jurist, although it may sometimes be troublesome to a statesman.

Commissions such as these differ from normal courts of justice principally in three respects—(a) jurisdiction; (b) composition; (c) procedure.

(a) *Jurisdiction*.—Whilst an ordinary court of justice has usually jurisdiction to deal with many kinds of cases, a judicial commission is commonly confined to dealing with cases of a particular class. Thus the main function of the Railway Commission is to ensure impartial treatment of all persons or corporations using a railway, and to arbitrate in disputes between railway companies or canal companies. The main function of the Irish Land Commission and of the analogous commission in Scotland is to deal with disputes between landlord and tenant.

(b) *Composition*.—In the United Kingdom, at all events, it is the uniform practice to select the judges exclusively from the legal profession. But judicial commissions usually include other persons as well as professional lawyers. Thus the Railway Commission, as originally constituted (Regulation of Railways Act, 1873, 36 & 37 Vict. c. 48), consisted of three commissioners, of whom one was to be of experience in law, another of experience in railway business. As recently remodelled (Railway and Canal Traffic Act, 1888, 51 & 52 Vict. c. 25), the

Railway Commission consists of two appointed commissioners, including one of railway experience and three *ex-officio* commissioners, namely, a judge of a superior court in England, in Scotland, and in Ireland respectively. The Irish Land Commission (Land Law Ireland Act, 1881, 44 & 45 Vict. c. 49) consists of three commissioners, one of whom must be a barrister of ten years' standing, and holds office for life, whilst the other two need not be lawyers, and are appointed for a term of seven years. This commission, however, delegates most of its work to sub-commissions. Barristers, solicitors, and persons possessing a practical acquaintance with the value of land in Ireland are competent to be appointed to the office of assistant-commissioner. The Crofters' Commission consists of three persons, of whom one must be an advocate of ten years' standing.

(c) *Procedure*.—The procedure of such a judicial commission as above described is wholly determined either by the statutes under which it acts or by rules drawn up by itself. There is no implied adoption of any system of procedure followed in any of the regular courts. At least such adoption is limited to one or two equitable principles, such as that of hearing both parties to a dispute, which we hardly regard as technical. Appeals to a superior court on questions of fact are not allowed, since this would defeat the purpose of instituting such commissions; but appeals on questions of law are in some cases permitted. Such commissions as above described are for some purposes a necessity of the body politic. But their unnecessary multiplication would be a great evil. A tribunal established to deal with a special class of cases is often the readiest instrument of injustice or oppression. Everybody is interested in the impartiality of a court before which he may appear as defendant. But many unfortunately will applaud partiality in a court where defendants belong exclusively to an unpopular class like landlords or railway companies. As compared with judges who are also jurists, judges who have had no legal discipline are less likely to deal with causes in a severely judicial spirit, to consider sufficiently the consequences of making a precedent, or to uphold that stringency of procedure which, tedious as it may seem, is the best safeguard against passion or carelessness. Hitherto the predominance of the regular courts of justice has protected us from most of the evils which might have been feared from commissions armed with judicial power. But the multiplication of extraordinary tribunals and of special procedures would break down this predominance, and with it the old English principle of submitting to a regular court for adjudication in the regular way every question which can be formulated in terms of law—a principle always precious and always difficult to maintain, but in an age of popular govern-

ment especially invaluable and yet especially liable to be overthrown.

[For further particulars respecting the Railway Commission see the Acts 36 & 37 Vict. c. 48, and 51 & 52 Vict. c. 25, and the Acts therein referred to; also the report of the joint-committee of Lords and Commons on railway amalgamation, 1872; and the text-books on the law relating to railways.

Respecting the Irish Land Commission, see the Act 44 & 45 Vict. c. 49 and the amending Acts. See also the rules issued by the Irish Land Commission, especially those of October 1881.

Respecting the Crofters' Commission see the Act 49 & 50 Vict. c. 29 and the amending Act.]

F. C. M.

COMMISSIONER. See FACTOR.
COMMISSIONERS OF SEQUESTERED ESTATE. See BANKRUPTCY, SCOTLAND.

COMMITTEE (with reference to cases of lunacy). A person charged to represent the interests of a lunatic, either as committee of his person or as committee of his estate. Committees are appointed for those lunatics only whose mental incapacity has been established by the inquisition of one of the masters in lunacy, either with or without the assistance of a jury. The same person is frequently appointed in both capacities, *i.e.* as committee of the person and of the estate of a lunatic. The administration of the property of a lunatic so found by inquisition is to a great extent under the control of the lunacy authorities.

E. S.

COMMITTEE OF INSPECTION (bankruptcy). A committee consisting of not less than three and not more than five persons, selected from the creditors of an insolvent debtor at the first or any subsequent meeting of creditors, for the purpose of superintending the administration of the bankrupt's property by the trustee. The trustee cannot exercise certain powers without the permission of the committee of inspection, and the committee can take the initiative in certain other proceedings. The appointment of a committee of inspection is not compulsory, and the act provides that in the absence of such a committee the Board of Trade is to exercise its functions. [See Bankruptcy Act, 1883, 46 & 47 Vict. c. 52, specially §§ 22, 57, 58 (2), 64, 74 (4), 89 (1), also Bankruptcy Act, 1890, 53 & 54 Vict. c. 71, § 5.]

E. S.

COMMODATUM. A term of Roman law used to express the loan of a thing which had to be returned in specie.

COMMODITY. The idea of something common in the way of usefulness is never absent from the use of this word in an economic sense, but to this meaning a very wide interpretation is given by some economic writers, while others are disposed to restrict its application much

more closely. A. Smith (*Wealth of Nations*, bk. iii. ch. iii.) defines the difference between productive and unproductive labour as that which does or "does not fix and realise itself in any permanent subject or vendible commodity which endures after that labour is past, and for which an equal amount of labour could afterwards be procured." Ricardo (ch. i. § 1) uses the word in a somewhat different manner. "If a commodity were in no way useful, in other words, if it could in no way contribute to our gratification, it would be destitute of exchangeable value," and includes among "the mass of commodities," "rare statues and pictures, scarce books and coins, wines of a peculiar quality." With J. S. Mill (*Principles of Political Economy*, bk. iii. ch. ii. § 3), while other considerations come in, the word is employed mainly in the same sense as by Ricardo. Mill speaks of the product of labour as "utilities," among which he would class not only the labour of the physician and the teacher, but that of the musical performer and the actor. This idea is further developed by H. Sidgwick (*Principles of Political Economy*, bk. i. ch. iv.) who proposes to extend the terms "produce" and "commodities" so as to include "consumable services," such as the utilities developed by "literary, artistic, and scientific culture." In this view E. Cannan (*Elementary Political Economy*, pt. ii. § 2) includes "services which do not involve the production of a useful material object" among "commodities." The difficulty of exact definition of "productive" and "unproductive" labour has led to this extension of the use of the term "commodity." The examples from the authors cited above sufficiently explain this gradual development. The original use was wide, e.g. "Tickling commodity, the bias of the world" (*King John*), and elsewhere in Shakespeare frequently (*Twelfth Night*, *Henry IV.*, etc.)

COMMON ASSURANCE. The legal evidences of the transfer of real property. These have been called "common" assurances as opposed to special methods of transfer such as fines or recoveries.

[Stephen's *Commentaries*, bk. ii. pt. i. c. xv.]

J. E. C. M.

COMMON EMPLOYMENT, DOCTRINE OF. "A servant, when he engages to serve a master, undertakes, as between himself and his master, to run all the ordinary risks of the service, including the risk of negligence upon the part of a fellow-servant when he is acting in the discharge of his duty as servant of him who is the common master of both." This extract from the judgment of Earle, C.-J., in *Tunney v. Midland Railway Co.* (L.R. 1 C.P. at p. 290) may be taken as a judicial statement of the doctrine of common employment first suggested in 1837 in *Priestley v. Fowler* (3 M. & W. 1), and afterwards adopted by the House of Lords.

In the earlier cases various reasons were given in support of the doctrine, but in the later cases the tendency is to base the rule upon an implied contract entered into by the servant with his master that the latter should not be under any necessity to indemnify him from the negligence of a fellow-servant. In order to establish common employment it is not necessary that the servants should be employed about the same kind of work; it is sufficient that they are engaged under the same employer for the purposes of the same business, however different in detail those purposes may be. The relative rank of the servants is immaterial, and a stranger who voluntarily gives help is for the time regarded as a servant.

The legal effects of the doctrine have been to some extent modified by the 43 & 44 Vict. c. 42. Under that act a workman is entitled to compensation for injuries resulting from the negligence of a fellow-servant acting as a superintendent or under orders issued by the master. Special provision is made for railway servants, who may claim damages from their employer for the negligence of their fellow-servants in charge of any signal, points, locomotive engine, or train upon a railway. An employer is also made liable to his servants for any defect in the condition of the ways, works, machinery, or plant connected with his business. The right to claim compensation is, however, burdened with numerous onerous conditions.

[*Addison on Torts*, by H. Smith, London, 1887. — *Treatise on the Principles of Obligations arising from Civil Wrongs in the Common Law*, by F. Pollock, London, 1887. As to liability of employers in foreign countries, see *Parl. Pap. Commercial*, 1886, No. 21. — *Harvard Law Review*, December 1888. On the subject generally, see *Essays in Jurisprudence*, by F. Pollock, London, 1882. — *Parliamentary Papers*, H. C., 1876, No. 372; 1877, No. 285. — *Report of Select Committee*, 1886, No. 192.]

J. E. C. M.

COMMON GOOD (Scotland). Property belonging to a municipal corporation, administered by the magistrates.

A. D.

COMMONS. Upon the origin of rights of common there are two main theories. The legal theory, in its crudest form, traces the primitive form of property to individual ownership, and regards rights of common as being based upon the grant or the sufferance of an individual owner. The historical theory traces the natural or original form of property to common ownership, and sees in rights of common the survivals of an era before the evolution of individual ownership. So far as the soil of England is concerned, the balance of probability appears to be in favour of the view that the legal theory, with certain modifications, approximates most closely to the truth. The question may have more than antiquarian importance, because it has a direct bearing upon that theory of the nationalisation

of the land which assumes as its basis the original common ownership of the soil. If the historical theory is correct, rights of common represent all that the encroachments of individual owners failed to absorb; if the legal theory is correct, rights of common represent the encroachments of servile tenants upon the possessions of individual owners. The essence of the Mark system or Teutonic village community of freemen is that the territory of the mark, or the soil occupied by the agrarian association, was owned by the community by which it was cultivated, or by the tribe or nation of which the community formed a part. Community of occupation and co-tillage are characteristic features of the Anglo-Saxon system of farming in the dawn of agricultural history (see AGRICULTURE IN ENGLAND). Writers like Maurer, Kemble, Freeman, Nasse, and others, have therefore argued or assumed that the mark system existed in this country in its pure form, and their contentions are supported by the researches of Sir H. Maine into the village community (see Digby, *History of the Law of Real Property*, and Joshua Williams, *Rights of Commons*). If this historical view is correct, then the manorial system is an encroachment upon the mark system, the "land-law of the noble" superseded the "land-law of the people," the mark of independent freemen was degraded into the manor of serfs and semi-servile tenants, and commons are a survival of the primitive form of property which existed in this country. This view is taken by Elton (*Tenures of Kent*), who dates the encroachments of individual upon common ownership, and of the manor upon the mark, from the reign of Edward the Confessor. But it is doubtful whether the mark as a system of land ownership ever existed in this country. As a unit of local administration it is assumed by Stubbs (*Constitutional History*, vol. i. 83-86), but even this assumption is open to question (see Lodge's *Anglo-Saxon Law*, p. 82). Although, as a means of farming, the mark system indisputably prevailed and regulated the agriculture of the country till the present century, Seebohm (*Village Community*) has shown good reason to doubt whether the partners of the association were ever in this country the independent owners of the land they tilled, and whether they were not always tenants tilling soil over which they enjoyed regulated customary rights, but of which they were not the owners. He proves beyond all question that in many cases the land was in Anglo-Saxon times owned by individuals and cultivated by communities who held under their lords by semi-servile tenure. These estates readily adapted themselves with the slightest possible changes to the Norman system of manors. Thus modified, the legal theory is probably most near the truth. According to Blackstone (*Commentaries*, ii. 92) and Coke

(*Complete Copyholder*, p. 8, etc.), rights of common existed subsequently to manors, and originated in the grant or the sufferance of the lord. And this is the legal basis upon which common rights rest. As a question of fact it may still be disputed whether rights of common over the wastes of a manor are exercised by the association of farmers in virtue of their former ownership of the soil, or by the grant or sufferance of the individual owner, whose tenants they are. But there can be no dispute that since the Norman Conquest such rights are legally of the nature of exceptional rights granted over land by its real owner to his tenants. They are of four kinds: (1) *Appendant*, i.e. attached or incident to the tenancies of freeholders; (2) *appurtenant*, i.e. enjoyed by strangers in respect of land not belonging to the manorial estate; (3) *in gross*, irrespective of land at all; (4) *customary*, i.e. enjoyed by copyholders. Such rights differ not only in origin but in kind. Thus there may be commons of pasture, of piscary (fishing), of turbary (turf-cutting), of estovers (cutting or taking wood).

The later history of commons is a history on the one side of attempts to extinguish the rights enjoyed, and on the other of efforts to resist such encroachments. At first no public rights were recognised; resistance was made if at all, in the interests only of the commoners. Opposition to the enclosure of commons entered upon a new phase in 1845 (Gen. Inclosure Act, 8 & 9 Vict. c. 148), when the necessity of preserving commons as places of recreation or as breathing spaces in crowded districts was recognised. Considering the untempered condemnation which has been passed on the Inclosure Acts by popular speakers and writers in recent years, it is amusing to contrast Bentham's opinion that "the tendency of the General Inclosure Bill seems alike favourable to the interests of the *rich* and *poor*." . . . "It effects the raising of the wages of labour" (Poor Bill introduced by Mr. Pitt, *Works*, vol. viii. p. 449). Miss Martineau in her illustrations of political economy is equally partial to enclosures. We may therefore distinguish between (A) *commoners' opposition up to 1845*, and (B) *public opposition after 1845*. (A) Legislation to limit and restrain the rights of lords of manors to enclose their wastes begins with the statute of Merton (1235) and the statute of Westminster (1285), which protected respectively commons *appendant* and commons *appurtenant*. Down to the year 1800 commons could only be enclosed by means of private acts of parliament. But under the pressure of increasing population it was necessary to utilise every available acre. In 1801, through the exertions of Young and Sir J. Sinclair, an Inclosure Act was passed (41 Geo. III. c. 109) which incorporated the provisions generally in-

cluded in the special acts, and regulated, and at the same time facilitated, the enclosure of land. The following statistics of enclosures illustrate the extent to which agriculture progressed in the latter half of the 18th century. Between 1700 and 1845 there were 3835 enclosure acts and 7,572,664 acres enclosed, the total area of Great Britain being 56,786,199 acres, and the cultivated area about 32,500,000. Of this total number 3209 acts were passed in the reign of George III. and 6,288,910 acres enclosed. (B) Signs of the change of policy which protects open spaces are previously seen in 18th century tracts (e.g. *Inquiry into the Influence of Enclosures on Population* (1786), or *Advantages and Disadvantages of Inclosing* (1772)), and in the debates upon the Inclosure Bill of 1836 (see Hansard 35, 1226 and 1271). But the new policy received full expression in 1845, when the General Inclosure Act was passed (8 & 9 Vict. c. 148). It was primarily passed to facilitate the enclosure of commons and wastes which impeded the productive employment of land, and for this object it appointed commissioners who were to decide whether or not enclosures were expedient. But it protects commons within a certain distance of London or large towns from enclosures, requires the appropriation of allotments for the exercise and recreation of the neighbourhood, and declares that no village greens shall be enclosed. But it was felt that the commissioners did not sufficiently protect the public. And in this direction legislation has since that time advanced. The public and not the landlord is now treated as the real owner. The Metropolitan Commons Act, 1866, was passed in this spirit. In 1869 a committee of the House of Commons reported on metropolitan commons, and suggested various alterations in the existing law of enclosures. Many of their suggestions were embodied in the Inclosure Act of 1876. The preamble of this act shows how completely the spirit of legislation was changed. It expressly forbids the commissioners to sanction any enclosures unless they are satisfied that such enclosures will benefit not only private interests but the neighbourhood. Clauses in the act also provide for the management, protection, and preservation of commons. Commons may now be enclosed in one of three ways—(i.) they may be appropriated by railway companies under the powers of their acts; (ii.) they may be enclosed under the Inclosure Act; (iii.) they may be enclosed by an individual owner who claims to be legally entitled to enclose.

R. E. P.

COMMONTY (Scotch). Common or waste, over which there are rights of common. A. D.

COMMUNE. When a group of families forming a tribe cease to lead a wandering life and settle down in a fixed place of abode, the commune springs into being. At present, in India the *village communities* are considered as composed of families descended from a common ancestor.

The commune is society's primary organic cell. A collection of communes united under the rule of a sovereign power forms the state. Primitively in all countries the commune was a political body where autonomy reigned, and which itself regulated all the local interests of its inhabitants. We see this in the Anglo-Saxon *Tunscip*, in the *Township* of New England, in the Germanic *Gemeinde*, in the *Gemeente* of the Netherlands, in the *Communautés* of the Neo-latin peoples, in the Russian *Mir*, in the Javanese *Dessa*, in the Indies, and in Japan, China, and Arabia, or in other words, in all climates and amongst all races. As the families living on the communal land have common interests to be considered and provided and legislated for, it necessarily follows that the commune becomes a sort of institution of the economic order. This is clearly apparent in following the birth and development of the New England townships.

As soon as a *plantation* is formed, the heads of the different families meet together in the spring-time, every year, in a town-meeting, to consult respecting public interests, and to appoint the various functionaries to fulfil the same: *Churchwardens* for the supervision of matters connected with the church; *overseers of the poor* to distribute succour to the needy; *highway surveyors* to maintain the roads in good order; *fence viewers* to overlook the hedges, gates, and enclosures generally; *wardens* for the repression of drunkenness, cruelty to animals; *constables* or police for the maintenance of general order; and *school trustees* or school-board officers to attend to the schools and appoint competent masters and mistresses. Everywhere, too, at the commencement, as I have shown in my book *Primitive Property*, the commune reserved the greater portion of its land as common pasture ground (commons), where all the inhabitants had the right to send their cattle to graze, and the remainder was periodically divided up between all the families of the commune, with the exception of the little plot surrounding each dwelling, which was the private property of the owner. According to Cæsar and Tacitus, this was the agrarian system which existed among the Germanic races, and it may still be found at the present

day, with precisely the same distinctive characteristics, in the Russian *Mir* and in the Javanese *Dessa*. If one be desirous of studying the working and results of this system on a small scale, one may do so in the *allmends* of Switzerland and southern Germany. The level land lying along the shore of the lake of Brienz, between Interlaken and Bönigen, is the *allmend* of this latter village. It is divided into small plots where vegetables and fruit-trees are cultivated. Each of these plots is owned by the head of a family for his life. The communal *allmend* comprises forests, which supply the inhabitants with wood for firing and building purposes, pasturage where their cattle can graze in summer, and arable land whence they can procure a portion of their sustenance. The commune is thus a sort of hive which furnishes each family with supplies, and thus attaches it to the soil of the *Alma Mater*.

At the present day, owing to the growing exigencies of civilisation, the commune is step by step recovering the economic status it possessed at the outset. This is plainly observable in countries where civilisation is the most advanced, in the United States and Scotland, for instance. The city of Glasgow may be mentioned as an example. The city here not only opens schools for the entire population but also supplies the drinking water, the gas, lights at its own expense the common staircases of large lodging-houses, lets out heating apparatus, stoves, and fixtures, at a low rental; it considers tramways to be a part of the street, and allows them to be worked by a company only on the fixed condition that the price shall not exceed a penny a mile, and that morning and evening cars be run for workmen at half-price. The local sanitary legislation is also thoroughly perfected. There is complete municipalisation of markets and slaughter-houses; the city also entered upon a scheme of wholesale demolition of slums and overcrowded districts, in view of better housing of the poor, and now it is building houses on sites it has cleared, and will then enter upon the functions of house landlord; it has also opened a series of common lodging-houses, having accommodation for 2000 persons slightly, and has established a magnificent system of baths, swimming-baths, and wash-houses; it maintains a corps of lady inspectors who go about among poor families to inculcate domestic cleanliness; it has entered upon the general laundry business, and is serving families at the current prices. Museums of all sorts, parks, playgrounds, and public libraries have been opened to foster the progress of civilisation.

It may be seen, in fact, in all parts of the world that the old "commune" notion is gaining ground more or less rapidly, and the socialistic ideal of the state as a providential power doing its best to remedy the results of

social inequality, is little by little forcing itself upon the world. Attention can only be drawn here to this fact. Its advantages and disadvantages must be elsewhere discussed. One thing, however, appears probable, that in the future organisation of society, communes will, as at its outset, play an important economic part.

[E. de Laveleye, *Primitive Property*, trans. 1878.] E. de L.

COMMUNE OF PARIS, 1871. It is widely believed in England that the Commune of 1871 was primarily a communist institution. In denying this the better informed are apt to merely explain the true meaning of the word COMMUNE (*q.v.*), and leave the impression that the establishment of the Commune was only an extreme application of the principle of local self-government (*e.g.* P. G. Hamerton, *French and English*, 1889, p. xii. n.) This is nearly as incorrect as the more common belief. It is quite true that adherents of the Commune are not properly called "communists," the French word being not *communistes* but *communeux* or *communeards*, but it is not the case that the Commune movement was a purely political affair. Local and temporary circumstances made its short-lived success possible, but any real strength which it possessed was entirely contributed by the partisans of a social or economic revolution. About one-third of the members of the council of the Commune were connected with the INTERNATIONAL (*q.v.*) The chief economic measure, passed by it or recommended by its committee on labour and exchange, which was entirely composed of socialists, provided for the remission of house rents for the period covered by the siege, the gratuitous return of all articles under £1 in value pawned at the Mont de Piété, the establishment of a list fixing the wages of labourers in communal contracts, and the transference of workshops abandoned by their owners to associations of workmen (*v.* ANARCHISM).

Malon, *Histoire du Socialisme, 1888*.] E. C.

COMMUNICATION, MEANS OF. Modern facilities for communication between one district and another are so complete generally that the fact that these facilities are comparatively recent is not unfrequently forgotten. Their economic value is so great that it is scarcely possible to over-estimate it. A reference to the condition of matters before present facilities existed in England will enable this to be better understood. Porter, in his *Progress of the Nation*, written 1842, makes the following observations on a part of Sussex now practically included among the suburban districts of the metropolis, and acces-

sible, when Porter wrote, within four hours of London. "An inhabitant of Horsham, in Sussex, lately living, remembers, when a boy, to have heard from a person whose father carried on the business of a butcher in that town, that in his time the only means of reaching the metropolis was either by going on foot or riding on horseback, the latter of which undertakings was not practicable at all periods of the year, nor in every state of the weather; that the roads were not at any time in such a condition as to admit of sheep or cattle being driven upon them to the London markets, and that for this reason the farmers were prevented sending thither the produce of their land, the immediate neighbourhood being, in fact, their only market. Under these circumstances, a quarter of a fat ox was commonly sold for about 15s., and the price of mutton throughout the year was only five farthings the pound." This illustration, as every one can supply the present condition of matters for himself, shows the effect of improved internal communication within a recent period and a restricted area. Mr. E. Atkinson has in his publications, *The Relative Strength and Weakness of Nations*, etc., recorded the corresponding but even greater effect of similar facilities in the United States of America—"The wages for one day's work of an average mechanic in the far East will pay for moving a year's subsistence of bread and meat a thousand miles or more from the distant West." These instances of results from improvements of means of communication illustrate comparatively recent changes, brought about by their means, in production, price, etc. Further development will, no doubt, be as active a factor in the future as it has been in the past. The main part of the comforts and conveniences of life, the whole work of commerce, to refer to no other points, depend on the power of ready communication, which, in its turn, depends almost as much on the absence of obstruction on the part of governments for fiscal and other purposes, as on the extension of mechanical facilities (see RAILWAYS; CANALS; TRANSPORT, COST OF.)

[Many economic problems presented by modern means of communication, including remarks on their utility to the community and the measurement in money of that utility, are discussed with great originality by Dupuit in the *Dictionnaire de l'Econ. Politique*, under the heads *Routes et Chemins*, *Voies de Communications*, abridged from certain longer memoirs to which reference will be found under DUPUIT.]

COMMUNIO. An expression of Roman law applied collectively to a number of persons jointly interested in some property or undertaking. If the joint interest arises by contract, the Roman writers speak of *societas* (partnership); if it is created by accident (as for instance in the case of joint heirs) the expression *communio incidens* is used by later writers. E. S.

COMMUNISM is the theory which teaches that the labour and the income of society should be distributed equally among all its members by some constituted authority. For an example of what communists mean by equal division of labour and income the following explanation may suffice:—"Here equality must be measured by the capacity of the worker and the need of the consumer, not by the intensity of the labour and the quantity of things consumed. A man endowed with a certain degree of strength, when he lifts a weight of ten pounds, labours as much as another man with five times the strength when he lifts fifty pounds. He who, to satisfy a burning thirst, swallows a pitcher of water, enjoys no more than his comrade who, but slightly thirsty, sips a cupful. The aim of the communism in question is equality of pains and pleasures, not of consumable things and workers' tasks" (Buonarroti, *Conspiration de Babeuf*, i. 297). (See BUONARROTI.)

As communism involves the conception of society as an industrial association for the production of wealth, it is of modern origin. That conception certainly played no part in the institutions attributed to Minos and Lycurgus, nor in those suggested by Plato in the *Republic*. The equal distribution of wealth among a governing class was then upheld as desirable wholly from a moral and political, not at all from an economic, point of view; equality of distribution, and, still more, equality of labour, among the whole population, would have been utterly abhorrent to the minds of Greek statesmen and philosophers, if they had been able to conceive the idea. The practice of the earliest Christians described in Acts ii. 44, 45; iv. 34, v. 8, has generally been considered as communistic, but all that is actually said is that a number of persons sold their property and gave the proceeds to be distributed among their poorer fellows, who doubtless treated what they received as income; in this there would have been no communism even if the gifts had been compulsory, and Peter's words to Ananias show that they were not. The first exposition of communism is to be found in Sir Thomas More's *Utopia* (see MORE, Sir T.) published at Louvain in 1516. Written in Latin, the *Utopia* was accessible to all the learned world of the time; at first in the original, and afterwards in translations, it has had an enormous number of readers. After a severe criticism of capital punishment for theft, of the habit of maintaining a multitude of idle followers, and of the extension of pasture at the expense of arable land, More enters on the description of a nation numbering apparently three or four million souls, living a simple life without private property, under elected officers who fix the duration of requisite labour and generally direct production. Distribution

is supposed to effect itself without difficulty, as the impossibility of ostentation and the general abundance prevent any one from demanding more than his fair share: "It is the fear of want that makes any of the whole race of animals either greedy or ravenous." Division of labour exists, but, agricultural labour being a "hard course of life," every one must take his turn in the fields. The institution of marriage is only slightly modified, but the adoption of children is largely practised in order to keep all the families nearly equal in size. Increase of population, if there is any, is dealt with by emigration. There is a small class of unenfranchised persons or slaves, consisting of convicts condemned to hard labour, prisoners taken in battle, and foreigners who have entered the service of the Utopians voluntarily. As a substitute for the stimulus to industry provided by self-interest when private property is established, the fact that "all men live in full view" is put forward.

It is highly improbable that More considered his book as anything more than a picture of an entirely ideal state of society, towards which some approximation might possibly be made in certain particulars. Not until the era of the French Revolution did a communist organisation of society come to be thought of as something to be actively striven for, and completely realised at no distant date. The *Civitas Solis* (1620) of CAMPANELLA (*q.v.*), a work of small merit and importance (for a translation, see *Ideal Commonwealths*, in Morley's Universal Library), is far less practical than the *Utopia*. The immediate precursors of the communism of the Revolution were Morelly and Mably, writers who, in accordance with the fashion of their day, placed their utopias in "the state of nature." MORELLY (*q.v.*), in his *Code de la Nature* (1755), taught that man naturally possesses every virtue, and is only depraved by bad institutions, the chief of which is private property. Every one would be industrious, he thought, if it were not that some are deterred from labour by the enervation of riches, and others by the desperation of poverty. He declared, therefore, that it would be "in conformity with the intentions of nature," if every citizen contributed to the resources of the state, in accordance with his strength, talents, and age, and in return were wholly maintained at the public expense. Every one was to engage in agriculture between the ages of 20 and 25. Celibacy was not to be allowed. MABLY (*q.v.*), who was a brother of CONDILLAC (*q.v.*), in Letters I. and II. of *Doutes proposés aux philosophes économistes sur l'ordre naturel et essentiel des sociétés politiques* (1768), endeavoured to show, in opposition to MERCIER DE LA RIVIÈRE (*q.v.*), that private property in land is not the natural and necessary basis of society. On the contrary, he said, society could exist, without

property, as is proved by the cases of Sparta, the Jesuits in Paraguay, and the monastic orders; while the establishment of property in land and inequality of condition, has been the great source of avarice, ambition, and vanity. In his *Traité de la Législation* (1776), Book I., he maintained the same views, and incidentally described the communist arrangements which nature, as he thought, dictated to primitive man; he imagines "the citizens distributed into different classes, the more robust are appointed to cultivate the earth, the rest work at the rough handicrafts with which society cannot dispense." "To exclude idleness, all that was necessary was to encourage labour by passing laws which should awaken in the citizens the natural instinct which induces us to seek the esteem of our fellows, and to fear their contempt." But it was undesirable, he admitted frankly, to try to restore the lost condition of natural equality. The rich would resist any such attempt, and it is doubtful if the poor would support it, and still more doubtful if they "could adopt the feelings which would be in harmony with their new position," if the attempt were successful.

The Revolution in France was economic as well as political. It made the people far more equal in wealth than before. But a mere redistribution of property, even when it makes wealth more equal, is not a communist measure, and need not tend in a communist direction. The creation of a great number of small freeholders, which was greatly promoted by the Revolution, is considered to have strengthened the institution of separate property. Though there was a large class which desired to reduce or destroy the inequality between rich and poor, there were but few who saw that the only way to create and maintain equality in wealth was to establish complete communism, and were at the same time convinced of the practicability of such a change. BABEUF (*q.v.*) and his fellow-conspirators of 1796, who called themselves the "Equals," were the most remarkable representatives of this small party. How far the Equals had actually thought out a scheme of communism is not very easy to decide, since the history of their conspiracy, written by their ablest member, Philippe Buonarroti, was not published till 1828. Buonarroti admits that he describes their economic plans almost entirely from memory; he has probably added many ideas which belong in reality to a later date than 1796. In the Babouvist Utopia, as described by Buonarroti, every one is allotted two different occupations, the one light and the other hard. To give variety and change of scene, all are employed by turns in the transport and postal services. Those who will not work are treated as thieves are treated under the system of private property. Education, carried on in vast boarding-schools, subordinates

family affection to patriotism. The increase of population is stimulated to the utmost. Distribution is ruled by the principle of strict equality of pains and pleasures. The transition to this state of things was to be effected by establishing at once the skeleton of a great national community, which would rapidly acquire all property by means of free gifts and escheats, bequest and inheritance being totally abolished. For the existing generation adhesion to the community would be voluntary. Whether the heads of the Babouvist conspiracy desired to carry out some such scheme as this or not, their immediate object was to overthrow the Directory, and for this purpose appeals to the love of plunder, in which they dealt very freely, were likely to be more useful than elaborate schemes of orderly communism. After the discovery and defeat of the plot, and the execution of Babeuf (May 1797), the revolutionary spirit slumbered for a time, and communism, which was as yet nothing more than an incidental outcome of the desire for destruction, slumbered also. The schemes of SAINT-SIMON (*q.v.*) and FOURIER (*q.v.*), which soon began to occupy the attention of those who were inclined to wish for social reorganisation, though they involve distribution by constituted authority, cannot properly be considered communistic, as they lack the essential characteristic of communism in not being founded on the principle of equality. Buonarroti's book, printed at Brussels in 1828, but not much read in France till some time afterwards, revived to some extent the idea of communist equality, and led to the publication (1837-40) of the *Moniteur républicain*, the *Homme libre*, and a number of other short-lived and bloodthirsty communist newspapers. The insignificance of the Babouvist party was shown in the futile insurrection of 12th May 1839, when the followers of Armand Barbès, Martin Bernard, and Louis Auguste Blanqui, to the number of three or four hundred, obtained possession of the Hôtel de Ville for a few hours. In the next year merely destructive communism was practically superseded in France by "Icarianism," the creation of CABET (*q.v.*), thought out in England, where ROBERT OWEN (*q.v.*) was the chief teacher of communism.

Owen's communism was very different from that of Babeuf, Buonarroti, and their followers. It had its origin not in politics and a worship of the abstract principle of equality, but in practical philanthropy. The primary object of Owen was not to destroy the existing state of society, but to substitute for it a new state, the superiority of which he considered he had proved. Assistant master in an elementary school at the age of seven, draper's apprentice at ten, mule machine maker at eighteen, manager of an important cotton spinning factory at nineteen, and successful in each capacity, he had every

claim to be considered "a practical man," and it was entirely through his own experience that he arrived at his schemes of social regeneration. The good effects of his treatment of the factory hands when manager and part-proprietor of mills in Manchester (1790-97) and New Lanark (1797-1828) established in his mind a theory that heredity is of very small importance as regards character, and that "it is impossible that any human being can form his own qualities or character," which are really formed by education and surroundings. This theory, if admitted, is obviously an excellent basis for communism. By its denial of moral responsibility it overthrows the common argument that poverty is generally "deserved," and that private property is therefore just. Further, it avoids the error of confounding wealth or material welfare with happiness, and it was suitable to a time when the desirability of making elementary education more general was beginning to dawn on the public mind. So Owen developed from the philanthropist manufacturer into the communist projector. In March 1817 he submitted to the House of Commons' committee, then considering the poor law, a report which he had drawn up for the "Association for the relief of the manufacturing and labouring poor." In this he proposed that the unemployed poor should be formed into communities of about one thousand persons, who should be provided with land and other requisites of production by the state, and support themselves by agriculture and manufactures. He says nothing in the report itself about the principle on which distribution within the communities should be effected, but in a letter to the newspapers of 30th July 1817, he argues that men will be as industrious "in a community of mutual and combined interests as when employed for their individual gain. . . . Wherever the experiment has been tried, the labour of each has been exerted cheerfully." When working by the day, he adds, the worker has no interest in his work, and when he works by the piece he is apt to overwork himself. "When employed with others in a community of interests both these extremes are avoided; the labour becomes temperate but effective, and may be easily regulated and superintended. Besides, the principles and practices are now quite obvious by which any inclinations from the most indolent to the most industrious may be given to the rising generation." The scheme was wonderfully well received; the *Morning Post* of 9th August 1817 declared that the "appeal, founded as it is upon genuine reason, virtue, and humanity, cannot possibly fail of success." But Owen, over-elated with approbation, went out of his way to declare at a public meeting on 21st August that the only reason his plans had not been adopted centuries ago was the errors of religion, which had

created enough bigotry and fanaticism to wreck not only a community but Paradise itself. This incident, which Owen grotesquely persisted in believing to be the most important event in the history of mankind, alienated much sympathy. Nevertheless in 1819 a committee (appointed by public meeting), of which the Duke of Kent, Ricardo, Torrens, and Sir R. Peel the elder were members, recommended the establishment of an experimental community by means of capital to be provided by a joint-stock company and on the principles of private property, communist distribution being strictly excluded. Nothing came of this, as subscriptions could not be obtained. In 1825 Abram Combe, a tanner of Edinburgh and disciple of Owen, in conjunction with Mr. A. J. Hamilton of Dalzell, obtained 800 acres of land and built a common dwelling-house for 100 families at Orbiston near Glasgow. About 300 persons willing to form a community were easily collected. Till a new generation fit for equality had grown up, it was proposed to distribute the income of the community according to the estimated value of the produce of each individual's labour. Combe died in August 1827, and the whole undertaking immediately collapsed. Meanwhile Owen was trying to establish a similar community in America. He bought, in 1825, the village of Harmony, Indiana, from the Harmony Society or Rappists, who wished to remove. He called the place New Harmony, and invited the "industrious and well disposed" of all nations and creeds to come and form a "preliminary society." Eight or nine hundred persons came, and the preliminary society, in which members were remunerated according to the amount of their services, was soon superseded (January 1826) by the definitive "community of equality," in which equality (modified by differences of need) was alone to regulate distribution. But the miscellaneous collection of individuals who had assembled in answer to Owen's comprehensive invitation never became united by any feeling of common interest, so that by November 1826 the official newspaper of New Harmony, edited by Owen's sons, had to admit that "New Harmony is not now a community." Attempts were made to form several smaller communities out of the ruins, but these all failed, and very soon scarcely a trace of Owen's scheme remained in America. In England from 1827 to 1832 the Owenites founded several hundred "co-operative societies." These consisted of persons who collected a small common capital by subscriptions and opened a shop, in the hope of accumulating from the profits of the business an amount sufficient for the establishment of a communist village. The system of sharing profits with customers which made co-operative societies successful at a later date had not yet been discovered, and the Owenite societies failed,

and were soon almost entirely forgotten. Owen himself continued a firm believer in the speedy advent of "a new system of society." His Labour Exchange of 1833 (see LABOUR EXCHANGE) was intended to be in some way an intermediate step. "The Association of all Classes of all Nations" and "The National Community Friendly Society" were founded in 1835, the first to propagate his principles, and the second to promote the establishment of communities founded upon them. The two organisations were amalgamated in 1839 under the title of "The Universal Society of Rational Religionists." The chief product of the labours of these bodies was the "Queenwood community," a communist farm at Tytherley in Hampshire, of which Owen was persuaded to take charge in 1841. The experiment attracted much attention, and its failure, which occurred a few months after Owen's arrival, seems to have been the death-blow of Owenism.

ETIENNE CABET (*q.v.*), French advocate and deputy was condemned in 1834 to five years' exile in consequence of his violent opposition to Louis Philippe's government. He spent the five years in England, and after studying More's *Utopia*, and no doubt submitting to some extent to Owenite influence, began to doubt whether the political revolution for which he had hitherto been striving was all that was required for his country. He returned to France in 1839 a thorough communist, and in 1840 published his *Voyage en Icarie*. Though provided with a hero and heroine, and a somewhat thin thread of romance, in order if possible to attract the frivolous as well as the serious reader, this work, like the *Utopia*, consists chiefly of a description of an imaginary state where communism is established. But while More's ideal state is totally detached from ordinary life, Cabet's is described as having grown, in less than half a century, out of a state in which all the evils of private property were rampant. Icaria is France in 1890, as Cabet thought it should and might be. Unlike the Babouvists, however, he saw that the change could only be carried out by pacific measures. "Communism," he says, "intended for the happiness of all men, must not begin by throwing a large party into despair" (*Voyage*, p. 562, ed. 1845). "Communism cannot be established and consolidated except by the power of almost unanimous public opinion (*Ibid.* p. 515)." It has been objected that the transition to communism in Icaria is made to begin with a bloody revolution, but this revolution is apparently considered necessary in order to overthrow a very odious political tyranny. Democracy once established, the change to communism is carried out peaceably enough, it being an indispensable condition that the rich and the owners of property, great and small, should not have their habits and prejudices wounded (*Ibid.* p. 343). In his account

of the details of the transitory *regime*, Cabet adopts much of the scheme propounded by Buonarroti. In the completed Icaria, the distribution of wealth is regulated by the principle of equality interpreted to mean an extraordinary, and most people would think a very oppressive, uniformity. Every one is allowed, so far as possible, to choose his occupation, and the stimulus to industry is provided by regarding the idle man as a thief. Marriage, and family life are strictly maintained. Great importance is attached to education. The increase of population is not thought to require any checks.

For some of the French communists of the time, Icarianism was far too moderate a doctrine. They objected to the condemnation of violence and to the maintenance of marriage and the family. But the protests of Théodore Décaux and others were of no avail against the wide circulation of Cabet's writings, and the Icarian school was soon supposed to number its adherents among working men by the hundred thousand. Warned no doubt by Owen's numerous failures, Cabet at first advocated only attempts to convert whole nations to communism, and deprecated the foundation of small communist societies, which "would do but little good if they succeeded, and much harm if they failed, as they were nearly sure to do" (*Voyage*, p. 564). Yet, urged on to some kind of action both by friends and enemies, he became himself the founder of such a society. After a consultation with Owen, he bought some delusive rights over a million acres in the north-east of Texas. On 3d February 1848, eighty-nine chosen men were despatched from Havre as the "first advance guard" of the multitudes who were expected to follow and establish an Icaria in America. Three weeks later Louis Philippe fell, and great numbers who had before been willing to emigrate now desired to remain in France and promote Icarianism in the new Republic, so that only about four hundred persons followed the "advance guard." When they arrived at New Orleans the advance guard had already abandoned the land in Texas, which was altogether unsuitable. Eventually about 280 of the colonists established themselves as a communist society at Nauvoo, Illinois, a settlement from which the Mormons had just retired. This community prospered fairly for some time, and increased, under Cabet's leadership, till it numbered some 600 members. On Cabet's expulsion in 1856, 180 of the members left with him and established a community at Cheltenham, near St. Louis, which lasted till 1864. The original community removed from Nauvoo to Icaria, Adams County, Iowa, in 1860. Its expulsion of Cabet had alienated sympathy in France, and it became surrounded by various difficulties. After the war its position gradually improved.

but in 1877 there was another schism; the conservatives or old party became "the New Icarian Community," and the young party "the Icarian Community," each numbering thirty or forty persons. The old domain was divided between the two new communities, but in 1883 the "Icarian Community" decided to remove to Icaria-Speranza, near Cloverdale in California. (Albert Shaw, *Icaria: a Chapter in the History of Communism*, 1884.)

The Icarian communities may be regarded as relics of a movement the history of which is nearly confined to the first half of the nineteenth century. From 1848 socialism, of which the fundamental principle is that the whole income of society should be received by labour, not that it should be divided equally, has taken the place of communism. "The proposal to organise society on a communistic plan . . . is one of which the serious interest has now passed away" (Sidgwick, *Pol. Econ.*, III. vii. § 3). But wholly apart from the history of the advocacy of that proposal, there have been innumerable cases where the principles of equal labour and equal distribution have been recognised and acted on (for a considerable list, see Roscher, *Pol. Econ.*, § lxxxii. notes). Religious societies, such as the Essenes, Anabaptists, Dunkers, Moravians or United Brethren, the monastic orders, and the six societies described in Nordhoff's *Communistic Societies of the United States* (1875), have always been prone to adopt a communist organisation, whether from asceticism, or unselfishness, or a desire to minimise communication with the world. Of these bodies the American societies are far the most important from an economic point of view, as their industrial character is not by any means wholly subordinate to their religion. In 1874 they consisted of about seventy communities, with a total population of 5258. The Shakers (58 communities or "families," population 2415, founded in 1792) and the Rappists or Harmonists of Economy (pop. 110, founded 1805) were celibate, the Separatists of Zoar (pop. 300, founded 1842) and the Aurora and Bethel communes (pop. 600, founded 1844) maintained the institutions of marriage and the family, while the Perfectionists of Oneida and Wallingford, followers of Mr. J. H. Noyes (pop. 283, founded 1849), practised an elaborate system of polygamy and polyandry. This was abandoned in 1879, and the society was converted into a joint-stock company in 1880. Most of the communities were well off, and all were able to secure efficient but not exhausting labour from their members. The population in general was declining, chiefly in consequence of the superior attractions presented to the young people, native and adopted, by the more exciting existence of the outside world. All the societies except the Shakers and the Perfectionists had German founders.

Communist elements, the importance of which seems to be growing, are present in the state provision of such things as roads, drains, lamps, parks, schools, and libraries, which are maintained by taxes and rates levied in the main according to the ability of the contributor to pay, and are used in common, or equally, or according to need. The English poor law is communistic as regards the contributions levied under it, but the comparison which used to be frequently made between the workhouse and a communist society is misleading, as the paupers have not the direction of their collective industry, and are not in the least affected by the increase or diminution of its produce.

The criticism of communism by economists begins (not to include Hume's *Essays*, II. p. 270) with Malthus's remarks on the schemes of OWEN and SPENCE (q.v.) in the 5th edition of his *Essay on Population* (1817). He gives two decisive arguments against communism: (1) the absence of "those stimulants to exertion which can alone overcome the natural indolence of man"; and (2) the absence of checks to the increase of population which would be brought about by the removal of "the laws of private property and the moral obligation imposed on every man by the commands of God and nature to support his own children" (ii. 276, 277). These two arguments have been very generally repeated by later writers down to the present time (e.g. Sidgwick, *Pol. Econ.*, III. vii. § 3), and very little has been added to them. J. S. Mill (*Pol. Econ.*, II. i. § 3) rejected them both, urging that both supervision and individual self-interest in the efficiency of labour would be more complete in a communist society than is at present the case as regards the great mass of labour, and that excessive increase of population would be more likely to be repressed by public opinion in a communist society, where it would cause "immediate and unmistakable inconvenience to every individual in the association." Mill's position as to the stimulus to industry has been strengthened by the support which many economists have given to co-operative production, in which the stimulus is collective and not individual, since each man's labour is supposed to be made more efficient than under the ordinary system by the desire of each that the product of the labour of all may be great. No one need look to political economy to prove or disprove the advantage of communism in the abstract. It is generally recognised that a society is likely to be happier the more equally the produce of its labour is divided (Sidgwick, *Pol. Econ.*, III. vii. § 1; cp. Jevons's *Theory*, ch. iii.), but the remaining economic question, "Can any kind of government organise labour and production so as to supply the wants of society (given the admitted advantage of equality) as well, on the whole, as they can be supplied by the system of private

property and competition?" is one as to which opinions may legitimately differ, and to which the true answer is probably different at different times and places.

For the "communists" of Paris in 1871, see COMMUNE OF PARIS. (See also ANARCHISM; BABEUF; BRISSOT DE WARVILLE; CHRISTIAN SOCIALISM; CO-OPERATION; PROPERTY; PROUDHON; SOCIALISM.)

[Among English economic writers J. S. Mill (*Principles of Political Economy*, bk. ii. ch. ii. § 2) makes the characteristic of communism "absolute equality in the distribution of the physical means of life and employment." H. Sidgwick again (*Principles of Political Economy*, bk. iii. ch. vii. § 3) restricts Communism and Socialism to systems which involve either the almost entire abolition of private property, or its restrictions to consumers' wealth.]

COMPAGNONNAGES. These were associations of itinerant workmen in Italy, France, and England, formed with the purpose of providing members with food, lodging, and employment; differing from the craft-guilds in that the latter were local, while the compagnonnage was a widespread organisation with local branches. A house of refuge, presided over by an officer called the "mother" of the lodge, was maintained in every town. Here board and lodging were provided for members of the society. Membership was tested by secret signs and passwords. Such employment as was to be found in the place was distributed to members in rotation, the last comers having a prior claim to those who had already had work in the town. The origin of the compagnonnages is involved in legend, but they appear to have started in Italy, and to have spread thence through France during the 12th century into England. In France they were closely connected with the order of the Knights of the Temple. They were divided into three main branches under the names of "Enfants de Salomon," "Enfants de maître Jacques," and "Enfants du père Soubise." The two former

divisions contained men of various trades, but the last was composed of thatchers and plasterers only. The rivalry which existed between these divisions gave rise to sanguinary conflicts, and the *compagnonnages*, originally useful in protecting workmen against seignorial oppression, tended to assume the character of secret societies, and to become sources of riot and disorder. They were the object of much repressive legislation from the 16th to the 18th century, and in France were finally abolished in 1791.

COMPANIES.

Companies, English and Scotch Law, p. 368; Increase of, p. 369; Influence on Business, p. 370; Companies, City of London, p. 371; Companies, Staple, p. 373; Companies, Trading, p. 375 (see Foreign Trade, Regulation of).

COMPANIES. ENGLISH AND SCOTCH LAW. The primary idea of partnership is the association of persons, mutually acquainted, for the purpose of commercial enterprise, that is, to gain something. Mutual acquaintance and mutual choice and confidence result in personal relations between the partners; one can bind his fellows in the way of the partnership business; when one dies or when his circumstances undergo a material change, the remaining partners can withdraw their confidence or resist the introduction of his representatives or assignees whom they may not know, and the continuance of the partnership then becomes impossible. As the outside world looks to the partners themselves, when they are known, or even when only some of them are known, credit is given to them and they are all either directly or ultimately liable to the creditors of the firm. Joint-stock companies as usually formed are built up by stated contributions from those who form them; the element of mutual personal choice disappears; the shares are transferable; the management is carried on by the officials of the company to the exclusion of the individual shareholders as such. The transition from simple partnership to joint-stock companies was hampered in England by the persistent application by the courts, to all forms of association, of those principles which are applicable in fact only to simple partnerships founded on mutual personal choice. In Scotland the transition was at first rendered easy by a different set of principles borrowed from Continental and Roman law. The Scottish common law recognises even in simple partnership a separate quasi-personality, in virtue of which it can sue and be sued by even its own partners, can enter as a partner into other partnerships, and is primarily liable for all the debts of the joint undertaking. Primarily only, however; ultimately the partners are liable for all the debts of the firm. A natural outcome of this

doctrine of separate quasi-personality, which was at the beginning of last century more broadly stated as a doctrine of separate personality, was that where a joint-stock company took care not to introduce the names of its partners into its collective name, but used a descriptive name of its own (compare the French *Société anonyme*), the creditors of the concern were held to have given credit not to any individual partners, but to the separate entity which had been created by their joint contributions. Accordingly it was decided in 1727 that the partners of the Arran Fishing Company were not personally liable beyond their shares in the company. Thus the Scottish law was at that early date within easy reach of the principle of joint-stock companies with limited liability.

The Scottish lawyers of the day appear to have considered that to obtain a royal charter was a superfluous though dignified measure; they explain that such a charter needed no legislative sanction, such as is necessary where monopolies are to be conferred, because the powers conferred were already in accord with the common law; there might, however, be an advantage in the explicit limitation of liability which was set forth in the charter. In England the current idea of the time was that limited liability companies were, generally, contrary to public policy; and English ideas began to affect the Scotch legal mind. In Scotch legal procedure it became customary and then necessary to add to the name of a company the names of at least three of its partners as such; confusion was introduced by the Scotch use of the word "company" to mean simple personal partnership as well as joint-stock company. In the leading case (1778) of the banking firm Douglas, Heron, and Co., generally known as the Douglas Bank or the Ayr Bank, it was decided that the liability of the partners was not limited, apparently because of the semi-personal name of the firm; this shook the confidence of Scotch investors in all joint-stock companies; next the Bubble Act, passed in 1719 after the South Sea crash, prohibiting companies from acting as corporate bodies with transferable shares, was unearthed and then believed to apply to Scotland; and the Act 7 Geo. IV. c. 67, empowering private banking companies to sue and be sued in the name of their principal officer on certain conditions, was believed to confirm by implication the view that joint-stock companies were no more than simple partnerships, and that consequently liability could only be limited by special and separate contracts with creditors. But even in Scotland, and even at that time, there was a doubt as to how things stood when the partners of a joint-stock company were known; and in extensive undertakings above the rank of ordinary commercial partnerships a favourite expedient was to obtain a royal

charter which placed the question beyond doubt by the creation of a mercantile corporation. Such a corporation was a distinct individual, with its own estate and liabilities, a corporate name, and its own seal; it could sue and be sued, and was managed by its own officials to the exclusion of the shareholders; it could hold lands without the intervention of trustees; it had perpetual succession and transferable shares, could make bye-laws, and could not be dissolved except by surrendering its charter; and when its property was exhausted, its creditors had no other funds to look to for payment of its liabilities.

Even with regard to chartered companies in Scotland the legislature (6 Geo. IV. c. 91, 1825) empowered the crown to insert in charters a condition of unlimited liability; and in the charters of the National (1825) and Commercial (1831) Banks the liability is stated not to be limited by the charters. An act of 1837 repealed this; and from that date, before which the circumstances in England and in Scotland had, so far as regards the powers of joint-stock companies and the liabilities of their shareholders, become practically the same, a long course of legislation has step by step evolved for the whole United Kingdom the principle of registered joint-stock companies either with or without limited liability (see COMPANIES, INCREASE OF); the governing statute now being the Companies Act 1862, upon which attend a number of supplementary statutes bearing the same name in successive years: the whole now forming a mass of legislation sorely in need of consolidation.

Where a proposed company tends to invade the privileges of the public, legislative sanction is necessary for its formation with the desired powers; for example, companies having monopolies such as the Bank of England and the Bank of Scotland, upon which a monopoly of Scottish banking was conferred for twenty-one years, both of which have charters following upon statutes. Railway companies and others having aggressive powers are formed directly by private acts of parliament; and for companies of this order a considerable measure of uniformity in administration is secured through the operation of the various general Clauses Consolidation Acts of 1845, and amending statutes. A. D.

COMPANIES, INCREASE OF. The marvelous expansion of joint-stock enterprise during recent years may be clearly seen from the following figures, which show the respective numbers of limited companies registered in each successive year since 1863. They are taken from the last return issued by the Registrar of Joint-Stock Companies, and do not include companies incorporated under special Acts of Parliament—as, for instance, Railway and Canal Companies—but only such companies as were incorporated under the Companies' Acts.

1876	831	64	29	1890	2769	145	91

The figures for 1891 will no doubt show a large falling off, and the movement may be further delayed for a few years by the continued effects of the financial difficulties in South America and the Baring crisis; but there can be no doubt that these are merely temporary hindrances, and that a tendency so marked must continue to exist and will even increase in intensity. It cannot be disputed that the expansion of joint-stock enterprise will produce considerable economic changes; these changes depend on certain characteristics of joint-stock as distinguished from private undertakings, the most important of which are the following: (1) A company is an artificial unit created by law, inaccessible to several of the motives and independent of several of the incidents to which a single trader or a private partnership is subject. The failure of a company does not in itself affect the mercantile standing of any person, and there may be therefore more temptation to enter on risky enterprises; on the other hand, the freedom from any ties of personal friendship or moral obligation makes it easier to conduct business on strict rules (*e.g.* in the granting of credits). A private trading concern generally depends on the continuation of one or more lives, and also on the continued wish of a limited number of individuals to carry it on; a company is generally formed for an indefinite time, and has a much greater chance of continued existence. No one would enter into a transaction with a private firm, involving the continuance of its solvency for a long number of years as, for instance, when a life policy is taken out which may not become payable for eighty years or more. (2) The persons engaged in the management of a company are not so directly interested in its success as the partners of a private firm. It may happen, and has happened, that directors or managers have actually had interests hostile to the company over which they were placed, through being more largely benefited by the success of competing undertakings, or through having sold shares in the hope of repurchasing them at a cheaper price. They may also for various

reasons be desirous of creating a momentary advance in the price of the shares, and with that view enter into transactions showing large profits on paper, but seriously compromising the continued prosperity of the undertaking. (3) Joint-stock enterprise favours the creation of businesses carried on on a large scale, and renders the existence of smaller establishments more difficult. (4) The greater publicity of business transactions and of their results is another of the leading characteristics of joint-stock companies.

The expansion of joint-stock enterprise, and the gradual absorption of private trading concerns, will probably produce the following results: (1) The profits of private traders will be diminished—because the expenses of management must necessarily be much smaller in proportion in the larger establishments, the existence of which will be facilitated by joint-stock enterprise, than in the smaller undertakings carried on by individuals, and because the former class will therefore be able to outbid the latter class until their own level of minimum profits has been reached. (2) Numerous opportunities will be created for employment with a fixed income. The small tradesman who now has some chance of acquiring wealth, but who runs a constant risk of being deserted by his customers, will become a clerk in a large establishment and thus acquire a more modest, but much less precarious source of income. (3) The man of real talent will have a better opportunity of acquiring a proper position, because he will not disappear in the crowd, but rise from step to step in the establishment in which he works. (4) The expansion of joint-stock enterprise will facilitate the introduction of improvements and inventions, as the probability of the presence of inventive persons is much greater in large than in small establishments, and as large establishments are in a better position to try experiments which may prove costly and unsuccessful. (5) As regards the relations between employers and workmen, the further development of joint-stock enterprise will probably prove beneficial. The decrease in the number and the increase in the size of industrial establishments will facilitate combinations between employers as well as between workmen; but this fact will also facilitate negotiations, and the contest will lose much of its bitterness when the workmen are no longer opposed to private individuals whose wealth and manner of living is conspicuously before their eyes, but on receiving their wages from impersonal companies, the profits of which are ascertainable by everybody. The publicity of profits will also facilitate profit-sharing arrangements.

It will thus be seen that the gradual substitution of joint-stock in the place of private enterprise will in all probability lead to a

general levelling of profits and incomes, and will at the same time in many ways facilitate the general production of wealth; but some of the above mentioned facts will, on the other hand, tend to increase the motives and opportunities for unsound trading. It is clearly within the province of legislation to counteract these motives and opportunities, but it is difficult to devise efficient means for that purpose. It has been proposed to introduce a system of registration requiring—in imitation of the provisions on that subject which are in force in some continental countries—an investigation of the circumstances attending the formation of a company and the subscription of a certain part of its capital, previously to the issue of the final certificate of incorporation; and the existing law has some stringent provisions with regard to the liabilities of the promoters and directors of companies for statements or omissions in prospectuses; but the object of provisions of that sort is more the protection of investors than the prevention of unsound trading; they may, in fact, even increase unsound trading by preventing prudent and solvent persons from joining the boards of new companies. Unsound trading—that is, trading without a chance of profit, or with overwhelming chances of loss—cannot be entirely prevented, but the legislature might, by insuring its detection, or by removing its inducements, succeed in restricting it as much as possible. Compulsory yearly balance sheets, and a compulsory yearly valuation of the assets by independent professional auditors would do much in that direction. A more active participation of the shareholders in the meetings of the company would also act as an efficient check on directors and managers; but legislation is powerless in that respect. If the principle of reserve liability (the liability to pay an additional amount on each share in the case of a winding up) was made compulsory generally, shareholders would possibly become more watchful; and, as in any case stock exchange gambling in the shares of companies would become impossible if such a measure were adopted, as it would take away the possibility of obtaining loans on the shares, one of the chief motives of unsound management would in this way be removed. There are many other means by which the dangers pointed out above may be counteracted in a certain measure, and the attention of legislators may be usefully directed to a subject the importance of which will, if the present tendency continues, become more conspicuous every year.

E. S.

COMPANIES. THEIR INFLUENCE ON BUSINESS. In the marvellous industrial development of the past half century, joint-stock companies have played a most important part. Their influence is not to be measured merely by

the magnitude of the capital that has been embarked in them, enormous although that has been. As to the amount of that capital, unfortunately no exact statistics are available. From parliamentary returns it appears that from the commencement of the Companies Act, 1862, to the 31st December 1890, there had been registered in the United Kingdom, companies with an aggregate nominal share capital of about £3,970,000,000. Of these companies, however, a multitude never got beyond the registration stage, which is only the preliminary to an appeal to the public for capital. Others again, which it was attempted to float, failed to meet with support; while many that were constituted had to be content with a smaller capital than was at first intended. Besides, in the great majority of cases the nominal capital is greatly in excess of the paid-up or working capital. The amount of proposed capital thus affords no guide to the amount of capital actually invested and used in business. According, however, to the calculations of the registrar of joint-stock companies, the paid-up share capital of the registered joint-stock companies of the United Kingdom carrying on business on the 30th of April last was £775,000,000; if to that be added the capital raised by debentures, mortgages, etc., it is probably not over the mark to estimate that the capital embarked by our joint-stock companies thus exceeded £1,000,000,000. But, as has been said, it is not so much the magnitude of the capital of the joint-stock companies as the way in which it has been employed that has influenced business. Joint-stock capital is essentially more venture-some than that of individual traders. The limitation of liability has enabled risks to be run and experiments to be made which would never have been ventured upon had it been necessary for those by whom they were undertaken to stake their whole fortune upon the result. Hence it is that the companies have to a large extent acted as the pioneers and promoters of private enterprise. They have explored all manner of new inventions, that otherwise might have fallen still-born, they have opened up new territories, have developed transit facilities all over the world, and girded the earth with the meshes of the electric telegraph. Thus they have not only opened up new fields for trade, they have also afforded the physical means by which these may be exploited; and further to some extent, by means of banks, finance houses, and similar institutions, provided traders with the requisite capital. In these ways they have given an impulse to business far beyond the extent of their own operations. To them also another feature of recent times, the now decided tendency to a lower level of the prices of commodities in general, is in no small measure due. Supplies of commodities have been increased by the

enlargement of the area of production; cost of transit has been reduced; and, by steam and telegraph, markets have been brought into such close contact that the former need for large stocks of goods has been reduced to a minimum. Further, a lower standard of profits has been established. Shareholders whose surplus capital is invested in an undertaking are naturally content with a smaller return than the individual trader who derives his whole income from a similar business; while the publication of their accounts by trading companies, and the great mobility of capital under the joint-stock system, ensure that whenever on any business a high rate of profit is being earned new capital will flow into it, and, by creating keener competition cause profits to be curtailed. The flow of money into business too has been made somewhat more direct. In the collection and distribution of the surplus capital of the country the banks do not play quite so great a part as they previously did. Some portion of what would formerly have been deposited with them, and by them lent out to traders, now goes direct into the hands of the companies, and this no doubt is one amongst other causes that have in recent years led to a continuous decrease in the amount of bills negotiated, notwithstanding the enormous increase in the volume of business. Such are some of the influences which joint-stock companies have exercised upon business. That their influence has not been altogether for good is notorious. Through them hundreds of millions have been wasted on chimerical enterprises, or gone into the pockets of fraudulent promoters; and shareholders have suffered grievously through the ineptitude or extravagance of the management. The question of comparative losses and gains, however, lies beyond the scope of these remarks.

[Compare Adam Smith, *Wealth of Nations*, bk. v. ch. i.—J. S. Mill, *Pol. Econ.*, bk. i. ch. ix. §§ 1, 2.] E. J.

COMPANIES (CITY OF LONDON). The city companies formerly constituted the administrative machinery by means of which the municipality of London exercised a minute supervision over trade and manufacture; while, on the other hand, freedom of one of the companies was a necessary qualification for the civic franchise. Though their trade functions have with very few exceptions (*vide infra*) long since become obsolete, they still form an integral part of the London municipality, and they administer great revenues. The companies, therefore, are the most important survival of the industrial and municipal system of the Middle Ages. It has been argued that some of the guilds, which became later the chartered companies, must have existed in Anglo-Saxon times, but there is no documentary evidence in support of this contention. The Pepperers, the Goldsmiths, and others, were amongst the adulterine

guilds amerced in the reign of Henry II., and the Guildhall is mentioned *circa* 1212. During the 13th century the influence of the city guilds increased, and gradually freedom of a guild and the civic franchise became practically convertible terms. Edward III. incorporated many of the trading fraternities, and himself became a member of the Linen-Armourers. In 1377 there were no less than forty-eight of these fraternities. In the same year the right of election of the city officers was transferred from the wards to the companies, but this arrangement led to tumults and discontent amongst the citizens, and "the approved and established practice of ancient and praiseworthy usage" was restored (*Liber Albus*, 37). The Grocers, originally founded by twenty-two pepperers of Soper Lane (now Queen Street), were apparently the most powerful of the companies at this time. There were complaints of their monopolising tendencies in 1363, but in 1385 and the two following years they were able to return Sir Nicholas Brembre to the mayoralty "be strong hand of certayne craftes" (Heath, *Account of the Grocers*, 443; Aungier, *Croniques de London*, xvii.; *Rot. Parl.*, II. 278; Herbert, *Livery Companies*, i., 38). The companies' charters were inquired into by the commission of Richard II. (1389), but they were confirmed and extended in subsequent reigns. It is evident that in the 16th century trade and industry had outgrown the regulations of the Middle Ages, and the exclusive privileges of the companies demanded some relaxation. But new companies continued to be incorporated till the reign of Charles II. At the Reformation their trust estates, which were charged with the support of chantries, obits, and lamps, were vested in the Crown (37 Henry VIII. c. 4; 1 Edward VI. c. 14, § 6). They were afterwards allowed to purchase these confiscated lands in the reigns of Edward VI. and James I. The terms of the grants then made have since been held by the court of Chancery to have vested in the companies the same absolute property in these lands which the act of Edward VI. vested in the crown. "They have thus been, since the Reformation, in the eye of the law, the corporate property of the companies, free from any trust. But these crown grants may be reasonably taken to have been made in the expectation that the income would continue to be in great part applied to charitable uses" (*Liv. Comp. Com.*, i. 40, and *infra*).

The seizure of the chauntry estates was followed by a statute (2 & 3 Edward VI.) which licensed all manner of workmen connected with the building of houses, etc., to exercise their occupations in cities and towns corporate, though they were not free of the corporations. This act was afterwards repealed, and the position of the companies was

strengthened by subsequent legislation (*v. APRENTICESHIP, STATUTE OF*). The charters of James I. constituted "courts of assistants," the first legal appointment of which was made by Mary on the formation of the Stationers' Company (Herbert, *Liv. Comp.*, i. 118), for the government of the companies. The system of forced loans from the companies, which was extensively practised by Henry VIII., was continued in the following reigns by *precepts* from the lord mayor, and during the civil wars there were periodical payments of large sums of money. In 1652, a committee was appointed to ascertain the validity of the charters of different existing corporations, when the Grocers' charter was called for. But Cromwell granted them a new charter, enabling them to make bye-laws for their own government, and conferring on them the power of levying a fine of £30 on each member at his admission. At the Great Fire (1666) many of the companies' halls were destroyed, and important documents and deeds were burnt. When Charles II. made himself Master of the Corporations in 1684 by action of *quo warranto*, the companies surrendered their charters, but they were restored at the Revolution (1688).

The city companies have several times in this century been made the subject of public inquiry (*v. Municipal Corporations Commission*, 1833; Charity Commissioners' Reports; Educational Endowments Committee of the London School Board, 1876-79; Livery Companies Commission, 1880-84), and their present position may be thus briefly summarised. The extensive powers which they formerly enjoyed, in the control of the London trades, have long since been repealed by statute or fallen into disuse. But some of the companies still enjoy exclusive trade privileges (*v. Apothecaries' Act*, 1815; Apothecaries' Act Amendment Act 1874, 41 Geo. III. c. 69, § 13; and the Copyright Act, 1842). There are at present twelve "great companies" and sixty minor companies. The civic precedence of the former, — mercers, grocers, drapers, fishmongers, goldsmiths, skinnners, merchant taylors, haberdashers, salters, ironmongers, vintners, and clothworkers, dates from the reign of Edward III., and Sir R. Wilmot (1742) was the first lord mayor who did not belong to one of the twelve great companies. *Membership* was probably never confined to the craft or the trade which the company represented. It is obtained by apprenticeship, real or colourable, patrimony, redemption, or election *honoris causâ*. Though there are now few freewomen of the companies, *sisters* were formerly admitted on the same terms as men, and attended the banquets and entertainments. There are three grades of membership: the court, or governing body, self-elective; the "livery," limited in

numbers; and the simple freemen. The courts, consisting of the master, wardens, and assistants, have the entire control of the companies' affairs, the appointment of the staff, the management of corporate property, the administration of charitable trusts, the admission to freedom, livery, and court, etc. Members of the companies are entitled, in case of poverty, to admission to almshouses, pensions, or other charitable reliefs. Till 1835 the freedom of the city could be obtained only through a livery company, but in that year the municipality decided to confer it irrespective of the companies on certain terms through the city chamberlain. But the "common hall," in conjunction with the court of aldermen, still chooses the lord mayor. The companies' estates lie in the city of London, in various parts of England, and in Ulster, where they were compelled to purchase and colonise certain lands in 1609. The capital value of their property was estimated at not less than £15,000,000, and the total income thence arising, in 1879 or 1880, at from £750,000 to £800,000. The accuracy, however, of these figures was disputed. Their income falls into two divisions: (1) *Corporate Income*, i.e. income which is at the absolute disposal of the companies, estimated at £550,000 to £600,000 per annum (1879 or 1880); and (2) *Trust Income*, i.e. income which the companies or their courts are bound to apply in accordance with (a) the wills of founders, (b) acts of parliament, (c) the decrees of the Court of Chancery, and (d) schemes framed by the charity commissioners, and by the commissioners of endowed schools. The companies' corporate income is expended in maintenance, entertainments, and benevolent objects: such as the relief of poor members; education, exhibitions at Oxford and Cambridge, University and King's Colleges, London, the companies' schools, the London school board, Girtton and Newnham Colleges, etc.; technical education, the Yorkshire College, Leeds, the technical schools at Huddersfield, Bradford, etc., in connection with the City and Guilds of London Institute, the Technical College in Finsbury, and the Central Institution in South Kensington; and in the support of some of the London hospitals. The Companies' trust income is expended in the relief of poor members, almshouses, etc., education, and on charitable objects of a general kind. It appeared (1884) that about half of the total income of the companies was devoted, either under the terms of bequests or voluntarily, to public or benevolent objects. But "the majority of the commissioners were of opinion that the law of trusts in its application to the increment of the companies' city house-property had promoted the increase of the companies' corporate estate at the expense of their trust estate" (*Liv. Comp. Com.*, i. 42). The com-

missioners proposed various measures of reform, the most important of which were the restraint of alienation, by the application to the companies of § 94 of the Municipal Corporations Act, 1835 (5 & 6 Will. IV. c. 76), the publication of accounts, and the appointment of a commission to undertake (i) the allocation of a portion of the corporate incomes of the companies to objects of acknowledged public utility; (ii) the better application of the trust incomes of the companies; and (iii), should it prove practicable, the reorganisation of the companies. It may be pointed out that the companies were formerly bound to contribute to various public works. Amongst these may be mentioned the employment of the poor, military and naval armaments, the provision of coal and corn, and the protection of the city.

[The materials for the history of the city companies are extensive; see especially Riley, *Munimenta Gildhallæ Londoniensis*.—Riley, *Memorials*.—*Croniques de London*, ed. Aungier (Camd. Soc.).—*Liber de Antiquis Legibus* (ed. Stapleton (Camd. Soc.))—Herbert, *Hist. of the Twelve Great Livery Companies*.—Heath, *Account of the Grocers*.—Norton, *Commentaries on the Hist. of Lond.*—C. Parl.*, *Municipal Corporations Commission* (1835-37).—*Livery Companies Commission* (1884).]

W. A. S. H.

COMPANIES, STAPLE. It is by no means difficult to understand the cause which led merchants trading independently to form themselves into companies for certain purposes. The dangers of travel, the difficulties arising in the places where they desired to trade, made combination almost a matter of necessity. To satisfy those needs leagues such as the HANSEATIC LEAGUE (*q.v.*) were formed; but when formed, other reasons led to the introduction of an organisation much closer and more complete than was necessary for the two foregoing ends. In the first place, combinations were more natural to the time than competition, and, as in the case of industry the GUILD (*q.v.*), so in the case of commerce, the company, became the central feature. Further than this, the formation of the company, following closely one of the primary causes of the guild, was answerable for its members. The sovereign made certain concessions to foreign merchants trading in his country, and they combined to accept these concessions and to regulate their conduct and their members by them. Of such organisations the institutions of the Hanse furnish many examples, the STEELYARD (*q.v.*) in London being one of the most prominent among them. But in the case of our own country, not only did the king order the comings and goings of the merchant strangers,

as to his own dominions, but it was only by his permission and under his direction that the English merchant could trade abroad with any certain hope of government support should he suffer wrong from foreign powers. In this connection it is that we are forced to consider the institution of the *Staple*. Individuals had traded and formed bands for the occasion, but the organisation of the staple first secured to the English trader a firm and steady footing.

The Staple was an organisation whereby all or the chief articles of export were ordered to be sent for foreign sale to certain fixed places on the continent (Schanz, vol. i. p. 329). Different staple towns might be assigned for the sale of different commodities. There is a variety of testimony as to the first introduction of this system; it is traced back by some to 1248, but while there is no certain authority for assigning it to so early a date, there is no doubt that the system of the staple was fully recognised in the reign of Edward I. In the reign of Edward III. it becomes of the highest political importance. To a large extent indeed it must be viewed as a political institution. It was introduced by the government and used by it for certain ends of its own. In the first place the institution of the staple in any town was a bribe to the sovereign within whose domains that town lay. In the second place, it provided an easy means for the collection of the export duties levied on commodities sent out of the kingdom. It may well be asked how far it aided English trade. Foreign traders indeed were permitted to enter into the staple organisation on equal terms with English. But though this was the case, the exceptional rights of jurisdiction and privileges granted to the company of the staple encouraged the English exporter to send his commodities abroad now that that could be done with every security and under favourable conditions. It may have assisted the development of trade among foreigners, but it certainly increased the traffic of the English on the continent. Each concession promised to the English king by foreign princes to induce him to establish the staple within their particular boundaries meant a corresponding advantage to the traders who were included in the staple, and most of these were English. The organisation of the staple was effective. The merchants of the staple elected their mayor, who exercised great power. He dealt speedy justice according to the LAW MERCHANT (*q.v.*); he regulated prices; and it was his function to arrange the various dues which had to be paid, and to see that there was necessary accommodation provided for storing goods, etc.

But while the staple was the institution on the maintenance of which the well-being of the English trade of the 13th and 14th centuries chiefly depended, the commercial necessities of later years brought into prominence traders

whose main purpose it was to exercise their functions outside the staple towns. The staple had been useful, but it neither directly supported the interests of the English trader as distinct from the foreigner nor did it provide means whereby the trade might be extended into new countries. This was the work of other and chiefly of one other organisation. Already in the 14th century there were separate bands of merchants trading outside the staple. These were the merchant venturers of different cities. But though they were termed companies of merchant venturers, it must not be supposed that they were in any kind of partnership, or that the bond existing between them was of any very stringent nature. There were companies of merchant venturers in York, Newcastle, Bristol, etc., and they were engaged in the most different directions. Some were adventurers to Iceland, some to Prussia, others into the southern countries. But the importance of these various bodies trading to various parts was thrown into the shade by the pre-eminence accorded to those engaged in the trade between England and the Netherlands. It was to them that the name of merchant adventurer particularly attaches (*v. ADVENTURERS, MERCHANT*). There is considerable doubt as to their origin. Most probably their history may be traced back (Wheeler, *Treatise of Commerce*) to the grant of privileges made by the Duke of Brabant to the English merchants trading in his domain. Thereby they became entitled to appear on equal terms before the tribunals of the land in the case of quarrel with natives, while special rights of jurisdiction were granted to them for settling disputes among themselves. This particular jurisdiction, according to Schanz, was the bond of union ultimately developed. It is probable also that prominent among the English traders was the brotherhood of St. Thomas of Canterbury, and that grants made in common to the English were appropriated gradually by this society. But as yet there was no sign of any close union.

At this time the connection of the merchant venturers in Flanders and the Netherlands with the organisation of the staple was very close indeed—so close that the mayor of the staple exercised a supervision over the traders in towns other than the staple. But when the staple was fixed at Calais, and when the cloth trade with Antwerp grew into sudden importance, as in the beginning of the 15th century, such relations were impossible. In 1407 the right was granted to the traders in the Netherlands to assemble and elect a governor who might regulate such matters as were common to them all. This was the second stage in the history of the merchant adventurers. The first marked their origin, the second their separation from the staple. But of any formal incorporation there was no mention. That such was as yet the case is contradicted, Schanz thinks, by the fact that

the various members belonged in England to various companies. But this continued in after times, when the merchant adventurers had long won the grants they sought. The third period in their history was under the Tudors.

Henry VII. was well aware of the importance of trade between the Netherlands and England. The conduct of that trade was chiefly in the hands of the London merchants, who did all they could to exclude others from participating with them in its benefits. This they hoped to effect by demanding from each newcomer a certain and not insignificant sum to pay for the costs of the governors or consuls, and to serve as insurance or surety money. That such an attempt could be made marks, of course, the growth which had taken place in the corporate direction. Hitherto nothing had been done to recognise the legality of such growth, but it was recognised at length when Henry VII., to set at rest all doubt and to prevent all extortion, decreed that every merchant should be free to trade to the Netherlands undisturbed on payment of a certain sum, much less than that which had been demanded, to the body of the merchant adventurers. From this moment their energies, both in the cause of trade and of monopoly, were redoubled. On the whole they met with support from Henry VII. and Henry VIII., who could not fail to understand their importance. In their great struggle with the staplers, though no definite grant gave victory to either side, they were enabled to snatch the substantial fruits of victory by gradual encroachment. As a matter of fact the organisation of the staple had become antiquated. The new trade was not such that it could be directed in regular channels and restricted to particular places; thus, when the staple lost its rights over the country beyond the towns of the staple, assert them though it might within these towns, it had lost far more than it retained. The traders of the staple had to pay their dues to the merchant adventurers when they traded outside the particular towns assigned to them.

The encouragement given to the younger corporation was wise; by it trade was taken out of the hands of the foreigners and placed in those of the English. Thus, indeed, it is that the policy of this society was a part of that great policy of adventure which marked the end of the 15th and the whole of the 16th century. And as the organisation of the merchant adventurers grew more rigid it lost its mobility, and in its turn it had to see much trade fall into the hands of new companies. The company of the merchant adventurers consisted of traders engaged in individual enterprises but united for purposes of jurisdiction and having rights of monopoly. But now new countries were about to be opened up, and new bands of traders appear,

having common interest in the ventures they were undertaking. They grew into importance during the reign of Elizabeth, from whom, by the wise advice of Lord Burghley, they met with support. The queen and her minister themselves were often sharers in the ventures. There was something else done for them besides this. The originators of the expeditions, and thus the principal venturers therein, in return for their toil and their risk were granted rights of monopolising the trade in the region to which they were setting sail. They did not form company partnerships in the ordinary sense of the words, they had monopoly rights, and each expedition was separate and distinct in which the original grantees and their friends made venture; but gradually these expeditions became regular, and in like manner it would appear the amount of each man's venture became fixed by custom. This process may be traced in the history of the EAST INDIA COMPANY (*q.v.*), founded 1599, in its development from the LEVANT COMPANY (*q.v.*), founded 1592. Among other companies may be mentioned, Company of Merchants trading to Spain, Russia Company, African Companies, Eastland Company, Company of Cathay, Turkey Company, Hamburg Company.

In due time the policy of granting monopolies both to these companies as also to the merchant adventurers became a matter of much debate (*v.* pamphlets by Lewis, Roberts, Brent, and Parker), and in 1672 the rights granted and hitherto continued were curtailed by act of parliament (14 C. II. c. 7).

[Schanz, *Englische Handelspolitik*.—Ochenskowski, *Engl. wirtsch. Entwicklung*.—Wheeler, *Treatise of Commerce*.—Pamphlets by Misselden and Malynes. There is a spirited but insufficient description of the growth and importance of these companies, both Staple and Merchant Adventurers, in Richard Jones's works, edited by Whewell.]

E. C. K. G.

COMPANIES, TRADING. See FOREIGN TRADE, REGULATION OF.

COMPENSATION. 1. *For land taken compulsorily*.—Where land is taken under the authority of the state for public undertakings the amount of compensation to be paid to the owner is, if the parties cannot agree, determined by justices, arbitrators, a jury, or a surveyor appointed by the justices, under the Lands Clauses Consolidation Act of 1845 (8 & 9 Vict. c. 18). The act does not prescribe the measure of compensation, though it directs that regard must be had to damage sustained by reason of the severance of lands or other injury done to other lands not taken. In the case of freeholds thirty to thirty-three years' purchase is usually allowed, and in the case of leaseholds such a sum as would at the expiration of the term repay a purchaser his original outlay and compound interest thereon. Other items that enter into

the amount payable are injury to severed lands, value of fixtures, loss on sale of stock, costs of removal, and value of goodwill. Ten per cent is added to the value of the land for compulsory sale. Probable increase in value may be taken into account, but no deduction is made in respect of the probable increased value of the lands not taken arising from the work in question. In the case of land taken under the Artisans' and Labourers' Dwelling Improvement Acts, 1875-82, the compensation is to be based on the principles laid down in the acts, and no additional allowance is to be made for compulsory purchase (see COMPULSORY TAKING OF LAND).

[*Law of Compensation*, by E. Lloyd, London, 1882.]

2. *For Tenants' Improvement.* At common law a landlord was not bound on the termination of a tenancy to compensate a tenant for improvements, but in particular localities "customs of the country" arose under which the landlord compensates an outgoing tenant for certain improvements, such as building, draining, manuring, or preparing land for crops. These "customs of the country," though most variable and based on no uniform principle, came to be enforced as part of the contract of tenancy. For lists of improvements for which allowances are made, see Woodfall's *Landlord and Tenant*, 1889. In 1875 an act (38 & 39 Vict. c. 92), was passed with the object of introducing a general law of compensation for England and Wales. Though based on the Report of the Central Chambers of Agriculture, 1875, its permissive character rendered the act largely inoperative. The royal commission on agriculture in 1882 reported in favour of making the principles of the act compulsory. In 1883 a new act (46 & 47 Vict. c. 61) was passed, under which an outgoing tenant can claim compensation equivalent to the value of the following improvements to an incoming tenant:—(1) for buildings, ensilage, pasture, osier-beds, water meadows, irrigation works, gardens, roads, bridges, water-courses, fencing, hop-planting, fruit-planting, warping, and embankments, provided the improvement is made with the consent of the landlord; (2) for drainage, provided notice of the improvement be given to the landlord; (3) for boning, chalking, clay-burning, claying, liming, marling, artificial manure, and consumption of feeding stuff not produced on the holding. The act only applies to agricultural holdings, and affords no protection to a tenant against the practical confiscation of his improvements by additions to his rent. As to compensation for tenants' improvements, or for disturbance, in Ireland, see 33 & 34 Vict. c. 46, 44 & 45 Vict. c. 49.

[The economic aspects of such compensation are discussed in Sidgwick's *Political Economy*, bk. iii. ch. 4.—*English Land and English Landlords*, G. B. Brodrick, London, 1881.—*Tenant's Gain*

not Landlord's Loss, J. H. Nicholson, Edinburgh, 1883.]

3. *Land Nationalisation.* Some writers admit that if land were nationalised landlords should receive compensation; others deny this on the ground either that the land is the property of the people, or that private property is injurious to the state. But property is the creation of law, and in no sense can it be said that the land "belongs to the people." Even assuming that it would be expedient to abolish private property, such form of ownership being injurious to the state, it does not follow that compensation ought not to be given.

[See *Land Nationalisation*, by A. R. Wallace, London, 1882.—*Progress and Poverty*, by H. George, London, 1881.—*Social Statics*, by H. Spencer, London.] J. E. C. M.

COMPETITION AND CUSTOM. Wealth having been produced, is forthwith—or even in the act of production—distributed amongst those who have been concerned in its production, and the share of the product which falls to the lot of each of these is determined in the absence of disturbing causes by competition. Competition has been defined as the free action of individual self-interest—that is to say, supposing a given amount of wealth to be divided amongst four persons, the proportion of it which each gets will depend on the extent to which he is superior to the others in the qualities necessary to the struggle, the strongest for this purpose getting most and the weakest least. But competition is more clearly seen in its results. 1. Granting that every man seeks to increase his pleasures and reduce his pains, *i.e.* to secure an increase of pleasure for a given amount of exertion, or a given amount of pleasure for a smaller amount of exertion, we see that every man will set himself to procure the necessaries and comforts of life at a minimum of sacrifice; no one will work harder for a given result than he need. The same holds good when division of labour and exchange appear. Every man will now strive to exchange the products of his labour for as much as possible of the products of the labour of others, for by so doing he will increase the amount of necessaries and comforts which his labour commands. When this process has become general the result will be that similar exchanges will take place on similar terms. This is commonly expressed by saying that there can only be one price at one time for the same unit of the same quality of the same article in the same market (see MARKET). Thus a quartern loaf of household bread may be assumed to be at the same price on the same day all over Oxford, but may be at a different price in Bristol, Norwich, and Durham; a quarter of wheat of the same quality to sell for the same sum all over England; an ounce of silver all over the civilised world. These are the results of "commercial" competition.

2. Granting that all are striving for a maximum return to their exertions, producers will betake themselves to those forms of production which offer such a return, whether immediately or by means of exchange. Labourers will go where wages are highest; manufacturers will embark in those industries which give the largest profits; capitalists will lend their savings to those who can be trusted to pay the highest interest. But in time all these inequalities will vanish. If occupation A, for example, is crowded because of the high return which exertion commands in it, occupation B will be comparatively deserted, with the result that the products of B will rise in value as compared with those of A, and the rewards of those engaged will rise and fall proportionately. Ultimately an equality will be arrived at—that is to say, that whether by wages, profits, or interest, equal efforts and sacrifices will secure an equal real reward, however dissimilar the services by which they are represented, or the money-payment in which their reward is given. This is popularly expressed by saying that “in the long run wages and profits tend to an equality,” and is the result of “industrial” competition.

Thus far the working and results of competition have been described in an “economic” world, among a people, that is, who were actuated by economic motives and no other. It is commonly brought into relation with the facts of life by saying that it is a “tendency.” This may mean one of two things—(1) In the economic world, as we see, competition is complete and its results are patent. The possibility, the vision, of a greater reward for his exertions will make a man shift his wares from one market to another, and the same prospect will lead him to shift himself and his capital from one undertaking or calling to another so soon as may be; with him no other motive can or does interfere. Competition in actual life is a tendency in so far as men in the absence of any counterbalancing motive are swayed by self-interest. The expression does not imply that self-interest is more than one motive out of many, but it is the motive to which alone economists attend. (2) It is sometimes assumed that competition is a tendency in the sense that it is a force of gradually increasing strength in determining distribution. How far competition is a tendency in this latter sense is a matter of considerable dispute. It would be quite impossible to discuss the relative strength at any moment of the various motives which influence human action, *as, e.g.* to show the comparative force of patriotism and self-interest in the average man in two successive generations. But taking the material world and the distribution of wealth in it, we may have definite forces at work which are, so to say, rivals of competition in this field.

1. Early in the century it was taken for granted that the only serious hindrance in the

way of perfect competition was custom. Custom, *i.e.* the doing a thing because others have done it, has at all times been a powerful influence in the world. It is seen in both the spheres of competition. Custom may fix prices year after year; custom determines a man's walk in life, the employment of labour and capital, often to the exclusion of any other motive. “Heralds in Sparta,” says Herodotus (vi. 60), “are not so made on account of any special clearness of voice, but son succeeds father.” The younger sons of the peasant owner in Auvergne leave their native mountains to work in Paris and elsewhere, not because wages are higher, but because it is the tradition to do so in order to avoid breaking up the family estate. It may be strongly argued that custom is losing strength. It is still powerful in the East, more powerful in Asia than in Europe, in Europe than in America; it was stronger and extended over a wider area a century ago than now; the professions, etc. in which it still lingers among ourselves are gradually shaking it off; its disappearance as a factor in exchange would be an additional illustration of the transition from status to contract, which is said to characterise the modern as distinguished from the ancient or mediæval world.

2. Combination is commonly said to be an obstacle or interruption to competition, and if competition be defined as the action of individual self-interest, it is, at first sight, inconsistent with combination. Thus, *e.g.* if competition in the above sense is thorough-going, every workman will make his own terms with his master, will compete against his fellow-workmen for employment, will stand or fall by his own individual strength. The labour market will exhibit the spectacle of a three-fold struggle, *viz.* of master against master for workmen, of workman against workman for employment, and of master against workman to settle the rate of wages. Remove either of these by combination of workmen in trades-unions or of masters in associations, and competition is *pro tanto* diminished. So, too, in exchange; here it is the struggle to sell and the struggle to buy, and the struggle between buyers and sellers which settles the price. A combination of buyers or sellers, a “ring” of any kind, diminishes the competition. In Michigan, *e.g.* the sellers of salt, by an agreement to sell through a joint agent only and at uniform rates, put an end to all competition amongst themselves. On the other hand it may be urged (*a*) that although in both of these cases competition is in one direction weakened, in another it is strengthened. The competition among sellers in the labour or the salt market is suspended only to increase their strength in competing with buyers, to enable their self-interest to act with greater force; the struggle is more severe as being between organised

bodies rather than between isolated individuals; (b) that all combination is really in the end dictated by self-interest, and that no one who joins a combination does so with the idea that his own interest will suffer, but rather that the interests of the individuals are bound up with the interest of the body to which they belong.

3. A third rival of competition is socialism. In competition, as we have seen, every man is left to secure for himself what he can of the wealth which he has helped to produce. Socialism would substitute for this "scramble" an orderly distribution by the state. So far as we are concerned with it here, socialism would not directly affect production, but taking wealth when produced, the state would distribute it by some one of its organs. The principle of distribution is immaterial to our subject; whether the state proceed on some real or supposed ground of equity, distribute according to deserts or according to needs, it will equally put an end to competition.

For Adam Smith the end of the statesman is to secure that all distribution proceeds on competitive principles; the removal of all hindrances and obstacles to the free play of individual self-interest is the general lesson of the *Wealth of Nations*; whilst at the same time the writer shows that the results of competition are but seldom seen in their fulness. For Ricardo competition is a postulate; his conclusions uniformly depend on the assumption that all men know and seek their own interest without let or hindrance. Mill assumes competition in part, and in part treats it as a growing force; much of his reasoning, like that of Ricardo, starts from the hypothesis that competition is universal; much again of his treatise is devoted to showing its limitations in practice. Cairnes has pointed out that these limitations are far more effective than was supposed in his theory of mutually exclusive, or, as he calls them, "non-competing," groups of producers, but his conclusions have perhaps no claim to finality. Cliffe Leslie again showed, by some remarkable instances, *first*, how much more lasting is custom than was once thought, and how much a man's actions are determined by his surroundings, rather than by simple motives such as self-interest; and *secondly*, that the areas over which anything like equality in prices can be traced are very small, and that so far the tendency has been for fresh inequalities to arise as fast as the old are obliterated.

[See Adam Smith, *Wealth of Nations*, bk. i. ch. x.; pt. ii. bk. iv. ch. i.-viii.—Mill, *Principles of Political Economy*, bk. ii. ch. iv.—Cairnes, *Some Leading Principles of Political Economy newly Expounded*.—Cliffe Leslie, *Essays in Political and Moral Philosophy*, xv. xvii. xxi.—Sidgwick, *The Principles of Political Economy*, Introd. i. iii.—F. Walker, *Political Economy*, bk. iii. ch. i.]

L. R. P.

COMPETITION AND REGULATION. Where one man vies with another for the advantage of dealing with a third party, there is competition. Simple examples are: the public at an auction bidding against each other; a shopkeeper lowering his prices to attract custom. The action of a competitor is less simple when, changing his occupation, he enters the trade of those with whom he competes. "The operation of competition . . . by which the terms of *similar* exchanges are kept approximately similar should be carefully distinguished from that other action of competition by which certain inequalities in the remuneration of *dissimilar* services tend to be continually removed" (Sidgwick's *Political Economy*, Introd. ch. iii. § 3). These varieties of competition are distinguished by Cairnes as "commercial" and "industrial" competition (*Leading Principles*, part i. ch. iii.) The simpler process may be illustrated by the action of physical forces tending to equilibrium. Jevons compares the equations of "final utility" which determine market prices to the differential equations which determine the equilibrium of a mechanical system (*Theory of Political Economy*, ch. iv.) The analogies of exact science, the formulæ of Jevons and Walras, are less helpful when we regard competitors as balancing the *total utilities* of different occupations. The equation of "net advantages," to use Prof. Marshall's phrase (see *Principles of Economics*) in different trades is not very analogous to any theorem in mathematical physics.

Competition is contrasted with monopoly and combination; with governmental regulation, charity, and custom. The preferability of competition to these *régimes* is debated on grounds which may be distinguished as transcendental and utilitarian.

(1) Competition is advocated as natural in an optimistic sense; as consonant with justice and abstract right. But (a) those who with Burke maintain that the "laws of commerce are the laws of nature, and therefore the laws of God," employ an argument from design which few now accept. And (b) the other metaphysical reasons presuppose an unreal freedom of competition. Actually, competitors do not start fair; inheritance and other causes favour some; want of capital, education, opportunity, handicap many (Wagner, *Lehrbuch der Pol. Oekon.*, § 100 et seq.) Society is stratified in "non-competing groups" (Cairnes, *Leading Principles*, ch. iii.; Mill, bk. ii. ch. xiv. § 2). Where mobility of labour from one group to another does not exist, there is no presumption that competition, thus hampered, effects an equitable distribution. Even if perfect equality of opportunity were attainable, natural ability would still constitute a non-competing group. Is it clear then that competition between workmen is "the only way to equity, and that any

interference with it must involve injustice?" (Danson, *Wealth of Households*, par. 811). Rather the coincidence of competition with justice is "a perfectly *a priori* assumption, an unproved supposition" (Wagner, *loc. cit.*)

(2) Rejecting the "metaphysical incubus" of abstract principles and rights (Jevons, *State in Relation to Labour*, ch. i.), let us weigh the utility of competition. Its tendency to equal distribution of wealth deserves place under this head (cp. Bentham, *Principles of the Civil Code*, pt. i. ch. vi.; J. S. Mill, *Utilitarianism*, p. 23). Also, in this régime, more than any other, each individual is stimulated by self-interest to do his best for the supply of others' wants. "The difficulty of finding any adequate substitute for it (the motive of self-interest) is an almost invincible obstacle in the way of reconstructing society on any but its present individualistic basis" (Sidgwick). However, "trusts" and other modern forms of monopoly are less blamed for inefficiency than for immoderate charges and gains (C. W. Baker, *Monopolies and the People*, 1889).

Competition is an almost ineradicable growth of self-interested human nature. "Expellas furor, tamen usque recurret." Combinations resisting the tendency of this force are liable to disruption. Professor Marshall says arbitrators "must not set up arrangements widely different from those which would have been brought about by competition." They should follow the example of Rennie, who, when he had to construct a breakwater, first ascertained "the slope at which the natural action of the waves would arrange a bank," and then "let stones into the water so as to form such a slope" (*Economics of Industry*, bk. iii. ch. viii. § 2).

Again, competition has the advantage of tending to a definite determinate adjustment; affording a simple intelligible rule, *laissez-faire*. Whereas the bargain between combinations is indeterminate; or only determinable by some extra-economic principle not commanding general assent (Sidgwick, *Political Economy*, bk. ii. ch. x. § 2; Menger, *Grundsätze*, ch. ix.; Edgeworth, *Mathematical Psychics*, pp. 20-56). Jevons says (*Scientific Primer*, ch. vi), "there is no way of deciding what is a fair day's wages" outside competition. It is difficult even to imagine upon what other principle certain complicated transactions of modern trade and industry could be regulated.

Again, competition is a struggle for life which results in the survival of the fittest. However, the "selection" is not "natural," but artificial; so far as the competitors do not start fair (Wagner, *Lehrbuch*, § 135; above (1, b)). Nor is the "fitness" which economical competition tests of the highest order. Success may be due to cleverness in attracting business, or to a lower standard of comfort. That a degraded standard may result from unrestricted competi-

tion is evidenced by Booth's *Life and Labour in East London*. Mere survival, adaptation to "being" rather than "well-being," is not an ideal (Sidgwick, *Theory of Evolution*, "Mind," vol. i.).

Against the advantages of the "struggle for life" should also be set the allegation of trades-unionists that in unregulated competition men injure themselves by over-exertion (Report of Trades-Union Commission, 1867), the infantile mortality, and other evils ascribed to the unrestricted employment of mothers (Jevons's *State in Relation to Labour*, ch. iii.).

Further objections to competition are that it defeats itself when the successful competitor, having crushed out his rivals, becomes a monopolist (see Hadley, *Railway Transportation*; Foxwell, "Des Monopoles," *Revue d'Économie Politique*, 1889). Again competition involves much waste of effort in advertising and search for employment;—much waste of capital, as when two railways are made where one would be sufficient. Again there are many arrangements which it is the interest of all combined to adopt, but of each acting in competition to violate; e.g. Sunday rest, or early closing of shops. Other disadvantages are stated by Professor Sidgwick with special reference to governmental regulation (*Political Economy*, bk. iii. ch. ii.)

The case for interference is *prima facie* stronger with respect to foreign trade; where the object of government is not the interest of all parties concerned, but only of their own country. List maintains that the freedom of trade advocated by Adam Smith is best for the world as a whole; but that for particular countries it is better to develop their own manufactures by protection (*Das nationale System der Polit. Oekon.*)

So far, on the supposition that all parties are intelligent enough to know their own interest, and free to make their own terms. The case for interference is stronger where those conditions are wanting. The plea of ignorance is urged "in those special cases where it is impossible, or at least difficult, for the buyer of goods to verify their character for himself" (Jevons, *op. cit.*; Say, *Cours*, 4^{me} Partie, ch. x.) Want of freedom is more difficult to define scientifically. Absolutely free competition nowhere exists (above (1, b)). Suppose as much mobility of labour to exist as in the case of Irish cottier-tenants before 1881, or the "sweated" workers in East London; if the terms established by the play of supply and demand are not favourable to those classes, shall we say that they are not free, or only not fortunate?

The general presumption in favour of competition may be outweighed in particular cases by the disadvantages which have been noticed. The balance of contemporary opinion seems inclining to the position thus indicated by Professor Sidgwick. "It does not appear to

me that the answer . . . in concrete cases can reasonably be decided by any broad general formula; but rather that every case must be dealt with on its own merits, after carefully weighing the advantages and drawbacks of intervention. The expediency of such interference in any particular case can only be decided by the light of experience after a careful balance of conflicting considerations."

[The authorities on this subject are innumerable. Prof. Marshall's *Principles of Economics* may be specially mentioned as showing (1) how deeply ingrained in our nature is the principle of competition, which makes itself felt even in institutions which seem to be only regulated by custom (2) how far from ideally perfect is the system of *laissez-faire*, since it is theoretically possible that governmental interposition should effect an increase of wealth (bk. v. *Doctrine of Maximum Satisfaction*).—The views of the older authorities are considered, and some new lights are imparted in Prof. Marshall's Address *On some aspects of Competition* to section F of the British Association, 1890.] F. Y. E.

COMPLEMENTARY GOODS. This expression is used by the Austrian economist Menger (*Volkswirtschaft*, 1871, pp. 11, etc.) who describes goods as of first, second, or higher rank in order of production. In the production of bread, for example, the bread itself would be of the first rank, flour, salt, yeast, the services of a baker and his bakery, etc., would be goods of the second rank; grain, mill, and miller's work would be goods of the third rank, and so on. In such cases the separate goods of each remoter rank must be combined, if they are to produce the goods of the rank nearer the actual consumption; they are complementary parts of a total. This conception becomes of special interest when the value of the complementary goods is considered for each separately; and this question has been carefully treated by Wieser (*der Natürliche Werth*, 1889, p. 101, etc.) and Böhm-Bawerk (*Positive Theorie des Kapitals*, 1889, p. 179, etc., English translation (1891), pp. 165, etc.) The discussion in J. S. Mill (*Political Economy*, iii. xvi.) of some peculiar cases of value (joint cost of production) followed up by Jevons (*Political Economy*, 3d ed. p. 197) is in many ways closely analogous. (See also *Quart. Journal, of Economics*, April 1889, p. 338.) (See CONSUMERS' GOODS.)

J. B.

COMPOSITION. See BANKRUPTCY.

COMPOUND INTEREST. Interest that arises from adding to the principal the interest as it becomes due and then considering the sum that accrues at the end of each stated time as a new principal. For short periods of time the compound interest of any sum differs but little from its simple interest, but if compound interest is allowed to accumulate for a number of years, the increase is very great. Any sum placed out at 5 per cent compound interest will double itself in $14\frac{1}{4}$ years. Hence at 5 per cent com-

pound interest £1 would in $14\frac{1}{4}$ years amount to £2; in $28\frac{1}{2}$ years to £4; and in $213\frac{3}{4}$ years to £32,768. At simple interest the £1 in $213\frac{3}{4}$ years would increase to £11:18:9 only.

COMPROMISE (Scots law). An actual adjustment of disputed claims by mutual concession.

A. D.

COMPTEES, CHAMBRE DES. In the reign of Philip IV., the *Cour du Roy*, the chief organ of the central administration in mediæval France was subdivided into three bodies, for the separate functions of administration, justice, and finance. These bodies were the *conseil du roy*, corresponding to the *concilium ordinarium* in England; the *parlement de Paris*, corresponding to our courts of king's bench and common pleas; and the *chambre des comptes*, corresponding to our Exchequer. The *chambre des comptes* originally followed the king, but was fixed at Paris by an edict of 1319. Its chief functions were to audit the accounts of the local *baillis* and *seneschaux*, to receive payments from the royal domain and direct taxes, and to decide judicial questions arising from these payments. Originally it had some voice in settling the amount and incidence of taxation, but its administrative functions were gradually curtailed by the growing omnipotence of the controller-general and the royal council. In the 14th century the *chambre des comptes* was a more important body than the parliament of Paris, and in 1339, when Philip VI. went to Flanders, he left the chief authority in its hands. But by the 18th century it had sunk into comparative insignificance, and is rarely heard of. The audit of accounts, which remained its chief function, had become a mere formality, and was often fifty years behindhand. But it must still have possessed some means of enriching its members, for its seats sold for a higher price than those in the other *cours souveraines*. The office of *conseiller* in the *chambre des comptes* was sold under Louis XV. for 150,000 livres; whereas the highest price in this century for a seat in the parliament was 60,000 livres, and in the *cour des aides* 45,000. The *chambre des comptes* was suppressed by a law of 7th September 1790, at which time it contained 289 officers.

R. L.

COMPULSORY PILOTAGE. By the Merchant Shipping Act of 1854 (17 & 18 Vict. c. 104), the master of a vessel, when entering or leaving certain harbours and districts, such as the ports of London, of Liverpool, and of Kingston-upon-Hull, the Trinity House outport districts, or the Tyne or Falmouth district, is required to take on board a qualified pilot, and

to hand over to him the navigation of the vessel. So long as the master and crew obey the orders of such pilot, the owners are not liable for any damage occasioned by the fault or incapacity of the pilot. Compulsory pilotage is based on the principle that the state is justified in interfering to protect ships and their cargoes from injury by other vessels owing to an inadequate knowledge of the dangers of navigation in specified ports and harbours and districts. The object aimed at is not so much to secure the safety of the vessel that is compelled to take the pilot on board as to prevent such vessel from damaging other vessels. The risk of collision is reduced and property at sea is rendered more secure.

[Macle and Pollock's *Merchant Shipping*, London, 1886.] J. E. C. M.

COMPULSORY PREFERENCE or "Preferential Payments." In the distribution of the property of a bankrupt and of the assets of a company being wound up the following debts are to be paid before all others, except funeral and testamentary expenses, viz. one year's rates and taxes; four months' salaries of clerks up to £50, and two months' wages of labourers or workmen up to £25. These debts rank equally between themselves (51 & 52 Vict. c. 62; 52 & 53 Vict. c. 60). J. E. C. M.

COMPULSORY TAKING OF LAND. The right of the state to take land for public purposes, subject to the obligation of making compensation, has been recognised by all modern legal systems. This right, which is sometimes called *dominium eminens* or *eminent domain*, may be exercised by the state itself or by individuals acting under the authority of the state. The object for which land may be taken compulsorily is stated to be "public utility." Government would be impossible if the state had not power to take land for the buildings and fortifications necessary to its existence, whilst the production of wealth would be greatly retarded if land was not obtainable for the construction of works of transportation and communication. Public utility is apparent in such cases. There is, however, great difficulty in defining "public utility," as it must vary in different countries owing to variations in material surroundings. Randolph suggests (*Law Quarterly Review*, vol. iii. p. 320) that undertakings should only be held to be of a public nature where they are such as the state itself or its subordinate political corporations might properly engage in, and he condemns the acts passed in the New England states to authorise the taking of land for the erection and maintenance of water power. In the United States a corporation taking land compulsorily *ipso facto* becomes liable to make compensation, since the written constitution recognises the right to compensation; in other countries provision for compensation is made by statute. The Code

Napoléon by art 545 declares, "that no one is obliged to transfer his property unless it be for the public utility and in consideration of a just and previous indemnity." In the colonies, e.g. in New South Wales, provision has been made for resuming land for certain specified public purposes, and the land grants usually contain a clause relating to resumption. But in England, though the Lands Clauses Consolidation Acts provide machinery for determining the amount of compensation to be paid where land is taken, no general law has ever been passed to define when land may be taken. Each taking of land must be authorised by special act of parliament. The Crofters Act, however, gives under certain conditions power to the crofter commissioners to enlarge crofter holdings.

English statutes on the compulsory taking of land fall into three classes: (1) Where compulsory powers have been conferred on public bodies for specified purposes, subject to a scheme being approved by a government department and to confirmation by statute. The Artisan Dwellings Acts, 1868-1882; 33 & 34 Vict. c. 75 (school sites); 44 & 45 Vict. c. 20 (post-office sites); and various statutes relating to improvements in London came under this class. (2) Where the statute gives a particular corporation, such as a railway company, power to take land. (3) The Crofters Act, 1886, enabling a commission to enlarge crofters' holdings.

[*Principles of the Law of Compensation*, C. A. Cripps, London, 1884.—*Law of Compensation*, by Lloyd, London, 1882.] J. E. C. M.

COMTE, AUGUSTE, the founder of *Positivisme*, was born at Montpellier 1798, and died at Paris, 1857. After studying hard, especially mathematics, he was received, the fourth on the list, at the École Polytechnique. Insubordination led to his expulsion from the school, and he found himself without position or means. After some fruitless efforts he attached himself, 1818, to Saint-Simon, whose secretary he became, succeeding in this office to the historian Augustin Thierry; but, in 1824, in connection with the bringing out of the *Catéchisme des industriels*, in which the *Système de politique positive*, due entirely to the pen of Comte, appeared, there arose a disagreement between the master and the scholar, and Comte could no longer content himself with the position of disciple; he desired to be master in his turn. The idiosyncrasies of these two personalities, to neither of which energy can be denied, were certain, sooner or later, to lead to a separation. Comte married soon after, but overwork and the burden of worries which his disposition magnified to a remarkable degree, brought on a serious derangement of the brain. This attack was successfully overcome by care and nursing, but it would perhaps be rash to affirm that the cure was complete.

On his return to ordinary life, after a treatment for this serious malady which lasted nine months,

A. Comte found himself afresh in face of the most pressing monetary difficulties. However, he obtained in time the position of assistant to one of the professors at the École Polytechnique, and the post of examiner to the same school. He joined to this a place as usher in a private institution, and, thanks to the moderation of his requirements, was able to employ himself quietly with his favourite occupations. It was at this date that he composed the great work we shall speak of later on, and which, as we shall proceed to show, deals rather with philosophy than with economics.

With a little prudence and care he would have been able, in this manner, to continue the labours which he had most at heart. Unfortunately, a professorship of algebraical analysis which he sought for was given to Sturm. He made an enemy of Arago, who had been the cause of this appointment. His temper set the backs of the whole council of the school up against him, and he was removed from his post of examiner, and in consequence from that of assistant lecturer. It should be stated that he had fulfilled both these duties in the most complete and conscientious manner, besides having, from 1830 to 1848, given to the *Association Polytechnique* gratuitously, and without a single omission, a course of lectures on astronomy.

Deprived of his regular resources, separated by mutual consent from his wife, he had to depend for the means of existence on the purses of his friends and disciples. It is to be regretted that he, we may almost say, demanded this help, with some persistence and even with *hauteur*. He held that he had a right to these subsidies in return for the services which, as a philosopher, he rendered to civilisation.—It was a debt the repayment of which he claimed rather than assistance which he solicited (see his *Lettres à J. S. Mill*).

His great work, on which he had laboured for twenty years, his *Cours de Philosophie Positive* (6 vols. in 8vo) appeared 1839-42.

The fundamental idea to which Comte has given the name of positivism is, that "we know nothing but *phenomena*, and that the knowledge we have of these is relative and not absolute. We know neither the essence nor the real mode by which any fact is produced; we only know the relations of the succession or the similarity of facts one to another. These relations are constant, that is to say, always the same under the same circumstances. The constant resemblances which bind phenomena together, and the constant successions which unite them under the titles of antecedents and consequences, are what are termed their laws. The laws of phenomena are all that we can know of them. Their essential natures and their causes are unknown to us, and remain impenetrable."

He supported this doctrine by a historic

theory which he called the Three Stages (*Théorie des trois états*)—the theological stage, including fetichism, polytheism, and monotheism; the metaphysical stage; finally, the positive or scientific stage. It will be seen that in all this we are rather at a distance from the domain of economics. Hence we must pause here in our exposition of the doctrines of Auguste Comte, contenting ourselves with reminding our readers that, after 1845, his mind underwent a transformation at which many of his disciples were justly astonished, and in which the majority of them declined to follow him. He, who previously had refused adherence to any form of worship, instituted one of which he made himself the high priest, and which, in its philosophy, borrows from pantheism, if not from fetichism. In his eyes, to quote only one example, it is due "to pay honour to the planets, especially to the sun and moon." He rearranged, rather let us say he reconstructed, his *Système de politique positive*, adding, as a sub-title, *ou Traité de Sociologie instituant la Religion de l'Humanité* (1851 in 8vo), he then composed a *Catechisme Positiviste*, and finally a *Calendrier Positiviste*, in which he instituted saints and sub-saints, supplementary ones, selected from all countries and from all periods of time. He even went further than this; he established sacraments, and under his title of *pontifex* proceeded to administer them—the last wanderings of a mind elevated in some respects, but ill-balanced and driven out of its right course by many freaks of temperament, particularly by pride. Apart from his theosophy A. Comte has had and still has many distinguished disciples in France and abroad. He may be said even to have founded a school. We may quote among his disciples who are dead Littré, John Stuart Mill, and Grote the historian.

A. C. f.

COMTE, AUG., AND ENGLISH POLITICAL ECONOMY. Comte's importance for the history of English political economy is due first, and chiefly, to his influence on John Stuart Mill. About 1830 Mill, dissatisfied with the views of his father and Bentham, was reading eagerly the tracts of the St. Simonians, including, at that time, one by Comte, which promulgated the law of the three stages of the evolution of science. In 1839, when Mill was planning his *Logic*, he took up the study of the *Philosophie Positive*. The conception of the inverse deductive method, described afterwards in the *Logic* as the proper method of historical and statistical inquiries (bk. vi. ch. ix., x.), was (he tells us, *Autob.*, 210) derived wholly from Comte. The two men corresponded with each other on cordial terms (1841-46), though they never met. This correspondence, so far as published (*Lettres d'Auguste Comte à John Stuart Mill*, Paris 1877), shows that Mill had substantially accepted the law of the three stages, and had been strongly impressed with Comte's

idea of a master-science of sociology, dealing both with the present order, or statics, of society and with its evolution, or dynamics. The idea was not new. It may be traced to Aristotle, and among economists Comte allowed that Adam Smith possessed it, while J. B. Say had discussed it with Comte himself (*Lettres*, p. 253). But Comte's exposition of it was original and striking. He gave Mill also a wider conception of what was meant by the general interests of humanity, embracing past, present, and future human beings as members of one body (*Aug. Comte and Positivism*, 1865, p. 135). Comte, too, first drew Mill's attention to the importance of the working classes as an element in all social movements; Comte had thought at one time of writing a special book on industrial life. He brought Mill to admit that in the universal *consensus* or solidarity of the phenomena of society no parts could be called independent of the others, and that the way to study the whole body of them was not (as Mill had said in 1830 in *Unsettled Questions*, publ. 1844, e.g. p. 146) Bentham's *a priori* method of deduction from known principles, but Comte's own method of first generalising from history and then verifying by deduction from known principles. We must learn to "predict the past" before we can know the present. The "limited and temporary value of the old political economy" (*Autob.*, p. 166) Mill learned not from Comte but from the St. Simonians. Comte soon found Mill was going on a way of his own, and had no intention of making his projected book on political economy a mere stalking horse for positivism (*Lettres*, p. 254). Mill still upheld the need of studying political economy by the *a priori*, as distinguished from the *inverse deductive* method, though he thought himself bound to show the modifications of *a priori* results in actual societies. Political economy must, provisionally, be a separate study. In the details of Mill's *Principles of Political Economy* (publ. 1848) Comte's influence is therefore not marked, though it was working, with other causes, to change Mill's views on the possibilities of human nature and the final constitution of society. After their correspondence, Mill recoiled from the object of his first attraction, though, for the sake of the public, he refrained from open criticism (*Aug. Comte and Pos.*, p. 3). He found in Comte too little heed for individuality and liberty. He agreed with Comte in appraising the proletariat, deploring the existence of an idle class, and of labourers degraded by minute division of labour; he admired his idea that possessors of wealth should regard themselves as public functionaries. But he refused to place the supreme government in the hands of the wealthiest capitalists, or to trust to the moral influence of a body of philosopher priests, for the securing of a fair and generous distribu-

tion of wealth. Though he regarded distribution as being, unlike production, under no "necessities of nature" (*Autob.*, p. 247) but under laws of arbitrary human institution only, Mill sought for progress by associations and by democratic government and legislation as well as by moral and intellectual improvement among people and rulers. Comte's social statics seem to Mill his weakest point. On the position of women, for example, the two authors are irreconcilable. Finally, Comte was nothing if not systematic; Mill was essentially eclectic. Otherwise the influence of Comte might have had the same effect on him as on Harriet Martineau, who abandoned all distinctly economical work when she gave up the particular economic doctrines she had herself helped to popularize.

If in England the application of the "historical method" to economics was (as is sometimes said) suggested by Comte rather than by English or by German writers, it was not, at least, through Mill's precept or Mill's example. Cliffe Leslie's indebtedness to Comte is not clearly acknowledged by the former (*Essays*, 1879, pp. 241, 411). Sir Henry Maine and Professor Thorold Rogers seem free of all debt to him. The controversy between Cairnes and Mr. Frederick Harrison on "Comte and Political Economy" (see *Fortnightly Review*, May and July 1870, Cairnes, *Essays in Political Economy*, etc.), served to make the issue clearer: Can there be a political economy as a study distinct from general sociology? But it was after Prof. J. K. Ingram's address to the British Association (in 1878), which put the Comtian criticisms in a broadly intelligible form, that the historical economists obtained recognition in this country as a distinct school. Prof. Ingram has since followed up the attack by a *History of Political Economy* (1888). Hitherto, both in this country and in America, the tendency of this movement has rather been to attract the attention of historians to the importance of the economic element in history, than to draw away any considerable number of economists from the study of economic theory (see *HISTORICAL METHOD, POSITIVISM*, etc.) J. B.

COMTE, CHARLES, born at Sainte Emainie (Lozère), 1782, died at Paris, 1837. His father, a warm partizan of the Revolution, gave Comte a rigid training which influenced him all his life. To this may be ascribed his vote in 1804 against the establishment of the empire, and the vote was *nominate* and signed with his name. Comte had to pay the penalty of his courage. As a consequence he devoted himself to the study of law, and founded, June 1814, a periodical *Le Censeur* (7 vols. in 8vo). Charles Dunoyer joined him in this. The two edited this organ, established in support of law and liberty, and hence as hostile to the legitimist reaction as to the pretended liberal empire. A

pamphlet on the subject of the day, energetically written and frankly brisk in style, *De l'impossibilité d'établir une monarchie constitutionnelle sous un chef militaire et particulièrement sous Napoléon*, brought on them a prosecution which did great honour to their spirit. The *terreur blanche* obliged them, towards the end of the year 1815, to suspend their journal, which they did not resume till 1817, under the title of *Le Censeur Européen* (12 vols. in 8vo), with the motto *Paix et liberté*. In the interval (1815-17) Comte, probably incited by Dunoyer, took up the study of political economy, associating himself in this with J. B. Say, whose son-in-law he shortly became. Notwithstanding private and public persecution and prosecution, the *Censeur Européen* was able to hold on its existence to the date of the assassination of the Duc de Berry (13th February 1820). This sad event rendered the maintenance of the contest impossible, and the editors were compelled, in face of a sentence which condemned them to imprisonment and a heavy fine, to abandon their straightforward and courageous publication.

Comte preferred exile to prison. He went first to Geneva and then to Lausanne, where he was appointed professor in natural law (*la morale*). The *Sainte-Alliance* was alarmed at this series of lectures given by so able a professor, and demanded his expulsion. The Canton de Vaud desired to resist, but Comte, in order to avoid bringing anxiety, perhaps even worse, on the territory which had befriended him, retreated to England while waiting the reversal of his sentence. He was, however, unable to defend his case, as the government refused to allow the registration of his notice of appeal. He then pursued his economic studies, and published, May 1826, his *Traité de législation* or exposition of the general laws by following which states prosper, perish, or remain stationary (4 vols. in 8vo), a work as much economic as judicial in tone, but which approaches in character closer to the *Esprit des Lois* than to a treatise on political economy. The author shows himself throughout a worthy disciple of the master whose daughter he had married. We may add that the *Académie Française*, in 1828 (under the *Restauration*) awarded Comte the *grand prix Montyon* as the author of the work of the greatest service to morals.

Less even than Dunoyer did he know how to lend himself to half measures, to accept compromises. Thus in 1830, being named *procureur du roi* for the tribunal of the Seine, after having been elected *Député de la Sarthe*, Comte could not remain long in possession of this office, and returned to the labour of his choice—scientific study. The *Académie des Sciences morales et politiques* was re-established by royal ordinance 26th October 1832; he joined it and became himself the first perpetual secretary. In this capacity he delivered the *éloge* on Garat, and

composed that on Malthus which death hindered him from reading. In 1834 he published his *Traité de la propriété* (2 vols. 8vo), a work, this time, exclusively economic, and the scientific importance of which is in no way behind his *Traité de législation*. The following year a second edition of the work last named appeared. Although Comte had experienced a disappointment in seeing Rossi preferred to him for the chair of political economy at the *Collège de France*, vacant through the death of his father-in-law, the nobleness of his nature kept him from bearing any grudge against his successful competitor, and, though he had been ill for four months, he caused himself to be carried into the Institute the 17th December 1836 to vote in his favour as a candidate for election to the *Académie des Sciences morales et politiques*. Some months after he expired. Mignet, the second perpetual secretary of that academy, read, 30th May 1846, at a solemn meeting of that body, a notice of Charles Comte in which full justice was done to the lofty character of this illustrious thinker.

A. C. F.

CONCESSION. A term not used in English law, but the word, or some similar word, is used in many foreign countries to denote the permission given by the government to the undertaking of certain works, or to the formation of certain societies or companies, in the cases in which such permission is necessary. This term has been current in France especially for the last three centuries or so in the sense of a right of property, privilege, or monopoly granted by government—to individuals or groups of individuals,—in land, mines, public works, performance of stage-plays, and generally speaking in anything that can be monopolised. At present it is used most often of mines, as in the case of the ruby mines of Upper Burma; tramways *passim*; railways, as in France, where the "concession" is terminable, and rights revert to the state; trading privileges including especially exemption from duties, as in the Russian "concession" to the Anglo-Siberian Company; and banks, as in the case of the Imperial Bank of Persia. "Concessions" of the nature of patents or monopolies have been recently (1889-90) granted by the Boer government in the Transvaal so lavishly and at such inadequate fees as to cause great public discontent; they include cordage, paper, paints, ropes, furniture, matches, electric lighting, and jam. The expediency of raising revenue in such a way will be discussed under **MONOPOLIES**; **PATENTS**.

J. B.

CONCILIATION, BOARDS OF. These boards are established in different industries with the object of preventing and adjusting industrial disputes between employers and employed. They consist of representatives of masters and of men engaged in the industries, with which they are concerned, who meet

together to endeavour to settle by discussion and mutual agreement any disputes which may arise. A typical illustration of their constitution and working may be found in the board established in 1869 in the manufactured iron trade of the north of England. Here the men belonging to the different works select in each case by ballot a delegate, and the employers belonging to a single firm are similarly represented by a single delegate. The members of the board thus constituted elect a president, together with one secretary, from among the delegates of the masters, and a vice-president, together with a second secretary, from among the delegates of the men. They also elect a standing committee, as it is called, consisting of five representatives of the men, and ten representatives of the masters (five of whom alone are able to discuss or vote on any question); and of this committee the president and vice-president are *ex officio* members, without enjoying any power of voting. The standing committee meets every month or, if occasion demands, more frequently, and the board itself meets twice a year and at other times when summoned by the committee. In the first instance all questions are laid before the committee. They are submitted in writing to the secretaries seven days before the meeting; the written reply of the other side is usually placed before the same meeting, and an agreement of submission signed by the parties concerned. If the standing committee cannot arrive at an agreement, the referee, who is a permanent official, is called in and can take evidence; and in this way all questions may be settled, except a general advance or reduction in wages, or the appointment of an arbitrator (see ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED). These questions the board alone can decide, and it also determines matters referred to it from the standing committee, selecting an arbitrator if it cannot itself arrive at an agreement. The necessary expenses of the board are defrayed by the subtraction of a penny every fortnight from the wages of every workman earning upwards of half-a-crown a day, and by requiring each firm to pay an amount equal to that thus subtracted from the wages of their employees. Up to the 1st September 1889 the standing committee had held 318 meetings and adjusted 850 disputes, and the board itself had met 109 times. Similar boards have been established in other trades, and notably in the Nottingham hosiery trade through the instrumentality of Mr. Mundella, and in the coal trade in connection with the sliding scales which have been adopted in that industry in different districts (see SLIDING SCALE). But the constitution of these other boards is, with some slight differences of detail, similar to that which has been described, and is, like that, based on the model of the French conseils de prud'hommes (see CONSEILS

DE PRUD'HOMMES). The advantages of this method of adjusting industrial disputes over that of arbitration (see ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED) lie chiefly in the fact that the decision is attained by friendly and informal discussion and mutual concession, and that therefore it is more likely to be faithfully observed, and is less calculated to leave behind a feeling of irritation. Mr. Mundella indeed has urged that with this object there should be only discussion and no actual voting at the meetings of the boards and committees. But it must be remembered that it seems to be necessary to have provision at least in the background for final reference to the decision of a single individual, be he called arbitrator or umpire or referee, if there is to be any means of escape from a deadlock.

[For an account of these boards reference should be made to the books mentioned at the end of the article on ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED.]

L. L. P.

CONCOURSE (Scots law). Concurrence or consent, *e.g.* concurrence of the lord advocate to criminal prosecutions by private persons.

A. D.

CONCURRENCE (Scotland). Backing a warrant by a J.P.

A. D.

CONDILLAC, ÉTIENNE BONNOT DE (1714-1780), Abbé of Mureaux, younger brother of Mably, born at Grenoble, died at Flux near Beaugency. As a philosopher he belonged to the school of the sensationalists, and published powerful and much valued works based on that system. As an economist he published one book, described by Jevons as "original and profound," entitled *Le Commerce et le Gouvernement considérés relativement l'un à l'autre*. The first edition of it appeared in 1776. In it he supports the doctrines of the physiocrats, except in regard to industry, which he considers as productive. This work has been reproduced in the first volume of *Mélanges d'économie politique* in the *Collection des principaux économistes*, published by Guillaumin 1847.

A. C. f.

CONDITIONING. In textile industries, mainly in the silk trade, "conditioning" covers the process of determining the quality and net weight, as well as the description of the raw material, or of yarns, etc.; and a *conditioning-house* is an establishment where at fixed charges such material may be prepared and arranged, and an official warranty as to condition can be obtained. Conditioning-houses and boards are met with in most of the textile manufacturing districts on the continent. In some places, such as Lyons, they are public establishments, that at Lyons dating from 1779; while in others they are houses provided by committees of the merchants themselves, and their verdict as to weight and quality is accepted as conclusive; but they are, as yet, scarcely known in the United

Kingdom, and the advantages they offer have not been properly recognised. The only conditioning-house in London of which there is record—it is possibly the only house of this nature in the United Kingdom—is the Trade Silk Condition Company, Limited, of Worship Street, E.C., which publishes a scale of charges arranged under the following heads:—Conditioning; Weighing; Boiling-off and Washing; Assay of Size; Assay of Spin and Throw, or Elasticity and Tenacity; directions being given under each head. This house has been in operation for many years, and not only furnishes the weight of the raw silk when freed from moisture and the numerous impurities to be found in the bales, but tests it in various ways, and by so doing places upon the tested article an unbiassed official stamp, which interested vendors and purchasers themselves could hardly do. It also carries its operations further, as the raw material is duly prepared for manufacture. In the same establishment wool can by arrangement be conditioned. It will be gathered from this that conditioning partakes of the nature of SAMPLING and GRADING, terms employed in various other trades, operations which will be found dealt with under those heads.

Some few years ago a small establishment for conditioning silk was started in Manchester, but it has either ceased to exist or to carry on operations as a separate undertaking. The Bradford chamber of commerce, amongst others, has for a considerable time past advocated the establishment of a conditioning-house in connection with the wool trade of that district, such an undertaking to be conducted by the corporation of Bradford. Parliamentary powers were duly obtained some years ago, but this conditioning-house is not yet established, although there are some prospects of a start being made in respect to it. Such an official undertaking might well become a decided success, and the Bradford standard be recognised throughout the entire Yorkshire woollen and worsted districts. It is evident that such establishments are to the advantage of the manufacturers of high quality goods, and enable them the better to draw the line between genuine and counterfeit materials. In this way, French, Italian, and other continental silk manufacturing districts have long recognised the advantages afforded, and it remains to be seen whether, if the Bradford corporation take the affair up in earnest, the conditioning-house will not soon become a recognised necessity of the textile industries in this country.

[See for conditioning at Lyons article on "Condition" in the *Nouveau Dictionnaire d'Economie Politique* and *Monographie de la Condition des soies de Lyon*, par Adrien Perret, Lyon, 1878.]

CONDORCET, MARIE CARITAT, Marquis de (1743-1794), born at Ribémond near Saint

Quentin, died at Bourg-la-Reine. He won his first laurels as a mathematician, and showed in this study qualities which astonished the most distinguished savants of his time. When he was twenty the Académie des Sciences considered an *Essai sur le Calcul Intégral*, from his pen, worthy to appear in the collection of their memoirs, and, in 1769, the same learned body received him into their number, appointing him, in 1773, their perpetual secretary. He soon won the friendship of Turgot, by whom his attention was turned towards political economy. Under the inspiration of Turgot he wrote various articles or works, among others *Les Réflexions d'un Laboureur de Picardie à M. N. . . . auteur prohibitif*, à Paris, 1775; and *Les Réflexions sur le commerce des bleds*, 1776, two writings directed against M. Necker, that *auteur prohibitif* who had brought out, May 1775, his work *Sur la législation et le commerce des grains*. The Académie Française admitted him, 1782, among its members. Condorcet's activity did not slacken up to the first days of the Revolution; in 1781 he published the *Réflexions sur l'esclavage des nègres* (there is no need to say that he was an abolitionist), then, in 1785, his *Essais sur l'application de l'analyse à la probabilité des décisions rendues à la pluralité des voix* (in 8vo); in 1786, *La vie de Turgot* (in 8vo); about 1787, *De l'influence de la Révolution d'Amérique sur l'Europe*, dedicated to Lafayette, which indicates the course of events at that time; in 1788, *Essai sur la constitution et les fonctions des assemblées provinciales*; in 1789, *Banque Nationale* (in 4to); and in 1790, *La fixation de l'impôt* (in 8vo). He did not belong to the Assemblée constituante but was member of the Assemblée législative and of the Convention which succeeded it. We shall not attempt to sketch out his career, which was frankly that of a republican, but a friend of law and liberty during the Revolution. It may suffice to say that his pen was never inactive and was vigorously supported by his eloquent words. Proscribed as a Girondin, he was sheltered for eight months by a devoted woman. It was then that he wrote his *Esquisse d'un tableau historique des progrès de l'esprit humain*, 1794, an eloquent tribute to the doctrine of the indefinite perfectibility of man.

Learning that the penalty of death had been pronounced against those who received the Girondins into their houses, he departed, not heeding the prayers of his courageous hostess, and wandered for several days. Entering a tavern at Clamart to appease his hunger, he was arrested by order of a member of the revolutionary committee, and thrown into a prison, where he was found dead the next day when sought for to be brought before his accusers. He had, it was believed, taken his life with a poison which he carried on him. Quick in

intelligence, vigorous in mind, passionately loving what was right, his was one of the worthiest and purest natures concerned in the first French Revolution.

A. C. F.

[For a criticism of the *Esquisse*, see Malthus, *Essay on Population*, bk. iii. ch. i. (Bonar, *Malthus and His Work*, bk. i. chs. i. and ii.) Condorcet's application of the theory of probabilities to the estimation of evidence in his *Essais sur l'application de l'analyse à la probabilité des décisions rendues à la pluralité des voix* . . . above noticed, claims the attention of the statistician. A very unfavourable verdict is pronounced on this part of Condorcet's work by Todhunter in his *Theory of Probability*.]

CONDUITT, JOHN (1688-1737), married Newton's niece, and succeeded Newton as master of the mint. His principal work, *Observations upon the Present State of our Gold and Silver Coins*, 1730 (published 1774), is supposed to represent Newton's views. It contains a luminous statement of the principle, that in order to keep silver in circulation, the "rate at which gold shall be current" should be the same as in neighbouring countries. Conduitt is referred to in Boulter's letters in connection with the Irish coinage. He was a member of parliament, and a fellow of the Royal Society, to which, in 1718, he contributed a learned paper on "The Situation of the Ancient Carteia."

F. Y. E.

CONFIDENT PERSON. See BANKRUPTCY, SCOTLAND.

CONFIRMATION OF EXECUTOR (Scots law). Proving a will as executor. A. D.

CONFLICT OF LAWS. One of the numerous titles applied to the principles that are followed, or which theorists think ought to be followed, in determining whether a domestic or a foreign law ought to be applied to a given set of circumstances. It is a well-settled principle that within its own territory a state is entitled to enforce its own laws. But in many cases it would be inexpedient or unjust to do so. The property in question may be situated abroad, the contract to be enforced may have been entered into in one country by persons of different domiciles with reference to performance in another country, or the document to be interpreted may be expressed in the technical language of foreign law. Hence every state finds it necessary to apply in certain cases the legal rules of other states. Though each state decides for itself when and how a foreign law shall be applied, there is a tendency to adopt a common practice. The law of the place where real property is situated governs all questions as to the tenure, title, and descent of such property, but in some countries it is held that a deed or will relating to real property is sufficient

if in accordance with the law of the place where it was made. On the other hand, movable property is, as regards succession or transfer on death or marriage, governed by the *lex domicilii*, the *lex situs* only applying in the case of title to a particular chattel. Contracts valid by the law of the place where made are valid everywhere, but everything that relates to their execution is subject to the law of the place where the contract is to be carried out. Proceedings in courts of justice are regulated by the *lex fori*.

[*Private International Law*, by J. Westlake, Q. C., London, 1880.—See also Holland's *Jurisprudence* for the different principles recommended by theorists, and for a list of the chief writers on the subject, and art. in *Law Quarterly Review*, vol. vi. No. 21, by A. V. Dicey on "Private International Law as a Branch of the Law of England."]

J. E. C. M.

It frequently happens in the course of judicial proceedings, that the court has to decide whether its own ordinary law has to be applied to the matter coming before it, or whether some other system of law has to be applied; this may happen when the parties reside in different localities, when the subject matter of the action is situated in a place where another system of law is administered, or when the events or acts which form the foundation of the proceedings have taken place in a locality governed by another system of law. The rules of law which determine questions of this sort are generally classed under the head of conflict of laws; and the branch of law to which they belong is called Private International Law (see INTERNATIONAL LAW, PRIVATE); but these rules, though based on the same principles in most countries, always form part of the municipal law, and are not, strictly speaking, international rules.

E. S.

CONFUSIO. A term of Roman law meaning—(1) the intermingling of things in such a manner as to render the separation of one of the component parts impossible (*e.g.* the pouring together of two separate quantities of liquid); (2) the extinction of a smaller right by being merged into a larger right (*e.g.* a pawnee acquires the absolute property in the pawned object).

E. S.

CONJUNCTUR. Recent German economists use this word to denote the conditions and opportunities of success which a man does not owe to his own efforts, but receives as a gift of fortune. For example, inherited wealth, influential parentage, and even nationality and education, give a good start in life which would be described as due to *Conjunctur*. It is perhaps most often used of the happy concurrence of circumstances by which the speculator is enabled to realise a fortune without labour but at the same time without breach of the rules of competition. Modern socialists, even of the

moderate schools, contend that in modern society *Conjunctur* and not skill or industry is the maker of fortunes; and they would restrict the influence of *Conjunctur* by alterations in the tenure of property and the conduct of business (see SOCIALISM).

[For a discussion of the "Wesen und Wirkung der *Conjunctur*," see A. Wagner, *Volkswirtschaftslehre*, Leipzig, 1879 (*Grundlegung*, p. 98, seq.)—See also Marshall, *Principles of Economics* (1890), pp. 656, 692 n.] J. B.

CONQUEST. The appropriation of the property in and of the sovereignty over a part or the whole of an enemy's country by force of arms. Though the title is usually regulated by the terms of a treaty of peace, the conquest is complete from the time the conqueror proves his ability to maintain, and his intention to retain, the territory as part of his own state. As a rule, the inhabitants retain their rights, except in so far as they are necessarily altered by the fact of conquest. Allegiance to the former sovereign is dissolved, but consent is necessary before allegiance is acquired by the new sovereign. Usually a limited time is given within which the inhabitants must transfer their allegiance or leave the territory. In return for allegiance the rights of citizenship are acquired. Municipal laws, including the rights of property, remain unchanged, except in so far as they are necessarily altered by the political institutions, or are in conflict with the laws of the new state. A country conquered by England becomes a dominion of the crown, and the crown may determine the form of government.

[Hall's *International Law*, Oxford, 1890.—Max Wirth, *Grundzüge der Nat. Oekon.*, considers "Conquest" as a form of "highly skilled labour."] J. E. C. M.

CONRING, HERMANN (1606-1681), was one of the most eminent of the polyhistorians of the 17th century. The estimation in which he was held in his own time is sufficiently proved by his epitaph, written by Meibomius—"Juris naturalis gentium publici doctor, philosophiæ omnis peritissimus practiciæ et theoreticæ, philologus insignis, orator, poeta, medicus, theologus. Multos putas hic conditos. Unus est, Herm. Conringius, sæculi miraculum." He was born in East Friesland, and studied medicine at Helmstädt, where he was afterwards professor in that faculty; he was also for some time court physician to Christina of Sweden. He early accepted and zealously propagated the Harveian doctrine of the circulation of the blood. His principal field of distinction lay, however, in politics and jurisprudence. He was among the first who formed a comprehensive conception of a science of political economy; he explains his ideal of it in his dedication of a new edition of the principal writings of Bodin, adding that such a body of doctrine, "Eam artem [Chre-matisticam] in justam aliquam et integram

methodum redactam non esse," though many scattered contributions to it might be found in various writers. He himself hoped to realise this scheme; he produced, however, only a number of separate writings on special heads: *De re nummaria*, 1662; *De Vectigalibus* and *De Aerario*, 1663; *De importandis et exportandis* and *De commercio et mercatura*, 1665; *De contributionibus*, 1669. His historical importance lies not so much in the complete treatment of economic questions as in the awakening and stimulating influence which he exercised both by his books and his personal teaching. In his great statistical work, *Examen rerum publicarum totius orbis*, he gives but little numerical detail, as was natural at his period, but has many just historical and political views (Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 254).

J. K. I.

CONSCRIPTION. Compulsory military service. In modern times introduced by Napoleon I., followed by Prussia, and since 1870 adopted by all the great continental powers. On the continent every male citizen capable of bearing arms becomes liable to military service on completing his twentieth or twenty-first year, but in some countries service can be avoided by a money payment or by passing an examination. The period of active service varies from one to four years. The liability to serve is universal, e.g. in Prussia and in France; but in some countries, e.g. in Russia, the number from whom full service is required is fixed every year. After completing the period of active service the men pass into the reserve, and are liable to be called upon in the event of an outbreak of hostilities. In Holland and Belgium, though the army is based on conscription, the greater part of the forces is formed of volunteers. Switzerland maintains no standing army, but every citizen is liable to serve, and the troops are called out for a few weeks' training in the year.

The social and economic effects of the military systems of Europe have been discussed by Cliffe Leslie (*Essays in Political and Moral Philosophy*, Dublin, 1879). Whilst admitting that the training of a soldier tends to make the workman more efficient, he points out that even a three years' system postpones to a late period the productive use of a part of the productive power of the country, whilst a longer period unfits the greater number of men for industrial pursuits. Adam Smith (*Wealth of Nations*, bk. v. ch. i.) thought that the progress of manufactures and improvement in the art of war would tend to make the soldier's a separate trade, but the tendency has been in recent years to make the army a national one. Whilst therefore a war between two states in which all the citizens are soldiers implies that the industrial population are fighting in the ranks, it must not be forgotten that wars are of much shorter duration now than in former times. It is very difficult

to make any comparison between the relative cost of armies. The most recent information will be found in Major-General Brackenbury's *Evidence before the Select Committee on Army and Navy Estimates*, 1887, Appendix to First Report, and in the *Journal of the Statistical Society*, March 1891, "Statistics of the Defence Expenditure of the chief Military and Naval Powers," by Sir Charles Dilke. Germany, with compulsory service and an expenditure of £21,000,000, can put eighteen army corps in the field; England, with voluntary enlistment and an expenditure of £18,000,000, can put scarcely two. The difference of cost arises from the increased expense of living in England, the higher rate of pay, and the great number of foreign dependencies to be garrisoned (see DEFENCE, COST OF).

J. E. C. M.

CONSEILS DE PRUD'HOMMES. These councils are found on the continent in France and in Belgium, and have for their object the adjustment of industrial disputes by a rapid and inexpensive method. They are said to have originated in the experts or *prud'hommes* selected by the mediæval guilds to settle disputes between manufacturers and merchants at the different markets and fairs about the genuineness of goods and other such matters. They were abolished before or during the Revolution, but were re-established at Lyons some ten years later, and subsequently in other French towns. They consist of representatives elected in equal numbers by masters and men, and the election is conducted by the *maire* and *préfet* of the particular town or district. In Paris there are four such *conseils* to deal with the many trades and industries there found. The *conseil* thus elected lasts for three years, and is divided into two *bureaux* or committees. The *bureau particulier*, consisting of one master and one man, sits daily, and the *bureau général*, consisting of at least five members, meets weekly. Disputants are first invited to come before the *bureau particulier* and to explain their differences, and arrive, if possible, at an amicable settlement. Should this attempt fail, they are formally summoned before the *bureau général*, which disposes authoritatively of the matter in the same way as an English arbitrator (see ARBITRATION BETWEEN EMPLOYERS AND EMPLOYED). Appeal from the decision of the *bureau général* lies, however, to the tribunals of commerce and the ordinary civil courts, but such appeals are apparently seldom made. Petitions for the establishment of the *conseils* are addressed to the minister of commerce. Statistics of these French *conseils* show that previously to the Franco-German war the number of cases brought before them had grown to a maximum of some 45,000 in the year 1868, and that after experiencing a temporary decrease during the war until they had fallen to some 30,000 in 1873, in 1880 they had risen again to some 40,000. Of these

some 60 per cent related to wages—but not to their regulation for the future, simply to the determination of disputes as to the past; some 13 per cent arose about dismissals; some 10 per cent were concerned with alleged misbehaviour; some 5 per cent with questions of apprenticeship; and some 13 per cent with various other matters. The majority of cases were settled by the *bureau particulier*, but a large proportion were adjusted outside the *conseils* altogether. In Belgium there are similar *conseils* to those in France, and a proposal has more than once been made to establish something after their pattern in England. An act, which has proved inoperative, was passed with this object in 1867 (30 & 31 Vict. c. 105).

[For an account of these councils see Price's *Industrial Peace*, ch. iii.—Jevons's *State in Relation to Labour*, ch. vii.—an article on "Conseils de Prud'hommes," by W. H. S. Aubrey in the *Contemporary Review*, April 1883—and a paper on "The Strikes of the past Ten Years" by G. P. Bevan in the *Statistical Journal* for March 1880, vol. xliii. pp. 35 to 64.—Parly. Papers, c. 5896-17 and c. 6206-18.]

L. L. P.

CONSIDERATION. A consideration in "value" is not necessary to a contract in Scotland either by deed or not by deed. A. D.

CONSIGNEE. A person to whom goods are shipped. A person whose orders the master of a vessel is to follow, by virtue of the clauses of a charter party, is called the consignee of the vessel.

CONSOLIDATED FUND. The division of the British revenue between the *Consolidated Fund* and *Annual Supply* will be best understood from the following official statement derived from Public Income and Expenditure, Returns ordered House of Commons 24th July 1866, pt. ii. p. 511.

"From the period of the establishment of a systematic parliamentary control over the expenditure of the public moneys, that portion of the total issues from the exchequer during the financial year, which is more strictly called the public expenditure, has always been divided into two separate and distinct general heads. The first of these is composed of the more permanent charges which have been authorised by parliament to be paid from time to time when due, the mode and period of payment being under the directions of the treasury. The second head consists of the charges annually granted by parliament, and thus brought periodically under its immediate cognisance and control. Since the establishment of the consolidated fund in 1786, these two heads of public expenditure have been known as the consolidated fund charges and the annual supply charges, so designated from the funds out of which they are respectively payable.

The consolidated fund charges have been usually subdivided into—

The annual charges of public debt.
 Civil list.
 Annuities and pensions.
 Salaries and allowances of certain independent offices.
 Courts of justice.
 At this date [1866] diplomatic salaries and pensions (now included among annual supply charges).
 Miscellaneous charges.
 The general heads of the supply charges are—
 The classified miscellaneous civil services.
 Payments out of gross revenue; or, since 1854, the charges of collection and management of revenue.
 Army, navy, and ordnance services.
 The other issues from the exchequer, consisting of—
 Advances by way of loan.
 Sinking fund and other payments for the reduction of the national debt have formed part of the consolidated fund charges, or the annual supply charges, according to the parliamentary enactments by which these issues have been authorised" (Public Income and Expenditure, or Return ordered 24th July 1866, pt. ii. p. 511).
 In explanation of this arrangement, A. Todd remarks—

"'Formerly,' that is after 'the old system of retaining public money at the exchequer itself' was 'abolished,' 'the proceeds of parliamentary taxes constituted separate and distinct funds'; but by the Act 27 Geo. III. c. 13, § 47, it was directed that the various duties and taxes should be carried to and constitute a fund, to be called 'The Consolidated Fund.'" (These permanent grants out of the consolidated fund are recapitulated above in the extract given from the Report on Public Moneys.) Todd continues: "These charges are made payable out of the consolidated fund by permanent statutes, from year to year, without any renewal of parliamentary authority. The principle of not subjecting to the uncertainty of an annual vote the provision for the security of the public creditor, the dignity of the crown, annuities and pensions to royal and distinguished persons, the salaries of judges and other officers in whose official character independence is an essential element, compensation for rights surrendered, and like charges, is one the soundness of which is generally admitted."

(Alpheus Todd, *On Parliamentary Government in England*, vol. i. pp. 733, 737, 2nd edition.)

Todd further raises a question whether in certain cases amounts may not have been carried to the consolidated fund which should have been voted as part of annual supply, but those who are conversant with the practice of the House of Commons in the discussion of the annual votes will agree that little would be gained in the way of real economy by this course being pursued.

CONSOLIDATIO. In Roman law this expression was used for the extinction of a usufruct in consequence of the usufructuary becoming the owner of the property to which it referred. It is also a technical term used by writers on feudal law, and is by them applied to the termination of a vassal's right by surrender, escheat, or some other cause which restored the beneficial rights of ownership to the lord.

E. S.

CONSOLS. A stock exchange abbreviation for "consolidated annuities," originally applied to the 3 per cent consolidated annuities of 1751 (25 Geo. II. c. 27) which bore interest payable on 6th January and 6th July. These 3 per cents were converted in 1888 into stock bearing interest at $2\frac{3}{4}$ per cent till 1903, and after that date at $2\frac{1}{2}$ per cent till 1923. The amount of these consols when first issued in exchange for pre-existing securities was £9,137,812, but they were afterwards increased to about £400,000,000: by 1888 they had been reduced by purchase in the market and by conversions into terminable annuities to £322,681,000. In 1889 Mr. Goschen completed the redemption of this enormous amount of stock, and these 3 per cents, which for upwards of a century were reckoned as the standard security of the London market, will soon be unknown there. They are now only a matter of history. The 3 per cent reduced annuities, although a similar, and at first a larger, issue, were never designated consols.

But the familiar term "consols" has recently been applied to a number of other investments. There are New Zealand 5 per cent consols, Cape of Good Hope 4 per cent consols, and other government securities, which are currently designated consols by dealers upon the exchange simply because the word is more readily spoken and written than consolidated stock. It is also at times applied to other consolidated stocks than those issued by governments (see CONVERSION OF BRITISH NATIONAL DEBT).

CONSPIRACY, COMMON-LAW DOCTRINE OF. Though there were some dicta to the effect that a combination for the purpose of raising wages would be unlawful, no case of a conviction for such an offence occurred until the year 1825. Mr. Justice Stephen is therefore led to conclude that up to that year an agreement to combine to raise or depress the rate of wages was not an indictable offence apart from statute. The opposite view was entertained by many persons and was enforced by the courts. "Reading Sir W. Erle's summing-up in this case (*R. v. Rowlands*, 2 Den. Cr. Ca. 364) and his memorandum on trade unions together, it seems that his view of the subject of conspiracies in restraint of trade was this—at common law all combinations of workmen to affect the rate of wages were illegal. A limited exception was introduced by the 6 Geo. IV. c. 129. But the

ordinary operations of a strike which do not fall definitely within those narrow exceptions are still illegal conspiracies." This view was enforced in subsequent cases, but by the 22 Vict. c. 34, workmen were not to be considered guilty of "molestation" or "obstruction" under the act of 1825 by reason of entering into agreements for the purpose of fixing wages or the hours of labour. A commission, issued in 1867, recommended a relaxation of the law, and the 38 & 39 Vict. c. 31 legalised trade unions, whilst the 38 & 39 Vict. c. 32 amended the law relating to "molestation." The decision in 1872 in the gas stokers' case to the effect that a strike might, under certain circumstances, amount to a conspiracy at common law to molest, injure, or impoverish an individual, or to prevent him carrying on his business, led to the passing of 38 & 39 Vict. c. 86, which enacted that an agreement by two or more persons to do any act in furtherance of a trade dispute should not be indictable as a conspiracy if such act committed by one person should not be punishable as a crime.

[Sir W. Erle, *The Law relating to Trade Unions*, London, 1869.—R. S. Wright, *The Law of Criminal Conspiracies*, London, 1873.—Roscoe's *Digest of the Law of Evidence in Criminal Cases*, titles "Conspiracy" and "Conspiracy in Restraint of Trade," London, 1884.—Sir J. F. Stephen, *History of the Criminal Law*, London, 1883.] J. E. C. M.

CONSTITUTUM DEBITI. An informal promise to pay. Such a promise gave a right of action in Roman law, by virtue of the prætorian edict, quite independently of the cause of the promise. It was frequently used, in the place of a regular contract of suretyship, for the purpose of guaranteeing another person's debt (*constitutum debiti alieni*). E. S.

CONSTITUTUM POSSESSORIUM. An expression used by mediæval writers on Roman law to express the fictitious delivery which takes place when the owner of a thing transfers the property to another, and contracts to retain the possession as bailee for the new owner. E. S.

CONSUL. Consuls are commercial agents appointed to reside in foreign countries for the purpose of protecting the individual interests of traders, travellers, and mariners belonging to the state which appoints them. A consul is not a diplomatic agent, and he is not therefore authorised, except in special cases, to make any representations to the government of the state in which he acts. He is not entitled to exemption from local jurisdiction, but enjoys certain specific privileges essential to the discharge of his duties, such as exemption from personal taxes and the inviolability of the papers of the consulate. The most important duties of consuls will be found in Hall's *International Law* (Oxford, 1889), and in the authorities there quoted. In eastern countries such as Turkey, China, and Japan, the subjects of western states

are not liable to the local courts, and jurisdiction is by treaty exercised by consular courts. (See also **CONSULAR REPORTS**.)

[Phillimore's *International Law*, ii. § 272.—Calvo's *Droit International*, §§ 495-99.—*Handbuch des Völkerrechts* herausgegeben von Dr. Franz von Holtzendorff, vol. iii., Berlin, 1887.]

J. E. C. M.

CONSULAR REPORTS. The ability of the various representatives of the United Kingdom in foreign countries to supply information of great value to the trading community at home has long been recognised, and every secretary of embassy or legation, and every paid consular officer is therefore required to furnish an annual report on the trade, commerce, and navigation of the country or district, as the case may be, in which he is stationed. Secretaries of embassies or legations are also required to report annually on the finances of the countries in which they act. Reports on special subjects are occasionally called for, and information on commercial or industrial topics of special interest is frequently sent home by diplomatic and consular officers on their own motion. These reports are published by the foreign office, and sold in three regular and several minor series.

1. The general series entitled "Reports on Subjects of Commercial and General Interest by Her Majesty's Representatives in Foreign Countries."

2. The diplomatic trade series, being "Reports by the Secretaries of Embassy or Legation on the Manufactures, Commerce, etc., of the Countries in which they Reside."

3. The consular trade series, being "Reports by Her Majesty's Consuls on the Trade of the Countries in which they Reside."

Reports from China, Japan, and Siam appear in three minor and separate series, each headed by the name of the country.

In the course of the year 1886 some attention was given to the possibility of rendering these reports of greater practical value to the commercial classes, it being the opinion of many that foreign traders were better served in this respect than those of the United Kingdom. Some evidence to this effect was given before the royal commission on the depression of trade and industry, who referred to the subject in their report. It cannot be said that this contention was established, but the result of the investigation made by that commission and the foreign office was to effect some substantial improvements. It was arranged that the reports should be more promptly published, that the importance of procuring full information regarding the industry and the condition of the working classes should not be lost sight of, and that samples of the manufactured goods chiefly in demand in the countries in which consuls resided should be sent home with the reports. The reports are now utilised by the *Board of Trade Journal*.

[The *General Consular Instructions* and the *Correspondence respecting the Question of Diplomatic and Consular Assistance to British Trade Abroad*, published in 1886 (c. 4779), contain much information on this subject. An Index to the Reports published from 1886 to 1890 is also available (c. 6374).] T. H. E.

CONSUMABLES. See CONSUMPTIBLES.

CONSUMERS' GOODS (or CONSUMPTION GOODS) include all those desirable things which directly satisfy human needs and desires, *e.g.* food and clothing. Those desirable things which are only useful indirectly as a means towards the production of consumers' goods—as, for example, machines and the raw materials of manufacture—are by contrast spoken of as *Producers' Goods* (or *Production Goods*). This distinction has been carried further by Professor Menger and the Austrian school of economists, who divide goods into successive orders: *goods of the first order*, consisting of consumption goods as above defined; *goods of the second order*, of those things which contribute immediately towards the production of goods of the first order, *e.g.* sewing machines; *goods of the third order*, of those things which contribute similarly towards the production of goods of the second order, *e.g.* machinery used in the manufacture of sewing machines; and so on. In many cases it is impossible to draw a hard and fast line between goods of different orders, or even between consumers' goods and producers' goods; but this does not destroy the importance of the distinctions indicated. It may be observed that while some things are in their very nature consumers' goods or producers' goods as the case may be, *e.g.* ball dresses and sewing machines, others cannot be classified until the use to which they are put is known. For example, a horse may be used as a pleasure horse or for work on a farm; or, indeed, sometimes for the one purpose and sometimes for the other. A thing may even belong to several orders of goods at the same time; as, for example, a furnace which, while working machinery of various kinds, also serves to warm a neighbouring club-room or workmen's common room.

[Marshall, *Principles of Economics* (2nd ed.), bk. ii. ch. iii. § 1; and Sidgwick, *Principles of Political Economy*, bk. i. ch. iii. § 4 (see COMPLEMENTARY GOODS).] J. N. K.

CONSUMERS' RENT. A term introduced into the nomenclature of political economy by Professor Marshall, to designate the difference between the price that a purchaser actually pays for a given commodity and the price that he would be willing to pay rather than go without it. While the former can never exceed the latter, it is clear that, as regards a large portion of each individual's expenditure, the latter must exceed the former. This is proved by the fact that although a rise in the price of a commodity may lead a purchaser to buy less of it,

he will not usually give up buying it altogether unless the rise in price is very considerable. Consumers' rent thus measures the surplus satisfaction that a consumer derives from the purchase of a commodity over and above the satisfaction that he sacrifices in paying away its price. In illustration, we may suppose the case of a man who, if the price of coals were £10 a ton, would just be induced to buy one ton annually; who would just be induced to buy two tons if the price were £7, three tons if it were £5, four tons if it were £3, five tons if it were £2, six tons if it were £1:10s.; and who—the price being actually £1—does as a matter of fact buy seven tons. The fact that for one ton he would be willing to give £10 shows that the satisfaction he derives from that one ton is economically measured by £10. Hence the purchase of it for £1 yields a surplus satisfaction that is measured by £9; it yields, in other words, a consumers' rent of £9. Similarly the surplus satisfaction yielded by the whole amount of coal that he buys is measured by the difference between his actual expenditure on coal (£7) and the sum of the prices that he would just be willing to give for each successive ton, *i.e.* £29:10s. In other words, the whole consumers' rent that he derives from buying coal at £1. a ton is £22:10s.

The term *Consumers' Rent* is seen to be employed analogically: agricultural rent is the excess of the value of the total produce obtained from a given piece of land over what is required to remunerate the farmer for the outlay involved in raising the produce; consumers' rent is the excess of the money equivalent of the satisfaction derived by an individual from the total amount of a commodity that he purchases, as measured by the total price that he would, if necessary, be willing to give for it, over the outlay actually incurred.

Since the amount of satisfaction yielded to different purchasers by the same expenditure may be very different, it follows that a given consumers' rent may represent varying amounts of surplus satisfaction. In particular, the utilities of two commodities cannot be regarded as even approximately represented by their money measures, when one of the commodities is consumed chiefly by the rich and the other chiefly by the poor. Professor Marshall points out accordingly that the practical usefulness of estimates of consumers' rents is limited to those cases in which the prices taken into consideration are those paid in markets where the average wealth of the purchasers is equal.

The working out of problems that relate to consumers' rent is much facilitated by the employment of diagrammatic methods. The use of diagrams also indicates clearly the analogy between consumers' rent and rent in the ordinary sense.

[The above account of consumers' rent is taken

from a paper by Professor Marshall, on the *Pure Theory of (Domestic) Values*, printed for private circulation in 1879, and from the same author's *Principles of Economics*. For further explanation and for illustration of the uses to which the conception of consumers' rent may be put in economic discussions, and the limitations with which they must be received, see the last-named work, bk. iii. ch. iv., and bk. v. chs. vii. and viii.]

J. N. K.

CONSUMPTIBLES. A TERM EMPLOYED BY THE SCHOOLMEN. The schoolmen based a theory of interest on the distinction between "consumable" and "durable" goods. In the case of the former, the use of which is inseparable from and transferred with the article itself, interest was in their eyes wrong. The transfer of a consumptible, *e.g.* corn and wine, carries with it the right to consume. So to require the thing back, and also something for its use, is to charge two prices for it, one, a fair and proper equivalent, the other an extortion (see **FUNGIBLES**).

[Aquinas, *Summa Theologie*, II. ii. Q. 78, Art. 1.—Böhm-Bawerk, *Capital and Interest* (Eng. trans.), vol. i. ch. i. p. 22.]

L. R. P.

CONSUMPTIBLES. The end of all production is consumption, and consumptibles are the individual material objects destined for, or capable of, consumption. This may follow after and extend over a longer or shorter period. The loaf which is eaten on the day of baking, the Suez Canal which will last, it is hoped, for centuries, are both consumptibles; they have this in common that they are destined to be consumed, and their destination is proved by the fact. But it is not necessary that the process even of consumption should begin at once on the completion of production. Consumptibles may be in stock an unlimited period before consumption begins without forfeiting the title. Thus the term covers the whole range of production, and includes all the products of industry. But it includes also a large number of other things. The gifts of nature, fruits, metals, animals, and also the forces of nature are all to be classed under the head of consumptibles. In some such cases the process even of consumption may not begin for centuries, and may continue for centuries more.

Consumptible and kindred terms would be by some restricted to articles that are desired for their own sake which are ends in themselves; goods of the *first* order, in Menger's phrase. In this sense a loaf is consumed, but not a machine. "Used up" has been proposed as a more general term than consumed. Another distinction is between commodities which in order to be useful must be used up, and those which, though in fact they do wear away, do not confer utility by being used up. A loaf belongs to the former class, the Suez Canal to the latter.

CONSUMPTION. Some economists have proposed to place consumption on the same

footing as production, distribution, and exchange as a special department of economics. Since in England, however, this has not been attempted in the standard text-books, it seems best to indicate the various problems in the accepted divisions of the subject which would naturally fall under a department of consumption. It will be found that to a great extent the problems of the new department have been already investigated under other names.

(1) First of all come questions of definition and the explanation of the fundamental ideas at the basis of consumption, generally treated by English writers in connection with production. "Consumption," says Adam Smith, "is the sole end and purpose of all production, and the interest of the producer ought to be attended to only so far as it may be necessary for promoting that of the consumer." Later criticism has thrown doubt on the possibility of making such a sharp distinction between the interests of producers and consumers. Apart from women who are largely employed in domestic duties, and old men, invalids, and children, the number of those returned in the census of any civilised country as "unoccupied" is extremely small and thus the great majority of the adult males are both producers and consumers. Accordingly the conditions as regards health, variety, moral and intellectual effects on the worker of the work done, etc., are of co-ordinate importance with the amount and quality of the definite commodities consumed. These questions are often discussed under the "disadvantages" of **DIVISION OF LABOUR** (*q.v.*), and sometimes under the effects of machinery.

The principal idea in consumption is utility, taken in the wide sense in which the term is used in ethics (utilitarianism); the characteristics of which were first analysed by Bentham. From the consumer's point of view the chief attribute of wealth is simply its utility—"its power or capacity," in Mill's language, "to satisfy a desire or serve a purpose." From this standpoint the fact that wealth requires land, labour, and capital for its production, that it may be distributed in different ways according to the laws of the state or so-called natural economic laws, and that it may be exchanged, are of secondary importance. The consumer looks primarily to utility. Thus if by some discovery of natural sources any commodity became so abundant as to lose altogether its exchange value, this would to the consumer be the best thing possible. Professor Jevons was the first to give full importance to utility as the foundation of consumption, and in this way the basis of economic science in general (*Theory of Political Economy*). Previous writers, as Mill, had been content with indicating broadly that utility was one requisite of exchange value. By the distinction between final and total utility (see **UTILITY**), Jevons threw a new light on the

whole subject. The utility obtained by the consumption of successive portions of any commodity is beyond a certain point subject to a species of diminishing return. The total utility of the things necessary to preserve life is very great, but the final utility of the last mouthful of bread and butter eaten by a well-fed labourer may be very small. The art of consumption, even without considering the limited powers of acquisition by an individual, consists in knowing when to leave off in one thing and to begin another. The ideal is reached when the final utilities of all the articles consumed are just equal. If everything were to be had in perfect abundance consumption would in each case be carried on until the zero point was reached, and further consumption would involve harmful excess or negative utility.

(2) The relation of consumption to production may next be noticed. The object of consumption is to obtain utility, but in general this can only be done by the destruction, at a more or less rapid rate, of the thing used. To replace this destruction, when the natural supplies are limited, is the object of production. This leads to the distinction between productive and unproductive consumption. The former may be defined strictly as that part of the producer's consumption which is necessary to keep up or increase his efficiency, whilst the remainder is unproductive. Thus it is impossible to separate the individuals who compose an industrial society into distinct classes of productive and unproductive consumers, for the great majority are both, though in different degrees.

Apart from this most general relation of consumption to production, we may consider the former as a stimulus to the latter. This is the principal point overlooked in Mill's unfortunately-worded proposition that demand for commodities is not demand for labour. It is the growth in the intensity and variety of the demands of consumers which is the mainspring of the increase of production, and thus of the employment of labour. This point has been forcibly illustrated by Adam Smith in his historical survey of the way in which the commerce of the towns contributed to the improvement of the country (*Wealth of Nations*, bk. iii. ch. iv.) Mill himself also observes (*Political Economy*, bk. i. ch. xiv.) that amongst the means of increasing the industrial activity of oriental nations must be reckoned "the growth of mental activity making the people alive to new objects of desire."

(3) Although in one way consumption through demand determines production, in another way production through the conditions of supply determines consumption. For the means at the disposal of any individual are limited, and in many cases give little surplus above what is required for the barest neces-

saries, and it follows that the price of the article is as important as its utility in determining the quantity consumed. The fundamental law of demand is that with every fall in price per unit, other things remaining the same, the number of units demanded increases. The consumer will aim at obtaining the maximum utility from the expenditure of the money at his command, and, to put the matter in the simplest form, a peck of apples may be of more use than a single pineapple. But the price of any article, not actually subject to natural or artificial scarcity or monopoly, depends normally upon COST OF PRODUCTION (*q.v.*) Thus cost of production has an equal reciprocal influence on consumption. This is well illustrated in the case of food. The introduction of a cheaper means of subsistence often leads to the partial, or even total abandonment of a more costly, though in other respects superior national food, as, for example, was the case with the potato in Ireland. Again in the matter of clothing, the cheapness of the commodities produced on a large scale has driven out of use various home-made articles, *e.g.* stockings. The total result of this substitution of cheap and inferior articles may contribute towards lowering the standard of comfort of the mass of the people, and in this way the effect of production upon consumption may be most important.

(4) The connection between the distribution and the consumption of wealth is obviously of the closest kind, for the kind of articles selected by the consumer will depend upon the amount of his income. If all incomes were at the same level of moderate competence there would be no scope for the higher forms of luxuries, which require exclusive use for their enjoyment. Accordingly we find that socialists who aim at comparative equality of incomes lay great stress on all forms of social enjoyment, *e.g.* theatres, picture-galleries, music, etc. Again, historically, we find that the forms of wealth at different times have been largely determined by its distribution. The production of works of art in mediæval Italy, and game preserving in England, are examples of the mode in which consumption varies with the interests of dominant classes.

(5) The question of consumption may next be considered from the point of view of governmental control or *laissez-faire*. In former times almost every government thought it a most important part of its duty to lay down what various classes, or even individuals, might or might not consume, and we find sumptuary laws of the most detailed kind. In mediæval England, for example, both clothing and food were subject to the strictest regulations. A person must be of a certain social standing to be entitled to wear silk, or to eat more than three courses at a meal. In oriental countries this idea has reached its full development in

the caste system. In modern times in progressive societies the tendency has been in consumption, as in production, to rely more and more upon *laissez-faire*, although public opinion, distributed through different social orders, still exercises considerable influence, especially in matters of dress, houses, furniture, etc. In some respects, however, the government still exercises a direct or indirect control over consumption, and it is held to be justified in doing so in cases where the consumer is not the best judge of his own real interests, or of the real value of the article consumed. Thus in most countries the sale of intoxicants and the prescription of medicines have been placed under legal restraint. At the same time also laws with detailed provisions have been enacted against various forms of adulteration and fraud. The interests of consumers who are considered unfit to judge for themselves, e.g. children, have been specially considered. Indirectly government influences consumption mainly by taxation, and some taxes are advocated principally for their social effects (see TAXATION).

If the department of consumption ever assumes in the text-books a position of co-ordinate importance with the other departments, it might well be made to embrace various other topics at present scattered through different parts of economics.

Such, for example, is the question of the poor and poor-laws (see CHARITY, STATE), the advisability of protecting the limited natural resources of a nation, the necessity of considering the ultimate social effect of certain forms of trade which, for the time being, may be profitable (see FREE TRADE), and various questions on the distribution and inheritance of wealth, e.g. the effects on national consumption of a system of peasant proprietary.

(6) Lastly, the light thrown by the study of consumption upon social progress may be considered. Consumption being largely determined by distribution, is itself in turn one of the best signs of the way in which the national wealth is distributed. Statistics as to the consumption per head of various articles in different nations, or in the same nation at different times, often give the best evidence available on the wealth of various classes. In making such comparisons, however, regard must always be paid to a possible change or difference in tastes and habits, and also to the cost of the various articles considered, whether influenced by natural or governmental causes, and to the use of substitutes. A relative falling-off in the rate of the consumption of coffee may be due to an increase in the use of cocoa, and a decrease in the use of intoxicants may be ascribed, not to diminished consuming power, but to higher moral development. But when proper precautions are taken, statistics of

consumption furnish a good outline of the material life of the mass of the people. The mere fact, for example, that so many articles are continuously produced on a larger scale shows, not only that they are consumed in increasing quantities, but also that larger numbers of people are able to purchase them, and thus the contention of the socialists that, through production on a large scale, wealth is being concentrated in a few hands, is shown to be an error, because the articles produced can only be consumed when spread over a wide area. In making comparisons of national progress from the consumer's standpoint, it would be most useful if index numbers based on the average consuming power of various classes were constructed (see INDEX NUMBERS).

[The subject of consumption is specially treated in Roscher's *Political Economy*, and in Schönberg's *Handbook*, by Professor Lexis. A useful development of Jevons's theory is given in Mr. Wicksteed's *Alphabet of Economic Science*; and in Mr. J. N. Keynes' *Scope and Method of Political Economy*, at p. 101 *et seq.*, there is an interesting discussion of the question whether the consumption of wealth should or should not be regarded as constituting a distinct department of political economy; with notices of numerous economists who have adopted this arrangement.] J. S. N.

CONSUMPTION, TAXES ON. The provision of an adequate revenue for the purposes of government has from the earliest times been effected, in part, by means of taxes on consumable articles. Adam Smith (*Wealth of Nations*, bk. v. ch. ii. art. iv.) ascribes the invention of such taxes to "the impossibility of taxing the people in proportion to their revenue by any capitation," but it would appear that the failure of direct imposts in mediæval times resulted in an increase and extension of a previously existing method of raising revenue, rather than in the institution of a system which is, in its essence, that of contribution in kind. Taxes on consumable commodities have been commended by economists on the ground of their convenience, it having been found possible by means of such taxes "to raise a considerable revenue . . . the payments of which by consumers are made in insensible portions, where it would have been impossible to collect the same amount by direct taxation at comparatively long intervals. Taxation is in this respect like bleeding" (Professor Nicholson, *Encyclopædia Britannica*, 9th ed., art. "Taxation"). It has also been urged in favour of this system of taxation that it may be assessed so as to leave no doubt concerning what ought to be paid, or when it ought to be paid, and Montesquieu (*Esprit des Loix*, liv. xii. cap. vii.) says in favour of taxes on commodities that they "are felt the least by the people because no formal demand is made for them. They can be so wisely contrived that the people shall scarcely know that they pay them." On the other

hand, while Ricardo affirms that a tax on necessities will not be borne by the working classes (*Principles of Political Economy*, ch. xvi.), Adam Smith distinguishes between the effect of taxes on necessities and on luxuries, observing (*Wealth of Nations*, bk. v. ch. ii. art. iv.) that in the former case the tax will eventually be shifted to other shoulders than those of the immediate consumer. McCulloch adds that the process by which this is brought about is slow and difficult, and that "there is in most cases a great risk in imposing or increasing taxes on necessities, lest the wages of labour should not sustain a corresponding rise, and the condition of the labourers be in consequence depressed." Professor Sidgwick emphasises the fact that the taxation of commodities is "incompatible with any very exact equalisation of the burden of taxation," but he adds that the system has "the merit of avoiding the worst inequalities which taxation proportioned to income would cause . . . since it enables those persons whose needs are greatest to diminish their share of taxation by abstinence from customary luxuries" (*Principles of Political Economy*, 1883, pp. 565, 566).

It is generally believed, with Adam Smith, that taxes on commodities take out or keep out of the pockets of the people more than almost any other taxes, in proportion to what they bring in to the state, although it may be doubted whether, under a well-ordered tariff and modern administration, any serious objection arises under this head (see COST OF COLLECTION OF TAXES).

Taxes on commodities have also been resorted to for other purposes than the provision of revenue, e.g. the discouragement of the consumption of intoxicating liquors, and the protection or encouragement of home industries by means of the imposition of duties either on imported foreign manufactures or on raw materials sent abroad (see PROTECTION). Such taxes may be levied either by the collection of a duty from the importer, producer, or manufacturer, in which case it is usual where the duty is at all heavy to permit the dutiable articles to be warehoused under the supervision of the revenue officers until such time as delivery for consumption takes place, or by the collection of an annual licence duty from the person using the article, as in the case of carriages and guns. The imposition of a licence duty in respect of the manufacture of or dealing in certain articles has practically the same effect as a duty on the articles themselves.

As to the incidence of duties on commodities, the summary of opinion given by Professor Nicholson in the article above referred to may be cited: "Where production takes place under free competition, the tax will, owing to the tendency of profits to equality, be transferred to the consumer, but when the article is

practically monopolised, a tax must fall on the monopolist." For a more minute discussion of these cases, see Pantaleoni, *Teoria della pressione tributaria*, and Cournot, *Recherches*, ch. vi.

The majority of the leading treatises on political economy specifically deal with this subject (see also CUSTOM, CUSTOMS DUTIES; EXCISE). T. H. E.

CONTINUATION OR CONTANGO. Under the word BACKWARDATION (*q.v.*) the process by which a person who, being unable to deliver stock which he has sold, borrows it, has been already described. In the same way, one who has bought stock or shares which he cannot pay for is obliged to borrow the money, and this he can often do from the person who has sold the stock or securities in question. But the seller charges him a "contango." Under normal circumstances the contango, or rate of continuation, somewhat exceeds the ordinary rate of interest at which money can be borrowed from the banks, for the banks do not lend to the full market-value of the securities lodged with them, whereas one who "contangoes" retains securities to the bare amount of his loan, and has no claim until the next settling day against the person whom he trusted to fulfil the bargain. A great deal of business is done by money-dealers, who borrow at a low rate and re-lend on the stock exchange in this way. A. E.

CONTINENTAL SYSTEM. The great war from 1803 to 1814 was primarily a duel between France and England, in which the other powers of Europe were engaged, sometimes on one side, sometimes on the other. But the war had this peculiar characteristic, that neither of the two chief belligerents could attack each other directly. The battle of Austerlitz annihilated the coalition which Pitt had formed, and secured the supremacy of Napoleon on the mainland. Almost at the same time Nelson's victory at Trafalgar destroyed the naval power of France, and put an end to all ideas of invading England. Thus the two states were forced to fall back upon indirect modes of warfare, and each sought to cripple the other's commerce. The measures adopted by Napoleon for this purpose in his famous decrees from Berlin and Milan have received the name of the "continental system." England retaliated by a series of orders in council, of which the two most important were issued in 1807.

There was no novelty in the questions raised or the means adopted in this war, except the vast scale on which mercantile hostilities were carried on. In all the wars of the 18th century England had sought to cut off France from commerce with its colonies. The result had been to throw this trade into the hands of neutral powers. To prevent this, England had laid down the rule of 1756, that a neutral had no right to relieve a belligerent by carrying on a trade in time of war, from which it would be

excluded during peace. The harshness with which England employed its maritime ascendancy to enforce this rule induced the states of northern Europe to conclude an ARMED NEUTRALITY (*q.v.*) in 1780, and again in 1800. The principles which they asserted were that "free ships make free goods," that a neutral may carry any commodities, except such as are contraband of war, and that a blockade can only be respected when it is effectual.

The essential difficulty of measures against the commerce of an enemy was that they must necessarily affect the interests of neutral states. This difficulty became very prominent in the war with Napoleon. On 16th May 1806, the Whig ministry in England notified to the ministers of neutral powers that the whole coast from the Elbe to Brest was blockaded against the introduction of contraband of war or of goods belonging to the enemies of England, while the coast from Ostend to the Seine was subject to a rigorous blockade. This measure gave Napoleon a pretext for issuing the Berlin decree on 21st November 1806. The preamble asserted that England had violated the law of nations: (1) by extending to private property on sea a right of capture which on land only applies to property of the state; (2) by extending to unfortified towns and ports a right of blockade which is only applicable to fortified places; (3) by declaring blockaded places before which there is not a single vessel, and "places which all the united forces would be incapable of blockading, such as entire coasts and a whole empire." On these grounds he decrees that—(1) the British Islands are in a state of blockade; (2) all commerce with them is prohibited; (3) every English subject in countries occupied by French troops, or those of their allies, will be made prisoners of war; (4) all property of an English subject is lawful prize; (5) all merchandise belonging to England, or obtained from her manufactories or colonies, is lawful prize; (6) no ship coming direct from England or English colonies shall be received in any port.

This measure went far beyond anything which England had ever attempted, and was the more preposterous as France had no naval power by which it could be enforced. Probably the wisest course for England would have been to leave France to meet the discontent of her subjects and allies, and the hostility of neutral states, of which the United States were the most important. In that case the Berlin decree would almost certainly have been a dead letter. But if the continental system owed its origin to the action of France, it owed its efficiency to the action of England. Without waiting to see what attitude would be assumed by neutrals, the Whig government issued an order in council on 7th January 1807. After reciting the purport of the Berlin decree, it

ordered that no vessel should be allowed to trade between one port and another belonging to France or her allies; that neutral vessels attempting such a voyage should be warned by English men-of-war and privateers; and that if they disregarded the warning, they should be captured as lawful prize. This order failed in its avowed object of compelling France to withdraw the decree, or inducing neutral states to insist on its withdrawal. On the contrary English goods in the north of Europe were rigorously confiscated by French troops. Meanwhile the Whig ministry fell, and the Tories, who succeeded to office under the duke of Portland, issued a second and far more stringent order in council, on 11th November 1807. This decreed that all ports belonging to France or her allies, or to any country from which the British flag was excluded, should be regarded as in a state of blockade; that all trade in articles produced in such countries should be condemned as unlawful; and that every vessel trading from or to such countries, or carrying their produce, should be captured as lawful prize.

Napoleon promptly answered this order by the Milan decree, 17th December 1807. Its chief provisions were as follows:—Every ship of any nation which submits to the order of 11th November is declared denationalised, and considered as British property; (2) the British Isles are declared in a state of blockade "by sea as well as by land." Every ship going to or from a port of England or English colonies is declared to be good prize; (3) these measures shall "continue to be in force until the British government returns to the principles of the law of nations, which regulates the relations of civilised states in time of war."

Thus the continental system, carried to its logical extreme by both the two great belligerents, threatened to put a stop to the commerce of the whole world. It was of course impossible to enforce with absolute strictness the provisions either of Napoleon's decrees or of the English orders. A vast system of smuggling was the inevitable result, and goods were carried to the blockaded ports, though their price was necessarily enhanced by the comparative scantiness of the supply, and by the risks run in conducting the trade. Perhaps the most curious thing is that this smuggling was connived at, and made a source of revenue, by the two states who were responsible for the prohibitions. Both England and France issued licenses for the evasion of their respective decrees. Napoleon is said to have amassed by their sale the sum of 400,000,000 francs; while in England the number of commercial licenses mounted from 791 in 1805 to 18,356 in 1810.

Although thus limited by licensed and unlicensed evasions, the results of the continental

system can hardly be over-estimated. It was a principal cause of the ultimate fall of Napoleon. To render the system efficient and complete he must make himself master of the whole of Europe. This impelled him to those enterprises in Portugal and Spain, and especially to the great expedition to Russia, which contributed essentially to ruin his power. And again the sufferings caused among the peoples of Europe by the scarcity and dearness of commodities which they had learnt to regard as necessities excited a discontent against French domination which had not existed at the beginning of the revolutionary conquests. The French had always professed to be the enemies of dynasties but the friends of the people, and their professions had long been believed. The continental system destroyed that belief, and the Napoleonic empire fell before the popular hostility which his measures against England had excited.

With regard to England, the policy or impolicy of the orders in council was hotly debated at the time, and can hardly yet be regarded as a matter on which opinion is absolutely formed. That they did in the end serve their purpose as measures of hostility against Napoleon is absolutely demonstrable. But they did this at considerable cost. In the first place they inflicted enormous hardships upon English manufacturers, who were to a great extent deprived of the market for their produce. No doubt these hardships were lessened by the system of licenses, but this in itself is indefensible on any principles of commercial morality. The almost unanimous petitions from the chief manufacturing towns prove that they had undoubted grievances to complain of, and that these were, to a great extent, due to the policy of the government.

But the most harmful result to England was undoubtedly the quarrel with the United States. It was inevitable that the enmity of neutrals should be directed less against the state which originated the continental system than against that which had the power to enforce it. In 1808 Congress passed an act of embargo, prohibiting all intercourse with England and France as long as the two countries maintained their decrees. In the hope of conciliating the last great power which was not hostile, England modified the orders in council in April 1809, by opening to American vessels the Baltic, the North Sea, part of Italy, and the foreign possessions of the Dutch. But the quarrel was not healed, and it was further aggravated by disputes arising from the English claim to search American vessels for deserters from the navy. To make matters worse, Napoleon offered to withdraw his decrees, on condition that England should revoke the orders in council and abandon "the new principles of blockade which they had laid down."

To this the English ministers would not agree, and at the end of 1810 the American ambassador quitted England.

The loss of the American market, and the prospect of a quarrel with the United States, increased the ill-feeling in England against the orders. The Whigs, who were responsible for the policy in its origin, now turned round and denounced it. At last, in 1812, Brougham carried a motion in the Commons for an inquiry before a committee of the whole house. The evidence was almost conclusive, and after a one-sided debate, the government avoided a division by announcing that the orders would be abandoned. They were repealed by an order of 23rd June 1812. But it was too late to avoid the war with America, which lasted for two years with little credit to either country, and was terminated by the treaty of Ghent in 1814. (See BLOCKADE; INTERNATIONAL LAW, PUBLIC; PAPER BLOCKADE.)

[The Berlin and Milan decrees will be found in the *Moniteur*: the orders in council in the *London Gazette*. They are quoted in *extenso* by Leone Levi, *History of British Commerce*, part ii. ch. iv., Appendix.—See also Alison, *History of Europe*, vol. viii. ch. i.—*Life and Times of Lord Brougham*, by himself, vol. ii. ch. x., and *Speeches*, vol. i.—Spencer Walpole, *Life of the Right Hon. Spencer Perceval*, vol. ii. ch. viii.—For the fullest criticism of the policy of the orders in council, see Hansard, *Parliamentary Debates*, sub. ann., 1812.]

R. L.

CONTRABAND. A term used to denote articles in which trade is carried on contrary to the provisions of (a) international law and comity, (b) the revenue laws of a nation.

(a) It has been generally admitted amongst civilised nations that the subjects of a neutral power are entitled to continue to trade with those of powers at war with each other without rendering their goods liable to capture and forfeiture. In order to enable this right to be exercised without detriment to the position of the belligerents, international jurists have endeavoured, with some limited success, to lay down the rules which should be observed in trade so carried on, and those rules have frequently been embodied in treaties. It is now well established that the carriage and sale to a belligerent of instruments and materials which are, by their own nature, fit to be used in war, are inconsistent with neutrality. "If," says Lord Grenville (*Letters of Sulpičius*, p. 26), "I have wrested my enemy's sword from his hands, the bystander who furnishes him with a fresh weapon can have no pretence to be considered as a neutral in the contest." All such instruments or materials are therefore regarded as contraband, or *merces banno interdicta*, and they are liable to seizure and forfeiture if captured in course of conveyance to a belligerent. Another class of articles is said to be *ancipitis usus*, i.e. of variable application, being of such

a character that it cannot be exactly determined whether they are intended for belligerent or for ordinary commercial purposes. Amongst these articles are coal, naval stores, timber, and tar. The decision whether articles of this class are to be deemed contraband will rest with the court before which the goods are brought, when regard should be had to the destination of the ship, the purposes for which the goods are intended, the position and character of the war, and the regulations and treaty obligations laid down or accepted by the belligerent. Even, however, if articles of this class are held to be contraband, they are not ordinarily subject to seizure, but merely to the right of pre-emption, under which their full value, with, in some cases, the ordinary mercantile profit, is paid for the articles if the belligerent desires to retain them. This right is described by Sir Robert Phillimore as "a fair compromise between the right of the belligerent to seize, and the claim of the neutral to export his native commodities, though immediately subservient to the purposes of hostility" (*Commentaries upon International Law*, vol. iii. 2nd edition, p. 451). Within these limitations as to commodities, and subject to absolute prohibition of commerce with besieged and blockaded places, "it cannot be too emphatically declared that it is the unquestionable right of the neutral to carry on a general trade with the belligerents" (*ibid.* p. 387).

(b) The term "contraband" is also applied to goods in respect of which the requirements of the revenue laws of a country have not been complied with, and which are liable to seizure hereunder. Section 177 of the Customs Laws Consolidation Act, 1886 (39 & 40 Vict. c. 36), provides that goods unshipped without payment of duty, prohibited goods (whether imported or shipped for exportation), goods illegally removed from a warehouse, goods concealed on board a ship or boat, and goods packed therewith for the purpose of concealing them—are all liable to forfeiture, and a similar provision is enacted (§ 179) in respect of prohibited goods found on board or attached to any vessel or boat found on arriving within the United Kingdom, or within three leagues thereof. The seizures may be disposed of as the commissioners of customs direct. The excise acts contain similar enactments with respect to excisable commodities.

In 1887 the customs officers made 2860 seizures, amounting in the aggregate to 20,185 lb of tobacco and cigars, and 467 gallons of spirits. The produce of these seizures is, as a general rule, sold, if a price over and above the duty can be obtained, and the articles are legally saleable.

[*Phillimore's Commentaries on International Law*.—*Wheaton's Elements of International Law*.—*Hall's International Law*, 2nd ed., 1884, pp. 598-637.—As to offences against the revenue laws see the annual reports of the commissioners of customs and inland revenue.] T. H. E.

CONTRACT. The origin of contracts must be co-eval with the first commencement of economic relations among mankind. The simplest actions of daily life, even amongst the least civilised communities, are really forms of contract. Exchange and barter, the earliest and crudest outcome of the law of supply and demand, is essentially a contract. The man who can make a rude plough finds himself, by the possession of that faculty, independent of the necessity of engaging directly in agricultural pursuits to obtain a share of the fruits of the earth. This elementary example will suffice to demonstrate the primary bearing of the doctrine of contracts on economic questions. For even in this there is traceable one of the great and fundamental principles of contract in its relation to political economy, namely, the power it bestows of obtaining at once a personal benefit, through entering into an engagement ultimately to discharge the original obligation. In more advanced conditions of society, the principle assumes more extended development; land-owners lease land to farmers possessing skill and capacity requisite to till that land to advantage, capitalists advance money to merchants to be employed in trade to produce profits exceeding the rate of interest demanded, but the principle is still the same. It is obvious that to induce a man to entrust his property to another, to part with his present enjoyment and use of it for the sake of future advantage, the certainty of that future advantage must be secured to him, he must have a hold over the person to whom he has entrusted it, he must, to carry on his business and arrange fresh combinations, be able to reckon with confidence upon the return to him of his capital, together with the increment which is the result of its temporary alienation. It is the establishment of this confidence, the basis of any system of credit, which is the aim and object of the law of contracts. The methods by which the law seeks to attain this security are various. For two objects, apt to clash, have to be borne in mind. On the one hand, that of ensuring performance of, inspiring confidence in, the fulfilment of the contract; on the other, that of encouraging the freedom of contract by attaching thereto such safeguards that persons may readily bind themselves, knowing that the law will protect them, and that precautionary measures exist which will prevent undue advantage being taken of ignorance, necessity, inadvertence, want of proper advice, or lapse of time; and that fraud, if it exists, will invalidate any contract, however formal and solemn. To turn to concrete examples. Among the first class, or what may be termed the promisee's safeguards, may be enumerated the rules by which money due or liquidated demands under a contract can be recovered by speedy and economical process, such as that provided by Order XIV. of the

rules of the Supreme Court, which practically casts the onus of proving non-liability on the defendant, and the procedure which amerces damages, assumed to be commensurate with the injury directly or reasonably referable to the breach of the contract, or where such damages afford no sufficient reparation, specific performance of the contract itself. The other class, which may be termed the promisor's protection, comprises enactments, such as the statute of limitations, which requires that actions on contracts should be brought within such period as to render it probable that witnesses who can speak to what really took place may be still available; the statute of Frauds, rendering writing necessary for proof of contracts attaining a certain degree of importance or extending over a specified period; the whole doctrine of the limitation of the contractual powers of infants and married women, the equitable rules which will in fitting cases set aside or modify unconscionable bargains with reversioners or persons whose immediate and pressing needs impair their liberty of action, and finally the great principle that fraud invalidates everything.

In certain exceptional cases the legislature goes even further than this, and adopts a course which must always be open to criticism and discussion. It passes an act to benefit a particular class, such for instance as the Agricultural Holdings Act of 1883, or the Ground Game Act of 1880, and then provides that it shall not be competent for any member of the class intended to be benefited to contract himself out of the act. How far this interference with freedom of contract is justified must always be an open question. It is never permissible save in the interest of a class admittedly improvident or prone to sacrifice future advantage for immediate gratification, such for example as sailors. But even in such cases, members of the class intended to be benefited must occasionally lose good opportunities by reason of the fetters so imposed on their contracting powers. Take the case of a farmer willing to take a farm at a lower rent if he could renounce the benefit of the Ground Game Act, having no inclination to avail himself of the sporting reservation it ensures him, and possessing a well-founded confidence that his landlord, from his own tastes and interests, to say nothing of his regard for an obligation assumed, would never permit ground game to increase to the prejudice of the tenant's occupation of the farm. It certainly seems hard that the parties should not be permitted to regulate their relations in accordance with their own wishes and their mutual interests. But the justification of such measures is to be found, if at all, in the general interest of the community and the welfare of the class specially concerned, and for one case where the rule might probably be relaxed with advantage, there would be many where the deviation would produce

ultimate disadvantage to one party. Some instances of legislative interference with freedom of contract seem, however, to be entirely beneficial, such for instance as the Truck Acts, and the legislation respecting the employment of women and children in mines and factories. (see CHILDREN'S LABOUR, and FACTORY ACTS.) An interference with contracts, frequently unjustifiable, is that of *ex post facto* legislation, enactments which set aside or modify existing contracts, not on the ground of any inherent disability or irregularity existing at the time the contract was entered into, not on any suggestion that the parties were not of competent and freely consenting mind when they contracted, or that the contract was in any way tainted with fraud, but on the plea that since that date circumstances have altered, that something has supervened which renders it equitable or desirable that its terms should be reconsidered or readjusted without the consent of at least one of the parties thereto. Whether such circumstances exist or not in any particular case, or whatever estimate may be made of the justice or the policy of such a measure, appears altogether outside the economic questions involved. If good is done in any particular case, the benefit is immeasurably outweighed by the danger of the precedent, by the general sense of insecurity induced, and the shock to confidence in the sanctity of contract occasioned thereby. Instances are not far to seek. Irish rents in recent times, and commercial obligations in France during the stress of the Franco-German war, have been the subject of this sort of *ex post facto* legislation, and however widely opinions may differ as to the degree of justification afforded in each case by the exigencies of the situation, the precedent cannot from an economic point of view be regarded as otherwise than dangerous. Such legislation has been likened to a convulsion of nature which by destroying the subject matter of a contract renders the fulfilment thereof impossible and takes away in ordinary cases any right to damages for the breach; and the simile indicates the legal attitude towards exceptional measures of this nature. A question of mixed economics and law in relation to contract which is at present taking definite and practical form is how far the law will intervene to limit combinations which, having as their objects the attainment of complete or partial monopolies and the elimination of healthy competition, may tend to enhance the price of articles of daily necessity, to the benefit of the few and the prejudice of the many. Contracts made with a view to such an end may be declared void as between the parties both in this country and in America, but community of interest secures adherence to the terms of such contracts and the remedy, if any, must be brought to bear from outside. As stated by Lord Coleridge in the recent case of the Mogul Steamship Company, Limited,

v. McGregor, Gow, and Co., 21, Q.B.D., 544, in a judgment affirmed by the H. of L. (92) Appeal Cases 25, the line which separates the reasonable selfishness of traders from wrong and malice is one difficult to draw in words. But the law of conspiracy is very untrammelled and general in its operation, embracing in its widest definition any combination of two or more persons for the accomplishment of anything which in the opinion of the court is detrimental to the public welfare, and it will probably come to be judicially settled before long how far salt unions, flour and coal unions, and the whole development of the ring system, fall within the scope of the criminal law under this head.

The intervention of bankruptcy law to preclude the full enforcement of contracts stands on a different footing (see BANKRUPTCY LAW). The possibility of bankruptcy is always a remote potential incident of every contract, from the inception of which it must be taken to have been in the contemplation of the parties and accepted by them; moreover, the obloquy and disabilities involved by becoming bankrupt, coupled with the necessary surrender of all existing, and until discharge, all accruing, property constitute a sufficient deterrent and punishment to warrant an interference which is after all more in the interest of the body of creditors than of the bankrupt.

Confidence in the fulfilment of contracts renders possible the replacement of a very large proportion of the circulating medium of a country by the employment of paper to represent the gold or silver which would otherwise be required. Bank-notes are merely contracts to pay, yet the firm belief in the validity of the contract supports a circulation adequate for the wants of the country, with the assistance only of coin representing a comparatively small proportion of the outstanding liability, and so with bills and promissory notes; though only contracts, yet, backed by the credit of the parties to them, they take, during their currency, the place of coin.

So again, the entire fabric of legitimate co-operation and combination, of partnerships, the utilisation of capital and organisation of labour, would be impossible were it not for the doctrine of contracts and its practical availability. A firm of contractors, themselves bound by contract to unite their energies and capital, or deriving that capital from others by means of contract, undertake under contract important works for a body of persons who again, as a company, combine their capital under the provisions of a contract of association, the contractors make subcontracts with managers, foremen, and workmen for their respective services, with producers, carriers, shipowners, and manufacturers for the supply and carriage of the requisite materials and plant, other contracts are entered into with landowners

for the site to be occupied, and so by the intervention of a series of contracts, an enterprise is carried through which would be absolutely impossible without such machinery. Employment is found directly or indirectly for a large number of persons, and money is put into circulation through the most remunerative and beneficial channels.

As we have seen that the principle of contract helped to supply the simplest wants of early economic society, so it keeps pace and expands with the increasing needs of advancing civilisation. By an inherent power of development, without any moving cause other than men's recognition of its necessity and appreciation of its efficacy, it rises to every fresh occasion, and almost insensibly permeates daily life to the welfare and progress of society at large.¹

[Addison on *Contracts*.—Chitty on *Contracts*.—Pollock's *Law of Contracts*.—Anson on *Contracts*.]

J. R. P.

CONTRACT, LAW OF. A contract is a legally binding promise made by one or more persons to another person or other persons, to do some act, to forbear from some act, or to suffer some act to be done, for the benefit of such other person or persons. Such a promise, whether legally binding or not, is called an agreement, and an agreement becomes a contract if the following requirements are complied with: (1) the promise must be intended to create a legal relation between the parties (*e.g.* a promise to dine at a friend's house is not a contract); (2) the parties must be capable of contracting (*e.g.* the agreements of infants and lunatics are mostly invalid, and a married woman having no separate estate is incapable of contracting); (3) the contents of the agreement must have been submitted by the one side to the other (offer), and must have been assented to by the latter in an unambiguous and unqualified manner (acceptance); (4) the agreement must not be entered into for an unlawful or immoral object (*e.g.* an agreement not to exercise a certain trade without any limit as to space is invalid, as being in general restraint of trade, and therefore against public policy; an agreement to commit an indictable offence is similarly void, and there are numerous other instances); (5) the contract must either be made by deed (*i.e.* signed, sealed, and delivered by the promising party or parties), or it must be supported by a "valuable consideration."

A contract made by deed is called a contract under seal or a specialty; contracts not made by deed are called simple contracts or parol contracts. A valuable consideration may consist in a benefit accruing to the promising party or in a sacrifice made by the party to whom the promise is made, in exchange for the promise.

¹ Montesquieu's story of the Troglodytes forcibly illustrates the dissolution of society through breach of contract.

If, for instance, A by contract under seal promises to B to pay him £500 on a given day by way of gift, B will succeed in an action against A if A fails to pay at such date. If, on the other hand, the same promise be made by writing without seal, B has no remedy in case of non-performance. If, however, A, by word of mouth, promises B to pay him £500 in two days in consideration of B lending him a book for two hours, there will be an enforceable contract, as the adequacy of the consideration is not inquired into except in so far as it might be evidence of fraud.

An agreement which satisfies the above-mentioned requirements is called a contract; if, on the other hand, any one of the requirements is not complied with, the transaction remains without any legal effect, and the agreement is called "void." Void agreements must be distinguished from unenforceable and voidable contracts.

Certain classes of contracts are not enforceable in the absence of written evidence as to their contents, the following being the most important:—

(1) Under § 4 of the Statute of Frauds (29 Car. II. c. 3).

(a) Contracts by which an executor or administrator assumes personal liability for debts owing to the estate administered by him. (b) Contracts of guarantee. (c) Contracts made in consideration of marriage. (d) Contracts for the sale or purchase of land or of any interest in land. (e) Contracts not to be performed within a year from the date on which they are made.

(2) Under § 17 of the same statute.

Contracts for the sale of goods at the price of £10 or at any higher price, unless the goods have been partly accepted and received by the buyer, or have been partly paid for by the same.

(3) Contracts arising on bills of exchange.

(4) Contracts of marine insurance, etc.

The requirement of writing in these cases does not affect the validity of the contract; only so long as no written evidence exists the contract cannot be proved in a court of law; but written evidence dated from a time subsequent to the date of the contract, if otherwise in order, is quite sufficient.

A "voidable" contract is one which may be rescinded by one of the parties, unless such party, after having become aware of the circumstances which make the continuance of the contract depend on his option, by his conduct or by express words shows that he intends to abide by the agreement. Thus, for instance, a contract induced by fraud or undue influence is voidable at the option of the defrauded or intimidated party.

The usual remedy for breach of contract is an action for damages; the party who suffers loss in consequence of such breach is entitled to receive compensation in money from the party

who failed to perform the contract. He is "as far as money can do it to be placed in the same situation as if the contract had been performed." The causal connection between the non-performance and the loss must, however, not be too remote, and the loss must be of such a description as might reasonably have been contemplated by the parties when entering into the contract. Thus a person who sends some machinery for repair through a carrier who fails to deliver it in proper time cannot claim compensation for the loss of trade arising through the delay in the receipt of the repaired machinery. If, however, a carrier undertakes to carry goods which to his knowledge were meant to be sold at a particular time, he is liable for the damage done by loss of market arising from a delayed delivery. In actions for non-payment of a debt nothing more than the sum due could be recovered formerly, unless there was an express promise to pay interest; it is now provided by 3 & 4 William IV. c. 42, §§ 28, 29 that in the case of a debt payable by virtue of a written instrument interest at the current rate may be allowed by way of damages.

The practice of the Court of Chancery has provided a remedy, in cases where money is no adequate compensation for a breach of contract, in the shape of an order for specific performance. This remedy is, however, available only to a very limited extent, the most conspicuous instances being contracts for the sale of land, and even in the case of a contract which, according to the nature of its subject matter, might be specifically enforced, the court will not grant a decree unless certain requirements are complied with, one of the requirements being valuable consideration, which for the purpose of specific enforcement must exist in a contract under seal as well as in a simple contract. E. S.

CONTRACT NOTE. The writing on these documents is a short and formal announcement that a stockbroker has bought or sold for his principal a given amount of stock, bonds, or shares at specified prices, to which is added brokerage and a stamp, which Mr. Goschen raised to 6d., on each contract note for more than £100, but which, before 1888, used always to be 1d. Contracts do not pass between members of the stock exchange. It is a rule that every bargain between members should be checked by 11 A.M. on the following day; and the committee will not listen to any dispute if this be neglected. A. E.

CONTRACTORS. Persons who are parties to a contract. The name is more specially applied to persons who make it a regular business to undertake large works (e.g. the construction of railways, bridges, or buildings) for sums fixed beforehand. E. S.

CONTRACTUS TRINUS. See ECK, JOHANN.
CONTRIBUTION, CONTRIBUTORY. See COMPANY.

CONVENTION OF ROYAL BURGHS OF SCOTLAND. This municipal federation originated in the court or parliament of four burghs, which consisted of representatives from Edinburgh, Stirling, Berwick, and Roxburgh. In 1368 Lanark and Linlithgow were substituted for Berwick and Roxburgh. In the 13th and 14th centuries this court, with the chamberlain of Scotland as presiding officer, exercised a general supervision over the burghs of the kingdom, legislating for them, and acting as their high court of appeal. The transition from the old parliament or court of four burghs to the modern convention of royal burghs seems to have taken place gradually during the 15th century. Already, in 1405, the process of transformation is perceptible. In this year the court of four burghs enacted that two or three burgesses from each of the king's burghs, south of the Spey, should assemble annually to treat and ordain concerning all things that relate to the well-being, liberties, and court of the king's burghs. The name "convention" gradually superseded "court" and "parliament" in the first half of the 16th century.

The most important member of the league was Edinburgh, which sent two commissioners to the meetings of the convention, while the other royal burghs usually sent only one. Edinburgh was also generally selected as the seat of the convention. But the place and time of meeting varied. As a rule, the commissioners assembled annually. The presiding officer, elected at each session, was called the moderator. He was generally the commissioner of the town where the meeting was held, or, if there were two commissioners, the senior delegate. A committee of representatives of various burghs was often appointed to transact urgent business while the convention was not sitting.

The chief function of the convention was the supervision of trade, domestic and foreign. It made regulations concerning markets, tolls, fisheries, manufactures, customs-duties, shipping, imports and exports, etc. It negotiated commercial treaties with continental states and cities. It exercised control over Scotch merchants in France, Flanders, and other countries of Europe. The chief foreign trade of Scotland was carried on with the Netherlands, and was monopolised by the royal burghs. This trade was regulated through "the conservator of the Scotch privileges in the Netherlands." He was elected by the convention, though the king sometimes claimed and exercised the right of appointment. The conservator lived in the Scotch staple-town, usually Campvere (the modern Vere in the province of Zealand), where the royal burghs enjoyed important privileges. He had general charge of Scotch merchants and factors in the Netherlands, and was the judge of the con-

servatory court, which tried all civil and criminal cases concerning Scotsmen. The "lord" conservator was himself guided by the instructions and orders of the convention. At Campvere there was, moreover, a "consergerie," where the Scotch merchants lodged and took their meals. The master of the consergerie was expected to enforce many minute regulations, some of which were peculiar. In the staple-town we also find a Scotch school, kirk, and prison-house. The convention carefully regulated everything relating to these various institutions, including even the wearing apparel of merchants and the price of their meals.

Besides the supervision of commerce, this powerful organisation exercised important functions in connection with national taxation. It apportioned public taxes among the burghs. It also sometimes made loans and grants of money to the king.

A third important function of the convention was the oversight of the internal administration of royal burghs. It took cognisance of weights and measures; altered the "setts" or written constitutions of towns; decided controversies between burghs, or between burghs and their magistrates; and regulated the election of municipal officers, the qualifications of burghship, the finances, etc., of towns. It also often appropriated money for the repair of harbours, and for the general improvement of particular burghs.

The federation is still in existence, but its most important functions have been absorbed by parliament. Its meetings are held annually at Edinburgh, which is represented by two commissioners and two assessors, while the other burghs send one commissioner and one assessor. The larger towns have cause for complaint owing to the inequality of representation. The convention now merely makes suggestions and recommendations concerning commerce and municipal affairs, for the purpose of influencing public opinion and parliamentary action. It used to exert great influence upon national legislation.

[This account is based upon the *Acts of the Parliament of Scotland* (12 vols., 1814-1875), and especially upon the *Records of the Convention of Royal Burghs*, edited by J. D. Marwick (6 vols., Edinburgh, 1866-90). These *Records* form a rich, unworked mine of information for historians and economists. There is no good history of the convention.—John Mackay's *Convention of the Royal Burghs of Scotland to 1707* (Edinburgh, 1884) is a very brief and fragmentary account. The subject is worthy of more attention than it has thus far received.] c. gr.

CONVENTIONAL TARIFF. This term is applicable to regulations, of a more or less arbitrary or empirical kind, giving a fixed value of conversion from one currency to another, in which the exact intrinsic value or

unit par of exchange is disregarded. Thus, the English sovereign in Portugal has a legal conventional tariff value of $53\frac{1}{2}$ pence per milreis of her own gold coinage, although the pure gold value of the latter is only 53·284 pence. Then again, in international postal conventions between England and a great group of other countries, similar fractional differences are allowed to be, so to speak, glossed over. For example, ten centimes and one penny are to an enormous extent taken as identical. But one penny, as the two hundred and fortieth part of a gold sovereign, has about ·00417 of its value, whilst ten centimes have only about ·00396. This is tantamount to depreciating English currency to the extent of more than 5 per cent of its real value. In the practical result, the British public has been unduly generous and quixotically lavish in letting itself be mulcted in this way by conventional tariffs. The extent of this may best be understood if attention be given to the fact that hundreds of millions sterling, by way of loans to foreigners, have been advanced, in which a conventional tariff has been used, either of 25, instead of 25·2215, francs, to the sovereign, or of 48, instead of 49·316, pence to the dollar.

F. H.

CONVENTIONAL VALUE. A term sometimes used as equivalent to Official or DECLARED VALUE (*q.v.*), for the Board of Trade and customs returns. The values of goods imported and exported were, down to 1870, computed at prices ascertained in 1694, as a conventional method of bringing them all together into money totals. Thus, *e.g.*, “eggs” were on importation calculated at a uniform value of 9d. a great hundred, though in the meantime the prices had risen to 6s.; and cottons on exportation at 1s. 6d. per yard, though they had fallen to $4\frac{1}{2}$ d. French values are re-adjusted every year, and those so obtained are conventionally used in all publications during the progress of the year, but corrected for the annual records.

S. BO.

CONVERSION OF BRITISH NATIONAL DEBT. The form in which the British National Debt has been held has frequently been modified. The improved condition of the public credit has from time to time enabled the government to make arrangements for the payment of a lower rate of interest, an object which is accomplished either by the issue to the holders of the stock to be converted of another stock bearing a different rate of interest, or by the repayment of the capital value of the stock out of moneys borrowed for the purpose. In the one case the stockholder remains unchanged, although the nominal amount of his holding, and the interest paid upon it may be varied. In the other, the place of the original stockholder is taken by one who is ready to accept less favourable terms for himself.

Operations of this character have not been infrequent. The first conversion of the British National Debt was carried into effect in 1711, when a mass of floating obligations was converted into £9,177,968 of South Sea Company's stock bearing 6 per cent interest. In 1750, Mr. Pelham converted £54,413,433, 4 per cent stock into the same amount of new stock eventually to bear 3 per cent interest only. In 1817 the Irish debt, of £103,033,750, was converted into the debt of the United Kingdom. In 1822, Mr. Vansittart converted £149,627,867, 5 per cent stock into £157,109,217, 4 per cent stock. In 1824, Mr. Robinson converted £70,098,935, 4 per cent stock into $3\frac{1}{2}$ per cent stock of the same amount. In 1830, Mr. Goulburn converted £150,790,176, 4 per cent stock partly into 5 per cent stock at the price of 70, but almost wholly into $3\frac{1}{2}$ per cent stock at par. In 1834, Lord Althorp converted £6,489,190, 4 per cent stock into an equal amount of $3\frac{1}{2}$ per cents. In 1844, Mr. Goulburn succeeded in converting £248,757,311, $3\frac{1}{2}$ per cent stock into a new stock to carry $3\frac{1}{2}$ per cent for ten years and 3 per cent for twenty years. In 1853, Mr. Gladstone arranged for the conversion of £3,063,906, 3 per cent stocks. In 1883 a sum of £70,241,908, 3 per cents was converted into terminable annuities, and in 1884, Mr. Childers converted £23,362,596, 3 per cent stocks into $2\frac{3}{4}$ per cents at 102, and $2\frac{1}{2}$ per cents at 108.

For some time prior to 1888, the price of the leading marketable securities, including British government stocks not redeemable at any early period, had made it evident that the state of the public credit rendered it unnecessary that so much as 3 per cent interest on the funded debt should be paid. On the 9th March of that year Mr. Goschen submitted a scheme for the conversion of the three per cent stocks then existing—consols, reduced threes, and new threes—into a single stock to bear interest, payable quarterly, at the rate of 3 per cent for the year ending the 5th April 1889, $2\frac{3}{4}$ per cent for the following fourteen years ending the 5th April 1903, and $2\frac{1}{2}$ per cent for the next succeeding twenty years ending the 5th April 1923, and thenceforward until it should be redeemed. The new stock was to be called “Two-and-three-quarters per cent consolidated stock” until the 5th April 1903, and “Two-and-a-half per cent consolidated stock” thereafter. An equivalent amount of the new stock was offered in exchange for the stock to be converted, and any increase in the nominal amount of the debt was thus avoided, but an important difference in the position of the three old stocks as respects redemption rendered a different *modus operandi* and some variation of terms essential. The new 3 per cent stocks had been redeemable at any time since the 5th January 1873, and Mr. Goschen proposed to assume consent to the

conversion unless the holders formally dissented, in which case they were to be paid off at par in one sum, or in such proportions and in such order and manner as the treasury might direct. The amount of stock to which this arrangement was applicable was £166,399,043.

The position of the holders of consols and reduced threes was a better one, for they possessed a right to twelve months' notice before their stock could be redeemed. In their case it was considered that assent to conversion could not properly be assumed in the absence of a formal acceptance of the altered terms, and in order therefore to encourage holders to give such assent and to forego their privilege of notice, a bonus of 5s. per cent was to be given to those who agreed to the conversion within certain specified periods. The amount of the stocks to which this arrangement applied was in the aggregate £391,593,466, of which £322,681,033 was in consols, and £68,912,433 in reduced threes. The former amount was subsequently increased by £34,625,778, created in lieu of the remaining sums to be paid in respect of a terminable annuity into which certain stocks belonging to suitors of the supreme court had been converted.

In order to compensate stockbrokers, bankers, solicitors, and other recognised agents for the trouble to which the offer made to holders of consols and reduced threes would put them, the treasury were to be empowered to pay a commission of 1s. 6d. per cent on the stock converted.

The proposals made by Mr. Goschen were favourably received both in parliament and in financial circles, and a bill embodying them received the royal assent on the 27th March 1888. It speedily became evident that the scheme would be successful. The simplicity of the terms proposed had undoubtedly much to do with the success of the operation, together with an impression current among business men that such a conversion was certain to be carried through. By the 29th March, the holders of new threes who had expressed dissent represented not more than some £400,000 out of £166,000,000, whilst assents on the part of the holders of consols and reduced threes to the extent of £297,406,173, or nearly 76 per cent of the whole, were received by the 26th April, an additional £70,861,170, or 18 per cent, being converted between that date and the 1st June. On the 5th November 1888, new stock to the extent of £549,094,011 had been accepted and £1,199,102 old stock had been paid off, leaving a balance of £42,325,173 still to be dealt with.

The operations undertaken for the conversion and failing this the redemption, of this remanet may be thus summarised :

Stock redeemed by the action of the ordinary Sinking Funds	£1,356,461
Paid off under discount	6,128,006
Stock acquired by National Debt Commissioners and converted	8,164,312
Stock temporarily converted into a 3 per cent Book Debt	6,376,143
Stock automatically converted	8,426,141
Paid away or claimed in cash.....	11,874,110
	<u>£42,325,173</u>

The final results of the whole series of operations were as follows :—

Stock dealt with.	Amount.	Per Cent.
Converted into new stock ...	£565,684,465	95·7
Paid off in money	19,354,253	3·3
Converted into a temporary "Book Debt"	5,785,689	1·0
Net amount of stock dealt with	<u>£590,824,407</u>	<u>100·0</u>

The cost of the operations was as follows :—

Bonus to redemptioners	£958,528
Commission to agents	234,073
Remuneration to Banks of England and Ireland	116,054
Dividend paid in advance	1,715,815
	<u>£3,024,470</u>

The saving in the interest payable on the National Debt exceeded a million in the years 1889-90; for each of the following thirteen years it will be about £1,400,000, an amount which will be doubled after 1903-4.

[Hansard's *Debates*, vol. cccxiii. pp. 709 and 1813; vol. cccxiv. p. 118.—The Acts 51 Vict. c. 2, 51 & 52 Vict. c. 15, & 52 Vict. c. 4.—*Parliamentary Papers*, Nos. c. 5584, 283 of 1889 and 153 of 1890.—Also, for a detailed account of the operations, *Conversion and Redemption*, by E. W. Hamilton, London, 1889.] T. H. E.

CONVERSION, COLONIAL AND FOREIGN STOCKS. In its financial aspect "conversion" is a term generally applied to consolidations and simplifications of securities or to reconstructions of a national currency, like that carried out by Germany in 1873. It is intended to confine these remarks to the most important conversions of colonial and foreign stocks. (For the conversion of the BRITISH NATIONAL DEBT see separate article.)

COLONIAL STOCKS.

Canada.—In 1860 Canada effected an important conversion of her 6, 5, and 4½ per cent debentures into 5 per cent consols or bonds, redeemable in 1885, when the holders were offered 4 per cent inscribed stock, and most of them accepted the offer.

Cape of Good Hope.—This colony has effected various conversions of debt, that of 1872 con-

verting the securities of the Cape Railway into government $4\frac{1}{2}$ per cent consolidated debentures and that of 1885, offering the holders of the entire debt bearing 6, 8, $4\frac{1}{2}$, and 4 per cent, the option of converting into 4 per cent inscribed stock. This offer applied to £10,840,100 in bonds and was largely carried into effect.

India.—In 1874 there was a partial conversion of the old $10\frac{1}{2}$ per cent stock of 1833. In 1880 India 5 per cent stock was converted into 4 per cent stock. In 1887 India 4 per cent stock was offered the option of converting into $3\frac{1}{2}$ per cent stock, when £48,215,678 accepted the terms offered. Since then there have been some conversions into 5 per cent stock.

New Zealand.—This colony effected important conversions of debt, in 1868, when New Zealand 5 per cent consols were issued, and in 1885 and 1886, when loans of about £14,000,000 were allowed to convert into 4 per cent inscribed stock, the holders mostly availing themselves of the option.

Jamaica, Mauritius, and Natal have likewise effected conversions of debt.

FOREIGN STOCKS.

In 1869 Austria compulsorily converted all her issues into internal 5 per cent rentes, whereupon the Council of Foreign Bondholders issued "Anglo-Austrian bondholders' certificates" to cover the loss entailed. These were redeemed at £5 each in 1871. In 1888 there was a partial conversion into 4 per cent gold rentes, which will probably be carried further.

Egypt has also effected many consolidations of this nature, but the unification carried out in 1877 was by far the most important of them. All the then existing loans of Egypt, many of them carrying high rates of interest and sinking fund, were converted into $33\frac{1}{2}$ per cent 5 per cent preference stock, and $61\frac{1}{2}$ per cent unified stock, which was to bear up to 7 per cent interest. But in reality it has borne 4 per cent interest. At the same time the Khedive's private loans were converted into *Daira Sanieh* debt. These conversions were the result of Mr. Goshen's mission in 1873, which proved the financial salvation of Egypt.

French debt conversions have been numerous, one of the latest being in 1883 of the 5 per cent national loans into new $4\frac{1}{2}$ per cent rente to the amount of £271,841,460. This stock may be again converted from 1893. In 1878 new 3 per cents were issued in conversion of some railway stocks; in 1883 this stock was added to by conversion of the savings banks' deposits. Altogether about £75,000,000 was so dealt with.

Mexico has made many conversions, with and without the consent of her creditors. The last, in 1886, whereby the entire foreign debts were exchanged for consolidated debt of 1883, bearing 1 per cent rising to 3 per cent interest, was

the result of protracted negotiations following on the practical repudiation of 1866.

Peru, to go no further back, effected partial conversions in 1832, 1862, 1865, and 1872, and it is evident, that before Peru ceases to be classed amongst the list of defaulters, a further consolidation and reduction of debt will have to be carried into effect.

Russia has carried out a number of conversions, partly of internal debt. But her latest conversion, that of 1889, is to exchange the 5 per cent railway loans of 1870, 1872, 1878, and 1884 into £49,120,788 of 4 per cent bonds.

Spain effected her first conversion of foreign debt in 1834, and from that time up to the consolidation and conversion of 1881-82 her arrangements with her creditors were numerous. By the last arrangement all her outstanding loans were exchanged for 4 per cent external and internal stock, with a large reduction in the nominal capital of the debt.

Turkey in 1865 converted her many internal debts into a general debt bearing 5 per cent interest. In 1882 all the loans upon which Turkey was in default were converted into four series of 1 per cent bonds amounting in all to £91,842,000.

The United States in 1871 and 1873 converted 6 per cents into a 5 per cent funded loan for \$500,000,000. In 1878 a further \$300,000,000 in $4\frac{1}{2}$ per cents were issued for conversion purposes; and in 1877-78 another \$732,000,000 were issued in exchange for 6 and 5 per cent bonds. In 1881 the 5 per cents of 1871-73 were renewed at $9\frac{1}{2}$ per cent, and in 1882 they were converted into 5 per cents, which have since been entirely redeemed.

There is hardly a foreign country of any standing which has not carried out similar operations, the main object in all being to pay lower rates of interest upon their obligations. It is not too much to say that if all the government debts of the civilised world carried interest now at the rates originally contracted for, their burdens in interest would quite double what they now are. It is evident too, that many further conversions to lower rates of interest will be effected in the near future.

CONVERSION OF ARABLE LAND INTO PASTURE IN ENGLAND.—Historically, two epochs stand out in which tillage has been on a large scale converted to pasture in England: (1) 1400-1540; (2) 1875 to present time.

(1) So long as self-sufficing farming was practised as feudalism prevailed, little or no attention was paid to the nature of the soil or climate. Whatever corn was required for the support of isolated villages, organised as separate communities complete in themselves, was necessarily grown upon the spot, and land was valued less for the rents it produced than for the men it supported. Divisions into arable and pasture were therefore dictated by social exigencies

instead of natural advantages. At the end of the 14th century farming for profit was introduced, and gradually tillage was superseded as the staple agricultural industry; pasture became the rule, and wool the source of the farmer's wealth. This change was, in the first instance, due to social causes. The BLACK DEATH (*q.v.*) depopulated rural districts. Landlords were deprived of their quit-rents, and holdings thrown upon their hands. There was plenty of land, but few to work it; little money was forthcoming to pay for labour even when it was available. In this crisis landlords adopted one of three courses: (a) they offered stock and land leases (Rogers, *Agriculture and Prices*, i. p. 24); (b) they exacted the labour services, which had now become exceptionally valuable; (c) they laid down their land to pasture, and enclosed vast tracts as sheep-runs. From these courses followed important results. From (a) sprang the class of tenant farmers; from (b) the Peasants' Revolt of 1381 and the effort to destroy the manorial muniment rooms (Denton, *Fifteenth Century*); from (c) the acceleration in the break-up of the old manorial and common-farm system, as a more profitable method was discovered of employing land. If this last course was adopted upon lands depopulated by the Black Death, no social grievance was caused. If the change simply meant the conversion of common farms into enclosures on which corn and cattle could be conveniently raised, it constituted an advance in agricultural science, and displaced little or no labour. But, as a rule, the change meant that landlords withdrew their demesnes from the common farms, ceased to employ labour, enclosed an undue share of the wastes, deprived copyholders and tenants of the means of cultivating their own holdings, and threw the new enclosures into vast sheep-walks. Thus the change caused a large amount of agrarian distress and social discontent [*Libelle of English Polycye*; Denton, *Fifteenth Century*; More's *Utopia*, p. 41 (English Reprints, 1869); *Dialogue between Cardinal Pole and Thomas Lupset*, E. E. T. S.; *Supplication of Poor Commons*, E. E. T. S.; F. W. Russell, *Kett's Rebellion*, etc.] When once the tendency began, it was accelerated by the dissolution of the monasteries and the high profits of the rising wool trade, and continued to develop in spite of the prohibitions of the legislature (*e.g.* 6 Hen. VIII. c. 5; 7 Hen. VIII. c. 1; 25 Hen. VIII. c. 13; 27 Hen. VIII. c. 22). England in fact became a grass-growing, wool-producing, pasture country until the pressure of population at the close of the 18th century reversed the agricultural policy.

(2) War prices of corn (1797-1815) encouraged farmers to plough up land for corn. But the preponderance of pasture over arable land continued after the change had been long in progress. Of this fact two inquiries give sufficient proof. Mr. Comber (*Inquiry into*

the State of National Subsistence, 1808) calculates the arable land and gardens of England and Wales at 11,588,000 acres, the lands depastured by cattle at 17,479,000 acres, and the commons and cultivated wastes at 6,473,000 acres. Mr. Couling (Select Committee on Emigration, 1827) calculated in that year the arable land and gardens of England and Wales at 11,143,370 acres, the meadows, pastures, and marshes at 17,605,630; the uncultivated improvable wastes at 3,984,000 acres. Temporarily checked from 1815 to 1850, the tide set subsequently in the direction of the conversion of pasture into arable land. In 1874 there were 13,900,000 acres of land in England and Wales under corn crops, green crops, or rotation grasses, as against 12,071,691 acres under permanent pasture. In 1875 there were 13,980,000 acres of land under corn crops, etc., against 12,202,596 acres of pasture. Thus, as compared with 1808 or 1827, the arable land exceeded the pasture by one and three quarter million acres, instead of the pasture exceeding the arable land and gardens by six and a half million acres. The preponderance of arable land over pasture ceased to increase after 1878. In 1879 and 1880 the area of arable land was 13,480,500 acres and 13,210,600 acres, and the area of pasture land was 13,007,400 and 13,267,600 acres. Thus, by 1880, the tide had commenced to turn. In 1888 and 1889, the area of pasture land exceeded the arable land. In 1888 the arable land was 12,715,800 acres, the permanent pasture, 14,554,500. In 1889 the arable land was 12,599,200 acres, the permanent pasture, 14,649,900 acres.

R. E. P.

CONVERTIBILITY OF BANK NOTES.

The convertibility of bank notes into specie on demand is an essential condition of a sound currency. It has been held, and it would appear difficult to controvert the statement, that immediate convertibility on demand is a complete safeguard against over-issue, for if a redundant note were in circulation the provision that it would be immediately paid on demand would appear sufficient to ensure that such a note, when redundant, should immediately be withdrawn. But, according to the currency principle supported by Sir R. Peel (see CURRENCY DOCTRINE), the question of convertibility might depend on other considerations. "The real question to be solved is, how to regulate the quantity of the paper circulation, so as to keep its value identical with what the value of the metallic currency should be" (speech of Sir R. Peel, House of Commons, May 20, 1844). "Convertibility alone will not ensure this. Convertibility provides, indeed, the means of taking out of circulation a quantity of paper already in excess; but it imposes a very imperfect check on putting too much paper into circulation." Sir R. Peel did not attempt

to reconcile the latter half of this sentence with the former, for it is difficult to understand how paper substituted for money can remain in excess of the wants of the country when the means of taking this excess out of circulation have been provided. Real convertibility, that is to say the means of obtaining specie for notes whenever required, appears an ample safeguard against over-issue of notes. Bank notes, however, play a very different part in the financial system of the country from what they did at the commencement of this century (see BANK NOTE; CURRENCY DOCTRINE.)

[Tooke and Newmarch's *History of Prices* is a perfect mine of information on the subject.—Fullerton, *On the Regulation of Currencies*.—James Wilson, *On Capital, Currency, and Banking*, and the writings of Huskisson, Ricardo, Sir W. Clay, Colonel Torrens, Walker on *Money*.]

CONVEYANCE. (1) The transfer of the ownership of property. (2) The instrument by which the transfer is effected. A conveyance, to be effectual, must be embodied in a deed (which is a document signed, sealed, and delivered by the parties in the presence of a witness). The conveyance of property need not necessarily have the effect of transferring the beneficial rights of ownership; in the case of a mortgage, for instance, the legal estate—i.e. the formal right of ownership—is vested in the mortgagee, but the mortgagor, as a general rule, remains in possession and in the full enjoyment of an owner's material right—excepting, however, the right of alienation. The methods of conveyancing have been considerably simplified within the last two generations, and even within the last decade. A modern conveyance begins with the date and the names of the parties; then follow the recitals, which in the first place explain the title, and in the second place state the nature of the transaction which has caused the conveyance to be effected (each recital beginning with the word "whereas"); these being finished, the so-called "Testatum" ("Now this indenture witnesseth") introduces the effective part of the conveyance, beginning with the statement of the consideration and the acknowledgment of the same, then proceeding with the "operative words" (e.g. "the vendor conveys," etc.), and afterwards describing the "parcel"—i.e. the property which is the object of the conveyance; by the "habendum" the nature of the estate which is conveyed is explained (whether in fee simple, for life, upon trust, etc.); and finally the "covenants" contain the mutual promises concerning the property or the adjoining property. Many of the alienating owner's covenants have been rendered unnecessary by the Conveyancing Act of 1881, the addition of certain expressions to the operative words implying a number of covenants which formerly had to be set out at great length. It is unnecessary to mention that the description of a

conveyance as given here is liable to a great many variations according to the circumstances of the case. A conveyance *on sale* is liable to a stamp duty of 5s. for every £50. E.S.

COOLIE SYSTEM. By this system a migration of labourers from India, China, and the South Pacific, to other tropical countries under European government, is placed under state regulation. The movement began (1834) when the freed negroes largely declined plantation work. The management being at first in private hands, unpleasant rumours called for government intervention, and now the egress from India is strictly controlled (acts of 1864 and 1869), the terms of engagement are regulated, and the colonial governments held responsible for their execution. Commissions of inquiry were issued for Demerara (1870) and Mauritius (1875). The French government on their part undertake inspection in their colonies. The movement from China is regulated by a convention (1866) between the governments of China, Great Britain, and France.

The chief colonies employing coolie labour are Demerara (one-third of population), Trinidad (two thousand a year), Mauritius (five-sevenths of population), Natal (one-fifteenth), Queensland (chiefly from the Pacific Islands), and the Straits. Outside the British empire, Cuba, Peru, Tahiti, and the French sugar islands.

The system is interesting—(1) as showing the beginnings of a movement from the two great centres of population in Asia, the dimensions of which cannot be foreseen; and (2) as an instance of non-economic considerations inducing state interference with private enterprise, for the protection of labour against the individual's ignorance of the value of his labour and his acceptance of a standard of living determined by the offers of competing capitalists.

[*Gornhill Magazine*, 1867.—Jenkins, *The Coolie*, London, 1871, an adverse report.—Histories of the colonies above mentioned.] A. C.

COOPER, THOMAS (1759-1840), was born in London and admitted to the bar, became a Radical, was involved in political troubles, and finally followed his friend Priestley to the United States, where again he took an active part in political affairs. In 1820 he became president of Columbia College in Columbia, South Carolina, and held that place till 1834.

In addition to pamphlets, he wrote *Lectures on the Elements of Political Economy*, Columbia, 1826, and a *Manual of Political Economy* (Washington, 1834), both good text-books in their day, expounding the doctrines of Adam Smith and Ricardo. F. W. T.

COOPER, THOMAS (1805-1892) imprisoned in early life as a chartist (see CHARTISM), was among the last survivors, as he had been one of the most sincere of the leaders in that movement.

CO-OPERATION

Co-operative Associations, p. 409; Co-operative Farming, p. 413; Co-operative Workshops, p. 415; Co-operation, Partial (Oldham Cotton Spinning Companies), p. 417; Co-operation, Social Aspects of, p. 418.

CO-OPERATIVE ASSOCIATIONS. The term co-operation has been employed by economists in two senses, (a) as indicating certain broadly marked phenomena connected with the automatic development of human communities, of which what is most widely known as division of labour is an instance; and (b) as indicating the deliberate association of individuals to form trading bodies on certain specific principles for their common advantage. The latter use of the term is the more common of the two, outside text books on economics.

(a) The simplest conceivable case of co-operation is when two men combine to move a weight too heavy for either to deal with singly. In this case two similar forces are integrated. Co-operation of this kind is only of limited application, for the number of men whose power can be brought to bear on even a large object at suitable points is comparatively small, unless some form of machinery is used. But the labour of men may also be combined by their performing different tasks simultaneously, in order to produce a joint result, and as soon as this is recognised the growth and organisation of the community become capable of much more rapid progress than before. A maker of bows can do his work without assistance, but his labour will be more efficient if he can send out some one to collect suitable pieces of wood for him. A skilful smith could, at a pinch, make a simple bit of ironwork by his own unaided exertions, but his trouble is enormously lightened if he has an assistant to blow his bellows. The case of the smith is typical of all operations which require two or more series of acts to be performed more or less simultaneously—in this case, blowing to keep the fire hot, and hammering. If the piece of ironwork to be executed is at all large, an assistant becomes indispensable. The thing could not be done at all without him. Supposing he gets a third man to sharpen or polish such articles as he and his companion have been making, the efficiency of the whole group is much increased. The constitution of this group of artificers illustrates the principle of division of labour, as Adam Smith called it. Modern economists have adopted the more accurate expression division of employment, but Smith's description of the principle as illustrated in pin-making is still the classical description in the English language (see *Wealth of Nations*, bk. i. ch. i.), though he left it to his successors, e.g. Babbage, to point out some of the most important advantages of the division of labour.

What is called civilised society has only

become possible because this principle of division of employment has been carried out to the full extent admitted of by the progress of scientific knowledge. For an analysis of the reasons why it has so greatly increased the efficiency of labour, reference may be made to Mill, bk. i. ch. viii.; Sidgwick, bk. i. ch. iv.; Marshall's *Economics of Industry*, bk. i. ch. vii. viii. (see DIVISION OF LABOUR). Division of employment implies, however, specialisation of employment, a result which is not without disadvantages. When there exist large bodies of men who can only perform some special kind of skilled labour, portions of these bodies are from time to time in danger of becoming redundant, and consequently of losing their means of subsistence. This evil result may be produced by climatic influences, by a miscalculation as to the requirements of the community, or in modern times of the communities supplied, by changes of fashion, or by new inventions. The latter cause is much less injurious to the men than it used to be, as the process of improvement, though constant, is only gradual. The violent disturbance of the labour market which followed the first introduction of steam machinery and of the factory system is not likely to occur again. The other three causes are still active and produce serious effects. It is to be observed that specialisation of employment is, from the nature of the work to be done, much less extensively carried out in agriculture than in manufacturing.

The mode in which the co-operation of individuals in modern society occurs presents other aspects besides division or specialisation of employment. It is marked, as is well known, by the association of larger and larger bodies of men acting under a single firm or company. Provided the management is good a large business can be conducted more economically than a small one,—that is, the labour of those concerned is more efficient in the former than in the latter case. Of late years this tendency has taken the form of the amalgamation under one management of several works engaged in producing the same article. Another very important feature of the modern conditions of industrial life is the high degree of dependence of each industry for its prosperity on the prosperity of other industries. Any influence tending to increase the activity of one trade tends to make several other trades more active, and generally the efficiency of labour in all trades is increased to some extent. Conversely depression in one trade produces depression in others. A high degree of economic efficiency arising from a high degree of industrial organisation necessarily carries with it a liability to frequent derangement of that organisation, the parts forming the industrial organism becoming more mutually dependent in proportion as differentiation is carried further.

(b) Co-operation in the sense of an association of individuals for certain specific business purposes is of two kinds: associations of consumers, and associations of producers.

Associations of consumers arose from the desire of individuals in the possession of small incomes to obtain the commodities they require for daily use at wholesale prices. In 1844 twenty-eight workmen of Rochdale subscribed a fund to be used in the purchase of flour, sugar, and other articles, which were bought retail by the subscribers at the ordinary prices of the district, the excess realised being periodically divided among the members after all costs had been met. The experiment was thoroughly successful and has been widely imitated. Shops worked on this principle are now well known as co-operative stores. Those carried on by workmen, which are now very numerous, have in some cases adhered to the lines on which they were started, which included the division of part of the profits among the persons employed in the store, and the setting aside of another part for educational purposes, but in some cases these latter practices have been dropped, the whole surplus being divided among the members of the store. The encouragement to thrift has been very great. The profits being at the disposal of the members only at fixed intervals, and in appreciably large amounts, are less likely to be dissipated. The stores also afford direct facilities for investment. As a working man co-operator said, "We may almost eat and drink ourselves into a house." The enormous institutions started in London by members of the middle classes have been highly successful, but are not co-operative in the special sense in which the word is used by those to whom "co-operation" is a species of religion. These great stores sell their goods at the lowest price they can, which is, of course, an excellent thing, and just what is wanted by the classes for whose benefit these stores are intended, but the persons employed in them have no share in the profits. The consumers, as such, have no share in the profits. It is this feature in their organisation which leads "co-operators" in the more special sense of the term, to deny that these stores are truly co-operative. Useful as they are they are less interesting to the economist than the real co-operative associations, from the growth of which great and salutary changes in the structure of society are looked for by those who are best acquainted with the subject. For information as to the magnitude of these quasi-co-operative associations, reference may be made to an article in *The Statist*, 2nd April 1892, from which it will be seen that, taking the five principal London societies, their sales were, in 1890, £5,766,000, and, in 1891, £5,495,000.

Co-operative Societies.—The associations which are conducted in the United Kingdom, either theoretically or in fact, on true co-opera-

tive principles, are of two kinds, distributive, and manufacturing. The origin of distributive societies has already been referred to, and it is not necessary to go at length into the history of the movement which, from such small beginnings, has achieved the remarkable results now apparent. Subjoined are three tables which will furnish a general idea of the present magnitude and the progress since 1861 of this movement, from which so much is hoped by thoughtful students of sociology. The figures, of which these tables are a condensation, will be found in full in the appendices to the report of the Central Co-operative Board to the Lincoln Congress, 1891. The report and appendices, together with the papers read at the Congress, are printed by the Co-operative Printing Society, Limited, 92 Corporation Street, Manchester.

The following is a statement of the number of co-operative societies existing in the United Kingdom at the end of 1890, and of certain particulars regarding their business; arranged (A) with reference to geographical divisions; (B) according to the special functions they perform.

A

Sections.	No. of Societies.	No. of Members.	Share Capital.

It will be at once seen from a glance at the totals given in these tables that, taken as a whole, the societies to which they refer are in a highly satisfactory condition. The net profit of £4,170,000 shown at the end of 1890 is very large relatively to the share capital, and the investments amounted at that time to over £6,290,000. The value of stock, land, buildings, etc. was, we may observe, over £10,760,000, and with these substantial assets available as cover, it is not surprising that the societies should be in sufficiently good credit to have been able to borrow, to a moderate extent, the amount of their loan capital at the end of 1888, being over £2,800,000. This is a modest commencement of the process by which it is hoped that in the end "labour will hire capital," and not capital labour.

Table A shows plainly where the strength of the movement lies, namely in the northern and north-western districts of England and in Scotland. Manchester is, indeed, the headquarters of co-operation, for it is there that the English Wholesale Society, which is commonly called "The Wholesale," has its chief office; but the great societies of Rochdale, Leeds, Halifax, Huddersfield, Burnley, Accrington, Bolton, and Bradford each contribute a very large quota to the total business done. In the midland, southern, and western districts co-operation is very imperfectly developed, but great, and to a large extent successful, efforts are being made to improve matters in this respect, especially in London.

Turning to Table B, the fact which will attract most attention is the small volume of

co-operative production,—meaning by co-operative production, in the full sense, a system in which the wage-earners, as such, share in the profits. This feature is a source of keen regret and disappointment to zealous co-operators. The report of the Committee on Production to the Ipswich Congress, 1889, was in many respects hopeful, and some progress has been made since then, but the obstacles to success in this department of co-operation are, and always have been, much greater than in the distributive department. The difficulty which impressed the Ipswich committee most was to get productive societies to abstain from competing with each other, as will be seen from the following extracts from their report: "As we have before stated in our reports, we have to admit that in the multiplication of these very small societies, each struggling for a separate life, there is the possibility of great difficulty in the future. We have to regret that our attempts to bring these societies into federation with each other have entirely failed, owing in a great measure to petty jealousies which seem inseparable from such associations. In the view of this committee it is a matter for serious consideration how far the formation of these small and isolated societies should be encouraged, unless there is some guarantee that they will act in co-operation with each other." And in concluding the report, the committee observe, "that there still exists among co-operative societies and their members a deplorable amount of disloyalty towards the efforts of those societies which are honestly striving to work out this difficult problem of co-operative production." These severe expressions are quoted partly in order to explain the comparative failure of productive co-operation up to the present time, and partly to show that the leaders of the co-operative movement are men who look facts in the face, and do not seek to disguise them under a cloud of words. This is an attitude of mind which is favourable to the ultimate success of the movement. It might almost be said that it is a guarantee of it, for the principle of productive co-operation is a sound one, though its practice requires the prevalence of a higher level of education, both moral and mental, than at present exists in the majority of co-operators. That a greater approximation towards the principle is possible may perhaps be inferred from the fact that, besides the Wholesale's boot and shoe works at Leicester, there are six corn-milling societies, each of which sold over £100,000 of goods in 1888, while one of these, the Sowerby Bridge Flour Mills, sold over £173,000 worth, and had £52,000 of investments at the end of 1890. It may be observed that the co-operative flour mills appear to be more successful than most other branches of co-operative industry. Co-operative farming has so far answered less well in the United

Kingdom (see CO-OPERATIVE FARMING), though something in this direction has been done in Scotland, and butter-making on the co-operative plan has been commenced in Ireland through the exertions of Canon Bagot and the Hon. H. C. Plunkett. As will be seen below, co-operative farming is far from being a failure on the continent.

It has already been said that co-operative manufacturing encounters much greater difficulties than co-operative distribution. The nature of the difficulties has been described as they present themselves practically to the able and energetic men who are trying year by year to overcome them. They can only be got rid of by degrees, for they are the result of the low state of general education. Professor Marshall has pointed out in *The Economics of Industry*, and also in his address to the Ipswich Congress (1889), that higher mental qualities are needed for carrying on a large manufacturing concern than in conducting a successful shop. At present workmen have not realised that good management must be paid for and is worth paying for (compare Walker, *The Wages Question*, ch. xv., *Co-operation: getting rid of the entrepreneur*). Their attitude in regard to this subject is well shown by the remark of a workman county councillor, that "he had never seen a man who was worth more than £500 a year." It is not suggested that managers of co-operative societies ought to be paid at this or any other specific rate in all cases, but until workmen generally realise that there are men whose worth for special purposes is, in the present state of society, £500, and even more than £5000 per annum, they will never understand why co-operative manufacturing fails to succeed in competing with its capitalist rivals. Still the obvious success of the Sowerby Bridge Flour Mills is evidence that in one branch of trade, at any rate, co-operators can adapt themselves to the industrial requirements of the time if they take the proper means.

The plain fact is that co-operative manufacturing is still in the experimental stage. A most interesting discussion on the question whether small productive societies should be encouraged to continue to work independently of the Wholesale, or whether the Wholesale should undertake the work itself, took place at the Ipswich Congress, and was reported fully in the *Co-operative News* of 22nd June 1889. The discussion ostensibly related to the best means of establishing PROFIT-SHARING (*q.v.*) in production, and the chief charge brought against the Wholesale was that it did not share profits with its workers, that, like some of the original societies, it had degenerated into "joint-stockism." The latter principle does not seem to be wholly approved even by the advocates of production by the Wholesale Society, but Mr. Benjamin Jones, of the Wholesale, in the course

of a paper read to the congress, pointed out that at Oldham, where many mills are owned by workmen, "joint-stockism" had led to the same results as "profit-sharing" was intended to lead to by making workmen well off. The whole discussion, which ended in the approval by the congress of production carried on by societies independent of the Wholesale, but "federalised," was a very business-like one, and is likely to encourage those who hope that eventually co-operators will discover the right path towards "profit-sharing production," though at present differences of opinion exist on the subject, which were alluded to by Mr. A. H. D. Acland, M.P., in his Inaugural Address to the Lincoln Congress. Mr. Acland, it may be observed, seems to think that it is mainly to the two Wholesale Societies that co-operators must look for progress in this direction, although they have, so far, been rather slow in taking up the position which is expected of them. There are, of course, numerous differences of opinion on minor technical points in relation to distributive co-operation, the most important of which is the question how far credit should be allowed to members of stores. The balance of opinion is, it need hardly be said, against the giving of credit.

Co-operation abroad can only be briefly touched on here. A good deal of valuable information on the subject will be found in a paper by Mr. Vaughan Nash on "Co-operation in relation to International Commerce," read before the Ipswich Congress. Mr. Nash had a special object in writing this paper, namely, to urge on co-operators in different countries the advantage that would result from their working together more than at present, but it furnished a useful *résumé* of the position of co-operation in foreign countries in 1888, which, with slight changes, may be accepted as correctly describing the state of things now. In two important respects these countries are in a decidedly more advanced condition than the United Kingdom, namely, in regard to agriculture and banking. In France, Austria, Germany, Denmark, Italy, Switzerland, and Sweden, there exist powerful organisations of peasant proprietors for the joint purchase or hire of farming implements and other requirements, for acquiring and working dairies, for the joint sale of produce and for obtaining credit. Apparently Denmark possesses a most highly organised system of agricultural co-operation, and it is owing to this that the export of Danish butter has so much increased of late. Co-operative dairies seem to succeed in most countries, including the United States, where "creameries" are an important feature. There can be little doubt that the system of popular banks with which the name of Schulze-Delitsch is associated has been of great service to agricultural co-operation in Germany, and a modification of the same plan

devised by Signor Luzzati has been introduced into Italy with success (*v. BANKS, POPULAR*). These loan societies are closely connected with the farming societies, being in fact chiefly composed of the same individuals. They contract loans on the guarantee of all the members and make advances to members at a slightly higher rate than that at which they borrow, but still much below the terms at which the individual members could raise money themselves. As regards the joint sale of agricultural produce the system is less developed than in other respects, and, generally, distributive co-operation is too much neglected on the continent, except in Switzerland and Holland, and to some extent in Belgium. As is well known, there are some important co-operative workshops in France, the most famous being those with which the names of Godin at Guise and Leclaire at Paris are associated (*v. CITÉ OUVRIÈRE; FAMILISTÈRE*). These two experiments in profit-sharing have realised a remarkable degree of success in the past, and although they have both lately suffered the loss of their founders, there is every reason to expect that they will continue prosperous in the future. It had always been feared, even by friends of co-operation, that such institutions were dependent on the lives of the individuals who started them, but so far these unfavourable anticipations have been agreeably disappointed.

"Russia," says Mr. Nash, "is by far the most co-operative country in Europe, but its village communities, or *mir*s, are beginning to show signs of dissolution, and its *artels*, being nomadic and shifting, have but little bearing on the question of international co-operation." The ARTEL (*q.v.*) is a species of workmen's society which is found in all branches of industry in Russia, the members of which jointly execute pieces of work, especially buildings, railways, and bridges.

As regards the United States, we have already mentioned the existence of creameries as the most important feature from a co-operative point of view, but there are also some co-operative workshops. There were also many co-operative stores before the Civil War, but their progress since then has been very slow. In the British colonies there is very little co-operation of any kind.

W. H.

CO-OPERATIVE FARMING. The application of co-operation to agriculture was one of the earliest aims of the founders of co-operation, and formed a part of almost all the plans of Robert Owen and his followers. The best known experiment in the pioneer period was that of Rathlahine (sometimes called Ralahine), in County Clare, Ireland, in 1831-33. Mr. E. T. Craig, a disciple of Robert Owen, was invited by Mr. J. Scott Vandeleur, an Irish landlord, to form a society based on the co-partnership of landlord and tenant.

The farm was 618 acres in extent, half of it under tillage. The labourers at the outset numbered twenty-eight men, twelve women, and fifty-two children. Subsequent admissions to membership were by ballot. Mr. Vandeleur, the landlord, was president and reserved to himself a power of veto, as well as the right to discharge labourers during the first year. He also stipulated for the exclusion of intoxicants. The labourers elected a committee who met nightly to arrange the farm work. At the year's end the landlord received his rent of £900 in kind, taking the risks of variations in value. The rest of the produce, which was not consumed by the members and charged to them, was sold for common account. The first profits were appropriated to enhancing wages twenty and twenty-five per cent. The surplus beyond was devoted to a fund to pay out the landlord. The experiment was successful commercially. It also restored peace on the estate and established harmony in the relations of the landlord and his people. But it was brought to a sudden end in 1833 by the flight of Mr. Vandeleur, who had ruined himself by gambling (see *Co-operative Agriculture* by Wm. Pare, Longmans, 1870; and *History of Ralahine*, by E. T. Craig; Trübner and Co., 1882). About the same time, 1829, Mr. Wm. Gurdon leased a farm at Assington, Suffolk, to a body of his labourers who formed themselves into a voluntary co-operative society, based on a plan of dividing equally the produce of the farm. He lent them capital without interest. The experiment was very successful, the labourers repaying the loan capital and making large profits for themselves. This success led to the leasing of a second farm to labourers in 1853, to be worked on the same lines. This also was very successful, yielding a profit to the labourers of £3674 up to 1879. In 1883 the association had to ask for help from outside sympathisers, in consequence of continued agricultural depression. The land being stiff clay, almost all under tillage, is suitable for little else but wheat-growing, and the co-operative labourers were unable to make a profit on wheat-growing after 1879. In 1884 a co-operative society was formed to continue the farm, the labourers' capital being augmented by subscriptions of co-operative societies and friends. This new society, the Assington Agricultural Association, at present shows an annual loss of about £1 per acre. The No. 1 farm established in 1829 is still being worked by the labourers' society, but no accounts are published.

In 1829 Lord Wallscourt commenced an Irish experiment, and reported in 1846 that, after seventeen years' trial, the venture had answered beyond his hopes; he had been able to travel abroad a year at a time, and on his return always found the farm had prospered.

He divided profits with his labourers, reckoning every £5 of their wages as being equal to £100 of his own capital. (See Professor F. W. Newman's *Lectures on Political Economy*, p. 338, Chapman, 1851).

After the pioneer periods of Robert Owen and the Christian socialists, the co-operative movement, advancing on the line of least resistance, left farming experiments—as it left productive efforts—almost neglected, and attended almost exclusively to the development of the simple stores system. But from time to time, during the thirty years which followed the establishment of the Rochdale Pioneers Society in 1844, co-operative farming experiments were made by advanced co-operators. Mr. Walter Morrison, M.P., established a co-operative farm in the Midlands, giving the labourers a share in the profits and management. The experiment was partially successful, paying five per cent interest, but in other respects was not considered sufficiently hopeful to render it worth while to persevere. Lord George Manners adopted profit-sharing with his labourers upon a farm at Cheveley, Newmarket. He told the writer of this article that the experiment was so successful as to yield him ten per cent on his capital, and permit of £3 per worker being paid as dividend on labour. To stimulate thrift Lord G. Manners adopted the plan of paying the labourers' dividends into the post office savings bank, and “handing the pass-books to their wives”—a device which he said answered perfectly. It was his intention to form a more complete co-operative society to work the farm, but his death brought this interesting and successful effort to a close. More recently Mr. Bolton King established two co-operative farms at his residence near Leamington. The rules were very generous to the labourers, leaving them with full powers over both the land and the landlord's capital, without the checks which in other cases have naturally been provided. The result was not successful. Equally unsuccessful was an attempt by Mr. William Lawson at Aspatria near Carlisle, described by him in a work called *Five Years of Gentleman Farming*, edited by G. J. Holyoake. Mr. William Lawson, a brother of Sir Wilfrid Lawson, gave time and money freely to his effort, but he adopted methods of farming which were condemned as impracticable by the Royal Agricultural Society's Commissioners on steam ploughing, and the failure can scarcely therefore be imputed to the co-operative arrangements (vide *Journal of the Royal Agricultural Society of England*).

Recently the opinion in favour of co-operative farming has received a great impetus, and many co-operative societies have taken farms to work as part of their enterprise. The report of the Central Co-operative Board for 1891 gives the following list of known co-operative farms:

Name of Society.	County.	Average.	Capital.	Rent.	Profit in 1890.	Loss in 1890.
		Acres.	£	£	£	£
Derby . . .	Derby . . .	26	78	78		
Lincoln . . .	Lincoln . . .	11½	700	34

Halifax	Yorks	48	318	175	21	
Lancaster . . .	Lancs	100	1500	190		
Manchester and Salford	”	370	4000	600		646
Mirfield	Yorks	15	80	45		
Pendleton . . .	Lancs	86	250	73		18
Plymouth	Devon	103	1200	280		25
North Seaton . .	Northumb'd . . .	30	302		48	
Scottish Farming	Renfrew	282	3362		480	
Assington . . .	Suffolk	223	3127	211		351

The three last on the list are farms worked by separate farming societies, all the others are farms attached to stores. The large amount of capital invested is due to the freeholds having been frequently bought by co-operative societies as investments for their surplus capital. The list is evidently incomplete. It omits entirely the market-garden farm of the Woolwich Arsenal Co-operative Society, near London, which has become a remarkable success in spite of the land having cost building price at the outset. This farm, of about fifty acres, has been arranged to grow a great variety of vegetables, fruit, and flowers, nearly the whole of which is sold through the stores to the workmen in the Arsenal who are the members of the store. A safe and sure market for the produce is thus secured. Five per cent interest is paid on capital, the customers receive an average drawback of 1s. 9d. in the £ on their purchases, and the labourers a similar dividend on their wages.

Of the separate societies, the Scottish Farming Society is the most successful. Since the annual report above quoted was issued this society has decided to take three additional farms in the neighbourhood of Hurlitt in Renfrewshire. The first venture was a dairy farm in the neighbourhood of Glasgow, and the produce was sold through one of the stores.

Simultaneously with this development of farming enterprise inside the co-operative movement, a considerable number of profit-sharing and co-operative experiments are being set on foot by landowners and farmers, like Earl Spencer, Mr. Boyd Kinnear, and Lord Wantage. The latter is stated to have taken 20,000 acres of land into his own hands and adopted a plan of working it upon a system of association with

the labourers which last year paid him good interest and yielded them about £2 each of dividend on labour. The results were recently described in glowing terms by the *Daily News* commissioner, whose letters have been published in book form (see *Life in our Villages*, Cassell and Co., 1891). In part iv. of volume ii. 3rd series of the *Journal of the Royal Agricultural Society* (31st December 1891) Mr. Albert Grey reports a most successful effort at co-operative farming carried out by him in Northumberland, on the large scale of 3765 acres, of which 1290 are permanent pasture and 2475 arable. In 1886 he commenced on the Home Farm at Hawick, and in the next four years was able to pay the labourers three annual bonuses of 6d. in the £ on their wages. The same year he applied the profit-sharing plan to the East Learmonth farm of 821 acres, of which all is arable but 122 acres. In the case of this farm the outgoing tenant had refused to continue his tenancy unless he were allowed a reduction of 20 per cent in his rent. Mr. Grey has been able to earn the old rent under the profit-sharing arrangement and also interest on capital. In addition he has paid the labourers three annual bonuses, viz. one of 1s. in the £, one of 1s. 1½d., and one of 1s. 3d. Mr. Grey adopts the formula for division of profits carried out by M. Godin of Guise in his celebrated co-operative workshops (see *CITÉ OUVRIÈRE*). Interest on capital ranks as equivalent to wages of labour for a *pro rata* division of profits (see *Co-operative Traveller Abroad*, Labour Association, London, 1888). On the additional area of land which Mr. Grey placed under the profit-sharing system in 1888, he is sanguine of making a profit, and his whole paper is filled with interesting details of economies effected and improvements obtained by the reconciliation of interests of employer, managers, and labourers. It is evident that the time is ripe for the application of co-operation to farming, and it only requires the evidence of a few successes on a considerable scale to bring about a great extension of the movement. E. O. G.

CO-OPERATIVE WORKSHOPS. In the article on **CO-OPERATIVE ASSOCIATIONS** the general fact is stated that productive co-operation has developed much more slowly than distributive co-operation. A quarter of a century ago the failures of co-operative workshops were so numerous that many writers held that co-operation had been proved to be inapplicable to manufacturing. Professor Beesly, in a pamphlet on *The Social Future of the Working Class* (Reeves and Turner), 1868, stated: "I believe there is not in England at the present moment a single co-operative society in which workmen divide the profits irrespective of their being shareholders," and he concluded that "we must look for improvement not to this or that new-fangled industrial system, but to the creation

of a moral and religious influence which may bend all in obedience to duty. When we have created such an influence we shall find that it will act more certainly and effectually on a small body of capitalists than it would on a loose multitudinous mob of co-operative shareholders." So far as this was a statement of facts it was too sweeping. Mr. J. S. Mill, Professor Fawcett, and other economists could see even then some favourable features in the struggling experimental attempts at workshop co-operation. Upon these and upon confidence in general principles they based very hopeful forecasts of the future, and the latest facts and figures seem to justify their views.

Comparing the returns issued by the Co-operative Union for 1890 with those issued for 1889, the following figures show that progress is becoming more rapid as the feeling grows that the initial difficulties have been overcome:—

	1889.	1890.
Number of Co-operative Workshops	106	111
Number of Members	25,728	26,925
Share Capital	£714,189	£766,425
Loan Capital	£274,784	£319,558
Reserve Funds	£28,469	£36,175
Total Funds	£1,017,442	£1,122,158
Sales	£2,308,028	£2,606,707
Profits	£118,355	£132,753
Losses	£5,581	£442
Net Gain	£112,774	£132,311

If a comparison is made between the latest figures for 1890 and those for 1888, it will be found that the percentages of increase in two years have been as follows—in number of workshops, 38·75 per cent; in members, 14·80 per cent; in share capital, 40·64 per cent; in business, 51·14 per cent; and in profits, 100·14 per cent. These figures show that whilst there has been a great increase of new societies (possessing of course fewer members than the older ones), the established societies have increased their capital, and have even more rapidly gained in trade and in the power to make profits. If a further comparison is made of the recent growth of the co-operative workshops as compared with the growth of the co-operative movement generally, it will be seen that it is the productive side of co-operation which is now growing most rapidly and is probably absorbing the most energetic and capable co-operators. The following were the percentages of increase of the co-operative movement in 1890 over 1888—in number of societies, 3·48 per cent; in members, 12·55 per cent; in share capital, 17·97 per cent; in business, 17·59 per cent; and in profits, 22·13 per cent.

Two kinds of workshops are included in the figures quoted above from the annual returns of the Co-operative Union, viz. workshops which divide their profits only between capital and custom, and workshops which admit labour also into partnership. Repeated resolutions have

been passed by large majorities of delegates at annual co-operative congresses affirming that the true principle of co-operation in production requires the co-partnership of labour. But the Central Co-operative Board, which is the executive of the movement, is reluctant to exclude from recognition the large workshops which belong to the Co-operative Wholesale Society, and those corn mills belonging to stores which violate the principle laid down by congress. The burning question of the movement is at present this one of whether the inclusion of the worker to share in profits and management is essential or not. As the promoters of industrial co-operation are generally agreed that nothing short of the partnership of labour with capital will finally reconcile the two interests and end conflict, public interest naturally centres most around the workshops in which co-partnership exists. According to the annual reports and other publications of the Labour Association (of No. 1 Norfolk Street, Strand, London) the co-operative workshops which recognise the principle of profit-sharing with labour now number seventy-six or seventy-seven, and are therefore in a majority. Eight or nine of them have been in existence over twenty years, but the majority having been established during the last six years, the average duration of all the self-governing workshops is about nine years. They are established in almost all parts of the kingdom and in about forty different trades. The number of workers employed is between four thousand and five thousand. The Labour Association, which devotes itself especially to the establishment and welfare of these profit-sharing societies, holds an annual exhibition of their productions at the Crystal Palace, and the goods shown are said to be very excellent and tasteful. The practicability of successful manufacturing on co-partnership lines may therefore be considered to be established. It remains to be considered how far these workshops answer other expectations formed of them by friendly political economists.

The absence of strikes seems to be satisfactorily assured. Where strikes have been made public in connection with "co-operative" workshops they have been in factories which exclude the workers from participation. Only one small conflict is known to have occurred at a profit-sharing workshop, and that was promptly settled.

The amelioration of the social position of the workers cannot be wholly stated in figures. The addition to the wages in the shape of "bonus" or "dividend on labour" varies very greatly, but appears to average $11\frac{1}{2}$ d. in the £, or rather under 5 per cent on wages. But only a portion of the effect of profit-sharing can be seen in this item. It is stated by Mr. Joseph Greenwood, the manager of the Hebden Bridge Fustian Manufacturing Society in York-

shire, that whilst profit-sharing with them adds only 9d. in the £ to wages, the average income of their workers (men, women, and children) has been increased in twenty years from about 12s. 6d. per week up to over 17s. per week, the chief increase being due to regularity of employment and saving of lost time. Fustian cutting was originally a sweated industry, but the society at Hebden Bridge now employs 272 workers, all of whom are shareholders. They own £5130 of the capital stock, which amounts in all to £22,332. That the condition of these workers must have been greatly improved beyond the amount of "bonus" distributed is evident from the fact that the latter has only totalled from £1500 to £2000, or about one-third of the sums invested by the workers in their society. The Labour Association, moreover, adds that the societies which have been formed during the six years it has been at work have almost all been induced to adopt rules which make provision for many excellent common funds. Thus the Leicester Co-operative Boot and Shoe Manufacturing Society when recently dividing £240 of surplus profits (for a quarter-year) apportioned the sum thus: to reserve £40; to the workers ($10\frac{1}{2}$ d. in the £ on wages), £80; to the committee (who are nearly all workers in the factory), £24; to the educational fund, £10; to the provident fund, £20; to the special service fund for rewarding inventions and economies, £6; to capital (in addition to 5 per cent), £20; to customers ($2\frac{3}{4}$ d. in the £ on purchases), £40. In this case the $10\frac{1}{2}$ d. "dividend on wages" formed but a third portion of the whole benefits.

The increase in the productiveness of labour under co-partnership rules seems very clear. The Agricultural and Horticultural Association commenced three to four years ago to manufacture oilcake for cattle, putting down machinery calculated to produce 35 tons per week and subsequently adding other machinery calculated to produce 60 tons per week. At first the new employes, unfamiliar with the profit-sharing system of the Association, only produced 21 to 26 tons off the first machinery and about 48 tons off the second. But, under the stimulus of "bonus," the first set of machinery now produces 57 tons per week and the second set produces about 76 tons per week. The difference in output converted a loss into a profit for the Association, whilst the average remuneration of the workers (men and youths) has gone up from £1:0:7 per week to £1:6:8.

The result upon the position of capital in these workshops has been to substitute a safe and steady reasonable dividend for a higher but fluctuating one. As the societies attain success they decrease the dividends on capital instead of increasing them. Several leading workshops have recently done so, including the Hebden Bridge Fustian, Leicester Hosiery,

Manchester Printing, Edinburgh Printing, and Paisley Shawl Manufacturing. The majority of shareholders, being customers and workers, attach most importance to the dividends on custom and on wages, and decrease the dividend or interest on capital to increase these. But this does not appear to check the inflow of investments, as the dividend or interest on capital is a first charge on the whole profits. These being swelled by the stimulus given to custom and zeal of the workers, the dividend on capital assumes almost the safe position of a first mortgage, and 5 per cent is found amply sufficient to attract funds.

E. O. G.

CO-OPERATION, PARTIAL (OLDHAM COTTON-SPINNING COMPANIES). The term "partial co-operation" is applied by Prof. Marshall (*Principles of Economics*, vol. i. p. 364, 2nd edition) to such partial applications of the co-operative principle to production as (a) profit- or profit-and-loss sharing (see PROFIT-SHARING), (b) the Leicester boot works and other similar productive establishments owned by the main body of co-operative stores through their agents the wholesale (see CO-OPERATION and CO-OPERATIVE WORKSHOPS), and (c) certain joint-stock cotton-spinning companies in Oldham and its neighbourhood. These last are owned by combinations of small capitalists, among whom are many workpeople with a special knowledge of the cotton industry, though few of the companies' employés can describe themselves as "their own masters." It is customary, but incorrect, to call these concerns "co-operative mills," and to say that many of them are owned by the working classes. It is, however, true that the foundation of a number of the Oldham "Limiteds" was due to an attempt by working men to apply the co-operative principle to production. The early history of the Sun Mill Company is typical of the whole movement in its initial stages, and throws much light on the difficulties attending even a partial application of such a principle to a highly organised industry.

The "Oldham Building and Manufacturing Society," the first of its kind registered under the Joint-Stock Companies Act, was founded in 1858: capital £1000 in £5 shares. The promoters were members of the Oldham Industrial Co-operative Society. Calls on shares were to be 3d. weekly, and the directors were paid 6d. a week for their services. Several months elapsed before all the shares were taken up, and a longer delay occurred before the society's business, weaving, could begin. At the end of the first quarter's working, a dividend of 7½ per cent was paid, but afterwards the looms were run at a loss. The difficulty of disposing of the manufactured goods, disputes among the directors, and between the shareholders and non-shareholders employed by the company, and above all the unsuitability of the climate for

weaving led to this result. It became necessary to make a radical change in the scheme, and accordingly the promoters decided to increase the capital to £14,870, and build premises for cotton-carding and spinning. The engines were "christened" in 1863, and under the new name of the "Sun Mill Company," business was carried on through the period of the Cotton Famine (see COTTON FAMINE) eventually with considerable profit. But, in 1867, Mr. Gladstone, visiting Oldham, was officially informed that out of more than a thousand shareholders, only four were also the company's employés, and that it was difficult to persuade workpeople to buy shares. In 1868, in order to ensure loyalty to the company's interests on the part of its principal servants, their salaries were reduced, and instead a bonus—a percentage,—was given on all profits over 10 per cent on the capital. The directors at one time desired to extend this system of profit-sharing to the operatives, but were strenuously opposed by the principal servants, and eventually, as the bonus was found not to have the desired effect, the directors went back to the old arrangement of fixed salaries. Since then the history of the concern, which in its early years had shown "much experimental enterprise but a want of judgment as to consequences," chiefly deals with the struggles of a young business to extend its connection. During the twenty years 1858-1877 £8:10s. was paid in dividends on the £5 share.

[*The Sun Mill Company, Limited; its commercial and social history*, by William Marcroft, Oldham, 1877. The same writer, in a pamphlet entitled *A Co-operative Village*, and published at Oldham in 1878, propounds a scheme of partial co-operation by which a small settlement could attain a kind of "industrial independence."]

It was hoped that the Limited Liability Act (see LIMITED LIABILITY ACTS) would encourage the labouring classes to invest their savings in manufacturing ventures; in Oldham and its neighbourhood the example set by the promoters of the Sun Mill Company was in several cases followed by working men. But the movement soon passed out of their hands, and losing its co-operative aspect, degenerated into a system of company promoting by outside speculators. Owing to the presence of great machinery works in the town a factory could be built there and fitted up with the newest machinery at the smallest possible cost. As a rule the buildings were mere "shells," so arranged as to hold mules with a very large number of spindles. During the fifteen years after the passing of the above-mentioned act the total number of spindles in Oldham, then as now the headquarters of cotton-spinning, was nearly doubled. In 1886, according to the official list, seventy-seven mills (average age nine years) contained 5,166,922

spindles, whose balance-sheet value was over five million pounds; at present there are more than a hundred, whose shares are quoted in the official list. The majority have at one time or other paid very large dividends.

Of late the Oldham "Limiteds" (see Mr. Albert Simpson's "statement respecting the Cotton Mills of Oldham, and the working of the Limited Liability Act in connection with them," handed in to the Labour Commission, group C, 10th July 1891) have been charged with omitting to write off enough per annum for depreciation, so that their large dividends are, in part at least, paid out of capital. In many cases there is evidence to warrant such a criticism; out of a hundred and ten concerns the shares of sixty-seven, many of which pay large dividends, are at a discount. The appointment of government auditors under the Limited Liability Act has been suggested as a remedy.

Again, it is certain that "divi-hunting" has forced many of them into rash speculation, and led to a serious loss of financial vitality. During 1890, to defeat attempts to "corner" cotton at Liverpool, many of their "buyers" bought cotton "to arrive" throughout the year; and, as a consequence of the sharp fall in 1891, the legitimate profits of cotton-spinning were swallowed up by the losses due to cotton speculation. Workpeople are not disposed to risk their savings in this manner, and though, in the case of the older and more stable concerns, conducting their business on sound principles, and setting aside a yearly sum to pay for renewal of machinery, etc., a small percentage of the shareholders are retired workmen, and a few even employés of the company in which they hold shares, generally speaking, the Oldham "Limiteds" are not even "partially co-operative."

E. B. O.

SOCIAL ASPECTS OF CO-OPERATION. The statistical information conveyed in the official reports of the Registrar of Friendly Societies and of the United Board of the Co-operative Union, whilst it furnishes very complete particulars as to the financial side of the co-operative movement, affords no sufficient criterion as to the social side. That provision is made for the social and educational development of co-operators may, however, be gleaned from those sources. Thus in the year 1889 the sum of £23,893 is stated to have been applied by co-operative societies to educational purposes, whilst the sum of £4824:17:3 was voted to the maintenance of the Co-operative Union, whose work is entirely of an educational character. The money spent upon education goes sometimes to lectures and classes, but more often to keep up reading-rooms and libraries, which in the northern counties are usually to be found in connection with the stores. Social gatherings and entertainments also come in for

a share of the educational grants. In addition to supporting university extension lectures in several centres, co-operators have founded two scholarships at Oxford, the Hughes and the Neale, to commemorate the services rendered to the movement by Mr. Thomas Hughes and Mr. E. Vansittart Neale. The development of the social side of the co-operative movement is promoted by an effective system of district and sectional organisation. Delegates are periodically brought together by this means to discuss the welfare of their movement, and much propagandist work is done. Once a year the Co-operative Congress is held, at which co-operators meet from all parts of the United Kingdom. "The annual congress is composed of delegates from societies in union, each society being entitled to send one delegate for each annual subscription of 1000 d. or fractional part thereof. Business of the congress: There is first the inaugural address, then the report of the Central Co-operative Board, the election of scrutineers, of the voting for the new central board, and the discussion of papers and proposals bearing on co-operation" (Acland and Jones, *Working Men Co-operators*, p. 111). Co-operators recognise that their business system depends largely upon the progress of mutual improvement amongst their members, and they are constantly urging that more attention should be paid to the special training of co-operators. "We regret to find that educational grants do not keep pace with the general growth of the societies. Our opinion is that it will pay every society to devote at least 2½ per cent of its net profits to education, and that though societies may and do succeed without this, yet it is because the older generation still lives and guides them, but when the day arrives that they no longer take part in their management, the societies will run a great risk of suffering thereby" (*Co-operative Wholesale Societies' Almanac, 1883*, quoted in *Working Men Co-operators*). It is, however, by the daily routine of co-operative transactions that the social life of the movement is chiefly fostered. To regard the mechanism of the movement as simply an adaptation of "shopping" is to completely misapprehend its character. Equally erroneous is the superficial estimate of the store system as a form of "joint-stockism." The store, it is true, contains the stock-in-trade of the shop, but its social significance lies in its being the centre of a consumer's league, the organised expression of a social standard of requirements. As a domestic dépôt or repository, the store has played an important part in the growth of neighbourly feeling. By affording opportunities for social thrift as well as consumption, it enters into the everyday economy of families connected with it, in many instances supplying the house itself, as well as the furniture, clothing, and food requirements of the inmates. The Women's

Guild recognises the influence of women in the co-operative movement, for though only established a few years, it has done much to educate them in the responsibilities of organised purchasing.

The constitution of the co-operative society is, after all, the best guarantee of its social character. If that constitution were of a merely joint-stock character, as is so commonly alleged by critics of co-operation, we should expect to find people going into the movement for the acquisition of shares, and using their position to enhance the value of, and increase the return upon, their holdings. This, however, does not happen. The shares in a store yield a stereotyped return of 5 per cent, sometimes less, and there is never a market, in the recognised sense of the term, for co-operative shares. When shares change hands they do so usually at par. The share list is never closed to new comers. "This open democracy of a million souls," to quote Miss Potter (*The Co-operative Movement in Great Britain*), is open to all comers. In its counsels the holder of the maximum allowed by law (£200) has just as much power as, and no more than the shareholder with two or three pounds. Thus we find none of the characteristics usually associated with the joint-stock system in co-operation. Instead of a trading concern in which the lion's share in the direction of the revenue goes to the large stockholder, the power is equally apportioned to all the members, and the dividend is proportioned to the use made of the store (dividend on Purchases).

Just as individuals have formed societies for distribution and saving on a mutual basis, so the societies themselves have united in order to perfect and consolidate the co-operative system.

The English Co-operative Wholesale Society, enrolled in 1863, has grown into an organisation of enormous power; the notable point in this connection, which is dealt with very fully in Miss Potter's book, being the social influence which this great federal institution, in common with its sister society in Scotland, has exerted. These federal institutions, while allowing free play to local activity, keep up a constant healthy circulation of ideas and commodities between the societies federated. Villagers and townsmen gather at the delegate meetings to transact the affairs of "the Wholesale." The best experience and information of the central institution is placed at the service of the most insignificant society. Just as the trade union and the friendly society have passed through the stages of scattered and isolated local effort into national associations, so has co-operation; and to the federal development of the movement may be ascribed much of the steady and uniform rise in the standard of requirements noticeable in the co-operative movement (see Miss Potter's book). Nowhere can this be more clearly per-

ceived than in those districts where the stores have remained outside the federal body. The county of Forfar, for instance, has held aloof almost entirely from the Scottish Wholesale Society, and inquiries made throughout the district show that co-operation has stood still in consequence during the past thirty years, each society in its own rut, whilst the standard of demand is lower than within the federation. The federal principle has been largely applied to the business of corn-milling, the price of bread in districts where co-operation is strong being frequently set by the joint agency of the mill and the store. It happens also, frequently, that instead of the store taking the current prices of the neighbourhood for its goods, it has come to set them for the district. Productive departments have been established on a large scale in connection with the two wholesale societies, and production is now carried on in many directions for use direct and not for profit, none of the commodities of the wholesales being sold outside the circle of the stores.

It is frequently stated in detraction of the co-operative movement that so far from being a social organisation it is mainly composed of self-seeking persons, devoid of public spirit, and intent upon personal acquisition. The advocates of co-operation do not, however, claim that their system is regenerative, though they maintain, as it would seem with reason, that the advantage of the individual can only be secured by the welfare of those associated with him. Seeing that the co-operative body now numbers a million associates, it would appear that a considerable number of those enrolled must contribute their quota of public work. Otherwise instead of continually increasing prosperity we should find corrupt and self-centred societies partaking of the propensities of members whose only thought was for themselves. But little inquiry is necessary to show that in this movement a large and increasing body of enthusiastic and efficient persons are continually devoting themselves to the furtherance of its principles. In no other movement is there so much hard and thankless voluntary work done for the love of the thing as in co-operation.

Not much can be said as to the social effects of profit-sharing industrial partnership. The theoretical treatises upon the question are quite valueless. In so far as the test of experience has been applied, it goes to show that under the factory system the worker is very slightly affected actually or subjectively by any profit-sharing schemes that have been tried in this country. The field of productive co-operation, in which the workers share in the management and profits, and of profit-sharing in which a proportion of profits is conferred upon the workers is, however, very limited. Some theorists hold that profit-sharing may be extended to workmen without loss to employers.

They argue that the efforts of workers being stimulated by the prospects of gain, an increment will accrue to profits, which if it be shared back again amongst those who contributed it, will result in no net loss. This view of profit-sharing has not, however, up to the present commended itself to workmen who, in this country, prefer to leave to their trade unions the business of adjusting with employers the remuneration of labour.

[See Acland and Jones, *Working Men Co-operators*.—Beatrice Potter, *The Co-operative Movement in Great Britain*.—*Annual Report of the Co-operative Union*.—*Annual Report of the Registrar of Friendly Societies*.—Sedley Taylor, *Profit Sharing*.]

V. N.

COPARCENERS. Persons to whom lands of inheritance descend jointly. For instance at common law, when an ancestor dies seised of land in fee simple or in fee tail, and his next heirs are two or more females, they will take an equal interest in the land. Under the custom of **GAVELKIND** (*q.v.*), which prevails in Kent, lands descend to all the males in equal degree. Coparceners take a distinct share in the land and can compel partition.

[Stephen's *Commentaries*, bk. ii. pt. 1.]

J. E. C. M.

The real property of a person dying intestate generally goes to one heir; but in some cases several persons are coheirs, and are then said to take as coparceners. This occurs (1) at common law when the persons entitled by descent are females (the rule of primogeniture applying to males only); (2) in the case of lands held under the custom of gavelkind, the males of the same degree of relationship (in so far as they are otherwise entitled) take as coparceners. There is no right of survivorship between coparceners—a circumstance which distinguishes the tenancy of coparceners from joint-tenancy (*cp. Joint-Ownership*).

E. S.

COPERNICUS, NICOLAUS (1473-1543). This great man has a place in the history of political economy in virtue of his tract *Monetae Cudendae Ratio*, written in 1526 by desire of Sigismund I., king of Poland, as a re-statement of the principles previously explained by the author at the Prussian Landtag of 1522 as those on which the reform of the currency should be based. The conditions on which he insists are—strict integrity in the weight and quality of the coin, the charge of a seigniorage just sufficient to defray the cost of mintage, and a unity of the monetary system throughout the entire state. There is, with much that is sound, some admixture of error in the tract. It was first published by Benkowski in 1861 and afterwards, in conjunction with the treatise of Oresme, in 1864 by Wolowski (*Roscher, Gesch. der Nat. Oek. in Deutschland*, p. 111).

J. K. I.

COPLESTON, EDWARD (1776-1849), born at Offwell in Devonshire, educated at Oxford,

he became provost of Oriel, 1814. He was the champion of Oxford University against the attacks made against it in the early numbers of the *Edinburgh Review*; and it was as "one of his constituents," that he wrote his chief economical treatise, his two "Letters to the Right Hon. Robert Peel, M.P. for University of Oxford, on the pernicious effects of a variable Standard of Value, especially as it regards the condition of the Lower Orders and the Poor Laws" (1819). He became Dean of Chester in 1826, and succeeded Sumner as Dean of St. Paul's and Bishop of Llandaff in 1827. He was an occasional writer for the *Quarterly Review* (see list of his works in *Memoir*, pp. 346-7). Though chiefly known as a theologian and ecclesiastic, he took part in the economical and political controversies of his day; his Oxford Prize Essay (1796) on "Agriculture" shows that his attention was early directed to the topics afterwards treated in his "Letters to Sir Robert Peel."

In the first of these Letters (which bears the motto "*laissez-nous faire*") he states the doctrine of currency which (he says), though "only a question of simple arithmetic," yet affects "all the most valuable interests of life." He gives illustrations, from English history, of what has happily been called by some later writers the "secular" depreciation of the currency (or its depreciation over a long period of time), and points out how very gradually and unequally prices adapt themselves to the change. As in retail dealings and in transactions between non-commercial people competition acts much less promptly and effectively than in dealings between merchants, so its efficacy is very imperfect in case of the agricultural labourers, as distinguished from the mechanics of the cities; they are quite unable to make their wages keep pace with any depreciation of money or rise in the price of food. "At no period of our history *till the present* was the condition of the labourer so bad as in the time of Elizabeth." Rather than raise the labourer's wages, the farmer will let him "come on the poor rates." Now the causes of depreciation may be the natural progress of trade and the discovery of mines; the distress is in that case unavoidable, and every civilised nation will at one time or other pass through the experience. But the depreciation may be due to artificial and preventible causes; and this is our own case, in 1819. We have ourselves to blame; and we ought to apply the cure. We should restore our currency to its old basis, and put an end to the suspension of cash payments. Copleston throughout follows the leading of Ricardo, Huskisson, and Canning against Bosanquet, Vansittart, and the opponents of the bullion committee.

In the second Letter he discusses what steps should be taken to secure that the

return to a more normal currency and low prices shall be as far as possible equable in its effects on all classes. The new corn law was meant to give to the agriculturists the supposed advantages secured to commercial men by restriction; but it would be better, he thinks, to dispense with both of them and return to our normal condition. Then he goes at some length into the question of the relief of the poor, discussing what government can and cannot do in this matter, what our own government had done, and, finally, what it ought to do. He considers that Malthus (whom he otherwise warmly praises) has not done full justice to the English Poor Law. Till lately, according to Copleston, this law was so well administered as to preserve life without encouraging the propagation of it. An historical review of the legislation in regard to the poor in England is made to support his view that depreciation of the currency has been a potent cause of distress to the poor, and unfair gain to their employers. His own recommendations are stricter than his criticisms of Malthus might have led his reader to expect. "Legal relief is necessarily of itself encroaching and unsatiable." He appeals to employers to raise wages without waiting till they are compelled; but (he believes) in any case the march of events will so lessen poverty that it will not be true of England as of India and China that its only source of wealth is its "redundant supply of human labour."

Copleston's article in the *Quarterly Review* (for April 1822), on the state of the currency, would lead him to be classed among the ultra-bullionists, who attributed more influence to the suspension of cash payments than the facts would justify. It is criticised by Tooke in his *Thoughts and Details on High and Low Prices*, (part i. pp. 19, 43, *seq.*, 1823); and Ricardo includes him among the adversaries who "put sentiments in my mouth that I never uttered" (letter to Malthus, 16th Dec. 1822). But, like many other of the minor economists, he did service by drawing attention to particular points that had been comparatively neglected by the more prominent writers.

[W. J. Copleston, *Memoir of E. Copleston, Bishop of Lindisfarne, with Selections from his Diary and Correspondence* (London 1851).—See also Mozley, *Reminiscences of Oriel College*, 1883.]

J. B.

COPPER MONEY (ENGLAND). This metal was first used for coinage in England in the reign of James I., when, under the authority of a patent granted by the king, Lord Harrington of Exton caused copper *Farthings* to be struck and put into circulation. These pieces, known as "Harrington tokens," weighed only six grains.

Copper Halfpence were first issued in the reign of Charles II., and

Copper Pence in that of George III. (1797).

Copper Twopences were issued at the same time as the first coinage of pence, but they were found to be inconveniently large and heavy (2 oz.), and their coinage was not continued.

Copper Half-farthings for circulation in England were first coined in the year 1843. The last issue of coins of this denomination bears the date 1856.

The following is a list of the denominations of copper coins issued for circulation in England since the reign of James I. :—

James I.	Farthing.
Charles I.	Farthing.
Cromwell.	Farthing.
Charles II.	Halfpenny, Farthing.
William & Mary.	Halfpenny, Farthing.
William III.	Halfpenny, Farthing.
Anne.	Farthing.
George I.	Halfpenny (125 grs.), Farthing (62·5 grs.)
George II.	Halfpenny (152 grs.), Farthing, (76 grs.)
George III.	(1770)—Halfpenny (152 grs.), Farthing (76 grs.)
	(1797)—Twopence (875 grs.), Penny (437·5 grs.)
	(1799)—Halfpenny (194·5 grs.), Farthing (97·2 grs.)
	(1806)—Penny (291·7 grs.), Halfpenny (145·8 grs.), Farthing (72·9 grs.)
George IV.	Penny (291·7 grs.), Halfpenny (145·8 grs.), Farthing (72·9 grs.)
William IV.	Penny (291·7 grs.), Halfpenny (145·8 grs.), Farthing (72·9 grs.)
Victoria.	Penny (291·7 grs.), Halfpenny (145·8 grs.), Farthing (72·9 grs.), Half-farthing (36·5 grs.)

In 1860 copper was superseded by bronze for the manufacture of pence, halfpence, and farthings; the old copper pieces being demonetised by royal proclamation of the 13th May 1869. They were, however, exchanged at the Mint for their full nominal value until the year 1873.

The weights of the bronze coins are as follows :—

Penny, 145·83 grs.
Halfpenny, 87·5 grs.
Farthing, 43·75 grs.

Farthings made of *tin* were struck in the reigns of Charles II., James II., and William & Mary; halfpence also were made of that metal in the two last-named reigns. F. E. A.

COPPER MONEY (SWEDEN). (*Copper plates or blocks used as money in Sweden.*) From 1644 to 1776 there was in Sweden a cumbersome form of copper currency. It consisted of thick square plates (plåtar) of pure copper of various dimensions and weights, the largest weighing as much as 17 kilogrammes (or 37½ lbs. av.) The nominal value in silver dalers, with the year of its issue, etc., was stamped in the corners and in the centre of each plate. The reason which led to the adoption of this form of currency was a desire to benefit the native copper mines, a feeling analogous to that which at the present date (1891) has greatly promoted the coinage of silver money in the United States.

By the law of 1644 one skeppund of copper (170 kilogrammes or $374\frac{3}{4}$ lbs. av.) was coined into a number of plåtar equal in total nominal value to 69 silver dalers. In the hope, however, of adding to the wealth of the nation, laws were passed in 1674 and 1715 which directed that the stamps on the blocks should be altered so as to cause them to pass at a higher nominal value than before, the number of silver dalers represented by a skeppund of copper being increased in 1674 to 100, and in 1715 to 180. The latter rate was maintained until 1776, when, by a new coinage law, the plåtar were demonetised, and ceased to form any part of the Swedish currency.

After 1715 one plåt was reckoned as equal to two silver dalers, or $\frac{2}{3}$ of a Rixdaler. This would be equivalent to $2\frac{2}{3}$ crowns of the present gold standard, which are equal in sterling to 2s. 11½d. The weight of one plåt at the valuation of 1715-1776 would therefore be (170 kilogrammes ÷ 90) 1·88 kilogrammes or 4 lbs. 2 oz. av., while the nominal value of the largest plate, weighing 17 kilogrammes ($37\frac{1}{2}$ lbs. av.), would be eighteen silver dalers, equal to twenty-four of the present gold crowns, which amount in sterling to £1 : 6 : 5.

For a long time these blocks of copper formed the chief medium of exchange in Sweden (so far as metal was concerned), and as they were necessarily very unwieldy, merchants were often obliged to provide themselves with a wheelbarrow when they had to pay or receive any considerable sum of money. The inconvenience of employing this form of money appears to have led to its disuse.

In Italy, Mommsen says, "there seems from the first to have been a fixed ratio for the relative value of copper and silver (250·1)"—Mommsen, *History of Rome*, vol. i. p. 458, ed. 1864. F. E. A.

COPYHOLD. Land forming part of a manor and subject to certain burdens in favour of the lord. Among these the fine payable on alienation and the so-called "heriot" are the most prominent. The right of heriot, wherever it exists, entitles the lord to take the best beast, and in some cases the most valuable chattel on the holding, whenever the tenant dies. The tenants' rights are derived from "the custom of the manor," the lord being still looked upon as the feudal possessor of the land, hence he is entitled to all mines and minerals under the land, and to all timber growing on the surface. The transfer of copyhold lands is still effected in the mediæval forms. The new tenant is admitted in the lord's court—the court baron—and his admittance is entered on the court roll, the copy of which is evidence of his title—hence the expression "copyhold." A series of copyhold enfranchisement acts have been passed within the last fifty years, the last of which, enacted in 1887, is the most far-reaching one.

Every facility is now given to enable both lord and tenant to put an end to their obsolete relation, and copyholds will, no doubt, disappear altogether in a short space of time. E. S.

COPYRIGHT. Copyright may be defined as the sole and exclusive privilege of multiplying copies of an original work of art or literary composition. It is a species of property partaking of the nature of a monopoly created by law. Though the existence of the right at common law has been denied, there is ample authority for saying that the author or owner of a literary composition or work of art had at common law a right, so long as it remained unpublished, to prevent the publication of any copy of it by any other person. After publication the protection of the common law ceased. Under the Tudors monopolies for printing special classes of books were often granted by the crown, but it was not until 8 Anne c. 19 that a general law was passed conferring copyright after publication. Copyright is now governed by 5 & 6 Vict. c. 45, and subsequent amendment acts.

(1) *Literary Copyright.* Original books, including pamphlets, sheets of letterpress, sheets of music, maps, charts, and plans or translations, are protected for forty-two years from the date of publication, or for the author's life and for seven years after, whichever period is the longer. No copyright can be had in a libellous or immoral publication. Newspapers under some circumstances may be within the acts. The first publication of the book must have been within the United Kingdom. An alien stands on the same footing as a citizen in this country, but in the United States until 1891 only domiciled aliens could obtain copyright, in that year a law was passed permitting aliens to obtain copyright, on condition that the book should be printed in the United States.

(2) *Dramatic Copyright.* Plays and musical compositions are protected for the same period as books, but the time runs from the publication or representation, whichever happens first. To dramatise a copyright book is an infringement.

(3) *Works of Art.* The period of copyright in the case of engravings, prints, and lithographs, sculpture, and busts, is fourteen years, and in the case of paintings, drawings, and photographs, the life of the author and seven years from his death.

(4) *Designs.* By the Patents, Designs, and Trade-Marks Act, 1883, any new or original design not previously published in the United Kingdom may be registered by the owner for particular classes of goods, and by such registration copyright will be secured for five years.

(5) *Copyright in Foreign Countries.* A summary of the law relating thereto will be found in Copinger's *Law of Copyright*, London, 1870.—Jerrold's *Handbook of English and Foreign Copyright in Literary and Dramatic Works*, London, 1881.

(6) *International Copyright.* Copyright, being conferred by the municipal law of a state, cannot be enforced in foreign states. Various attempts have been made to secure international copyright. By 7 & 8 Vict. c. 12, amended by 15 Vict. c. 12,

the crown can grant copyright to works published in another state, provided a similar convention securing reciprocal rights be concluded. Such conventions have been arranged with the German states, 1846 and 1847; France, 1852; Belgium, 1855; Spain, 1857; Sardinia and Hesse-Darmstadt, 1862; Spain, 1880, and with our leading colonies. An International Copyright Union was formed in 1886 (see *Law Quarterly Review*, 1887, p. 14).

(7) *Basis of Copyright*.—Blackstone (2 Com. p. 405), adopting Locke's view of occupancy, was inclined to base the right of an author to the exclusive use of works composed by him on occupancy founded on personal labour. Other writers have adopted this idea (Copinger on *Copyright*, p. 7). But it is difficult to see how, without great straining of language, a title which the Romans applied to material things can be made to embrace the right of an author to his ideas embodied in outward form. Judicial decisions appear to have adopted the economic view that a manuscript having value was a form of wealth, and ought therefore to be protected like other property, *Millar v. Taylor* (4 Burr, 2362), *Donaldson v. Becket* (4 Burr, 2408), *Jeffries v. Boosy* (4 H.L.C. 567). Spencer (*Social Statics*, c. xi. § 1) holds that "a man may claim the exclusive use of his original ideas without overstepping the boundaries of equal freedom, it follows that he has a right to claim them, or in other words, such ideas are his property."

On the other hand several able writers have argued against the expediency of recognising any right of property in books (M'Laurin's *Origin and Progress of Literary Property*, 1798), denying that there is any inherent right apart from legislation in an author to literary property (Dicey, *Fortnightly Review*, vol. xxv.), and it has been suggested that the republication of all books should be perfectly free, subject to the payment of a fixed royalty. A full discussion of these points will be found in the *Report of the Royal Commission on the Copyright Laws*, and the *Minutes of Evidence*, 1878.—See also *The Law of Copyright*, by T. E. Scrutton, London, 1891.—*The Law relating to works of Literature and Art*, by J. Shortt, London, 1884. J. E. C. M.

COQUELIN, CHARLES (1805-1852), born at Dunkirk, died at Paris. Beginning life in business (1829-44), he published a *Traité de la filature du lin* (Paris, 1845). Soon after, having joined the free traders in their campaign in favour of customs reforms, he wrote in the *Revue des deux mondes*, also in the *Journal des économistes*, to which he contributed many articles, much noticed and justly valued at the time, on banks, commercial companies, railways, canals, conversion of the *rente*, the corn laws, the circulating medium, liberty in commercial matters, etc. He superintended up to his death the publication of the *Dictionnaire de l'économie politique* of Guillaumin (1852-53). His principal work, *Des crédits et des banques* (Paris, 1848, 1st ed.; 1859, 2nd ed.), still remains, though some of the details are out of date, one of the ablest

arguments in favour of freedom for institutions of credit and circulation. A. C. F.

CORBET, THOMAS; wrote—

An Inquiry into the Causes and Modes of the Wealth of Individuals, or the Principles of Trade and Speculation Explained (London, 1841) sm. 8vo.

The author, claiming for himself only that degree of originality which Newton evinced when he explained the most ordinary transactions, such as plumbing and weighing, assigns as the "distinguishing principle of trade" though "not noticed by Adam Smith"—"to buy and sell always at the market price." "Many other principles," as the author says, "will be found to be as novel."

CORBETTA, EUGENIO, author of *Conferenze popolari di economia pubblica e sociale*, Milano, 1872, Dumolard.

M. P.

CORN LAWS. A corn law is an expedient adopted by the legislature, with the object of securing a higher price for the cultivator, and a higher rent for the landowner. It takes two forms. One, and the most familiar, is a tax or prohibition on importation. The other is a bounty on exportation. The first corn law of the former kind in the English statute book is one enacted 3 & 4 Edward IV. The only law of the latter kind is the famous Bounty Act of William and Mary, enacted in 1689 (1 W. and M., s. 1, c. 12). The act was extended to Scotland by 5 Anne c. 8, and was slightly modified by 13 Geo. III. c. 43.

Acts of the sovereign, probably by the advice of the council, prohibiting the export of corn, with the view of distressing the king's enemies or of preventing scarcity at home, are of early and frequent occurrence in English history. But they are temporary, the expedients of military policy, or of a feeling that it was the first duty of a sovereign to assist in procuring plenty at home, and were not intended to promote the interest of either cultivators or landlords. These restraints were constantly enforced by severe and even savage penalties.

The preamble of the petition on which the act of Edward IV. is founded (Rolls of Parliament, v. p. 504), asserts that "husbandmen and occupiers in husbandry are sore hurt by the bringing of corn out of other lands and partes when corns of the growing of the said realm have been of easy price." Imports of wheat, rye, and barley are prohibited, unless the prices of these three kinds of grain are at 6s. 8d., 4s., and 3s. respectively the quarter. The corn thus imported is to be forfeited, half to go to the king, half to the informer. Prize of war, however, apparently (for the language of the petition is not very clear), is exempt from these provisions.

The year in which this act was passed was one of very low prices, for wheat was only 3s. 10½d., rye 2s. 10d., barley 2s. 4½d. the quarter. During the period before 1542, when prices began to rise permanently, i.e. for eighty

years (1462-1542), prices for twenty-three years only were above the rates, sometimes only slightly, so that one could hardly say that the act was very effectual in promoting its avowed object. Besides, for a very long time, acts of parliament were very imperfectly obeyed, perhaps hardly known to exist; and governments, even in the most despotic times, were very much alarmed at any discontent which might arise in case the price of food was artificially heightened. There are numerous statutes prohibiting the exportation of corn in times of real or apprehended scarcity.

Imported corn, like every other foreign commodity, was made liable to the charges which were imposed by Cecil (*see* BOOK OF RATES)—the constant subject of quarrel between the early Stuarts and their parliaments. Here, however, the maximum price at which imported wheat was freed from customs duty was 48s. a quarter. The average price of wheat during the 17th century was 41s. and nearly the whole century was a period of exceeding suffering to the poorer or labouring classes.

The real commencement of the system of imposing a scale of charges on imported corn, with a view to heightening prices and thereafter rents, was the sliding scale of 22 Charles II. c. 13. Under this law a duty of 16s. a quarter was imposed on wheat as long as it was at and below 53s. 4d. and of 8s. when the price was between 53s. 4d. and 80s. Other kinds of grain were similarly treated, for 16s. was to be exacted when rye was below 40s. barley and malt when below 32s. and peas and beans below 40s. Oats, when at 16s. and under, were to pay 5s. 4d. There was as yet no malt, but only a beer duty. Now during the 17th century, the average price of wheat was 41s., of barley 21s. 11 $\frac{3}{4}$ d., of malt 23s. 7 $\frac{3}{4}$ d., of peas 23s. 2 $\frac{3}{4}$ d., of beans 23s. 1 $\frac{1}{2}$ d., and of oats 14s. 7 $\frac{3}{4}$ d. I have not found the price of rye in sufficient frequency to justify an average. But the above figures prove that the intention of the act was to put a prohibition on the importation of food. It is true that when scarcities came, as in the seven years' dearth at the end of the 17th century, in 1709-10, in 1756, and on some other occasions, the act was suspended for a period, and, as Adam Smith says, "the necessity for these temporary statutes sufficiently demonstrates the impropriety of this general one." The act remained in existence as the ordinary corn law for more than a century, for it was changed only by 13 Geo. III. c. 43.

The sliding scale act of Charles II. was, as far as the realisation of its objects are concerned, a total failure. The price of wheat was generally low to the end of the century, for during the forty years 1663-1702 inclusive the average is 38s. 10d., this period including the so-called seven dear years 1692-1698 inclusive.

Besides, the act was suspended as soon as it really came into operation. With rare exceptions too the harvests were exceedingly abundant well into the third quarter of the 18th century, average prices being constantly less than half the average rate of the 17th century. For this result there were two dominant causes. The first was the extraordinary geniality of the seasons. The second was the gradual adoption of the new agriculture, the substitution to a great extent of the four-course for the three-course system of cultivation, the spread of turnip and artificial grass culture, and the great increase as a consequence of live stock. The development of English industry and manufactures was remarkable, and was due in great measure to the plenty which prevailed. We shall see presently what bounties did.

When prices occasionally rose to what, till recent years, we should call moderate rates, say 50s. a quarter, there were great discontents and occasionally serious bread riots. The act of Charles does not appear to have been blamed for these disagreeable experiences, for the calamity was generally assigned to the acts of the corn dealers, who were branded with the names of forestallers and regraters, and looked on generally as public enemies. (*See* FORESTALLERS AND REGRATERS.) The government were exceedingly alarmed at these symptoms, and did their best to keep the ports open for foreign food. At last by 13 Geo. III. foreign corn could be imported at nominal duties when wheat was over 48s., rye, beans, and peas 32s., barley, bere, and bigg 24s., and oats 16s., the rate on wheat being 6d. a quarter, on rye, etc. 3d., on barley, etc. and oats 2d., and the whole duty might be drawn back, if re-exported in six months. In 1791 the corn laws were consolidated but not materially changed. During the great continental wars prices were all that the farmers and land-owners could desire.

But in 1813, after the retreat from Moscow, the domination of Napoleon came to an end, and with it his anti-commercial decrees. Large quantities of foreign corn came into England and prices fell. In 1815, therefore, another act was passed (55 Geo. III. c. 26). Under this act no foreign corn could be taken out of bond unless when the following prices were reached—wheat 80s., rye, peas, and beans 53s., barley, bere, and bigg 40s., and oats 26s., some favour being shown to the produce of Canada. It was supposed that this enactment would raise prices, but they continued provokingly low, and in consequence there occurred what was called agricultural distress. By 3 Geo. IV. c. 60, a new scale of maxima was adopted of 70s., 46s., 35s., and 25s. Certain modifications were made between this date and 1846, when the corn laws were abolished, the measure to take final effect in 1849. Only a

shilling duty was left, which was abolished twenty years later by Mr. Lowe.

The bounty on exported corn, as is stated above, was granted in 1689. The corn law of Charles II. had been a failure. It did no good in cheap years, it was dangerous in dear times, and had to be suspended. The bounty was far more plausible, and, at first sight, far more defensible. It stimulated corn growing, and to stimulate corn growing was to provide more abundant, perhaps cheaper food. The bounty too seemed so small, especially when compared with the duties on imports under the act of Charles. English agriculture was in a deplorable condition in 1689. It was affirmed by the closest and most intelligent observer of the time, Gregory King, that the average rate of corn production in England was, one kind with the other, not above fourteen bushels to the acre, and the bounty would mend this serious deficiency of enterprise. State-aided industry was a superstition of the time; the grant of the bounty by parliament seems to have excited—and I have read much that was written at the time—neither criticism nor opposition.

The bounty was not to be given when the price of wheat reached 48s., of rye 32s., of barley and malt 24s. a quarter. When the prices were below this amount, the payments on exportation were 5s. on wheat, 3s. 6d. on rye, 2s. 6d. on barley and malt. After the Scottish union oats were included and bere, and 2s. 6d. was to be paid on these, 15s. on oatmeal. By 13 Geo. III. c. 43 the maximum price of wheat was made 44s. and 5s., rye 28s. and 3s., barley, malt, and bere 22s. and 2s. 6d., oats 2s., oatmeal 2s. 6d. But after 1773 it was rarely that prices were low enough to admit a bounty, and very soon the bounty was practically suspended. The form, however, survived during the continental war.

The sliding scale of import duties had no effect on agriculture, and till the last thirty years of its existence only a fitful effect on prices. It did not encourage cultivation, because the best hopes of farmer and landlord seemed to lie in scarcity. Its effect was that it destroyed or weakened the foreign market, by rendering it uncertain, and that it prevented the exchange of British manufactures against foreign grain. It deluded the farmer by the excessive range of variation in prices which it caused, and it was a serious injury, for the same reason, to the mass of the people. Hence there were people who denounced the sliding scale, but thinking that British agriculture could not prosper without some assistance, advocated a fixed duty. This was the policy of the Whigs. The advocates of free trade answered that a fixed duty was a fixed wrong, and this criticism was accepted and endorsed by parliament.

But the operation of the bounty was very

different. It cannot be doubted—the writer has, for the first time, collected the evidence—that the bounty stimulated corn-growing, enclosures, and to a very limited extent arable agriculture. But this advantage, such as it was, was countervailed by mischievous consequences. In the first place, it discouraged the spread of the new agriculture, *i.e.* in general terms, the substitution of the four-course for the three-course system, and the abandonment of bare fallows for turnip and artificial grass culture, and with this the increase and improvement of cattle and sheep raising. The legislature encouraged only one branch of agriculture, corn raising, and by implication discouraged the other branches. In the next place, men gambled for the bounty. It was reckoned that in average cheap years, only a thirty-third of the crop won the bounty, but it obviously affected the whole crop which was raised. In just the same way, in modern times, the beet-root crop, favoured by continental governments, is the most unsatisfactory and disappointing industry on the continent.

In the next place, for a long time, as no rule as to quality was established, the bounty was favourable on corn which was below the average quality. The contrast between minimum and maximum prices of grain on the London Corn Exchange is extraordinary, constantly being thirty to forty per cent, for so great an interest was created by the bounty that it has been possible to collect, from the days of the great famine of 1709-10, accurate accounts of weekly London prices from the newspapers. At last the legislature required the city of London to furnish a return of prices and quantities, and established a system of averages. But the most important action which parliament took was in 1770, when returns of corn prices were required from every county weekly, which were published in the *London Gazette*. These returns disclose the fact that, though by this time the effect of the bounty was much diminished, the price of corn in the inland counties, *i.e.* those who had no access or no easy access to the ports, was fully 5s. a quarter higher than it was in the maritime counties or from fifteen to twenty per cent dearer. The whole country paid the tax, and some parts of it had to pay all the more for food. The officials too, who made the returns, were constantly charged with stating that prices were far lower than experience justified.

There was considerable difference of opinion about the operation of the bounty. Arthur Young, who had only the interests of progressive agriculture at heart, believed that it and the sliding scale were important stimulants to agriculture. Smith, as might be expected, though he was not possessed of the facts which prices disclose, denied that the effect was any thing but mischievous. Tooke, perhaps the

last considerable economist who handled the question, declares that in the absence of accurate information on the effects of it, he is unable to determine whether the good was greater than the evil. On this, the evidence of facts, of which a summary has been given, is conclusive.

J. T. R.

CORN RENTS. During the latter half of the 16th century rents were very slow to improve. In Stafford's famous pamphlet, at one time ascribed to Shakespeare, the complaints of the landlord are loud. Prices had trebled and rents were stationary. The explanation is, that everything needed for agriculture, except labour, had increased near threefold in price, and the margin from which rent could be paid was therefore not increased. The Oxford and Cambridge colleges, the schools of Winchester and Eton, were greatly impoverished, and apparently found it difficult to live. Their tenants too were all on customary rents.

In this crisis parliament, at the instance of Burleigh or Sir Thomas Smith, for the credit is divided, came to the rescue by the act of 1576, 18 Eliz. c. 6, under which the colleges and the two schools were empowered in the grant of fresh leases to reserve one-third of the old rent in produce or in money at the maximum prices of wheat and malt, in the markets of Oxford, Cambridge, Winchester, and Windsor. I have found that the produce rent, at fictitious prices, had been for some time customary at King's College, Cambridge, before the act was passed; and the hint probably came to Burleigh or Smith from this practice. Thus the college demanded that the lessee should supply so many quarters of wheat and malt at 6s. 8d. and 4s. though the market price might be treble these amounts, and sheep at 2s. when the lowest price was 6s. 8d. The Cambridge colleges clung to this system despite the act till the end of the century. The reason, I believe, was that domestic grinding and baking were customary at Cambridge, while at Oxford purchases were made from the common baker or brewer. The local custom was dropped at last, it appears, because these covenants did not secure high quality.

The act did not prejudice existing leases. Hence it is some time before the returns of corn prices appear. The earliest which I have found in Oxford is in 1582. The practice of Eton long continued to be that of King's College, and Winchester appears to have adopted the change slowly, for the accounts of this school have, it seems, been lost up to the time of the Long Parliament. The rent days at Oxford on which the market returns are given are rarely more than two, New College alone having occasionally a third. At King's College they were thirteen, but one seldom finds the whole. At St. John's they are six, and

these are always found. At Winchester there were also six, at Eton seven, though at last Eton only has two. Winchester has occasionally oat rents.

These corn prices are of the greatest value in the history of agricultural prices, which indeed could not, since the Reformation, have easily been constructed without them. In the early part of the 18th century Fleetwood, afterwards bishop of St. Asaph, and previously fellow of Eton, extracted the Eton prices, and published them in his *Chronicon Preciosum*. This gave the hint to parliament, which, during the 18th and 19th centuries, occasionally called on the Eton authorities to return their corn prices. These were published in parliamentary papers. The writer of this article was the first to collect the Oxford, Cambridge, and Winchester prices, as well as those of Eton, from the original records. It is probable that no other country could supply such a series, but from casual and broken notices of French corn prices, it is plain that generally they are not very different in amount, money and measures being duly interpreted, from those which prevailed in Southern England.

J. T. R.

CORN RETURNS. By the Corn Returns Act 1882 (45 & 46 Vict. c. 37) which consolidated and amended the 5 & 6 Vict. c. 14 and the 27 & 28 Vict. c. 87, the buyers of corn in certain towns named by order in council, are required to make to the inspectors of corn returns, weekly returns of the amount of each sort of British corn bought by them, and the weight and the price thereof. Such returns are to be made in not less than 150 and in not more than 200 towns. The inspectors are to forward to the Board of Trade weekly summaries of these returns, and from these summaries the Board of Trade computes the weekly, quarterly, and yearly average prices of each sort of corn. These averages are computed by dividing the total prices by the total quantities. On these averages depends the yearly amount payable to owners of tithe rent charges (see **TITHE**).

J. E. C. M.

CORNAGE. A monetary payment called cornage was a frequent incident of the tenure of land in the counties of Cumberland, Durham, Northumberland, and Westmoreland. Littleton explains cornage tenure to be the tenure of land by the service of blowing a horn to give notice of the incursions of the Scotch; and this explanation has been often repeated, but is certainly incorrect. The true explanation is that in lands held by cornage tenure the tenant paid to the lord a small sum of money for every horned beast in his possession, or a fixed sum as a composition. The payment was an incident of both free and unfree tenures, and in the latter case was paid by all the tenants together. In the manor of Easington in Durham it was fixed at 30s. a year from a very early period, and in most cases the amount paid bears no

relation to the actual number of cattle on the land. But a charter of Henry I., in granting the cornage of Borton to the monks of Durham, estimates its amount as twopence from each animal. For similar payments in other countries than England see Ducange, *Glossarium*, s.v. In England cornage seems to be confined to the four counties named, where it is also known as "horngeld" or "hornbield." It perhaps points to an early payment of rent in cattle. Servile tenants owing cornage were often also bound to provide the lord with a milch-cow or its value.

[Littleton's *Tenures* 1481. *The Boldon Book*, edited for the Surtees Society by the Rev. William Greenwell (see esp. "Glossary," s.v.)] C. G. C.

CORNER ON STOCK EXCHANGE. A speculator is said to have got into a corner when he cannot deliver the securities or other articles which he has sold for delivery at a given date (v. BACKWARDATION and BEAR). A. E.

The word is an Americanism now acclimatized here, signifying a condition of a market in which speculators of one class are placed at the mercy of their opponents. It is a term even more extensively used in the produce markets, in the corn trade, and so forth, than upon the stock exchange. As a rule, the speculators "cornered" are those who have sold what they did not possess in the expectation of being able to buy upon lower terms. In many cases such sales have extended to a larger amount than there are goods of the class, or securities, upon the market or in existence, and if the buyers are strong enough to demand a delivery of what has been sold it is evident that the sellers must at last apply to those to whom they have sold to let them off their bargains. The result is that the buyers may then demand their own terms to cancel the transaction. In America, where gambling in produce is carried to enormous lengths, these "corners" are frequent. A "corner" may be said to differ from a "rig" in that the latter more often is applied to a transaction such as the recent French operation in copper. In that case an effort was made to secure the entire production of the world, amounting to upwards of 200,000 tons annually, and to sell it only at an advance of about 100 per cent, all consumers of copper being compelled to purchase from the syndicate. The result proved disastrous. The French *Société des Métaux* "rigged" the market for upwards of a year, but it may also be said that they "cornered" those who had speculatively sold copper for forward delivery in October 1887, the price advancing from under £40 per ton early in that month up to nearly £90 in January 1888 (see CARTEL; COMBINATION).

CORNIANI. GIAMBATTISTA (1742-1813) born at Orzi Nuovi, in the province of Brescia, wrote *Riflessione sulla Moneta*, in 1796 (published in Verona for the first time, and repub-

lished in 1804 by Custodi) on the general effects depending on the quantity of coin which circulates in a country, and two other essays, entitled *Discorsi due della Legislazione relativamente all' Agricoltura*, read in 1777 before the academy of Brescia on rural legislation, and also published by Custodi, whose personal friend he was. Corniani, although an indifferent economist, was a distinguished man of letters.

M. P.

CORPORATION, MUNICIPAL. A body of persons incorporated for the purpose of promoting the good government of a town.

By the Municipal Corporation Act 1835 (5 & 6 Will. IV. c. 76) the greater number of municipal corporations were reformed and their constitution placed upon a uniform basis. That act and subsequent acts have been consolidated by the Municipal Corporations Act 1882 (45 & 46 Vict. c. 50).

The government of a municipal corporation is entrusted to a mayor and a certain number of aldermen and councillors who constitute the "council." The council is elected by the burgesses; the aldermen and mayor by the council. The qualification of a Burgess consists in (1) being of full age; (2) having occupied a building in the borough for twelve months; (3) being rated to relief of the poor and having paid his rate; (4) not having received parochial relief; and (5) residing within seven miles of the borough.

The rents, profits, and interest of all corporate property is paid into a borough fund, and out of such fund the expenditure is defrayed. Any deficiency is made up by a borough rate.

The consent of the Treasury is required to enable a corporation to acquire or dispose of land, but it may, subject to certain restrictions, make leases not exceeding thirty-one years.

The chief powers enjoyed by municipal corporations are: the administration of all town property; paving, lighting, and the cleansing and maintenance of thoroughfares; the making of sewers; the establishment of public buildings; appointment and supervision of the police; the administration of special trusts; and the superintendence of education where there is no school-board.

Special powers are enjoyed for the purpose of removing unhealthy areas and erecting workmen's dwellings.

By the Local Government Act 1888 boroughs are divided into four classes: (1) those under 10,000 inhabitants; (2) those over 10,000 but without quarter-sessions; (3) those over 10,000 but with quarter-sessions; and (4) sixty-one named boroughs each with a population of 50,000, on the 1st June 1888.

The first three classes form part of the county in which they are situate. Class 1 is practically incorporated with the county. In class 2 the right of the borough justices to grant licences is withdrawn. In class 3 the

boroughs are permitted to continue to manage minor business. Class 4 is invested with all the powers of a county council. A county borough is entitled to share in the local taxation account; the amount depending on an adjustment to be made between the county and the borough; and all boroughs are to receive from the county council grants in aid of the salaries of certain officers, and of county lunatics.

Any deficiency of income is met by borough or police rates. As a sanitary authority a borough may also levy general district rates and private improvement rates. Money may be borrowed with the assent of the local government board.

[C. Gross, *The Guild Merchant*, Oxford, 1890.—J. S. Vine, *English Municipal Institutions*, London, 1879.—C. N. Bazalette and G. Humphreys, *Local and Municipal Government*, London, 1888.—J. M. Lely, *Municipal Corporations*, London, 1882.] J. E. C. M.

CORPORATION, AGGREGATE. An association of persons which the law regards as capable of possessing rights, and of being subject to duties. The existence of a corporation depends in English law on one of five things, viz. (1) common law, (2) prescription, (3) statute, (4) charter, or (5) implication (see *Grant On Corporations*); but practically all corporations may be traced to charters granted by the crown or to acts of parliament. The early corporations were generally ecclesiastical or municipal bodies, though some were formed for charitable or educational purposes. Trading corporations are more modern. At first they were, and sometimes are, incorporated by charter (see **CHARTER**) or by special act of parliament, but in 1844 persons were allowed to form a company by means of a certificate of incorporation. Each member of a company so incorporated was liable for the debts of the company, but in 1855 an act (18 & 19 Vict. c. 133) was passed which authorised the formation of companies in which the liability of each member is limited to the amount of shares held by him. This principle has been developed by subsequent legislation, and the "company" is to a large extent taking the place of the "partnership." Apart from the limitation of liability, a company possesses a great practical advantage over the partnership, inasmuch as the death of a partner usually dissolves the partnership, whereas the death of a member of a company does not affect its existence. A further important distinction between these two modes of conducting business is that one partner can as a rule withdraw his capital, whereas a shareholder cannot do so unless the company is wound up.

J. E. C. M.

CORPORATION, SOLE, is a name under which each successive holder of any public office is described in his capacity of owner of any property attached to such office (*e.g.* the rector of a parish as owner of the glebe). E. S.

CORPORATIONS OF ARTS AND TRADES.

England, p. 428; France, p. 430; Germany, p. 431.

The constitution of manufacturing industry in the Middle Ages was everywhere in Europe characterised by the system of Guilds, or corporations of arts and trades. These differed more or less in the different countries. In England, where the state was consolidated and a strong central power established at an earlier period than in France or Germany, trade was earlier and more completely controlled by the government, and the state regulations relating to it more energetically and systematically carried into effect. The guilds were not as widely diffused in England, nor had they as great a degree of autonomy, as elsewhere. But in their aims and operations, wherever they existed, there was a remarkable general similarity, so that a statement of these for England will apply in a great degree to the other countries which have been named. The same remark may be made respecting the history of these institutions. A survey of their rise, progress, and decline in England, France, and Germany respectively, will show that in their development and downfall identical social causes were everywhere in operation.

England.—Already, in the Anglo-Saxon times, religious and social guilds had existed for the performance of pious offices and for mutual help and solace, and frith-guilds for joint action in personal defence and for preservation of the peace. The latter rose naturally in a society where the state was not strong enough to provide adequately for the legal protection of its members. But the merchant guilds, which are found in the Norman period in many English towns, though they may have been suggested by these earlier associations, had quite different aims. The merchant guild (or "hanse" as it was sometimes called) was a society "formed primarily for the purpose of obtaining and maintaining the privilege of carrying on trade" in a town. This privilege implied the restriction of that trade to the guild brethren, who had also defined rights of traffic with other towns. Any one, not a member of the guild, trading in the town, was subject to fines. An entrance fee had to be paid on admission to the guild, and probably annual dues to the common fund, which were spent in festivities or religious offerings, or in relieving the poorer brethren. Rules for the conduct of buying and selling in the town, and for the enforcement of commercial morality, were framed by the guild, and binding on its members. Admission to the merchant guilds seems to have been open only to those inhabitants of the town who were full burgesses by virtue of holding land within the town boundaries. Each guild had for its head a president called an *alderman*, with two or more assistants

known as *wardens*; and there was a council of twelve or twenty-four.

The earliest distinct mention of a merchant guild is in the year 1093, but they may have existed before the Conquest. The charters granted by Henry II. to a number of the leading English towns recognise the existence in them of guilds merchant. The craft guilds appear somewhat later; they are found in some places early in the 12th century, and in the 13th we hear of them in most of the industrial towns. Their origin has been variously explained. Some have regarded them as the descendants of the *collegia* of the Roman artisans. But the latter organisations, at least under the later empire, were not free associations, but were imposed by the government on the working classes; and it is not likely that they had a continuous existence from the 5th to the 12th century. Others suppose the craft guilds to have arisen out of organisations, under seigniorial regulations, of artisan serfs on the lands of monasteries and great nobles. But this is a mere hypothesis, so far as England is concerned, and for France and Germany it has been made probable only in some special cases. Brentano, again, has put forward the view that the craft guilds were formed in consequence of the expulsion of the petty artisans from the merchant guilds, the craftsmen combining for mutual protection against the old burghers. An obstinate struggle does seem to have taken place in Germany and the Netherlands between a burgher oligarchy which had got possession of the municipal government and the members of the craft guilds; but there is no evidence of any such contest in England. These guilds seem to have everywhere arisen spontaneously out of the social conditions of the Middle Ages, and to have been at first simply private associations for the general advancement of the interests of the artisans, as the merchant guilds had been for promoting those of the traders.

The earliest English craft guilds that came into notice were those of weavers and fullers of woollen cloth. We hear of them in 1130 as making an annual payment to the king for the royal licence, without which they were treated as "adulterine" and fined. The royal charter forbade any one in the town to which it related to follow a craft unless he was a member of the corresponding guild, and conferred on the guild the right of exercising a certain supervision over its members. Of the powers thus bestowed the municipal authorities were often jealous, and we find those of London offering King John a money payment on condition of his abolishing the weavers' guild. The exclusive right to engage in trade which had belonged to the merchant guilds brought these last into collision with the craftsmen, who sometimes sold the wares they produced directly to their customers; and the craftsmen ultimately gained the rights

of burgesses, though we cannot trace the history of the change. The monopoly of the burgesses was probably lost before the end of the 13th century; in any case the statute of 1335, establishing the freedom of buying and selling, must have abolished it. This amounted practically to a dissolution of the merchant guilds, which survived only as social and religious clubs, or as a machinery for the discharge of certain functions of the municipal government, especially for admission of apprentices to the freedom of the city. The bye-laws of the several craft-guilds made it a requisite for admission to a trade to have served an apprenticeship of a certain duration, the term being usually seven years. They also prescribed the proper treatment of apprentices by the master, and sometimes limited the number which a master was allowed to have. They fixed the conditions which must be satisfied before setting up as a master, and regulated the processes of manufacture with a view to the production of good and solid work. They exercised a general surveillance over the moral conduct of their members. Violations of the rules were punished by fines, and, in case of repeated offences, by expulsion from the trade. The guilds further performed in some degree the functions of friendly societies, and practised common festivities and religious observances.

These bodies have sometimes been represented as issuing the regulations and exercising the jurisdiction we have described quite independently of the city authorities, whilst others consider them to have been no more than the mechanism through which the municipality superintended manufacture, the officers of the guilds merely bringing offenders before the municipal courts. The truth seems to lie between these two views. The town magistrates *could* issue regulations binding on the crafts; but the guild rules were in fact generally drawn up by the craftsmen themselves and submitted to the magistrates, who usually sanctioned them as of course and, though sometimes taking causes into their own hands, commonly left the supervision of the manufacture and the decision of minor questions to the masters, bailiffs, or overseers of the trades. The extent of the jurisdiction of the guilds was probably different in different places. The kings, from Edward I. onward, favoured the craft guilds as a useful counterpoise to the urban magnates, and as a serviceable auxiliary for police purposes. And the municipal authorities themselves became friendly to them as subserving the latter object. Indeed before the end of the reign of Edward III., citizenship was bound up with the membership of one of the guilds, and it was natural that the jealousy between them and the town governments should disappear.

In the time of Edward III. there were as many as forty distinct companies or crafts in

London, and at the end of the century not fewer than sixty; in towns of the second rank their number increased more slowly. In the first half of the 14th century the guild system was at its maximum of efficiency. It continued to extend itself to new centres for two hundred years afterwards. But under the Tudors the direct control and superintendence of industry was more and more taken into the hands of the central government, and the regulations of crafts and trades were incorporated into the public law of the realm. The act 5 Eliz. c. 4 (1562), commonly called the Statute of Apprentices, adopting what had been the ordinary bye-law of the corporations, required a seven years' apprenticeship in all trades carried on in market towns. It provided that when there were, in certain specified trades, three apprentices in a workshop, at least one journeyman should be employed, and for every additional apprentice another journeyman. It also contained enactments respecting the hours of labour and the annual fixing of the rate of wages by the justices of the peace. This statute was held not to apply to trades established at a later period, or to places which only obtained corporate privileges after 1562; and thus some of the most important manufactures of England were never subject to it. In Scotland no such law existed, and Adam Smith says that "he knew of no country in Europe in which corporation rules were so little oppressive."

The increasing application of great capitals to industry, and the substitution of the factory for the workshop, tended to make the old trade rules obsolete; and the guild spirit became at the same time more narrow and selfish. In the 18th century any statutes which gave coercive power to the guilds, though not formally repealed, were in a great degree allowed to fall into desuetude, and the importance of these institutions practically disappeared. They were discredited in principle by the polemic directed against them in the *Wealth of Nations*. Adam Smith condemned "the exclusive privileges of corporations, statutes of apprenticeship, and all those which restrain in particular employments the competition to a smaller number than would otherwise go into them," as "encroachments on natural liberty," as raising the market prices of the wares produced above their natural price, and as obstructing the free circulation of labour from one employment to another. Smith held that a long, or indeed any fixed, term of apprenticeship was altogether unnecessary; but he certainly exaggerates the facility with which handicrafts can be thoroughly learned. He also thought it a mere pretence that corporations are required for the better government of trade. After several partial enactments of a liberal tendency, the apprentices' act of Elizabeth was repealed in 1814 (54 Geo. III. c. 96), and the trade

privileges of the guilds formally abolished in 1835 (5 & 6 Will. IV. c. 76). Partly as a result of the legal destruction of the old system, a new legislation has been introduced for the protection of the working classes by provisions for the healthy conduct of manufacturing production, and the limitation and regulation of the labour of women and children.

France.—In France the name *jurande* was given to the office of those who were appointed to watch over the execution of the trade regulations and the conservation of the interests of the several crafts. These *jurés* corresponded pretty nearly to the English wardens. Those only who were admitted as *maîtres* could carry on a manufacture on their own account. The production of a *chef-d'œuvre* (masterpiece) was commonly required for admission to the *maîtrise*, and it was the business of the *jurés* to pass judgment on its execution. The journeymen (*compagnons*) had been apprentices to the trade, and expected in time to be themselves *maîtres*. The relations of the three classes were substantially the same as in England. Powerful corporations existed from early times in Paris. The Parisian *marchands de l'eau* (*navette Parisiaca*) dominated the commerce of Paris. The provost of this body was the head of the municipal magistracy. The corporations of goldsmiths and of money-changers were also very ancient. The documents relating to the trade corporations of the metropolis begin to be numerous in the time of Philip Augustus. The trade statutes and customs of the city of Paris in the 13th century are preserved in the collection made by Étienne Boileau (see BOILEAU, E.), appointed provost of the city by Louis IX. about 1260. The kings, who at first were hostile to the claims of the corporations, from the beginning of the 15th century favoured them, both as useful instruments of police and as a source of fiscal aids. But they also sought, though often with but little success, to temper their exclusiveness, repress their exactions, and adapt their regulations from time to time to the development of new branches of industry and new methods of production, whilst on the other hand they insisted on their royal right of issuing letters of *maîtrise*, and of supervising the guilds. Louis XI. in 1467 armed the trades, forming them into banners and companies, bound by an oath of fidelity to the crown. An edict of Henry III. (1581) gave to the institution of corporations the extent of a national system, and placed all the trades of the kingdom under a general law. The edict at the same time corrected prevalent abuses. It mentions in particular the heavy expenses to which artisans were subjected in order to obtain the *maîtrise*, the masterpiece which they had to produce sometimes absorbing the work of more than a year, and candidates being expected to regale the *jurés* with banquets and

conciliate them by gifts. The crown, by this act, may be said to have taken possession of the police of manufacturing industry throughout the realm. But, owing to the opposition of the guilds and of the civic authorities, the provisions of the edict were very imperfectly carried into effect, and a law of Henry IV. (1597) was not much more successful.

In the last states-general (1614) the *tiers état* brought forward a strong protest against the prevailing evils, and prayed for the suppression of all guilds created since 1576, and the opening of crafts to all persons without exception, subject only to visitation by state inspectors. But the government did not respond to this appeal. The industrial policy of Colbert recognised the guilds, but only as organs of the state, subject to its control and direction; he revised the statutes of the existing bodies, and founded many new ones, and regulated their whole proceedings (1673-74). But though eminently successful in his own hands, his general system, as carried out by his unintelligent and feeble successors, tended rather to impede than to promote industry. While the guilds were not duly controlled, they were subjected to exorbitant charges, and were thus forced to impose extravagant dues on their members, and to insist more strongly on their monopoly. There were endless prosecutions of individual artisans, and conflicts as to the limits of the several industrial professions, as well as struggles for precedence between them, and these tended to bring the whole system into disrepute. The body of laws relating to them, however, remained essentially unaltered till 1776, when Turgot proposed to Louis XVI. the entire abolition (except in a few trades for special reasons) of the *jurandes* and *maîtrises*, and the establishment of absolute liberty of manufacture. In an elaborate report which, according to his custom, he prefixed to the ordinance, he maintained that "the right to work is the sacred and inalienable property of the poor man," and that "all sound principles were violated by the accepted doctrine that it was a royal right, which the prince might sell and the subjects must buy." The ordinance was carried against the will of the parliament in a *lit de justice*, but its execution was strongly opposed by interested parties, and, after the fall of the minister, the old system was introduced again, though with some liberal reforms. This state of things lasted until the constituent assembly in 1791 abolished the corporations and proclaimed the complete liberty of industry. With some fluctuations this policy has, on the whole, been maintained up to the present time.

Germany.—The German *Zünfte* were in their aims and constitution essentially similar to the English guilds and the French corporations. The Emperor Henry I. had required all artisans to settle in towns, and the handicrafts were

long held to be the special right of urban communities. The *Zünfte* are first found in the 12th century in particular cities and towns. They gradually gained influence in the civic administration, and on the other hand strengthened the cities against the nobility. At first purely private associations, they came to be recognised as organs of the state, and exercised certain magisterial functions. In the 13th and 14th centuries they extended to many additional cities, and in the 15th century there was a complete guild organisation of the trades throughout Germany. The rules of the system were rigorously carried out. What was known as the *Zunftzwang* was strictly enforced, that is, the requirement that every artisan should belong to one of the corporations. The boundaries of trades were precisely fixed, so that a member of one could not do work which properly belonged to another, however cognate the occupations might be. The *Zünfte* in different places were bound together and kept in touch with each other through the institution of the *Wanderjahr*.

In the 17th century the decline of these corporations began. The growth of the arts, the rise of new crafts outside the *Zünfte*, and the extension of manufacture on the great scale made it impossible to maintain the old restrictions on processes of production; and the opening of distant markets and the development of speculative production required a new trade régime. At the same time the central governments, in the spirit of the mercantile system, assumed more and more the direct control of the whole field of national industry. As the *Zünfte* increasingly failed to serve real public ends, they were more and more governed by a spirit of selfish exclusiveness, and were worked in the interest of a few privileged families. For those who were not sons of masters it became almost impossible to obtain admission except by marriage with the daughter or widow of a master. The reception of apprentices was made difficult by the imposition of conditions and charges, the qualifications required of journeymen (*Gesellen*) were enhanced by lengthening of the wander-period and the time of probation. The education of apprentices was neglected, and there was little care for the condition and treatment of the journeymen. But the *Zünfte* still retained their powers, and it was only late in the 18th century that they were seriously attacked. They had then to sustain the same assaults of economic theory which were directed against the English guilds and the French corporations. Schlettwein, a German follower of the *Physiocrats* (*q.v.*), denounced the whole system and demanded freedom of industry. But the legislative overthrow of these institutions belongs to the 19th century, and was not completed in all the states before the middle of its sixth decade. The Stein-Hardenberg legislation of 1808-10 and the law of 1811 established the liberty of

manufacture in Prussia, which had been previously introduced in the provinces which formed part of the confederation of the Rhine. The principle of freedom was embodied in the general ordinance (*Gewerbeordnung*) of 1845, but the revolutionary period which followed prevented the fair trial of this ordinance, and the complaints against it led to a modification of its provisions and a partial return to the old order of things in the ordinances of 1849. In 1861 and 1865 changes were again made in a liberal direction, but the law of 1849 remained substantially in force in Prussia. In most of the other states, between 1860 and 1864, the principle of industrial liberty was introduced. All these local laws were in 1869 merged in the uniform code of the North-German Confederation, which has since become that of the empire. By this code the exclusive rights of *Zünfte* or mercantile corporations, the distinction between city and country with respect to manufacture, the necessity of a proof of capacity before entering any craft or trade, the limitation of each artisan to one branch of production, and all restrictions as to modes of production, have been abolished, and it is left open to every subject of the empire to carry on any industrial profession, and to take apprentices and employ journeymen in such numbers as he may find expedient, subject only to sanitary and other police regulations and to such fiscal obligations as may be imposed by the laws.

Adam Smith and other economists have dwelt too exclusively on the evils and abuses of these institutions, and have left out of account the social necessities out of which they arose, and the not inconsiderable advantages which they possessed. There has of late been a feeling in France and Germany that with the abolition of the restrictions enforced by the corporations, there was a real loss of moral and social, as well as of some economic, benefits. In Prussia several efforts have been made to restore them on a free basis; and it is understood that further steps of the same kind are now likely to be taken by the German governments, whose object is thus to establish a sort of police of the industrial world and solve a part of the great problem of the organisation of labour. It seems, however, extremely questionable whether these institutions could be usefully revived; and the good ends which some have hoped to attain through their instrumentality must probably be effected by other means better adapted to existing conditions.

[The best book on guilds merchant is Gross's *Gild Merchant*, 1890.—On English guilds, the student should first read Brentano's *Essay on the History and Development of Gilds*, prefixed to Toulmin Smith's *English Gilds*, 1870. With it may usefully be compared Ochenkowski's *Englands wirtschaftliche Entwicklung im Ausgange des Mittelalters*, 1879, and Cunningham, *Growth of*

English Industry and Commerce.—In Ashley's *English Economic History and Theory*, vol. i., 1888, will be found a clear account of the origin and early history of the guilds, founded on a study of the sources. Seligman's *Two Chapters on the Mediæval Guilds of England* (Amer. Econ. Assoc., vol. ii.) may also be recommended. For the French and German guilds, see the article "Gewerbe" by Schönberg in his *Handbuch der politischen Oekonomie*, 3rd ed. 1890. Art. "Maîtrise," *Encyclopédie* of Diderot and D'Alembert.—The early Parisian trade rules may be seen in Étienne Boileau's *Règlements des Arts et Métiers*, published for the first time by Depping, 1837.] J. K. I.

CORTI, ADOLFO. Author of *Elementi della scienza del Commercio*, Pavia, 1829. M. P.

CORVAIA, BARON, a socialist, caused a book to be written by Michele Parma, proposing the foundation of a national bank intended to redeem the lower classes from the oppression of capitalists. This bank was to be connected with a savings bank, and was designed to eliminate usury. The treatise, *La Bancocrazia, o il gran libro sociale, novello sistema finanziario* was published at Milan in 1840, and was translated into German. M. P.

CORVÉE. In the strict sense of the term, *Corvée* is used to signify a tax levied by the state on the labouring classes, and paid by them in a certain number of days of labour, either wholly unremunerated or remunerated at a rate less than the ordinary rate of wages. In particular such a system of taxation has very generally been applied in many countries to the construction and maintenance of roads and bridges, each locality being compelled to defray the cost of such works by contributions of labour from its inhabitants. In England the common law threw upon the occupiers of land in each parish the duty of keeping the roads in repair. It is not easy to say exactly how this duty was originally carried out, but it may fairly be presumed that the statute 2 & 3 Philip and Mary, c. 8, which is the first of the many highway acts, did little more than declare the system in use. Under this act each parish is to appoint surveyors of highways to oversee the repair of the roads in that district. Labour required for this purpose is to be distributed by the inhabitants in the following proportions. Every occupier of land is to send for every ploughland occupied by him a cart with horses and two able men with them, and every householder, cottager, or labourer, unless he be a yearly hired servant, is to work himself or by a substitute on such days as the surveyors shall appoint for the repairing of the roads. These days under the act of Philip and Mary were to be four in number, but the act 5 Eliz. c. 13 extended the number to six, which were all to be before Midsummer day. Fines for non-attendance on the days fixed were to form a fund for the repair of the roads. The first step towards the abolition of this form of taxa-

tion was taken by the act 15 Charles II. c. 1, the first of the turnpike acts, which applies the system of tolls to the counties of Hertford, Cambridge, and Huntingdon, through which ran the great road to York and the north. Statute labour, as *corvée* was called in England, had already been found inadequate to keep in proper repair many of the great ways of communication, and the bad state of the chief roads was a frequent subject of complaints and petitions to parliament about this time. The system of turnpikes was accordingly extended by degrees to the whole of England, and in many cases its introduction gave rise to great discontent and serious local riots in spite of the fact that the inhabitants were thus set free from statute labour. However, many of the roads in the country, including almost all purely local ones, were not turnpike roads, but remained subject to the provisions of the various highway acts which were enacted from time to time. But even for the repair of these statute labour was beginning to be found insufficient. The act 3 & 4 William and Mary, c. 12 gives to the justices of the peace power to levy a rate in cases where the six days of forced labour should be found to be insufficient, and after various changes had been introduced by subsequent acts, statute labour was finally abolished by the act 5 and 6 William IV. c. 50, which substituted for it the system of highway boards and rates now in existence.

It would not appear that in England this limited application of *corvée* was ever unpopular. In France, however, where the *corvée* originally existed only in certain districts, its extension to the whole of the country, effected by M. Orry, controller-general of finance in 1737, gave rise to much discontent. The burden on the peasant was heavier, and the peasant was less able to bear it, than in England. In 1758 M. de Boullogne, then controller-general, estimates the annual value of the labour so contributed at 1,200,000 livres, probably a modest estimate. Certainly the burden on the peasant was much heavier. Necker estimates the cost to the peasants of the services rendered in Berry alone at 624,000 livres. These consisted not only of the labour of the peasant himself; beyond this he was compelled to bring with him any beasts of draught or burden, and any vehicle, that he possessed. Nor was it only for the repair of the roads that *corvée* was imposed upon him. In De Tocqueville's *Ancien Régime*, p. 444, will be found an account of the various public services carried out by means of *corvée*, and Turgot's *Lettre au Contrôleur Général sur l'abolition de la corvée pour les transports militaires* gives a vivid picture of the wastefulness and inconvenience involved in that particular application of forced labour.

A good account of the inadequacy of *corvée* as applied to the construction and maintenance

of the roads is given in Diderot's *Encyclopédie*, but the most effectual indictment of this tax is to be found in Turgot's *Mémoire au roi sur un projet d'édit tendant à supprimer la corvée*, with the accompanying criticisms of M. de Miromesnil and Turgot's often rather contemptuous replies (see vol. ii. p. 237 of Turgot's collected works). This, with the curious *Procès verbal du lit de justice tenu à Versailles le 12 Mars 1776*, will give a good idea of the arguments used both by Turgot and his opponents on this question.

The abolition of *corvée* by this edict was, however, only temporary. Turgot's successor Calonne at once restored it, and though again abolished in the early days of the Revolution, the reactionary policy of the Directoire once more reinstated it under the name of *Prestation* by the decree of 4 Thermidor, an x. At the present day the repair of the communal roads of France is carried out under this system. By the laws of the 28th July 1824 and the 21st May 1836 the municipal councils may call upon every male citizen between certain ages to give three days' labour yearly for this purpose, and may exact the same time from every beast of draught or burden and vehicle within the commune. A money payment in lieu of labour may be made at discretion.

For an account of the use of *corvée* in Egypt, see the *Times*, 14th September 1888. The construction of the Suez Canal during its early stages was carried out under a system of forced labour on a very large scale. In most countries, however, taxes of the nature of *corvée* are now disused, unless the CONSCRIPTION (*q.v.*) is regarded as an exception to this rule.

In mediæval societies payments in labour to individuals, especially in lieu of rent, were common, and in France were termed *corvées personnelles*. The nature of these and their economic bearings will, however, be most fitly treated of under MANOR and FEUDAL SYSTEM (*q.v.*)

CORVETTO, LOUIS-EMMANUEL, COMTE DE CORVETTO (1756-1821), born and died at Genoa, early distinguished himself in law and politics in his native city, and was made a director of

the Bank of St. George there in 1802. Bonaparte created him councillor of state in 1805, and transferred him to Paris, where he helped to draft the *Code de Commerce* and the *Code Pénal*. In 1811 he became inspector-general of state prisons, was retained in the state council by Louis XVIII., made president of the section of finance, and (27th Sept. 1815 to 7th Dec. 1818) minister of finance. The economic interest of his career centres in this last office. Upon Corvetto devolved the problem of freeing the territory by meeting the war indemnity of 700 million francs (£28,000,000), in addition to claims of 1400 million francs (£56,000,000), for requisitions made during the war. Though the latter claims were cut down to 240 millions (£9,600,000), Corvetto was obliged to issue large amounts of stock, and to seek the aid of Messrs. Hope and Baring; but the circumstances under which the loans were floated, and the action of the government in inflating the price of the stock by large purchases, led Wellington to describe the Paris money-market as the scene of such speculation as had not been equalled since the days of Law. Corvetto justified his action on the ground that it was patriotic to pay the state debts as cheaply as possible and to maintain its credit. His conduct has been severely criticised by M. Léon Say, who argues that the intervention of the government in such speculations can have but a momentary effect upon prices, apart from other and pernicious consequences. The intentions of Corvetto were good: his example was dangerous.

COSHERY. In the Middle Ages social and political relations in Ireland were regulated by the clan system. There was no private property in land: the clansmen being co-proprietors with the chief. But although the chief was not lord of the land, he had large customary rights over the property of his dependents. One of the most important of these was *coshery*, an old custom which allowed him to take the houses and provisions of his clansmen for the use of himself and his followers. The English invaders of Ireland based upon this right the practice of *coigne and livery*, by which they extorted from the Irish free quarters and provisions for their soldiers. After the Cromwellian settlement many of the dispossessed chiefs lived for years at the expense of their former dependents, and various statutes were passed to prohibit this custom of *coshery*.

R. L.

COST (COMPARATIVE AND RELATIVE). The doctrine of comparative cost is the basis of the theory of international trade. It is held that

the labour and capital of a country naturally flow into those departments of production in which it has the greatest comparative advantage, or in which the comparative cost is least. Thus, at the time of the gold discoveries in Australia, although the absolute real cost (reckoned in days' labour) of producing various articles, was less than in other countries, their cost, compared with gold, was greater, and consequently they were imported in exchange for the gold. The theory rests on the assumption that labour and capital only move with difficulty from one country to another.

[Cairnes's *Principles of Political Economy, newly Expounded*.—Professor Bastable's *Theory of Foreign Trade*.—Cournot's *Théorie des Richesses*.]

Relative cost is a term used in the theory of value. The normal value of freely produced commodities is said to depend upon the relative cost of production, that is, relatively to that of other things, value always expressing a relation of one commodity to others (see **COST OF PRODUCTION**). J. S. N.

COST, IN THE SENSE OF PRICE. Cost is sometimes used to signify price, meaning by this money value at the moment. J. S. Mill says (*Principles of Pol. Econ.* bk. iii. ch. iii. § I.), "Adam Smith and Ricardo have called that value of a thing which is proportional to its cost of production its natural value (or its natural price). They meant by this the point about which the value oscillates, and to which it always tends to return—the centre value towards which, as Adam Smith expresses it, the market value of a thing is constantly gravitating; and any deviation from which is but a temporary irregularity, which, the moment it exists, sets forces in motion tending to correct it." The cost of a thing is thus taken to be indicated by its price, in the sense in which a purchaser uses the word as equivalent to the maker's price at the time. "In common speech," as Prof. F. A. Walker says, "the word price brings up the idea of money value." The "cost" may differ greatly from the "price" which a thing may ultimately fetch, as it may from its "value," but when used in the sense indicated above, the expression refers to the price at the moment. The essential distinctions (1) between normal and market value; (2) cost, in the sense of real cost, and expenses are treated elsewhere. See **VALUE**; **COST**, **COMPARATIVE AND RELATIVE**; **COST OF PRODUCTION**.

COST BOOK. The book which contains the names of the shareholders and the number of shares held by each, and particulars of all transactions in a partnership formed for working a mine. Mining regulations differ in various parts of the United Kingdom. In Devon and Cornwall a licence is first obtained to try for ores; and if the metal is found, a lease is then granted for a number of years. The mine is

managed by an agent who is appointed by and works under the direction of the shareholders. A shareholder cannot bind the other shareholders by any contract except for necessities required for the due working of the mine according to the usual custom of the district. The agent has no power to make the shareholders liable for money lent or upon bills of exchange.

[M'Swinney, *On Mines*, London, 1884.]

J. E. C. M.

COST OF COLLECTION OF TAXES. One of the maxims or principles of taxation enunciated by Adam Smith, and which, as Mill observes, "may be said to have become classical," is that "every tax ought to be so contrived as both to take out and to keep out of the pockets of the people as little as possible over and above what it brings to the public treasury of the state" (*Wealth of Nations*, bk. v. ch. ii. pt. ii.) Smith cites four ways in which a tax may offend against this principle. The cost of collection, he says, may be excessive; the regulations and procedure which a tax necessitates may be such as to obstruct, and even to divert, industry; it may, by holding out inducements to evasion, require the levy of penalties and forfeitures; and, finally, it may cause annoyance and vexation to the taxpayer from which he would gladly pay to be free. Fawcett adds a fifth ground of complaint under this head, viz. that the price to the consumer of a taxed commodity may be unduly enhanced, and that the dealer may be enabled to augment his profit thereby.

The scheme of taxation at present existing in the United Kingdom cannot be said, except in a few minor instances, to be open to objection on any of the grounds mentioned by Smith. Its revenue is collected at a low cost, amounting in the aggregate to little more than $3\frac{1}{2}$ per cent. of the amount collected; the supervision of the excise is practically restricted to breweries, distilleries, and tobacco manufactories, as to all of which it has been stated that the advantages arising from enforced regularity and accuracy fully balance any disadvantages ordinarily incidental to state supervision; the penalties and forfeitures recovered are inconsiderable, being £45,387 out of a total net revenue of £75,497,000, or .06 per cent; and lastly, the annoyance and vexation to the taxpayer is certainly not in excess of that which of necessity attends the collection of enforced contributions of every kind.

Dowell (*History of Taxation and Taxes*, 2nd ed., vol. ii. p. 529) describes the causes which have brought about this result. "The reform of the tariff, diminished smuggling, and the consequent reduction in the customs establishment and abolition of the preventive coast guard; an equalised spirit duty throughout the kingdom and diminished illicit distillation; the consolidation of the numerous revenue boards and establishments; the abolition of the taxes

on manufactures; increased facilities of communication by railroad, letter post, and telegraph; the abolition of the pernicious system of appointments to offices through parliamentary influence; and improved education, higher intelligence, more sustained assiduity in business, and the use of ready explanation and willing courtesy—arts, perhaps, unknown before in tax-gathering—by a permanent staff, growing in experience from precedent to precedent, and working under carefully formed instructions and, it may be added, eagle-eyed supervision from headquarters, have reduced the percentage by half in the sixty years."

The effect, on the cost of collection, of the limitation of the indirect taxes to a small number of commodities, aided doubtless by greatly reformed administration, is very marked. In 1775, when "heavy duties were already imposed upon many of the most important articles of consumption," and "almost all our most important manufactures were taxed," the net revenue of the customs did not amount to more than two millions and a half, but it was levied at an expense of more than 10 per cent in salaries and other incidents, and more than 20 or 30 per cent if the perquisites at that time exacted by custom-house officers are taken into account (*Wealth of Nations*, bk. v. ch. ii. art. iv.) In 1816, "with everything taxed that could be taxed," the net amount received from customs duties cost more than $14\frac{1}{2}$ per cent to collect. In 1825 this rate had fallen to less than 8 per cent, in 1843 it was $5\frac{1}{2}$ per cent, and it is now about $4\frac{1}{4}$ per cent.

The earlier economists concluded, from the facts of which they were cognisant, that the cost attending the collection of taxes on commodities was much in excess of that of collecting direct taxes. The operation of the various causes above enumerated has, however, tended to equalise that cost, and the same tendency is observable in other countries. Thus in 1841 the cost of collecting the customs duties was 5.33 per cent, and in the case of excise 6.37 per cent as compared with 2.16 per cent for stamps, and 4.13 per cent for assessed taxes (Bohn's *Cyclopædia of Political Knowledge*, 1849, art. "Taxation"). In 1885 the cost of the customs had been reduced to 4.36 per cent, and that of the whole inland revenue (excise, stamps, and taxes) was 3.52 per cent. The cost of collecting direct taxes in France before the Revolution is stated (Roscher, *Finanzwissenschaft*, bk. iii. § 91) to have been 6 per cent as against 14 per cent in the case of indirect taxes, but in 1881 the duties on commodities cost only 5.13 per cent to collect, and the direct taxes 3.5 per cent. In Prussia the cost of the direct taxes rose from 4 per cent in 1861 to 7 per cent in 1883-84, whilst the cost of the indirect imposts fell during the same period from 12 to 9 per cent.

In the United Kingdom it may be said that

the chancellor of the exchequer need not now concern himself with any considerations as to the direct cost of collection when increasing or diminishing the burden of taxation, so long as he is content to alter and adapt existing taxes and not to impose new ones. The expense of collecting the considerable additions made to the stamp duties in recent years has probably not involved an extra expenditure on the part of the state of so much as 1 per cent on the amount received.

The customs and excise duties may now be taken to cost the state something over 4 per cent to collect, as compared with 3·5 per cent for taxes and 1·3 per cent for stamps, but in the latter case it is to be observed that much of the business performed in connection with their collection is paid for by the individual taxpayer, who is frequently compelled to employ solicitors and agents for the preparation of the accounts required in connection with the death duties, and to enlist similar services in making payment of many of the stamp duties on deeds. In the case of the stamp duties levied in connection with stock exchange and other commercial transactions, expense and labour devolve upon bankers, brokers, and others, the cost of which cannot be precisely estimated, but which in the aggregate must be considerable. The cost of the collection of the income-tax is comparatively low by reason of the great ease with which much of the revenue under that head is obtained. The deduction of the tax from dividends payable out of the public funds and other similar incomes is a simple matter, and it may be taken that one-third of the tax costs less than 2½ per cent to collect, which would bring up the cost of the remaining two-thirds of the tax to about the same point as in the case of the indirect taxes, viz. 4 per cent.

The small stamp duties on such documents as receipts and cheques are collected at an exceptionally low cost, whether the charges defrayed by the state or by the individual taxpayer be taken into consideration.

It remains to consider the ground of objection under this head against taxes on commodities, viz. that a dealer makes an additional profit by reason of their existence. Fawcett was of opinion (*Manual of Political Economy*, 5th ed., p. 554) that the retailer is able to obtain "the ordinary trade profit" on the amount of the duty, and assuming this profit to be 20 per cent, he estimated that the consumer would pay at least this amount more than the revenue would receive. This, he says, "is the most serious objection which can be urged against taxes on commodities." It may, however, be doubted whether this proposition is clearly established, the fact that the price of an article is augmented by the imposition of a tax will not of itself be sufficient to enable the trader to secure the same rate of profit on the enhanced price as that which he would obtain on the price of the article

calculated duty free, as for many commercial purposes it usually is. It is probable that the only circumstances connected with the existence of a tax on commodities which will affect the amount of a trader's profit are either that the tax is collected, and its evasion prevented, in such a manner as to increase the labour and skill necessary to prepare the commodity for sale, or else that the tax is so arranged as to render the employment of additional capital requisite. In so far as the taxation of commodities in the United Kingdom is concerned, the direct cost attending their collection, whether paid by the state or by the trader, is now very low, and, as has been shown above, it does not differ materially from that of other taxes. The necessity for the employment of additional capital in consequence of the manufacturer or dealer being required to pay over the duty prior to the delivery of the commodity for consumption, has been very much reduced by the establishment of bonded warehouses, in which articles can be stored without payment of duty until the time approaches when they are to be taken into consumption. In the case of beer, which is not permitted to be warehoused in bond, a limited amount of credit is given to the manufacturer for the payment of the duty.

"The English customs system is remarkable for its vigorous adherence to the principle of purely financial duties." See Prof. Bastable, *Public Finance*, London, 1892, bk. iv. ch. vii. § 3.

The following table shows the actual gross receipt of duty by the inland revenue department, and the percentage of the cost of collection in the years specified:—

Year.	Total Gross Receipt by Inland Revenue Department.	Net Charges of Collection.	Percentage of Charges of Collection to Gross Receipt.
	£	£	
1847	32,812,000	1,451,000	4·42
1850	33,363,000	1,358,000	4·07
1855	44,938,000	1,557,000	3·46
1860	44,141,000	1,608,000	3·64
1865	40,806,000	1,548,000	3·79
1870	40,588,000	1,610,000	3·97
1875	43,682,000	1,625,000	3·72
1880	49,817,000	1,831,000	3·67
1885	54,736,000	1,927,000	3·52

The following table is extracted from the reports of the commissioners of customs for the purpose of illustrating the decline which has taken place in the cost of the collection of the duties under their control. It is, however, clear, from the observations contained in the 29th report of the commissioners (1885), that the system of calculation adopted is unduly favourable, and it has now been abandoned. The real cost is probably about 1 per cent in excess of that shown in the table.

Year.	Gross Receipt.	Percentage of Cost of Col-lection.
	£	
1847	21,824,000	5.97
1850	22,194,000	5.78
1855	23,482,000	5.60
1860	23,517,000	3.27
1865	22,295,000	3.46
1870	22,575,000	3.55
1874	22,867,000	3.47

The cost of collection of duties received by the customs department, calculated on the basis at present adopted, has recently been as follows:—

1875	4.36 per cent.
1880	4.44 „
1885	4.40 „

T. H. E.

COST OF LABOUR. See COST OF PRODUCTION.

COST OF PRODUCTION. The *real* cost of production of any commodity is held to be the “sum of the efforts and abstinences” requisite to make it ready for consumption, and the act of production is not said to be completed until the commodity is in the hands of the consumer or until (as Mill phrases it) it has received the utility of being in the place where it is wanted. In a modern industrial society, with a complex system of division of labour and with raw material and other requisites of production drawn from all parts of the world, it is clear that in most cases the series of efforts of all kinds, taking into consideration those which are indirect as well as those which are direct, would be practically infinite. This difficulty, however, may be overcome as in other sciences by neglecting quantities below a certain magnitude. But even after the mental elements in real cost have been reduced to a minimum in number in this way, it is found that the analysis cannot for most purposes, practical or scientific, be carried so far, and we must attempt to arrive at some common measure by which the summation may be effected and a comparison made. This leads to the position emphasised by Mill (bk. iii. ch. iv. § 1), “If we consider as the producer the capitalist who makes the advances, the word labour may be replaced by the word wages; what the produce costs to him is the wages which he has had to pay.” After making allowance for the partial error concerning wages implied in the word “advances” (see WAGES; WAGES FUND), we arrive at the distinction which is expressed by the phrase “*expenses of production*” (adopted by Prof. Marshall in his *Economics of Industry*) as contrasted with the *real cost* in the sense defined above. That is to say, we are to consider only the money measures of these various efforts of labour, and it is left to the theory of wages and profits to explain how

the nominal or money expenses tend to become proportioned to the real cost. We assume then that in any industrial society there is at any time a certain general rate of wages which is necessary that labour may be forthcoming and a certain general rate of profits which is necessary for the creation and application of the requisite auxiliary and sustaining capital. The forces, whether “natural” or due to the “policy of Europe,” to adopt Adam Smith’s language, which are the efficient causes of variations in these rates, or which account for the actual rates at any time, are estimated in considering the distribution of the wealth of the society, and it only leads to confusion in considering cost as affecting value to repeat the analysis at the later stage. It may then be taken for granted that in any modern industrial society no article will continue to be produced which does not yield the wages and profits which will satisfy the labourers and capitalists concerned. It must be added, however, as is shown also in the theory of wages and profits, that there are various natural and artificial causes of difference in the returns in different employments even in “the same neighbourhood” (Adam Smith), and with what would now be termed perfect mobility of labour and capital. These causes of difference must be allowed for in addition to the general rates, and we may then assume that in any industrial society there are at any time determinate rates of wages and profits requisite to bring into play particular kinds of labour and capital.

At this point the fundamental law of cost (or rather expenses) of production may be thus stated:—*The normal selling price of any article tends to be such as to yield the wages, interest, and profits involved in the expenses of production.* If the price is above this rate, labour and capital are attracted to the industry, the supply is increased, and the price falls; whilst conversely, if the remuneration is not so high, labour and capital are repelled and the price rises. But it must be observed that in any established industry, owing to the want of perfect mobility of labour and capital, the effect of a fall in price due to a lessened demand for the product on the part of other industrial groups may be to cause a quasi-permanent fall in the rates of wages and profits in that industry; and thus lower for a considerable time the expenses of production (see WAGES). If, however, we assume that mobility is perfect, or allow time for the full effect of the forces which determine wages and profits, the normal expenses of production are given in the law as stated. The argument involved in this analysis will be found to coincide with the ideas implied in the popular usage of the phrase “cost of production.” This is best seen from considering a new industry. The maker of a new article will expect to obtain from the selling price a sufficient return to

attract the labour which he requires, and to give besides a fair amount of profit. Otherwise he will not continue to make the article, whilst conversely, if the price is higher than this normal rate, the industry will rapidly spread until through competition the price falls.

We may now carry the analysis a step further and consider the causes of variation in the "cost price" of articles, to adopt a useful popular phrase. It must be assumed once for all that price will vary exactly with or exactly measure value, in other words that the causes of purely monetary variations may be neglected. It would be as absurd to repeat at this stage the theory of MONEY and PRICES (*q.v.*), as at an earlier stage to bring in the theory of wages and profits. To make the assumption quite clear, let it be supposed then that so far as the causes affecting the general level of prices are concerned, there would be no variation in the prices of particular articles.

With this hypothesis it will be seen that a rise in the general rate of wages, reckoned in money, will so far raise the normal price of the articles on which the labour is employed. It is not necessary here to inquire in detail how such a rise might take place; it might be at the expense of profits, or be caused by a lessened amount of unproductive consumption on the part of governments, municipalities, or individuals, or it might be due to increased cost of living caused by natural or artificial causes. It is sufficient to assume that a general rise occurs as described. There is in this case no necessity *a priori* for a corresponding rise in the rate of profit, and in fact that rate may decline. It follows, then, that so far the cost price of things made by the direct employment of labour will tend to rise relatively to those in the production of which there is much fixed capital and a longer time involved. Thus a general rise in wages may disturb relative prices, considered as dependent on cost of production. Similarly a rise in general profits would disturb relative prices, acting of course in an opposite direction. Conversely a fall in general wages or profits would also disturb prices *mutatis mutandis*.

It may next be noted that any change in the quantity of labour or capital employed will so far affect relative prices, as is best illustrated by the effects of the adoption of labour-saving machinery. Ricardo (and to some extent Mill) appears to lay too much stress on the quantity of labour, and in this way to fall into the paradox, true only under extreme hypothetical conditions, that movements in the general rate of wages cannot affect relative values.

Variations in the relative rates of wages and profits requisite for the normal support of any industry, naturally cause corresponding differences in the normal cost price. This is too obvious to require amplification.

Besides labour and capital in the ordinary sense of the terms, raw material is required. This raw material, however, is itself the product of labour and capital, and so far would come under the analysis just given. But since Ricardo gave such prominence to the economic theory of rent, the text-books have emphasised the fact that raw material is more directly dependent upon natural sources of supply, and that these sources of supply may be exploited at unequal costs. This leads to the position that when there is a difference in the cost of producing the various parts of the normal supply, the normal price must be such as to give a fair return to that portion produced under most unfavourable circumstances. If it falls below, the supply from that source would be discontinued until the price rises, whilst if the price is above this limit resort will be made to inferior sources until the "source on the margin" again just determines the normal cost. If, however, the worst land or mine (or the like) just pays the expenses of working at the price, the better sources will give more than the ordinary return. This difference constitutes *economic rent* (see RENT). According to this view it is obvious that economic rent cannot enter into the cost of production, in other words, *price determines rent not rent price*.

Although economic rent, under the simple hypothetical conditions laid down in the theory, does not enter into cost price, the payment of rent under actual conditions may affect this price in several ways. The object of the landowner is to obtain a maximum net return when the land is let, and it is possible that under a system of cultivating ownership more labour and capital would be devoted to land than it would pay the landowner to sanction in the case of a tenant. Many great improvements, for example, have been effected by English landowners with a very small return, and the consequent increase in the supply must have affected the price, whilst a farmer farming for profit and paying rent would have invested much less in the land. Peasant proprietors, again, notoriously cultivate their land beyond the point at which it would yield a rent, and the produce is consequently somewhat cheaper. On the other hand, the kind of produce may be determined partly by the convenience of the landlord (*e.g.* large grazing farms or deer forests as against arable or crofts), and the consequent effect on the supply operates on the price. If we consider the case of a new kind of produce introduced into a fully cultivated country, the grower would naturally consider the rent which he must pay for the necessary land as part of the cost of production. In some cases also there is in rent an element of monopoly, and in all cases it is difficult to separate purely economic rent from profit rent. This point has been pushed to an extreme by M. Leroy-Beaulieu in

his *Repartition des Richesses*, which is much criticised by Prof. Walker in his work *Land and its Rent*. On the whole it may be said that economic rent, if it can be actually separated from the other elements in cost according to the hypothesis assumed, does not enter into cost, but that practically other factors are closely combined with it to form rent in the popular acceptance of the term, and that, in this sense, rent often does form part of the cost (compare Prof. Marshall's *Economics of Industry*).

To complete the enumeration of the elements in cost of production, reference must be made to the effect of taxes (see TAXATION) and to the manner in which cost operates when combined with a complete or partial monopoly (see MONOPOLY).

The doctrine of comparative cost as determining the course of international trade and the limits of international values, originally enounced by Ricardo, and developed by J. S. Mill, Cairnes, and recently by Prof. Bastable, is properly treated under the headings named (see DIFFICULTY OF ATTAINMENT; INTERNATIONAL TRADE; VALUE). It may simply be noted here that in the statement of the theory cost is taken in the sense of real cost, as, owing to the absence of mobility of labour and capital between different countries, there is not the same correspondence between real cost and expenses as may be assumed in the same industrial area.

The most recent criticism of the generally accepted theory of cost of production described above, as embracing wages and profits, is the attempt of Prof. Walker to place profits on the same footing as economic rent, and thus to exclude it from cost of production in the same way as rent is excluded (see PROFIT).

[Cost of production forms such an important part of the general theory of *Economics*, that it is fully treated in all systematic works, and it is not necessary to refer to monographs on the question.]

J. S. N.

COST, RELATIVE. See COST, COMPARATIVE.

COTTIERS. Under the Stuarts the clan system of joint occupation of land, based upon the customs of gavelkind and tanistry, was abolished in Ireland. In its place was introduced the English system of private ownership by landlords. The landlords let their lands to tenants at a rack-rent. But these tenants were not capitalist farmers, as in England, but labourers who cultivated a small holding by their own labour and that of their families. This system of peasant-tenants, or cottiers, has been extremely disastrous in its results. Owing to excessive competition for land—resulting from the absence of alternative occupations—the tenants were in the habit of offering more rent than they could possibly pay, and thus

scraped a miserable existence from the soil, while owing ever-increasing arrears to the landlord. In the early part of last century Swift records that “it is the usual practice of the Irish tenant rather than want land to offer more for a farm than he knoweth he can ever be able to pay: and in that case he groweth desperate and payeth nothing at all.” The inevitable result of the cottier tenure under these conditions—aggravated by absenteeism and the consequent presence of middlemen—was a distressed peasantry and a wretched system of agriculture. These evils have led in the present day to the Irish land acts of 1870 and 1881.

[Lecky, *History of England in the Eighteenth Century*, vol. i. p. 240 seq.—J. S. Mill, *Political Economy*, bk. ii.—J. E. Cairnes, *Political Essays; Fragments on Ireland*, essay iv.] R. L.

COTTON FAMINE (1861-65). Some of the most serious economic disturbances of modern times arose out of the great civil war in the United States, occurring between 1861 and 1865. Amongst these, the most prominent, so far as its influence upon the interests of the United Kingdom is concerned, was the almost complete extinction for four years of the chief source of supply of cotton, the raw material of the largest textile industry of this country. In the month of July 1861 the United States government established a blockade of the southern ports, and, from that time the American cotton field was practically closed for four years. Fortunately the crop of 1860-61, the largest ever grown up to that time, had already been shipped, and stocks in the consuming countries had been abundantly replenished. The existence of these stocks, and the doubts, then widely entertained, of a long continuance of the war, kept prices of cotton comparatively low until nearly the end of 1861. With the opening of 1862, however, a period of scarcity and abnormally high prices began, which has been fitly named the “cotton famine.” The immediate and most striking commercial results of the famine were the gradual establishment of new and extended sources of cotton supply, and the diminished use of cotton fabrics, accompanied by an enlarged consumption of woollen and linen goods. At the same time an industrial disturbance was occasioned in Lancashire, Cheshire, Derbyshire, and in the neighbourhood of Glasgow, which stands out very prominently in the history of those years. An excellent and very full record of the painful consequences of the famine upon the manufacturing population, and of the measures taken to mitigate them, is given in Dr. Watt's *Facts of the Cotton Famine*. Its direct commercial effects upon the cotton trade are stated in a paper read before the Manchester Statistical Society in April 1869, by Mr. Elijah Helm, and entitled “A Review of the Cotton

Trade of the United Kingdom during the Seven Years 1862-68."

When the civil war began the English cotton industry had for more than a year been in the enjoyment of unusual prosperity. Prices of the raw material were lower than they had been since 1856, and to this advantage was added a good general demand, home and foreign, for cotton manufactures. The workpeople had been well employed at very high wages, and the profits of spinners and manufacturers had put them into a comparatively strong position. Those engaged in the industry were, therefore, well prepared, for a time at least, to battle with the difficulties which were in store. This fact, together with the prevailing opinion that the war could not last long, explains to some extent the courage with which the threatened disaster was at first faced, and the refusal of external aid which was offered very early. Towards the close of 1861, however, the advancing price of cotton, and the absence of a corresponding rise in the markets for cotton goods, which had previously been supplied very freely, if not too abundantly, began to tell upon the activity of the industry, and as winter approached it was found that the number of people applying for relief to the guardians of the poor in Lancashire was steadily increasing. It was then realised that the cotton manufacturing districts had to face a public danger of great magnitude, which would require much endurance, co-operation, and effort, if it was to be successfully averted. The rapidly increasing number of applicants for pauper relief told a story the significance of which the employers were well able to interpret. It meant that the various reservoirs into which the savings of their workpeople had percolated were beginning to run dry. The funds of the savings banks, the co-operative and friendly societies, and the trade unions had been heavily drawn upon, and their subscriptions had rapidly fallen off. Private and public appeals for help multiplied, and at length relief committees were established in nearly every cotton manufacturing town or village. These formed the machinery of distribution, by means of which an untold amount of local and national assistance was brought home to thousands of workpeople who were thrown out of employment. Suggestions were often made during the winter of 1861-62 that an appeal for national assistance should be made, but they were at first discouraged from a feeling of self-respect; but in the spring of 1862 a fund for relieving distress in the manufacturing districts was started at the London Mansion House, which before its close reached the sum of £528,336. This fund together with other contributions was dispensed through the instrumentality of the central committee in Manchester, the president of which was the then Earl of Derby; the active,

energising, and organising instrument being the late Sir James Kay-Shuttleworth, who occupied the position of vice-president. But besides the national, colonial, and other contributions which were forwarded through the Mansion House, large local gifts in money and in other forms were made, and the spinners and manufacturers and other local employers freely gave their labour (besides contributing abundantly in the shape of money) in the work of distributing help to their poorer neighbours by means of "relief tickets," and of clothing and household supplies, of which large quantities were liberally forwarded from many parts of the country. Towards the close of 1862 Mr Cobden, who was a member of the Manchester committee, taking a very serious view of the crisis, advocated an appeal for extended help. He accepted an estimate of the loss of wages occasioned by the want of cotton at more than £7,000,000 per annum, which he said meant a loss to Lancashire of about £10,000,000. He added that from facts which had come within his own knowledge he had arrived at the conclusion that the whole mass of the working population had been brought down "to one sad level of destitution." He urged, therefore, in view of the fact that the shopkeeping portion of the community was fast sinking into poverty, that an earnest appeal should be made for more liberal contributions. This appeal did much to increase the funds at the disposal of the committee. As time went on the sufferings both of the workpeople and their employers greatly increased. Poor rates and other assessments became heavier, and the burden of the famine fell upon all classes. The distress was extreme and widespread. Emigration had been often suggested, and in April 1863 an "Emigrants' Aid Society" was formed. By means of its funds more than 1000 persons were sent to new lands. In that year the number of emigrant spinners was 2086, whilst in 1861 it was only 123. Many more left their homes in the cotton manufacturing districts, whose occupations were not specified. On the whole, however, the prominent fact of the cotton famine, so far as the working population is concerned, is that it was kept at home. The opportunity was used by local authorities to employ by means of borrowed funds the disemployed population in the paving and sewerage of streets, and in other improvements, the advantage of which is now observable in the generally clean and sanitary condition of the streets in most Lancashire towns and villages. The impetus given to the linen industry by the cotton famine may be inferred from the fact that whilst there were, in 1858, only 91,646 acres under flax in Ireland, the area had increased in 1864 to 301,942 acres.

The following figures, taken from the transactions of the Manchester Statistical Society

(1868-69), show the average yearly exports of cotton, linen, and woollen piece goods during the seven years preceding the cotton famine, and the seven years which include that occurrence, and during which the three trades were influenced by it:—

Exports of Cotton Piece Goods.

E. H.

COTTON LISTS. In the cotton industry the wages of spinners and weavers are regulated by rates or "prices" framed by committees representing associations of employers and employed. A certain rate of wages is taken as a standard, and the object of the list is to adjust wages to the very varying conditions under which the trade is carried on. In the spinning lists wages depend on (1) the amount of yarn spun; (2) the size of the spinning mule; (3) the fineness of the yarn; and (4) the twist in the thread. Any advantage arising from improved machinery is divided between the employer and the employed, and any extra work not coming within the normal duties of the spinner is paid for separately. In the weaving list the elements taken into account are (1) the fineness of the yarn; (2) the closeness of the threads; (3) the width of the cloth; and (4) the length of the cloth. Neither in the spinning nor in the weaving list is the price of the raw material or the price of the finished product taken into account. Adjustments take place from time to time by adding or subtracting a certain percentage from the standard rate.

[See *Reports on the Regulation of Wages in the Cotton Industry*: (1) Spinning; (2) Weaving, published by the British Association for the Advancement of Science, 1887.] J. E. C. M.

COTTON, SIR ROBERT BRUCE (1570-1631); the founder of the celebrated library; was not a mere antiquary, but one who applied the lessons of the past to practical problems.

Such is the character of his speech at the council table, "Touching the Alteration of the Coyne." By numerous precedents, Cotton shows the danger of tampering with the purity of coin. The parity to be maintained between the valuation of gold and silver, that the mintage may be reduced to some proportion of neighbour parts, is also inculcated. Among the "divers choice pieces of that renowned antiquary" which have been preserved, may be noticed here—*The Manner and Meanes how the Kings of England have Supported their Estate*, in Cottoni Posthuma, 1651.

[M'Culloch, *Collection of Tracts on Money*.—Jevons, *Investigations in Currency and Finance*, p. 347.—Edwards's *Lives of the Founders of the British Museum*.] F. Y. E.

COULISSE. The name given to the unofficial market on the Paris bourse and supposed to have its origin in the word *coulisse* or sliding bar which formed a passage for the *agents de change*, outside which speculators used to congregate to transact business. This irregular market in time organised itself in a separate building until the licensed brokers (see **CHANGE, AGENTS DE**) in 1859 instituted proceedings to defend their monopoly, and a number of offenders were condemned to heavy penalties. The coulisse, however, although disorganised could not be suppressed, and the *agents de change* eventually submitted to tolerate it as a lesser evil than an increase in the number of their own offices, with which they were menaced. It now forms two groups, each with its own directing committee which decides on the admission of members and draws up a daily price list of the business done. One group deals exclusively in French *rentes*, but three per cents only; the other in stocks and shares, principally foreign, the number of which is limited by tacit agreement with the syndical chamber of *agents de change*, French banks and railways being among those excluded. The coulisse does not buy or sell for money; it has only one account day monthly, and its rates of brokerage are lower than those of the licensed brokers. Most of the speculative transactions with London and the continental *bourses*, are executed in the coulisse, and for convenience prices of certain foreign government stocks are quoted in fractions instead of in decimals as on the official market. Its members have no common fund as a guarantee towards the public, and contracts with them cannot be enforced by law excepting for stocks and shares not dealt in on the official market, and consequently not comprised in the monopoly of the *agents de change*. The number of *coulissiers* syndicated is nearly two hundred, but in addition a certain number not "on the sheet," as it is called, are recognised. They are not bound by the strict rules of the *agents de change*, who

are forbidden to operate on their own account. Business in the *coulisse* commences half an hour earlier than in the *parquet* or regular market, and governs in a great measure the opening prices on the latter. The *coulisse* for *rentes* meets in the *bourse* itself near the railed enclosure called the *corbeille* reserved for the *agents de change*; the other is dispersed in groups inside or around the building, but always in the same places. The *agents de change* recently adopted measures to defend their monopoly, and, May 1892, reduced the number of foreign funds, dealings in which by the *coulisse* were tolerated, and interdicted quotations of prices on the *coulisse* before or after the business hours of the official market. T. L.

COUNCIL BILLS (*India Council Drawings*). Bills, or cabled instructions, issued by the India Council in London on the treasuries of Calcutta, Bombay, or Madras, as desired, and sold through the Bank of England to bankers or merchants requiring to remit to India. It was not till after the Imperial government superseded the East India Company, that India Council bills were first offered for public competition in London. The Indian government found that it was necessary to make large payments annually in this country for interest upon its sterling debt and for salaries, pensions, and materials—payments which could hardly have been made by remittances in money, and for which therefore it was necessary either to secure “exchange” operations, or to obtain funds in London by additional borrowings. The latter method was first resorted to. Between 1857 and 1862 the sterling debt raised by India was increased from £4,000,000 to £35,000,000, and for the time the necessity to remit to London was obviated. Indeed the Indian government was, on balance, compelled to remit extensively to the East. At that time, too, the external trade of India did not present the remarkable features now disclosed. The exports of merchandise were mostly somewhat larger than the imports, but the movement of specie was sufficient to counterbalance this difference, and, including specie, there was, in each of the seven years 1st May 1855 to 30th April 1862, a balance of imports over exports. Then came the American War and India's opportunity, when Lancashire had nothing but Indian cotton to exist upon; and in the four years 1862-1865 the exports of India averaged £13,500,000 a year more than the imports, specie included. From that date Indian exports have constantly exceeded the imports, and that in spite of the very large amount of silver sent thither from Europe. Indeed in the past twenty years that excess of exports has in value averaged quite £15,000,000 sterling annually. Hence merchants have had on balance constantly to remit very large sums to India in payment for goods, sums quite equal to the amount of the govern-

ment remittances homeward. Hence there arose the possibility that the government and the merchants should balance each other's commitments by paying them, thus obviating cash shipments out and home by a simple exchange operation. The India Council drawings constitute therefore a method whereby the Anglo-Indian merchants, or rather the bankers on their behalf, provide the cash to cover the Indian government's requirements in this country, while the government in India provides the cash requisite to cover the merchants' payments on the other side.

In 1861-62 there was a stoppage of the heavy India loans issued in London, and the Indian government in consequence had a balance of payments to make in England for which the Secretary of State for India drew bills to an amount of 1,20,03,592 rupees, obtaining for these in London £1,193,729, the average rate being 1s. 11d.·867 per rupee. Thenceforward the India Council drawings increased rapidly. In 1862-63 the bills drawn by the India Council realised £6,641,576, and in the following year £8,979,521. In the next five years they averaged about £6,000,000 per annum; and in the five years 1st April 1871 to 31st March 1876, these drawings realised an average of over £12,000,000 sterling annually. In the next five years the depreciation in silver became distinctly pronounced (see Table on next page); but the India Council drawings increased until, in 1879-80, bills were allotted to the extent of 18,35,00,000 rupees, realising £15,261,810. In the financial year ended 31st March 1882, the total issued was 22,21,09,350 rupees, the sum received in respect to those drawings being £18,412,429. In the twenty-seven years ended March 1889, the total drawings were 357,47,59,165 rupees, realising £303,269,974, or an average of close upon 1s. 8d. per rupee.

Time was when these India Council drawings consisted wholly of bills which were offered weekly on Wednesday by the Bank of England, there generally being a stipulation that not more than a certain proportion would be drawn upon Madras. But gradually the character of merchants' operations changed, and the establishment of telegraphic communication with India worked a revolution. The bill became too slow in its operation, and the Indian government found that a higher price was being paid for cabled payments than for its bills. In January 1882 it was decided to sell telegraphic transfers as well as bills, so as to obtain the additional price which remitters were prepared to pay for the advantage given by the more expeditious means of remittance. From the first, these telegraphic transfers were largely purchased, and at the present time in most weeks they exceed the amount of the bills sold. Especially is this the case when there is a pressure for money in India. Another innovation has been that bills or trans-

fers can be obtained on other days than Wednesday; and it is usual on Thursdays for the India Council to sell additional drafts to enable bankers to complete their remittances, charging a slight additional rate for these beyond that paid on the Wednesday. The Bank of England now announce what the minimum rates will be, what amounts are sold, and the amounts realised; these details are published regularly in the money market intelligence of the newspapers.

COUNTERVAILING DUTY. A duty or surtax imposed on imported goods in order to place them on an equal footing with articles of the same class manufactured at home, and liable to excise or other inland revenue duties.

The duties of this character which are levied in the United Kingdom are intended to be the exact equivalent of the cost to the home producer of the duties levied upon his products. Thus, whilst British spirits are chargeable with the duty of 10s. 6d. per proof gallon, imported spirits are subject to a customs duty of 10s. 10d., the additional 4d. being imposed in respect of the loss and hindrance caused to the home producer by the regulations of the excise department. An interesting account of the negotiations which led to the increase of the countervailing duty from 2d., at which it was fixed by the Commercial Treaty with France in 1830, to 5d., and to its subsequent reduction to 4d., is to be found in the twenty-eighth report of the Commissioners of Inland Revenue (p. 11). Imported articles in the manufacture

of which spirits are used are, in the like manner, subjected to countervailing duties, amongst the principal of these being liqueurs, perfumed spirits, chloroform, and transparent soap. On imported methylated spirits, which are not chargeable with duty if prepared according to the prescribed regulations, the countervailing duty of 4d. is alone levied. In the case of imported beer, the customs duty is 6s. 6d. per barrel of thirty-six gallons, at the standard gravity of 1055 degrees, the corresponding charge on British beer being 6s. 3d. On imported playing cards, the stamp duty per dozen packs is 3s. 9d. as against 3s. in the case of cards manufactured at home. In all these instances, the countervailing duty is estimated to be no higher than is necessary to place home and foreign producers on an equal footing as regards the real burden of the home duty. If, in any case, the countervailing duty were in excess of the amount requisite for this purpose, it would become protective in character.

The term is also applied to a duty imposed on imported articles, the manufacturers of which receive a bounty in respect of them. Thus Sir Thomas Farrer discusses the proposal to impose a countervailing duty on "bounty for sugars," and arrives at the conclusion that it would be impossible to fix the amount of such a duty, that it would be contrary to treaty stipulations, and that its effect would be to raise the price of a necessary article (*Free Trade versus Fair Trade*, p. 262). (See also remarks made by Ricardo in *Letters of Ricardo to Malthus*, "If I could convince myself that any part of the price of corn was owing to taxation, I should be in favour of a protecting duty to that amount," p. 64.)

For a complete list of the countervailing duties levied in the United Kingdom, see the *Statistical Abstract*, 1891.

T. H. E.

COUNTY BOROUGH. All boroughs having a population of over 50,000, together with some old county boroughs, were, by the Local Government Act of 1888, created county boroughs so as to exclude them from the administrative business of the adjoining county. Retaining all their powers as municipal corporations, these boroughs exercise all the chief powers of county councils, whilst as district authorities they exercise powers in regard to infant life protection, mad dogs, petroleum, habitual drunkards, and slaughter houses (see CORPORATION MUNICIPAL, and COUNTY COUNCIL).

J. E. C. M.

COUNTY COUNCIL. By the Local Government Act 1888 (51 & 52 Vict. c. 41), England and Wales has been divided into sixty administrative counties and sixty-two county boroughs. The county council consists of elected councillors and nominated aldermen. All persons registered as local government voters, all persons entitled to be so registered except in respect of residence, but who are resident within

15 miles of the county, and are possessed of property to the amount of £1000, or are rated to the poor at £30 per annum, and all peers owning property in the county, are qualified to be county councillors. The occupation as owner or tenant of land or any tenement worth £10 a year, provided the owner or tenant has resided six months and has paid all poor rates and assessed taxes, or the occupation as owner or tenant of a building of any value provided the owner or tenant has been in occupation for twelve months and has paid the poor rate and county rate, is the qualification required of an elector. The aldermen, who are one-third in number of the number of councillors, are chosen by the council. County councillors hold office for three years and retire together: aldermen hold office for six years, one half retiring every third year.

The chief powers conferred on county councils are:

1. Authorising sanitary authorities to take land compulsorily for allotments.
2. Maintenance of main roads and their bridges, with the control of traffic thereon.
3. Enforcement of the River Pollution Prevention Act, 1876.
4. Licensing of theatres.
5. Varying the season for protecting wild birds.
6. Enforcing orders of the privy council as to contagious diseases of animals and destructive insects.
7. Licensing magazines and factories of explosives.
8. Formation and regulation of fishery districts.
9. Provision, maintenance, and management of asylums.
10. Establishing and contributing towards reformatory and industrial schools.
11. Deciding claims for compensation for damage by riot.
12. Verifying weights and measures and regulation of gas meters.

Certain counties possess special powers. For instance, London and the metropolitan counties license music halls and racecourses, whilst the Yorkshire councils have power to make rules subject to confirmation of the lord chancellor as to the registration of deeds. Some of the general powers of county councils can only be exercised with the assent of some department of state, whilst the control of the police is vested in a joint committee of the council and the justices of quarter-sessions. The revenue of the county councils is derived from three sources, viz. (1) two-fifths of the probate duty, which is distributed amongst the councils in proportion to the share which each council received during the year ending 31st March 1888 out of the "grants in aid" made by the imperial exchequer. (2) The revenue derived by the in-

land revenue from the local taxation licences.

(3) County rates (see COUNTY RATE).

Powers of borrowing for specified purposes and with the consent of the local government board on the security of the council's revenue, for any period not exceeding thirty years, have been conferred on the county councils.

The county of London occupies an exceptional position as, in addition to the powers of an ordinary county council, it succeeded to the duties and liabilities of the metropolitan board of works.

[A. Pilling, *Handbook for Council Authorities*, London, 1889.—A. Macmorran, *The Local Government Act*, 1888, London, 1888.]

J. E. C. M.

COUNTY RATE. All moneys required by a county council over and above the local taxation licences and fees, are raised by a county rate. The basis of this rate is determined in the first instance by a committee of the council, whose duty it is to estimate the net rateable value of each parish. The council may alter such basis, and any inhabitant of a parish may appeal to quarter-sessions against the basis, on the ground that his parish is treated unfairly. The 15 & 16 Vict. c. 81, § 2, directs the "basis or standard to be founded and prepared rateably and equally according to the full and fair annual value of the property." On this basis the county council rates each parish at so much in the pound, and serves a notice on the guardians of the parish requiring them to pay the same. In London the rate is levied on the same valuation as the poor rate. In 1886-87 the valuation of England and Wales for the county rate was £130,000,000 and the rate varied from 1½d. in Lancaster to 6d. in Montgomery.

J. E. C. M.

COUPON. A certificate entitling the bearer to payment of interest on a government or other public security at the time and for the period stated on its face. These certificates are printed on the same sheet as the instrument certifying the principal security, each of them as it falls due being detached by the holder and encashed by him. The original coupons do not always cover the whole period of the currency of the security, in which case there is often a so-called "talon" which entitles the holder, when all coupons are used, to obtain a new coupon-sheet. In other cases the principal document must be presented in order to have a new series of coupons attached to it. E. S.

COURCY, ALFRED DE (1816-1888), born at Brest, died at Montmorency. At the age of seventeen he entered the employment of the "Compagnie d'assurances générales," Paris, the manager of which he afterwards became. He translated the *Théorie des annuités viagères et des assurances sur la vie*, by FRANCIS BAILY (q.v.) (2 vols. in 8vo). He was the author of many works on questions connected with insurance

and similar subjects. Among the more important of these are *Essai sur les lois du hasard* (in 32mo, 1862), *Un Examen de la loi du 24 juillet 1867, sur les sociétés anonymes* (in 18mo), *Un Précis de l'assurance sur la vie* (in 18mo, 1870), *Commentaire des polices françaises d'assurance maritime* (in 18mo, 1874); finally, *Le Droit et les Ouvriers* (in 8vo, 1886). His principal claim to notice, however, was the establishment in 1870 of a "caisse de prévoyance" for the employees of his company, based on the individual subscriptions of each. Many other associations have followed the lead thus given, to the advantage both of employers and employed. A law proposed by the French senate, but not, at the date of writing, ratified by the chamber of deputies, proposes to apply the same system to government officials. De Courcy's honest and laborious life was devoted to the improvement of the condition of the humble; during his last years he established the *Société de secours aux familles des marins français naufragés*. His authority on all questions of maritime risk was reckoned the highest that had ever been known in Paris. A. C. f.

COURNOT, ANTOINE AUGUSTIN, eminent mathematician and philosopher (1801-1877), deserves notice as the first who successfully applied mathematics to political economy. His success was signal. His *Recherches sur les Principes Mathématiques de la Théorie des Richesses*, published 1838, is still the best statement in mathematical form of some of the highest generalisations in economic science. This work may be summarised under three headings: pure theory of price, abstract propositions on taxation, and miscellaneous applications of mathematical reasoning.

I. Cournot appears to have been the first to represent by means of an equation, or curve, the relation between the price of a commodity and the quantity saleable at that price in a market consisting of purchasers competing with each other. Let D stand for quantity demanded, and p for corresponding price. Then the law of demand is expressed by the equation $D = F(p)$, or the corresponding curve whose ordinate is D and abscissa p (ch. iv.) How much logomachy is saved by this appropriate conception! How difficult it is in words to distinguish between what has been called a "rise" of demand occasioned by a change in the form of the function F , or displacement of the curve, and an "extension" of demand due to a change of the variable p , a movement along the curve. The price for which the total value is greatest is found by making the expression $D \times p$ or $F(p) \times p$ a maximum. The price thus determined is that which a monopolist would fix, on the supposition that the expenses of production are either zero, or a fixed charge independent of quantity produced, as in the case of a "mineral source." Otherwise, the expression to be maxi-

mised must be diminished by the cost of production. This cost is to be regarded as a function of the quantity produced, say $\phi(D)$. The relation of cost to product may be graphically illustrated by the curve $p = \phi'(D)$; where p , the price, as before is the abscissa, and $\phi'(D)$ represents the cost of producing the last unit of the quantity produced. In the most general and important case, the function $\phi'(D)$ increases with the variable D agreeably to the law of diminishing returns.

After analysing the operation of monopoly, Cournot advances from the simple to the complex by introducing a second proprietor (ch. vii.) He argues, by reasoning which has been traversed by M. Bertrand (*Journal des Savants* for 1883; cp. Prof. Marshall, *Principles of Economics*, bk. v. chap. viii. § 2, note, 2nd ed.), that with the division of the proprietorship, the price diminishes. There is, however, one curious exception to this rule. Suppose two commodities have no other use but to enter into the formation of a certain compound commodity in the fixed proportions $m_1 : m_2$. And let the "sources" from which the component commodities are derived be initially in the hands of a single monopolist; but afterwards let each of the two sources pass into the hands of an independent proprietor. What effect on the price of the compound will be produced by this breaking down of monopoly? Common sense would probably reply that the price would be lowered by increase of competition. But Cournot's reasoning concludes that the price will be raised by the separation of the proprietorship (art. 57). Cournot gives the imaginary instance of zinc and copper having no other use but to make brass. The following would be a more important example. If a railway and line of steamers have no other use except to form part of a certain through journey; then *primâ facie*, and in the abstract, it is more advantageous for the public that the two should be in the hands of a single monopolist than that they should be owned by two competing companies, each seeking independently to obtain for itself the maximum net profit. This theorem exhibits the power of Cournot's methods in a very striking light.

When by the multiplication of producers, monopoly becomes "extinct," the equation for determining price assumes a certain simplicity. It becomes of the form $\Omega(p) = F(p)$; where $D = F(p)$ is as before the demand curve; and $D = \Omega(p)$ is a curve expressing the quantity that would be offered at any assigned price. The function Ω is compounded out of the functions expressing the cost of production to each producer, in such wise as to bring out very clearly the principle that the price is equal to the cost of production of the last unit produced. In symbols $p = \phi'_k(D_k)$; where p is the price, D_k is the quantity of commodity

supplied by any one producer, and ϕ'_k a function representing the cost to that producer of the last unit produced. It is to be observed, that cost of production as used by Cournot must be interpreted as expense, exclusive of the remuneration to the entrepreneur for his own labour. Cournot does not take into account what Jevons calls the "final disutility" of labour, any more than he has expounded the theory of final utility in the case of the consumer.

II. The formulæ which take account of cost are well adapted to investigate the effect of a tax which may be regarded as an increase in cost of production. Cournot has discussed a variety of taxes, including "negative taxes," or bounties; on the supposition either of monopoly, or a regime of perfect competition. The following appear to be the most striking theorems.

If a tax of so much per unit of commodity is imposed on a monopolised article, the consequent rise in price may be greater, equal to, or less than, the tax. The loss to the monopolist is greater than the gain to the treasury (arts. 33, 38).

If a similar tax be imposed under a regime of competition, the rise in price will be less than the tax. There is no general relation between the loss to the producer and the gain to the treasury (arts. 51, 52).

Converse propositions are true of bounties. Similar conclusions are deducible with respect to an *ad valorem* tax and a tithe (chaps. vi. and vii.) There are also some interesting theorems as to the effect of taxing one of two commodities employed in a fixed proportion in the "joint production" of a certain compound, and not useful for any other purpose (art. 62).

The most remarkable results obtained by Cournot's method are those which relate to a tax on the importation or exportation of a commodity subject to the law of diminishing returns. Cournot finds that the price in the importing country may possibly be lowered by the imposition of the tax (art. 70). This paradoxical conclusion appears to the present writer to be due to a flaw in the mathematical reasoning. Equations (6) chap. x. appear not to be legitimately deduced. The following is another argument unexpectedly favourable to protection. Suppose a restriction of trade in respect of a certain commodity between two localities is removed. Cournot concludes that neither the quantity nor the total value of that commodity is necessarily increased by freedom of trade.

III. Among miscellaneous topics treated mathematically there occurs first variation in general prices. Comparing ratios to differences upon the principle which is at the foundation of logarithms, Cournot illustrates the change in the value of money in relation to other commodities by the motion of one body relative to a set of other bodies. He compares the move-

ment of general prices caused by a change on the part of money to the apparent motion of the stars due to the revolution of the earth (chap. ii.) It will be seen that Cournot's measure of the variation in the value of money is of the nature of a mere type, or simple average as distinguished from a "weighted" index number (see INDEX NUMBERS).

The next topic to be noticed is Cournot's mathematical treatment of the foreign exchanges (chap. iii.) We may say with Jevons of this investigation that it is "highly ingenious, if not particularly useful."

It remains to speak of Cournot's theory of "social revenue" (chap. xi.) He well defines the national income so as to include the wages of so-called "unproductive" labourers. He gives formulæ for the "real gain" and "real loss" in revenue which are very similar to the methods by which statisticians would now estimate a change in the "volume of trade." In the definition of "real gain and loss" abstraction is made of the detriment suffered by those consumers who are deterred by a rise of price from purchasing and the converse advantage accruing to those who are induced by a lower price to become purchasers. The peculiarity of this definition permits the truth, while it diminishes the importance, of Cournot's paradoxical conclusion that, when a restriction of trade in respect of a certain commodity between two localities is removed, the importing country suffers a "real loss" (art. 89). Cournot himself points out the limitations of his theory. He does not pretend to treat the question "*au point de vue de l'homme d'État.*" But he adds with modest confidence, in words applicable to his whole book and the mathematical method in general:

"Il y aurait toujours de l'avantage à éclaircir en quelques lignes, à la faveur de signes précis, et d'une méthode d'argumentation plus rigoureuse, les difficultés soulevées par des volumes de controverse."

The main outlines of Cournot's system have been presented by their author in a form divested of mathematical symbol, or rather in two such forms, in two works dated 1863 and 1876 respectively. Of these versions the latter seems best to preserve the elegance of the original investigation. Both paraphrases are accompanied with some additional and valuable matter. Particular attention may be called to the criticism of Mill's theory of international trade, and to the remarks on "economic optimism." Some of these reflections may be found in an earlier work treating of the relation between the first principles of the different sciences.

Yet another debt of gratitude is owed by political economists to Cournot. In his masterly work on chances he has pointed out the bearing of the calculus of probabilities on statistics.

The following are the works of Cournot which wholly or in part relate to political economy :

Recherches sur les Principes Mathématiques de la Théorie des Richesses (1838).—*Exposition de la Théorie des Chances et des Probabilités* (1843).—*Traité de l'Enchaînement des Idées Fondamentales dans les Sciences et dans l'Histoire* (1861).—*Principes de la Théorie des Richesses* (1863).—*Revue Sommaire des Doctrines Économiques* (1876).

COURT, PIETER DE LA (1618-1685), born at Leyden where he succeeded his father as a cloth-manufacturer after having studied law. He emigrated to Antwerp, 1672, being an adherent of the pensionary of Holland, John de Witt, murdered that year. In 1673 he settled at Amsterdam, where he resided until his death. His principal works, all of a polemical character, are :—

Het Welvaaren der Stadt Leyden (*The Welfare of the City of Leyden*), edited for the first time, 1845, by B. W. Uittewaall, under the title *Proeve uit een onuitgegeven staathuishoudkundig geschrift* (*Specimen of an unedited economical Work*).—*Intrest van Holland of te Gronden van Hollands Welvaeren unquaeeezen door v. d. H.*—(*Van den Hove de la Court*), (*Interest of Holland, or Grounds of Holland's welfare explained* by V. D. H.), Amsterdam, 1662, translated into German 1665 (twice) and 1668. The second edition of the same work was entitled *Aanwijzing der heilsame politike gronden en Maximen van de Republike van Holland en West-Vriesland, door v. d. H.*—(*Explanations of the wholesome political doctrines and maxims of the Republic of Holland and West-Friesland*, by v. d. H.), Amsterdam, 1669, translated into German, 1670; into French, 1709, under the title *Mémoires de Jean de Witt*; into English, 1743, under the title *Political Maxims of the State of Holland, etc.* by John de Witt, Pensionary of Holland, etc. London, printed for T. Nourse at the Lamb, without Temple Bar. The fact is, that John de Witt added only some remarks, and wrote the chapters 5 and 6 of part iii., as is now placed beyond doubt. De la Court was a free-trader by conviction, but principally for the merchants' sake. Monopolies, especially those of the Indian Companies, he severely opposed. Industry too should be free in developing itself—guilds hinder improvement; governmental rules, prescribing the mode of producing and the quality of merchandise, give no security as to adulterations, and cannot have any salutary effect, the consumer being the only person who can judge of what he wants.

As E. V. L.

COURT ROLLS, MANORIAL ACCOUNTS and EXTENTS. Among the mediæval documents most valuable for the purposes of economic history, must be placed those which illustrate the manorial system. These may be classified under the three heads specified above.

I. COURT ROLLS. The practice of enrolling the business done in the king's court seems to have been begun near the end of Henry II.'s reign. The earliest extant roll is one of 1191, and from that date onwards there is a fairly

continuous series of these rolls at the Public Record Office. Some of the entries on them are of interest to the student of economic history; but the rolls that are likely to interest him more are the rolls of local, usually manorial, courts. Such rolls, not being public documents, must be sought in the libraries and muniment rooms of cathedrals, colleges, and landlords; but the Record Office has a fine collection of rolls concerning manors which at one time or another came into the hands of the king. A few lords of manors had begun to keep rolls before 1250, many before 1300; but rolls of the 13th century are not now very common. They are of great value as evidence of the condition of the peasantry, the terms on which they held their lands, and the mode in which justice was done between and upon them. The entries fall into three main classes: (1) cases of litigation between the tenants; (2) the punishment of petty offences, either against the manorial custom or against the general law; (3) the transfer of the customary tenements by surrender and admittance, for the villain or customary lands of the manor could not be alienated without being given up into the hands of the lord, who thereupon admitted the new tenant. In the earlier ages, entries of the two former classes prevail; in later times, the court almost ceases to exercise a contentious jurisdiction, and the court roll becomes little more than a register of the titles of the copyholders. The copyholders, as in the 15th century the customary tenants or tenants in villinage came to be called, acquired this name because copies of the entries on the court rolls concerning their lands served them as title-deeds. From the older rolls a great deal may be learnt about villinage, the common field system and the state of agriculture. It may safely be said that we never shall know how far the tenure of the mediæval peasant was precarious until these documents have been examined. Rolls of municipal courts, and of the courts which administered "the law merchant" in fairs and markets, illustrate another side of economic history, the condition of trade, the nature of merchant guilds and trade guilds, the treatment of foreigners and town life in general. We have some rolls of this class even from the thirteenth century. As yet hardly a beginning has been made towards publishing the court rolls; but the Selden Society's volume for 1889 contains a selection of entries from certain rolls of the 13th century which may be considered as typical.

II. MANORIAL ACCOUNTS. The accounts of the manorial officers, bailiffs, and reeves, are scarcely of such general interest as the court rolls and extents, but they afford excellent materials for the history of prices, and have been largely used by Professor Thorold Rogers. They have not been printed, at least on any

large scale, and must be sought in the Public Record Office and private muniment rooms. A very full and very early set of accounts relating to the Bishop of Winchester's manors is in the possession of the Ecclesiastical Commissioners. It goes back as far as John's reign.

III. MANORIAL EXTENTS. The "extent" of a manor is a description of it which generally gives the names of the tenants, the size of their holdings, the legal character of their tenure, the amount and nature of their rents and services, whether rendered in money, in produce, or in labour. Generally the extent is the result of a sworn verdict returned by a jury of tenants to a set of interrogatories addressed to them by the lord's steward. To "extend" (*extendere*) a manor is to obtain by this process a full statement and valuation of all the lord's rights. On the continent, the practice of making such manorial registers can be traced to very remote times and possibly is of Roman origin. The most famous of these very ancient registers is that of the Abbey of S. Germain des Prés, made in the time of Charles the Great (published 1844 by B. Guérard under the title *Polyptique de l'abbé Irminon*; the first volume of a new edition by Auguste Longnon appeared in 1886). The England of the days before the Conquest has apparently left us nothing at all comparable with this. But the "extent" comes in with the Conqueror, and is at once applied to England on a vast scale; Domesday Book is an extent of the realm made on the king's behalf by local juries. Gradually the lords of manors, especially the religious houses, followed the example thus set. We have a few extents from the 12th, many from the 13th century. Some have been printed; some believed to be of almost equal value still lie in manuscript.

[Among published extents are the *Boldon Book*, a survey of the Palatinate of Durham, printed as an appendix to the official edition of *Domesday*, and again by the Surtees Society.—The *Glastonbury Inquisitions* (Roxburghe Club).—The *Cartulary of Burton Abbey* (Salt Society).—The *Black Book of Peterborough*.—The *Domesday of St. Paul's*.—The *Register of Worcester Priory*.—The *Cartulary of Battle Abbey* (all for the Camden Society).—The *Cartulary of Gloucester Abbey*, and the *Cartulary of Ramsey Abbey* (both in the Rolls' series).—The *Hundred Rolls*, published by the Record Commissioners, give very valuable extents of manors in Cambridgeshire, and some other counties.]

COURTIER (BROKER). See CHANGE,
AGENTS DE.

COURTS OF LAW (ENGLAND). The principal courts in England are the County Courts; the Supreme Court of Judicature; and the House of Lords. The jurisdiction of the County Courts is in most cases limited by the amount or value of the claims brought forward, the

limit varying according to the subject matter of the action, but some matters cannot be taken before a County Court, while in others their jurisdiction is unlimited, as for instance in bankruptcy proceedings. England and Wales are for County Court purposes divided into five hundred districts. The districts are grouped together into fifty-nine circuits, one judge being as a rule appointed to each circuit. The county courts have no criminal business. The various statutes relating to these courts, which were first established in 1846, have been consolidated by the County Courts Act, 1888 (51 & 52 Vict. c. 43). The Supreme Court of Judicature consists of Her Majesty's High Court and Her Majesty's Court of Appeal. The High Court has taken the place (a) of the Courts of Queen's Bench, Common Pleas, and Exchequer now united in the Queen's Bench Division; (b) of the High Court of Chancery now transformed into the Chancery Division; (c) the Courts of Probate and of Divorce and Matrimonial Causes and the High Court of Admiralty now merged in the Probate, Divorce, and Admiralty Division. The London Bankruptcy Court has also been absorbed by the High Court, the London bankruptcy work being, at present, allotted to the Queen's Bench Division. The High Court has original jurisdiction in all civil matters which may be brought before an English tribunal, but a plaintiff instituting proceedings in the High Court for which a County Court would have been competent has to submit to unpleasant consequences as regards costs. The active judges of the High Court are the Lord Chief Justice, the President of the Probate, etc. Division and twenty puisne judges (fourteen in the Queen's Bench Division, five in the Chancery Division, and one in the Probate, Divorce, and Admiralty Division). The judges as a rule sit alone, but some matters in the Queen's Bench Division (e.g. appeals from County Courts) are heard by divisional courts consisting of two, and in exceptional cases even of three judges. In Admiralty proceedings the judge has frequently the assistance of two nautical assessors. The courts of assize, sitting periodically in the provinces, are now considered as belonging to the High Court; the matters coming before these courts are generally tried by judges of the Queen's Bench Division, but they act as judges of assize by virtue of a special commission issued separately on each occasion. For the purpose of the assizes England and Wales are subdivided into seven circuits. There are also district registries in the provinces attached to the High Court in which all preliminary steps may be taken. In London these preliminary proceedings take place partly in the central office, partly in the judge's chambers. Criminal causes are tried at the assizes and also (exceptionally) by the Queen's Bench Division. Five judges of the latter division form the Court

of Crown Cases Reserved, hearing appeals on points of criminal law reserved by judges of assize, and in cases of particular importance all the Queen's Bench judges sit together for that purpose. The Court of Appeal hears appeals from the High Court. It is composed of four *ex-officio* judges: the Lord Chancellor, the Lord Chief Justice, the Master of the Rolls, and the President of the Probate, Divorce, and Admiralty Division, and of five ordinary judges (called Lords Justices of Appeal). As a general rule, three judges of the Court of Appeal sit together; in particularly important cases the court is sometimes composed of six judges. The Supreme Court has been created by the Supreme Court of Judicature Act 1873 (36 & 37 Vict. c. 66), and its constitution has been modified by a number of subsequent acts. The House of Lords hears appeals from the English Court of Appeal, and from the corresponding courts in Scotland and Ireland. There are four salaried judges forming part of that tribunal who are called lords of appeal in ordinary, and who enjoy all the privileges of the peerage during their lifetime (Appellate Jurisdiction Act, 1887). Besides these, the Lord Chancellor and such peers as have held any high judicial office take part in the judicial proceedings of the House. It ought to be mentioned that the same lords and a few other members of the Privy Council form the Judicial Committee of the Privy Council, a tribunal hearing appeals from the ecclesiastical courts and from the highest courts of appeal in India and the colonies and dependencies. In addition to the courts which we have enumerated, there are a number of courts of exclusively criminal jurisdiction (such as the Central Criminal Court at the Old Bailey, the courts of quarter session and of petty session, the stipendiary magistrates' courts, etc.), and others of purely local importance (as the Lord Mayor's Court in the city of London, the Liverpool Court of Passage, etc.). E. S.

COURTS (IRELAND). The courts in Ireland are, on the whole, organised on the same system as the English courts. There is a Supreme Court consisting of the High Court and the Court of Appeal, the former consisting of the Chancery, Queen's Bench, and Probate Divisions. The Chancery Division has taken over the jurisdiction of the former Landed Estates Court (40 & 41 Vict. c. 57; 50 Vict. c. 6). There is a Court of Bankruptcy which remains distinct from the High Court, and local bankruptcy courts have been constituted by an act passed in 1888 (51 & 52 Vict. c. 44). The courts corresponding to English county courts are called Civil Bill Courts and are held before the chairman of Quarter Sessions or the recorder as the case may be. The chairmen of Quarter Sessions are now called "County Court judges and chairmen of Quarter Sessions," and are appointed by the Lord Lieutenant. They

must be barristers of ten years' standing (14 & 15 Vict. c. 57; 40 & 41 Vict. c. 56). The Lord Lieutenant is also empowered to appoint stipendiary magistrates, having all the powers of justices of the peace in counties and boroughs (6 & 7 William IV. c. 13; 3 & 4 Vict. c. 108). The inspector-general of constabulary, his deputy, and assistants, have power to act as justices of the peace throughout Ireland (2 & 3 Vict. c. 75; 9 & 10 Vict. c. 97). The jurisdiction and constitution of the courts of Quarter Sessions and Petty Sessions is similar to that of the corresponding courts in England. The Land Commission constituted under the Land Law (Ireland) Act of 1881 (44 & 45 Vict. c. 49) and the Purchase of Land Act 1885 (48 & 49 Vict. c. 73) has quasi-judicial functions in connection with the carrying out of these statutes.

E. S.

COURTS (SCOTLAND). The principal courts in Scotland are (1) the Sheriff Courts, (2) the High Court of Justiciary, (3) the Court of Session.

Courts are also held by justices of the peace and magistrates of burghs, but these are not of the same importance as the corresponding courts in England, as a great part of the jurisdiction exercised by the justices in England is in Scotland entrusted to the sheriffs. In the burghs of Edinburgh, Glasgow, and Aberdeen, the magistrates (who are salaried officials) have the powers of a sheriff, and occupy, in fact, exactly the same position within their respective burghs as sheriffs within their respective counties.

(1) A Sheriff Court exists for each county, and has an extensive civil and criminal jurisdiction (including bankruptcy jurisdiction); it is presided over by the sheriff principal (formerly called sheriff depute) or by the sheriff substitute; juries act in criminal trials only, and even in criminal trials the sheriff is frequently competent to act without a jury. The sheriff principal and sheriff substitute are both salaried judges and must be trained lawyers. An appeal lies from the sheriff substitute to the sheriff principal, and from the sheriff principal to the Court of Session.

(2) The High Court of Justiciary is the supreme criminal court for Scotland. The judges of this court are called "lords commissioners of justiciary"; they hold sittings with juries both in Edinburgh and in the larger provincial towns (Circuit Courts). Since 1887 every judge of the Court of Session is one of the lords commissioners of justiciary. The lord president of the Court of Session, as president of the High Court of Justiciary, has the title of "lord justice general."

(3) Before the Court of Session, actions which the sheriff is not competent to try *must* be brought in the first instance; and as regards

all other actions, it has a concurrent jurisdiction with the Sheriff Court. Its judges are called "Senators of the College of Justice," or "Lords of Council and Session"; the presiding judge has the title "lord president," and the judge next to him in rank is called "lord justice clerk." The court is divided into (a) the Inner House consisting of two divisions, presided over respectively by the "lord president" and the "lord justice clerk," four judges sitting in each division, three forming a quorum; and (b) the Outer House consisting of five judges who are called "lords ordinary." Actions are generally brought, in the first instance, before one of the lords ordinary, and may then go to one of the divisions of the Inner House by way of appeal, but certain matters (including appeals from the Sheriff Courts) must go at once to the Inner House. Actions of a certain description coming before the Court of Session are tried with a jury, but, on the whole, the trial by jury of civil actions is not nearly as frequent in Scotland as it is in England. E. S.

The Court of Session is the superior court in Scotland: a court both of law and equity. Appeals lie from the Court of Session to the House of Lords.

In respect of the administration of estates the court has the full powers of a court of equity, but in practice the court interferes as little as possible with executors or with the trustees under a settlement; and when it is necessary for the court to do so, or to direct the administration, it appoints judicial factors, independent administrators, who give security, are paid a commission, and report periodically. A. D.

COVERTURE. A legal term used to denote marriage; a married woman being said to be "under coverture." At common law coverture merged the wife's personality in that of her husband, and the result was that her property was governed by the following rules. (1) All freeholds of which she was seised at the time of marriage or afterwards vested in her and the husband jointly during their joint lives, he being entitled to the control and management and to the profits, but only able to alienate with the wife's consent. On the death of the wife, the husband, under certain circumstances, took a life interest in her heritable freeholds. (2) All chattels real vested in the husband, so that he could alienate them during his life; but if she survived him, and he had not alienated them, they vested in her. (3) Chattels personal vested in the husband absolutely, but if they were *choses in action* his title only became complete when he reduced them into possession.

The above rights of the husband were modified by the equitable doctrine, that if he required the aid of a court of equity to enable him to acquire the property, such aid was only given on the condition that he settled a portion of the property on the wife and children. By

the Married Woman's Property Act of 1870 (33 & 34 Vict. c. 93) certain descriptions of property which at common law would have vested in the husband were declared to be separate estate, and by the Act of 1882 (45 & 46 Vict. c. 75) every woman married on or after 1st January 1883 is enabled to acquire, hold, and dispose of property as if she were unmarried. The result is that the wife's personality no longer merges in that of her husband, though in some respects she does not possess the same status as a single woman.

[Macqueen's *Law of Husband and Wife*, 3rd ed., London, 1885.] J. E. C. M.

COWELL, JOHN WELSFORD, author of *Letters to the Right Hon. F. T. Baring on the Institution of a Safe and Profitable Paper Currency*, 1843—an automatic arrangement for maintaining a gold reserve, the third (or some definite) part of the outstanding notes payable on demand. This idea is reproduced in *Further Letters on Currency* . . . 1858. Cowell contributed, as assistant commissioner, to the evidence collected by the poor law commissioners, 1834.

F. Y. E.

COWRIE. A shell found on the shores of the Maldives and Laccadive Islands, and used as small change in Siam, parts of India, and on the west coast of Africa. In Guinea 2000 cowries=1 macuta, or ten-cent silver piece, which is valued at 4.9d. F. E. A.

COXE, TENCH (1755-1824), born in Philadelphia, Pennsylvania. Having entered on a mercantile life he became assistant secretary of the treasury in 1790, and commissioner of the revenue 1792-97. He early devoted much attention to economic subjects, and in 1787 wrote *An Inquiry into the Principles on which a Commercial System for the United States of America should be founded; to which are added some Political Observations connected with the Subject*, Philadelphia, 1787, pp. 52. This favoured the prohibition of the coasting trade to foreign shipping; the importation of foreign goods in the bottoms only of the country producing them, and in other respects was influenced by the commercial policy of England at that time. Coxe also demanded special encouragement to manufactures and the exemption of raw materials from tariff duties. In 1792 he published an *Examination of Lord Sheffield's Observations on the Commerce of the United Provinces*, to prove that Lord Sheffield was wrong in his gloomy prophecies for the future of the new republic. These two articles with others and additional matter may be found in a *View of the United States of America, in a series of papers, written at various times between the years 1787 and 1794; interspersed with authentic documents; the whole tending to exhibit the progress and present state of civil and religious liberty, population, agriculture, exports, imports, fisheries, navigation, ship-building, manufactures, and general im-*

provements, Philadelphia, 1794, pp. 513. He laboured energetically for the establishment of cotton manufactures, and is said to have been the first to attempt to bring an Arkwright machine to the United States. Among his other writings are *Thoughts on Naval Power and the encouragement of Commerce and Manufactures*, 1806; *Memoir on Cultivation, Trade, and Manufacture of Cotton*, 1807; *On the Navigation Act*, 1809; and in particular *A Statement of the Arts and Manufactures of the United States of America, for the year 1810*, Philadelphia, 1814. This latter was prepared under the direction of the government for the census of 1810, and represents the first extended attempt to make an industrial census of the country. The first part of this is descriptive, and the remainder statistical. As a statistical inquiry, it is almost a failure as measured by modern standards. His official papers, 1790-97, may be found in American State Papers, Finance, vol. i.

D. R. D.

CRADOCKE, FRANCIS, author of *An Expedient for taking away all Impositions and for raising a Revenue without Taxes*, 1660; and of *Wealth Discovered* . . . 1661. The author proposes a land bank with "imaginary money," as "a discovery of richer mines than any the king of Spain is owner of." This projector was added (along with Petty) to the king's council on trade (*Wealth Discovered*, flyleaf.)

CRAFT GUILDS. See CORPORATIONS OF ARTS AND TRADES.

CRAIG, JOHN, of Glasgow, author of *Elements of Political Science*, 1814; and *Remarks on some Fundamental Doctrines in Political Economy*, 1821. All Craig's remarks are not so erroneous as his doctrine that "value in use must be very accurately measured by value in exchange."

F. Y. E.

CREDIT. The fundamental notion in credit, as the name itself implies, is trust or confidence, but this characteristic obviously needs limitation; for the buyer of an article must always repose some confidence in the dealer even when the transaction is for cash, and the practical rule is *caveat emptor*. There emerges then as the second principal characteristic the idea of deferred payment, taking payment in the widest sense of the term. A credit transaction involves time before it is completed, that is to say, a commodity, or the use of a commodity for a time, or service of some kind is rendered now, whilst the reciprocal service or commodity is given after a specified interval. Some writers have regarded this time element as really the primary characteristic, because in some species of credit transactions there is practically perfect security, and thus no demand on the confidence of the person who makes the advance. It is certainly useful to emphasise the time in some

cases. In this way, for example, we understand how the ecclesiastical economists of the Middle Ages thought it sinful to demand or receive a reward on account of deferred payment, because they conceived that time in itself had no value, whilst a modern writer who looks on time as fundamental in the accumulation and use of capital, has no difficulty in giving moral approval to the reward for ABSTINENCE (*q.v.*) Historically, however, and to a very great extent in the modern world, confidence or trust is certainly of the essence, and not merely an accident, of credit.

Much controversy has taken place as to the distinction between capital, in the sense of production capital (see CAPITAL), and credit. The individual merchant or manufacturer regards his credit as one of the principal requisites in carrying on his business. A manufacturer with good credit can at once expand his business to meet a growing demand, whilst his inferior in mercantile standing must proceed more slowly. It thus appears that, from the individual point of view, it is naturally regarded as giving increased productive power. Then, as so often happens in economics, a simple summation is made of the advantages of individuals, and credit comes to be regarded as part of the national (production) capital, just in the same way as a national protectionist policy is fallaciously constructed from considering the gains to particular protected industries. It is evident, however, that in its simplest form, so far as production is concerned, credit cannot directly increase the actual means of production which are potentially at the service of a nation, but can only transfer the right to use these means from one member of the community to another. Credit supplies in fact (as pointed out above) a species of medium of exchange, and logically the mere exchange of products or instruments is quite different from the actual increase of commodities. Thus, credit in the ordinary sense of the term cannot be considered as part of the national (production) capital.

But although a sharp distinction may be drawn logically between exchange and production, it is obvious that in a modern industrial society exchange is practically a necessary part of production. For without exchange division of labour, which is fundamental in production, could not be carried out, and without credit exchange itself, in the present state of society, could not be effected sufficiently for division of labour. Accordingly, so far a well organised system of credit may be regarded as one of the productive forces of industry. This is well illustrated by the occurrence of commercial crises, which for the time being through the collapse of credit place a check on the production of the nation. Bagehot very justly ascribed a large part of our commercial supremacy over continental nations to the superior organisation of our credit.

At the same time, however, it seems useful to retain the old distinction so sharply emphasised by Ricardo, McCulloch, Mill, etc., between the actual material (production) capital and the mere transference of the right to use that capital. If this is done, it will still be open to the economist to point out the different methods by which indirectly credit tends to increase production and also the accumulation of capital (in the narrower sense). (1) By means of credit capital finds its way into the hands of those who can use it to most advantage, as is shown in the increased discount of bills when a trade begins to flourish. Again many large undertakings would be impossible without credit, e.g. the construction of railways, the improvement of lands by funds obtained on mortgage, etc. The return for the funds immediately advanced must from the nature of the case be deferred. We may go further and say that as soon as we pass from the simplest stage of society in which the individual provides for his own wants, this deferred element which is the basis of credit comes to the front. The landowner must give credit to the *métayer* and also to the farmer, and similarly at every stage of a manufacture credit is given before the finished product is available to meet the cost of production. (2) By means of credit also the amount of national capital available for production is increased. Those whose savings would be too small (e.g. the working classes) if used alone, and those (e.g. the professional classes) who cannot use their wealth in material production, are enabled by credit institutions and all kinds of joint-stock associations to add to the means of production. In former times, as Adam Smith points out, almost the only means of employing possible surplus wealth was by keeping large numbers of retainers who were for the most part unproductive consumers.

The effects of competition in increasing the efficiency of production in spite of the defects of the *entrepreneur* system, have often been pointed out (e.g. by Walker), and even the socialists often allow that from the production point of view simply the *régime* of competition is perhaps superior to that of organised state control. But credit is evidently essential to the full development of competition, and the growth of credit is historically one of the most marked characteristics of the progress of society from status to contract. In nearly all contracts there is a deferred element on one side at least, in other words nearly all contracts involve credit, and thus again, indirectly at least, credit, by giving play to freedom of contract and competition, increases production.

Even taking the comparatively narrow view of Mill on the relations of capital to industry, we learn that although industry is limited by capital it seldom comes up to that limit, and

we may add the more perfect the credit organisation the greater the mobility of capital, and the nearer it approaches to the limit. And when we take the wider definitions of capital (see CAPITAL), now generally accepted, it seems possible to include certain species of credit directly under capital. An effective system of banking certainly increases the revenue not only of bankers but of the nation at large, and the "bank money" of the money market is to a great extent purely the creation of credit, and is as efficient as actual coin. It may of course be said that it is only "representative" money, but it is the result of highly-skilled labour and of reservation for future needs which are the general characteristics of capital. Thus JOHN LAW (q.v.) in his famous system was guilty not of a direct fallacy, but rather of exaggerating a truth from the theoretical standpoint; and practically, as he himself pointed out, he failed by trying to compress within too short a time what must take generations for its development. Credit effects a very great economy of the national resources, and thus may fairly come under revenue capital. Nor does this view appear to clash with popular usage, for we find in estimates of national capital that account is generally taken of the capital of banks and insurance societies and the like, although strictly, and taking only material (production) capital, this would involve counting the same elements twice over.

[Besides the treatment of credit in the text-books, the reader may consult the masterly work of Knies (*Der Credit*), which gives a critical historical survey as well as an original view of the theory, and the article by Wagner in Schönberg's *Handbuch*, which, more Germanically, gives a complete bibliography up to date. For the views of Mr. Masedon on credit see his works.] J. S. N.

CREDIT. INFLUENCE ON PRICES. Credit supplies the means whereby the transfer of wealth from one person to another is effected for a period of time, at the end of which it is restored to its owner. Having given this very general description of credit, it is necessary to be more specific. Thus, credit may be given in the form of commodities transferred by a tradesman to a customer, and paid for in money after an interval. In this case, the "consideration" for the credit given is sometimes not mentioned, but as a matter of fact it is obtained by the tradesman in the form of an addition to the price. Sometimes it is expressly understood that when goods are sold, some rate of interest on the cash price will be charged if they are not paid for at once. This form of credit, however, is of little importance from an economic point of view, though it is of importance in other ways. The only prices it affects are retail prices.

The credit given in wholesale transactions is

of much greater interest to the economist. It is a powerful agent for influencing prices, since it gives rise to what are known as bills of exchange (see BILL BROKING; BILL OF EXCHANGE), with all the consequences which their use brings with it. In this case, however, the credit is given, or at any rate is supposed to be given, as the result of a transaction in commodities, that is in real articles of definite value such as actual bales of cotton, or cotton cloth, pigs of iron, or other goods. The bill is drawn by the seller on the buyer, and the buyer "meets" it in three, four, or six months' time according to the nature of the bill. He gets the money, however, at once, by "discounting" the bill with his banker, who keeps it until it is due; or the drawer may discount it with a bill-broker if he has facilities for such an operation, who in his turn may sell it to a banker, or employ it as a "security bill" in his business. When any particular trade is active and profitable, bills arising out of it appear in increased numbers. They not only enable the drawer to use the money due to him for a sale at once, and set the drawer free from the immediate need of finding money to pay for what he has bought, but they may also be used as a basis for a temporary increase of the credit commanded by the person who discounted them. Bill-brokers sometimes pledge bills they have bought with bankers, as security for a short loan, and this leads to the consideration of another form of credit, which is even more effective than bills as an instrument for raising prices.

Bankers' Advances.—Many people suppose that a banker's "deposits" are solely the result of the paying in of money to the customer's account. As regards private individuals this is so in the main (see DEPOSITS), but a considerable part of a business man's deposit is the result of advances made to him, usually but not always on security. A successful manufacturer or merchant has no difficulty in getting such advances except in times of abnormal pressure in the money market, sometimes as an "over-draft," though this mode of giving credit is rarely adopted by banks in the metropolis, but usually as a loan, provided he can satisfy his banker that the operation he wants the money for is a sound one. In times of great trade activity a great deal of the money in the hands of bankers is placed at the disposal of enterprising men of business, and in these circumstances prices generally are apt to rise very rapidly, especially if the men to whom the advances are made are engaged in one or two of the leading trades of the country. A considerable rise in the price of coal and iron is sure to produce a rise in most other articles of commerce, and during the middle stages of a general rise in prices, money is lent freely, and under these circumstances the economic organism is in a state of the highest efficiency. Credit is then

at its *maximum*, and exercises its fullest effect on prices. Later on, when prices have risen very much, bankers become aware that the total volume of their customers' obligations is larger than is quite safe, and they therefore make advances with more caution.

Bank Notes.—It used to be thought that bank notes were the most powerful of all agents for raising prices, but that idea has long been abandoned, though it has been true where the notes are inconvertible. All authorities are now agreed that convertible notes cannot be over-issued. Inconvertible notes can be and have been over-issued, but they cannot be kept in circulation at par unless their issue is carefully restricted to meet the actual needs of the commercial community, as was done with consummate skill by the Bank of France after the war of 1870. An excessive issue of inconvertible notes may raise prices enormously. Theoretically the rise will be equal in all articles, but in practice some commodities are usually affected more than others. One peculiarity of an excessive note issue is that it operates primarily on retail prices instead of on wholesale prices as an expansion of banking credit does. In some countries—in Scotland, for instance—*convertible* notes are an important part of the machinery by which the business of bankers is carried on. A person in a small way of business, for whom an account is opened by a Scotch bank, may take a large part of what he requires in the bank's own notes, which thus practically take the place of Cheques. The system works well in Scotland, and it is quite probable that it would also work in England, though it is questionable whether it is absolutely needed, as owing to the great extension of the cheque system any person who has a good business, however small, can obtain the support of a banker. In any case a sound, that is a convertible, bank note issue cannot be nearly as effective an agent for facilitating the expansion of business as the system of advances, or "book credits," as Mill called them. Such credits are capable of expansion, limited only by bankers' opinion of the solvency of their customers. That opinion may at times be wrong, and then too much money is lent to the wrong people, prices are forced up too high, and a commercial crisis ensues.

Cheques.—The cheque system is a necessary part of the banking system, and cheques are not, in the first instance, a form of credit at all. If a bank's customer merely draws against cash actually deposited by him, it is obvious that the cheques he draws to pay debts or to provide himself with cash for daily use are not credit instruments, except to a very limited extent. Even when a cheque is drawn against an advance granted to the customer by the bank, it is not the cheque which is the instrument of credit but the advance itself. But when, as is occasionally the case, cheques pass through

several hands before being presented to the bank on which they are drawn, they become instruments of credit, taking the place of coin or notes in the district where they circulate. In England, where a large proportion of people have banking accounts, cheques do not circulate long in this way, for they almost immediately reach the hands of some person who pays them into a bank, by whom they are "cleared" in the usual manner, but there is reason to think that in countries where banking is less developed than in the United Kingdom, cheques on banks of great reputation are made to do a good deal of work as an aid to the coin and note circulation. Cheques on London banks given to hotel-keepers on the Continent often "remain out" for months, and when finally cleared are covered with the endorsements of the persons and firms through whose hands they have passed. Such cheques have, during the period in question, formed a real addition to the circulation of the districts they have traversed.

Foreign Cheques.—During the last ten or twelve years there has been an important extension of the cheque system in connection with foreign trade, cheques drawn in Berlin and Paris on a London banking house having become negotiable instruments payable at sight, just like a cheque drawn in Manchester on a London bank, so close are the relations between these two great capitals and London. A still more remarkable feature of modern business is the use of "telegraphic transfers," which are largely used in trade with India and the United States. They are of course merely orders sent by bankers to their agents in foreign cities to pay specific sums over to certain persons, but they greatly facilitate the operations of merchants and bankers.

Among the arrangements which have facilitated the extension of credit must be included the clearing houses established in London, Manchester and New York (see CLEARING HOUSES).

CRÉDIT FONCIER OF FRANCE. This institution is intended to enable house and landowners to raise money on mortgage at a low rate of interest, with facility of repayment by an annuity including redemption of the capital. The foundation of the *Crédit Foncier* was due to the economist M. Wolowski. It dates from 1852, but had been preceded in 1820 by a mortgage bank called the *Caisse Hypothécaire*, which, after a struggling existence, was finally liquidated in 1846. The new establishment was created under governmental patronage, and invested with special privileges which constituted a virtual monopoly. The

original idea was to found a number of mortgage banks, each with its operations confined to a prescribed region. Three only were organised, those of Paris, Nevers, and Marseilles; the last two were afterwards absorbed by the first, the operations of which were then extended to the whole of France. They were styled *Banques Foncières* with the name of their locality. On their amalgamation the subsisting one was at first called the *Banque Foncière de France*, but on representations by the *Bank of France*, which feared a confusion from the similarity of names, the title was changed to that of *Crédit Foncier de France*. The operations of this establishment were at first restricted to loans on houses and rural property, with or without redemption by a sinking fund. They were extended in 1858 to loans for drainage; in 1860 to Algeria, and in 1860 the *Crédit Foncier* was authorised to lend to towns and departments for public works and improvements. This last extension contributed in a great measure to the vast public works commenced under the empire and since continued. The *Crédit Foncier* was also empowered in 1860 to make advances in the form of discounts to the *Sous-Comptoir des Entrepreneurs*, a contractors' bank, which lends on mortgage to builders after their work has reached a certain stage, and while in progress; the *Crédit Foncier* itself only granting loans on houses when ready for occupation. When the buildings are finished the bills discounted by the *Sous-Comptoir*, and rediscounted by the *Crédit Foncier*, are cancelled by a regular mortgage to the latter company. The *Crédit Foncier* patronised in 1861 the formation of an institution called the *Crédit Agricole*, for advances to agriculture, not authorised by its own statutes, and which it assisted in a similar manner by rediscounts. This association involved the *Crédit Foncier* in difficulties in 1876, the *Crédit Agricole*, having imprudently taken in nearly seven millions sterling of treasury bills of the Egyptian floating debt, and passed them on to the *Crédit Foncier*. The Egyptian government having made default, the *Crédit Agricole* had to go into liquidation, and was merged in the *Crédit Foncier*, shareholders receiving a part of their capital in new *Crédit Foncier* shares. The *Crédit Foncier* also absorbed in 1882 a rival mortgage bank called the *Banque Hypothécaire*, which had been founded on the expiration of the exclusive privilege of the former, which had been only granted for twenty-five years. That operation gave rise to a further creation of shares, and as the business of the *Crédit Foncier* increased, new capital had to be raised, the right of issue of mortgage and communal bonds being limited to twenty times the share capital, the present amount of which is £6,820,000, with a limit of £8,000,000. The government exer-

cises a direct control over the *Crédit Foncier* by the appointment of the governor and two deputy-governors. The decisions of the elected board of directors are not valid without the approval of the governor. The *Crédit Foncier* enjoys the special privilege of issuing bonds which, in addition to the fixed interest, give a right to drawings for prizes. Each issue of bonds with a lottery requires, however, a special authorisation by the government. The *Crédit Foncier* can only lend on first mortgage, and to the amount of one-half the estimated value of houses and farms, and one-third of that of vineyards, woods, and other plantations. The commission or profit on mortgage loans cannot exceed six-tenths per cent, or an addition of 60 centimes to the rate of interest paid by the *Crédit Foncier* on its mortgage bonds of the preceding issue. The present rate (1890) for loans without amortisation is 4f. 50c. per cent, including commission. The annuity, interest and sinking fund, is 12·52 per cent for a loan to be redeemed in ten years; 7·63 per cent in twenty years; 5·04 per cent in fifty years, and 4·66 per cent in seventy-five years. Borrowers have always a right of reimbursement on specified conditions. The rates for loans to local bodies, communal or departmental, are lower, being calculated on interest at 4·20 per cent. The total amount of mortgage loans granted by the *Crédit Foncier* down to the end of 1891 was £144,004,661, of which £77,976,789 was outstanding. About one-fifth of the extinctions, amounting to £66,027,872, had been effected by the working of the sinking fund, and four-fifths by the exercise by borrowers of the right of liberation. The loans were about equally divided between property in Paris and the environs; and in the rest of France and Algeria. The communal and departmental loans amounted to £82,670,891, of which £47,285,961 remained due on the 31st December 1891. The nominal amount of *foncier* and communal bonds in circulation at the same date was £161,101,564, representing a realised sum of £122,376,926. The charter of the *Crédit Foncier* is now extended for a period of ninety-nine years from 1881.

[An account of the *Crédit Foncier* is given by Chas. Gide, *Principes D'Economie Politique*, Paris, 1889, pp. 331-333; see also Alph. Courtois fils, *Histoire des Banques en France*, Paris, 1881.]

T. L.

CREDIT, LETTER OF. A letter addressed to a banker, or some other person or firm, containing a request to make payments or give acceptances to a third person or firm for account of the writer or writers of the letter. Sometimes the letter, instead of being addressed to one particular person or firm, is directed to a number of banks, with an indication that all payments must be indorsed on it by the parties effecting them, so as to show what amount

remains unused. A letter of this kind is called a circular letter of credit. Circular letters of credit are also issued in the form of a request to the banks to whom they are addressed to purchase the holder's drafts on the bank who issued the letter, such drafts to be drawn on the forms which are handed to the holders of the letter of credit, each of these forms being marked with a fixed amount. Another class of letters of credit—commonly called confirmed letters of credit—is much used in mercantile transactions with foreign countries. These letters are addressed to the person to whom the credit is granted, and contain an authority to issue drafts up to a certain amount on the writer or writers; and also an undertaking, not only as against the drawer, but also as against all *bona fide* holders, to accept such drafts, provided they are issued within a certain time. If the credit is given for the purchase of goods there is a further condition added, according to which shipping documents of a value corresponding to the amount of the drafts must accompany or precede them.

E. S.

CRIMINAL PROSECUTION in Scotland is conducted by public prosecutors, and private prosecution, which cannot take place without the "concourse" or concurrence of the lord advocate, is almost unknown. When a crime has been committed, all who are supposed to be able to give evidence are called to testify before a magistrate in private: the suspected person may also make a declaration, which may at once be satisfactory and entitle him to liberation; if not, he is at once, or after further examination, committed for trial before a jury of fifteen, who acquit, condemn, or find "not proven," by a majority.

CRISES, COMMERCIAL AND FINANCIAL. Times of difficulty in commercial matters are, when pressure becomes acute, termed crises. The crises of 1857 and 1866 will be described in some detail. The most important ones which have occurred since the end of the last century likewise deserve notice; those earlier than that date, though historically of interest, exhibit features which have little in common with the methods of conducting financial and commercial business at the present day. The crisis of 1792-93, of which Macpherson (*Annals of Commerce*, vol. iv. p. 266) was the historian, is described by him as having followed heavy investments "in machinery and in land navigation." The number of bankruptcies was unprecedented. "Many houses of the most extensive dealings and most established credit failed; and their fall involved vast numbers of their correspondents and connections in all parts of the country." The usual features of a panic followed. Temporary loans became almost unattainable; hoarding followed. "It was impossible to raise any money upon the security of machinery or shares of canals, for

the value of such property seemed to be annihilated in the gloomy apprehensions of the sinking state of the country, its commerce and manufactures; and those who had any money, not knowing with whom they could place it with safety, kept it unemployed and locked up in their coffers." At a meeting of some of the principal merchants and traders in the city (23rd April 1793) the government was asked to assist business houses of real substantial standing by advances of exchequer bills. To this Mr. Pitt, then prime minister, agreed: the result entirely justified his resolution. "The very first intimation of the intention of the legislature to support the merchants operated all over the country like a charm, and in a great degree superseded the necessity of the relief by an almost instantaneous restoration of mutual confidence." A similar plan to that adopted in London was pursued in Liverpool, and parliament authorised the corporation of Liverpool to issue negotiable notes to the amount of £200,000 in support of the credit of individuals. Tooke mentions (*History of Prices*, vol. iv. p. 272) that in 1792, although the bank rate of discount was not reduced below 5 per cent, the market rate had fallen to, or below, 3 per cent per annum, and the 3 per cent consols had reached 97½ in the March of that year. "This comparatively low rate of interest had been, in some degree, both a cause and an effect of the great extension of the country bank system, which about that time took place." Too heavy advances on insufficient or inconvertible securities, and an overstimulated spirit of mercantile enterprise, appear to have been the causes of this crisis.

During the year 1796, and at the commencement of 1797, a severe pressure in the money market, extensive failures of banks in the north of England, and great mercantile discredit prevailed. The difficulties experienced were very great. At a meeting held in the city, 2nd April 1796, resolutions respecting the "alarming scarcity of money" were passed, and affirming "that this scarcity proceeds chiefly, if not entirely, from an increase of the commerce of the country, and from the great diminution of mercantile discount which the Bank of England has thought proper to introduce in the conduct of that establishment during the last three months." A plan was drawn up for a board to be constituted by act of parliament for the support of credit. They were to issue promissory notes, payable six months after date, bearing interest at the rate of £1 : 18s. per cent per annum, upon receiving the value in gold and silver, Bank of England notes, or in bills of exchange not having more than three months to run (Tooke, *History of Prices*, vol. i. p. 201). This proposal was not carried out. The pressure was aggravated to a great extent by alarms prevalent at the time.

The next serious crisis, taken in chronological order, took place in 1810-11. A careful history of the events which led to this disturbance is found in Tooke (*History of Prices*, vol. i. p. 303). A great advance, and an enormously high range of prices in this country, in 1808, while on the continent they were low, through the operation of the same causes which made them high here (see CONTINENTAL SYSTEM), induced merchants to make great efforts to overcome or elude the obstacles to trade. Heavy importations took place, a great fall of prices followed, so great that in many instances the importer, after paying for the enormous charges on importation, was left with nothing whatever to meet the previous cost. Simultaneously a total stop was put to the exports from this country to the Baltic. Here, as Tooke remarks, all the incidents which lead to a severe crisis were present. "So many circumstances, on so large a scale, combining in the same direction, the fall of prices, the reduction of private paper, and the destruction of credit, were greater and more rapid than were before, or have since been known to have occurred within so short a space of time." In August 1810 several failures of banks, and of important business houses were reported (monthly *Commercial Report*, 1st August 1810). It is stated—"speculations in Spanish wool, an article which has fallen about 50 per cent, are considered as the origin of those unlooked-for disasters. Five Manchester houses have stopped payment in the city, and we are sorry to add, have involved numerous industrious persons, both in town and country, in their ruin. The demands upon the five houses are said to amount to two millions; but it is supposed that their real property will ultimately cover all deficiencies. Speculative exports to South America are the rock upon which these houses have split. In consequence of these unexpected events, public credit is at the present moment as low as ever it has been in the memory of man." The report continues, 1st December 1810—"A numerical evidence of the present state of trade may be deduced from the number of bankruptcies in the *London Gazette*. They amounted—

This month in 1810 to 273	
The same month 1809 „ 130	
„ „ 1808 „ 100	
„ „ 1807 „ 97	
„ „ 1806 „ 65	
„ „ 1805 „ 80	
„ „ 1804 „ 60	

besides stoppages and compositions equal in number to half the traders in the kingdom! These failures throughout the kingdom have wonderfully affected the manufacture of every description of goods; and a general want of confidence exists between the manufacturer and the export merchant" (1st January 1811). "In our last report we stated the vast increase

of bankruptcies within the last month compared with similar months for seven years back ; and we regret to say that they still continue to increase in number, and that confidence in the mercantile world seems nearly at an end. . . . In Lancashire the cotton manufacturers appear, by the late gazettes, as well as by private information, to be greatly distressed, and business quite at a stand. In Manchester and other places houses stop not only every day but every hour. Cotton wool is in no demand at any price, and no export of the manufactured goods, except a few fine sorts to Rio, etc. The trade of Birmingham, Sheffield, etc., quite at a stand, and no orders for execution there, except a few for our home consumption." A reference to the parliamentary debates in the spring of 1811 will show that this is no exaggerated description. A select committee of the House of Commons made inquiries into the state of commercial credit, and reported that the statements as to the great embarrassment and distress were founded on fact, and that it "had arisen out of great and extensive speculations, which commenced upon the opening of the South American market in the Brazils and elsewhere, to the adventures of British merchants." The chancellor of the exchequer (Hon. S. Perceval) referred to the subject in his speech during the debate on the Commercial Credit Bill ; and after mentioning the report of the select committee, he continued, "the distress, originating with the merchant, and disabling him from paying the manufacturer, was felt most severely by the manufacturer and those employed by him. All the principal manufacturers had been compelled to contract, and some wholly to suspend, their works. It appeared by the report that there was scarcely a cotton manufacturer in the kingdom who had not diminished by one half the number of persons employed in his mills ; and that many of the smaller manufacturers had discharged their people altogether." Those employed by the manufacturers who still carried on business were retained at lower wages, and "the most calamitous distress" is described as prevailing in many of the manufacturers' districts. The commercial troubles of the time were not confined to the United Kingdom ; the condition of trade in the United States was fully as bad. Tooke quotes a letter from New York, dated 11th February 1811, which states that : "Such times for money were never known, and all confidence among merchants is totally, and indeed very justly, destroyed." This crisis appears to have been one of great severity ; in reference to it and to the further and even heavier troubles of 1825 the very artificial conditions of business induced by the restrictions on trade imposed by the great war waged at the commencement of the century in Europe, must be borne in mind. Tooke gives (*History of Prices*, vol. i. pp. 308-311) many details of the heavy charges which

had to be paid by merchants. Thus the freight and insurance on hemp from the Baltic to London was, 1809, in some instances from £40 to £50 per ton. The charge of conveyance of silk from Italy to Havre amounted nearly to £150 per bale of 240 lb. The following cases referred to, occurring between 1809 and 1812, are even more extraordinary. "The charges of freights and French licence on a vessel of little more than 100 tons burden, have been known to amount to £50,000 for the voyage merely from Calais to London and back ; this made the proportion of freight on indigo amount to 4s. 6d. per pound. A ship, of which the whole cost and outfit did not amount to £4000, earned a gross freight of £80,000 on a voyage from Bordeaux to London and back." Tooke says of this period (*History of Prices*, vol. iv. p. 273), "the commercial distress and banking discredit of 1810-11 nearly equalled, in point of intensity, those of 1792 and 1825 ; and the losses caused by the fall of prices in 1810 were, I am inclined to think, greater than they had been at any former period. In the still more violent fluctuation of prices which took place between 1812 and the close of 1815, it is possible that the losses were greater ; but there was not then any such sudden and extensive revulsion of credit and commercial distress as occurred in 1810-11."

The next serious crisis occurred in 1825, one of the most severe through which the commercial and banking systems of the country had ever passed. At this date speculation ran very high, for the most part in loans and mining adventures, and other investments abroad. The foreign exchanges were so much depressed as to be the cause of a nearly continuous drain on the bullion of the bank. This foreign drain, Tooke remarks, was not counteracted by any operation of the bank ; it was suffered, he observed, to run its course, till it ceased of its own accord, that is by simple efflux, towards the close of the summer. Many and heavy banking failures, and a state of commercial discredit, preceded and formed the earlier stage of the panic. The tendency to speculation, and the undue extension of credit, was preceded, probably caused, and certainly favoured and promoted, by the low rate of interest which had existed for some time previously ; and this low rate of interest was apparently prolonged by the operations of the Bank of England. Facility of banking accommodation which had existed for some time previously, favoured undue extension of credit.

This gradually led on to the great difficulties of the year.

In the summer of 1822 the bank reduced its rate of discount from 5 to 4 per cent. The course of the rate of interest is marked by the following statement of the price of the 3 per cent public funds.

1823.	3rd April . . .	73½
„	1st July . . .	80½
„	3rd October . . .	82½
1824.	1st January . . .	86
„	2nd April . . .	94½
„	28th „ . . .	97¼ (the highest)
„	November . . .	96¼
1825.	January . . .	94½
1826.	14th February . . .	78½ (the lowest)

The great severity of the pressure extended over a very short time, hardly more than three weeks. Some banking failures, principally in the provinces, in the month of December, were followed by the failure of several banks in London. A severe drain on the resources of the bank of England took place—"the lowest amount of the bank treasure was on the 24th of December, viz.,

Coin	£426,000
Bullion	601,000
	<hr/>
	£1,027,000

"The accidental discovery, for such it was said by Mr. Harman, in his evidence in 1832 (Bank Charter Report, 1832) to have been, of an amount of £1 notes which had been put away in the bank was, doubtless, a fortunate circumstance; for, although the sum was not large (between £700,000 and £800,000), it served to meet the peculiar difficulty of that time, which consisted in an extensive discredit of the small note country circulation. And it is probable that it had an immediate and very great effect in stopping the demand from the provinces for gold" (Tooke, *History of Prices*, vol. iv. p. 343). Though the period of pressure in 1825 was so short, it had been preceded by considerable and extravagant speculations in foreign loans and shares of companies, mining and commercial. Besides several mining companies for operation in Mexico, Chili, Brazil, Peru, and the provinces of Rio de la Plata, "so great was the rage for speculation that, in the course of a very few weeks, in the early part of the year (1824), the following undertakings, among others, were brought forward in London, and found subscriptions court- ing their acceptance:—The Alliance Fire and Life Insurance Company, with a capital of £4,000,000; the Palladium Fire and Life Insurance Company, with a capital of £2,000,000; the British Annuity Company, whose capital was £3,000,000; the Metropolitan Investment Company, with a capital of £1,000,000; the Thames and Isis Navigation Company, with a capital of £120,000; an Ale Brewery Association, with a capital of £200,000; a company for obtaining from government a grant of a million of acres in New South Wales, and for improving the growth of wool; an association for the cutting a canal across the Isthmus of Darien" [a curious anticipation of the attempt made to join the Atlantic and

Pacific oceans by the recent Panama canal]. More than thirty private acts were brought forward in the House of Commons to give effect to these projects. "In all these speculations, only a small instalment, seldom exceeding five per cent, was paid at first; so that a very moderate rise on the prices of the shares produced a large profit on the sum actually invested." Tooke describes the spirit of speculation aroused as follows. "This possibility of enormous profit by risking a small sum was a bait too tempting to be resisted; all the gambling propensities of human nature were constantly solicited into action; and crowds of individuals of every description—the credulous and the suspicious, the crafty and the bold, the raw and the experienced, the intelligent and the ignorant; princes, nobles, politicians, placemen, patriots, lawyers, physicians, divines, philosophers, poets, intermingled with women of all ranks and degrees (spinsters, wives, and widows)—hastened to venture some portion of their property in schemes of which scarcely anything was known except the names."

The extent of the speculative rise in prices is well shown by the following instances of the upward movement in market prices of five of the principal mining companies.

	10th December 1824.			11th January 1825.		
	£	£	£	£	£	£
Anglo-Mexican	100 sh.	10 pd.	33 pr.	158	115	125
Brazilian . . .	100	10	10s. dis.	66	70	44 pr.
Columbian . . .	100	10	19 pr.	82	62	59
Real del Monte	400	70	550 —	1350		
United Mexican	40	10	35 —	155	115	125

The recoil from these speculations was inevitable. The country banks, whose advances and whose issues of notes had both exceeded the limit of prudence, were among the principal sufferers. Several London banks likewise failed. A remark made by Mr. Huskisson, "that we were within a few hours of a state of barter," has often been quoted as showing the severity of the trial the country passed through. The turning point appears to have been in the week ending Saturday 17th December 1825. On that day, according to a statement made by Mr. Richards, then deputy governor of the bank, "whether from fatigue, or whether from being satisfied, the public mind had yielded to circumstances, and the tide, turned at the moment on that Saturday night." The greater part of 1826 was a time of considerable depression, but by 1827 the trade and manufactures of the country had resumed their usual and steady course.

The monetary disturbances of 1836-37 are not included by Tooke among the memorable commercial crises (*History of Prices*, iv. p. 269). "It was confined in a great measure to two branches of trade, the American and East Indian including China. The bank raised its rate of discount to 5 per cent, and laid some restriction upon the bills of the American houses, who were notoriously overtrading. But for purposes

of trade generally there was no want of accommodation; and the utmost rate that was heard of was 6 and 7 per cent for fair commercial bills of moderate length. And, with the exception above mentioned, there was depression in the prices of produce." The derangement of trade in 1836-37, as well as that of 1839, appears to have been but slight.

Of a far different character was the crisis of the year 1847. As was the case before the crisis of 1825 came on, a considerable period of speculative activity, fostered by a low rate for money, preceded this crisis also. Another circumstance has to be noticed. The bank act of Sir R. Peel came into operation 2nd September 1844. The automatic arrangement for the management of the note circulation which that act introduced took away from the directors alike any power or any responsibility for the "regulation of the currency" so far as this consisted of their notes. This responsibility being removed, the old arrangement by which a fixed or nearly fixed rate of discount was usually charged passed away as well. The demand for money being extremely slack at the time, a charge of 4 per cent, as their rate then was, had kept the bank entirely out of the market. On 5th September 1844 the rate was lowered to 2½ per cent for first-class bills, with not more than ninety-five days to run, and to 3 per cent for notes. 13th March 1845, the rate was placed at 2½ per cent, both for bills and notes, a lower rate than had ever been previously charged. The published rate was also for the first time stated (March 1845) to be the minimum rate, and this form of announcement has been continued ever since. The fact that the bank competed now, practically for the first time, with the bill brokers in the open market was a very important factor. The bank soon became a large holder of commercial bills, and exercised a great influence accordingly. Meanwhile several other causes had contributed to the stringency of affairs which deserve attention. Such causes are usually to be traced to reasons which have been in existence for some time previously. Previously, both in 1825 and 1847, considerable reductions had been made in the interest paid on the public funds. This had in 1825 the effect of turning people's minds to foreign investments. In 1847 speculation was chiefly directed to the development of railways and other improvements at home. "In social and financial interest and importance railways far surpass the other agencies of transport. The creation of the present century, they have contributed largely to promote its special characteristics." Prof. Bastable, *Public Finance*, London, 1892, bk. ii. ch. iii. § 12. Up to 1846 their progress had been slow.

The amounts which parliament had authorised railway companies to raise are given in Porter's *Progress of the Nation*, p. 327, as follows—

Railway Capital.		Yearly Average.
	£	£
In four years 1826-29	3,267,000	817,000
" " 1830-33	8,629,000	2,157,000
" " 1834-37	43,522,000	10,880,000
" " 1838-41	14,458,000	3,614,000
In two years 1842-43	9,173,000	4,586,000
In one year 1844	17,870,000	17,870,000
" " 1845	60,824,000	60,824,000
" " 1846	132,096,000	132,096,000

The enormous increase in this class of expenditure, after 1841-43, explains of itself great part of the monetary difficulties which succeeded. Tooke gives (*History of Prices*, vol. iv. p. 314) an estimate of the actual outlay on labour and materials of railways about this period which is very instructive.

Estimated Outlay on Labour and Materials
(Railways).

1841 . . .	£1,176,000
1842 . . .	2,384,000
1843 . . .	3,548,000
1844 . . .	4,880,000
1845 . . .	11,280,000
1846 . . .	29,188,000
1847, first half-year	20,560,000

After an outlay which in the first half of 1847 had been nearly two-thirds of the whole of that in 1846, this class of expenditure was sharply arrested. The effect of these different operations—(1) a sudden immensely increased outlay of capital on fixed investments; then (2) an even more sudden and sharp stop put to this outlay—on the business of the country may be well understood. Meanwhile, simultaneously with this double derangement to the ordinary course of transactions, a wild speculation in railway stocks went on.

Some idea of this may be obtained from a very careful paper read before a meeting of the Statistical Society, January 1847, by Mr. Dawson.

"Between March and September 1845 joint-stock speculations for the immediate investment of capital were set on foot, involving a larger aggregate amount than had ever before been so involved in this country. The amount to raise which, for railways alone, the sanction of parliament was actually applied for in the following session, exceeded £340,000,000 sterling. And if we include all the new schemes in which scrip, or letters of allotment, were actually selling in the market at a premium in July, August, and September 1845, the amount cannot be estimated at less than £500,000,000.

"Many of the schemes of 1845 reached a high premium within a few weeks after their issue; and all those first in the market, and having any substantial merit, were raised considerably above their true value. For instance, the Leeds and Thirsk Railway—£50 shares, with only a deposit of £2 : 10s. paid—were selling in March at £3 : 10s., in September at £23 : 15s., and in November at £4 : 15s. per share. Again,

the Bolton, Wigan, and Liverpool—£40 shares with £4 paid—were selling in January 1845 at £4:10s.; in September at £42:15s.; and in December, when £9 had been paid, at £20 per share. If we assume an average premium of £10 per cent upon the schemes then in the market, the property temporarily created by these speculations (and the repeated purchase and sale of which, on commission, furnished profitable employment to some thousands of brokers) must have been at least £50,000,000.

"And to this there is to be added an increased value, during the same period, of the shares in the established lines of railway. For instance:

"The Midland stock—amount £4,180,000—was selling in January 1845 at 114 per cent, and in July at 188 per cent; showing a rise of 74 per cent, and an increase in the aggregate value of the stock of £3,098,000.

"The Great Western—share capital issued £8,100,000—£100 shares selling in January 1845 at £156; and in July at £228; and (allowing for a call at £5 per share in the interim), showing a rise of 67 per cent, and an increase in the aggregate value of the shares of £5,467,000.

"The Manchester and Leeds—share capital £4,660,000—£100 shares selling in January 1845 at £126; and in August at £215; showing a rise of 89 per cent, and an increased value in the aggregate of £4,147,000.

"The average increase in the value of £100 shares in these three lines was £76; and the total increase of value in August and September was upwards of £12,000,000."

Mr. Dawson continues: "It will be seen, on reference to the tables, that during those months in which the purchases and sales of railway property were most numerous and extensive, while everybody was buying and selling shares, and the current rate of interest was only 2½ per cent, that portion of the circulating medium which consisted of Bank of England notes was but very slightly, if at all, increased; and that it reached its greatest amount when the prices of shares were lowest—when the number and amount of current transactions were reduced to the lowest point by discredit, and when the current rate of interest for first-class bills had risen from 2½ to 4½ per cent."

These last remarks of Mr. Dawson's refer to an important point connected with this crisis—the first authoritative suspension of the bank act of 1844, and also, incidentally, to the question of the connection between the circulation of notes and periods of commercial crisis. Reference will be made to this further on. Meanwhile other complications occurred.

The failure of the potato crop in 1846 caused the need for a heavy importation of corn. "The price of corn was very high in 1847, the average in May being 92s. 10d. per

quarter, but the imports rose in proportion. In the three years from 1845 to 1847 they were as follows:

	1845	1846	1847
	Cwts.	Cwts.	Cwts.
Wheat	3,777,140	6,207,894	11,511,305
Wheatmeal and Flour	945,864	3,190,429	6,329,058
Maize.....	241,667	3,024,883	15,464,194

The corn merchants, who for some time had great difficulty in obtaining advances upon cargoes in consequence of the high rate of discount, lost immense sums from the great fall in prices which took place, owing to the prospect of an abundant harvest. And the result was the failure of many houses in the corn trade, which became the signal for other heavy bankruptcies. Several banks succumbed, and credit was severely shaken" (L. Levi, *History of British Commerce*, p. 310).

The fluctuations in the rate charged by the bank were very considerable, and were the more noticed at the time as nothing exactly similar had ever occurred before.

On 1st January 1847 the notice of 27th August 1846, fixing the minimum rate at 3 per cent per annum on 95 days bills, was still in force.

1847.	Per cent.
14th Jan.	3½ minimum on 95 days bills.
21st "	4 "
8th April	5 "
15th "	5 omitting all stipulation as to the term of the paper.
2nd Aug.	5 on 1 month bills; 5½ on 2 months; 6 per cent above 2 months.
5th "	5½ minimum rate.
2nd Sept.	5 on loans till 14th Oct.
23rd "	5½ on 2 months bills; 6 per cent on 3 months.
1st Oct.	5½ on everything falling due before 14th Oct., and total refusal to advance on public securities.
25th "	8 minimum rate under authority of the government letter of this date.
22nd Nov.	7 minimum rate.
2nd Dec.	6 "
23rd "	5 "
1848.	
27th Jan.	4 "

The announcement of 1st October that no advances would be made on public securities produced (see *Economist*, 9th October 1847) a severe panic on the stock exchange. There was no failure of a bank, however, except that of Cockburns and Co. of Whitehall, till 13th October, when Knapp and Co. of Abingdon suspended payment. On 18th October the Royal Bank of Liverpool stopped; before 23rd October other important banking failures took place at Liverpool, Manchester, Newcastle, and in the West of England. 3 per cent consols, which had stood at 84½ on 5th October, were

by this time 77½, the lowest point, and a total suspension of all business and all payments was imminent. The reserve of the bank was reduced to a very low ebb.

1847.	Reserve of Specie.
16th Oct.	£3,070,000
23rd „	1,990,000
30th „	1,600,000

Meanwhile the anxiety and alarm prevailing were causing a general hoarding of coin and bank notes, and it really appeared not unlikely that the banking department of the Bank of England might be compelled to stop payment while there was more than £6,000,000 of specie in the issue department. The chancellor of the exchequer (Sir C. Wood, afterwards Lord Halifax) was urged by many deputations and remonstrances to relax the bank act, but he declined. At last, on 22nd or 23rd October, some of the leading city bankers had an interview with the prime minister (Lord John, afterwards Earl Russell), and on their explaining the necessities of the position, the desired relaxation was given. The official letter (25th October) recommended "the directors of the Bank of England, in the present emergency, to enlarge the amount of their discounts and advances, upon approved security." A high rate, 8 per cent, was to be charged, to keep these operations within reasonable limits; a bill of indemnity was promised if the arrangement led to a breach of the law. The extra profit derived was to be for the benefit of the public. No really adequate reason has ever been given for this last stipulation, unless it is supposed to have been made to prevent the bank from maintaining the extra rate unduly long.

The effect of the government letter in allaying the panic was complete. When anxiety as to obtaining bank notes or gold was removed, the immediate pressure shortly disappeared. Speaking in the House of Commons, during the debate of 30th November on this subject, the chancellor of the exchequer (Sir C. Wood) stated that the tenor of the remarks made by those who applied to him was "Let us have notes" . . . "We don't mean indeed to take the notes, because we shall not want them; only tell us that we can get them, and this will at once restore confidence."

The space which can be allowed here to this subject does not permit further details being given. It should be observed that the earlier crises than the last one mentioned here, that of 1817, were all so greatly influenced by the highly artificial condition both of trade and credit, caused by the terrible wars of the commencement of the century, that the lessons to be drawn from them are, comparatively speaking, inapplicable to the business circumstances of the present time. The commercial histories of that period, including the admirable one con-

tained in Tooke and Newmarch's *History of Prices*, are full of remarks on the questions how far the crises were brought on, or increased in severity, by the issues of notes made by the country bankers at that period. That those banks employed their own credit frequently unwisely there is no doubt, and equally that they frequently gave credit unwisely to traders on inadequate security. Notes were at that date the recognised medium in which advances were made; and that there was by all banks, including the Bank of England, at times an over-issue of the circulating medium may be conceded. It is, however, matter for fair discussion whether any statesman nowadays would have arranged the bank act of 1844 on the principles of Peel, or whether it is advisable to concentrate the whole of the issues on one bank, however powerful and well-organised.

Commercial crises may take place without any reference to the circulating medium, as has been exemplified in Hamburg and elsewhere. They can only be averted or mitigated by the judgment of those with whom the guidance of commercial affairs and of the banking institutions of the country rests at the time.

[The periodicity of crises has frequently been noticed. Mr. Wm. Langton, in his paper "Observations on a Table showing the Balance of Account between the Mercantile Public and the Bank of England," *Transactions of Manchester Statistical Society*, 1857-58 (reprinted also in the *Transactions*, 1875-76, Appendix), has made valuable remarks on the subject.—Mr. John Mills ("Paper on Credit Cycles," *Transactions of the Manchester Statistical Society*, 1867-68), has shown the connection between these periods and the variations of personal feeling.—Also paper by H. Chubb (*Statistical Society Journal*, June 1872), "Bank Act and Crisis of 1866.—Prof. Jevons (*Investigations in Currency and Finance*, pp. 153, 203-8), has shown, with his customary ingenuity of research, that the period of credit cycles and of the solar cycles of maximum intensity correspond with considerable exactness. The frequent recurrence of periods of excitement and depression in monetary and commercial matters is likewise referred to by Mr. James Wilson, *Fluctuations of Currency, Commerce, and Manufacture, referable to the Corn Laws*. We must be careful not to yield to the belief that *post hoc* is identical with *propter hoc* in these matters; but this subject is eminently one in which careful historical investigation may be expected to produce useful and practical results. For earlier history, Macpherson, *Annals of Commerce* (4 vols. London, 1805).—Anderson, *Origin of Commerce* (4 vols. London, 1801).—*Select Tracts on Commerce and Early Tracts on Commerce*, reprinted and edited by J. R. McCulloch, 1856-1859, may also be consulted.—Max Wirth, *Geschichte der Handelskrisen*, Frankfurt am Main, 1891.—D. Morier Evans, *Commercial Crisis*, 1847-48 (published 1848).—D. Morier Evans, *Commercial Crisis*, 1857-58 (published 1859).—C. Juglar, *Des Crises Commerciales*, Paris, 1889.]

CRISES, 1857-1866-1890. The early panics of the present century having been described above, our attention will be confined here particularly to the events of 1857, 1866, and 1890.

One of the most remarkable and instructive facts is negative, viz. that there has been really no panic in England since 1866. The difference between the events of that year and what occurred in 1890 will be explained later on. It was formerly regarded as almost a law of nature that a crisis should arise every ten years or thereabouts, and the years 1825, '37, '47, '57, and '66 confirmed this impression. But since the last date, with the exception of some alarm in 1878 (when the City of Glasgow and the West of England Banks collapsed under circumstances calculated to cause such disquietude as would in former times have caused alarm if not panic), though there have been many changes in business, and a huge development of trade, we had no crisis until November 1890. This last crisis differed much from previous disturbances of credit. In former times alarm was diffused over the whole kingdom; London was drained of its reserves to fill up the wants of the country, and the imprudences of banks having caused or aggravated alarms, there was a general uneasiness in the banking world and a consequent increased holding of cash, and an indisposition to grant assistance to the trading world. But, on this last occasion there was no general alarm in the country. Banks outside London were hardly sensible of the crisis, and even in London there was no panic except in Capel Court. No bank failed in town or country, and no suspicion of danger to banks seems to have existed amongst their customers. Some great issuing houses lost their position, and narrowly escaped suspension. Enormous losses fell on the public, but not on banks, except indirectly. It was not a panic as involving general alarm amongst the public, but a crisis in special directions, which might easily have extended, so as to have caused such a panic as never yet has occurred in any country. The danger was prodigious, but it was averted.

In former crises the danger was not averted, and things were allowed to drift, so that great houses and banks failed, and general alarm ensued. In this case, no great house suspended, though Barings, one of the greatest of all, went into liquidation. Instead of a huge lock up of mercantile capital in unpaid documents, business was carried on without any serious inconvenience to any one; and it may be fairly said that, for all practical purposes, nothing was known of the crisis in the country at large, until all was over.

In some respects all crises are alike, inasmuch as all such events arise from what is called an "abuse of credit." But that abuse may take various forms. Sometimes the vagaries of banks in lending enormous sums

without any security that can be realised, have caused the trouble. At other times, as for instance in the case just referred to, great investments by the public in stocks which are worthless, or much depreciated, have had a similar effect in arousing exaggerated alarms. The causes varying, the results also vary much.

Of course, if the errors of banks start the anxiety, it is natural that other banks should feel the effects more than merchants who have nothing to do with the matter, except that they suffer for the mistakes of others. If, on the other hand, as in 1890, mercantile imprudence originated the mischief, then, most naturally, mercantile credit is affected more than that of banks, who may suffer, but not deservedly.

A glance at the peculiar features of the several crises above mentioned will illustrate what has been here stated, and will bring out more clearly those resemblances and differences which tend to throw light on the whole subject.

It is not very easy to define how far credit may extend safely, but it is very clear that during the years 1855 and 1856 the extension of credit was enormous and dangerous. It has been sometimes asserted, though there is no way of testing the truth of the assertion, that during the years in question there were as many bills offered for discount in Lombard Street as there are now, though the real volume of trade has vastly increased since 1857, the total of the imports and exports being unitedly £311,764,000 in 1856, and £748,944,000 in 1890. In those times it was a common thing for banks in manufacturing districts to send great masses of bills to London for rediscount, i.e. bills taken by the banks, but which they were unable to hold to maturity from their own resources. The amount of this business in 1856 and 1857 was enormous, and even after the panic of that year, when many bills came to an end by failures of traders and of bankers, the amount of rediscounts by banks continued to be very large. But, at this moment, that business has almost come to an end. It was much reduced after 1866, and it is now confined within narrow and perfectly legitimate limits. In fact most of the banks which in 1857 were borrowers in London are now large depositors there.

Those who are too young to remember 1857 would not find it easy to imagine the condition of things which then existed. The reserve of the Bank of England may be said to have been continually at danger point (the amounts in the autumn of 1857 are given in the table that follows), although the daily transactions in Lombard Street were large and important. The demands were often heavy, as we have said, but the reserve was miserably small. It was a common thing for the largest operators in bills to keep practically no reserve whatever,

and to depend on application to the Bank of England for the supply of their wants. The average rate of interest paid on loans and discounts was very high, and though it is true that no prudent trader was ever killed by interest paid on borrowed money, it is clear that in a condition of things when traders generally were large borrowers, the existence of a very high rate of discount was one of those circumstances which combined to create an electrical and excitable condition in men's minds, so that alarm and panic were very liable to supervene.

The immediate cause of panic is of course the fear on the part of borrowers that they will not be able to secure what they need, accompanied by a fear on the part of lenders of giving what, in ordinary times, they would grant with pleasure. This fear arises in different ways on different occasions. It may be caused by heavy failures making even the solvent anxious as to their future, for all traders have payments for which they must provide. Or it may arise from the condition of the Bank of England, as her accounts are periodically published, and are supposed to tell all the world what may be expected as to borrowing and lending. However small may be the reserve kept by other operators, "the bank" is expected to be ready for every emergency, and if her reserve should be depleted, every one gets alarmed and desires to provide without delay against a very uncertain future. So it comes about that adverse exchanges combine with internal alarms to reduce the surplus notes of the bank, and this condition adds to the demands upon her just when she is least able to meet them. Under our system, however great the pressure, she cannot take a sovereign from her issue department. The gold held there is as sacred as if deposited at Westminster in the custody of the government. The bank, therefore, raises the rate of interest, so as if possible to attract gold from other countries. That movement cannot operate at once, but the fact of her taking such action is quickly effective in increasing alarms outside. Demands increase still more, so that the bank has recourse to restrictions in one form or another—restrictions which only aggravate panic, until at last the bank must either collapse as a bank, and cease to make advances, or must obtain extraordinary powers, so that she may allay alarm by a greater freedom in her operations.

So marked has been the influence of these considerations during recent panics, that some writers have been disposed to attribute our present liability to these alarms to the change made in our currency laws in 1844, when the two departments of the bank were separated, and the old elasticity of the issues of the bank was replaced by a hard and fast limit dependent on supplies of bullion. But the answer to this suggestion is very simple, viz. that our

panics before 1844 were probably far more severe than those which have occurred since, and that for twenty-three years since 1866, with the same law, we have had no proper panic. In 1837 the bank was very nearly denuded of gold, her issue of notes not being restricted, whereas since 1844 she has never been deprived of a large reserve in the issue department, a reserve not available without special authority from government, but still a reserve which is available, and has been found ample for every emergency of modern times. Alike in 1847, 1857, and 1866, a letter from the chancellor dissipated the panic as by the wand of a magician. Once remove the fear of a complete break-down, and panic passes away far more quickly than it arose. It is astonishing how soon all real alarm disappears, and business resumes an ordinary course. High rates of discount may prevail for some time, but, sooner or later, they too disappear, and the contrast is quite ridiculous, when one considers how small is the real change in affairs in a comparatively short space of time. The weak spot has been discovered, the leak has been stopped for a time, and so it is said "confidence is restored," until a renewal of commercial blunders or follies brings about a renewal of discredit and consequent alarm.

The following table shows the rapid change which arises as soon as the panic has subsided:—

000 omitted in cols. 2 and 3. Figures from nearest return.

1 Year and Month.	2 Gold Bullion in Bank	3 Reserve of Notes.	4 Rate of Discount per cent.
September 1, 1847	£7545	£4488	5½
October 1, "	7185	4112	6
November 1, "	6745	1547	8
December 1, "	8315	4228	7
January 1, 1848	10,262	7786	5
September 1, 1857	10,564	5830	5½
October 1, "	10,681	6014	6
November 1, "	8777	3485	9
" 11, "	6666	957	
" 18, "	6079	1148	
" 25, "	6784	1918	
December 1, "	6895	2268	10
January 1, 1858	10,905	6064	8
March 1, 1866	13,113	7345	7
April 1, "	13,502	6881	6
May 1, "	13,005	5884	7
June 1, "	11,434	415	10
July 1, "	14,170	4346	10
August 1, "	12,893	2630	10 ²

¹ £2,000,000 was, under authority of treasury letter, 12th November 1857, added to the securities in the issue department, in the returns from 18th November to 23rd December 1857, both inclusive. The strict limits of the act of 1844 were only exceeded in the returns of 18th and 25th November 1857.

² Reduced to 8 per cent 6th August.

So far the features of both the panics now under consideration are very similar. The difference is more one of detail than of principle. In both there was the high rate of discount following adverse exchanges, and great demands for accommodation by traders. In both there was the depletion, more or less rapid, of the bank reserve, and finally the heavy failures and the consequent alarms, ending in a sort of "stampede" or "*saute qui peut*," if one may use such expressions in this place. In neither case did a single solvent firm succumb, though in both cases, and especially in 1857, more than one solvent house escaped as by a sort of miracle.

Of course the panic of 1866 was marked by the great failure of the almost historic house of Overend, Gurney, & Co., and by that memorable "Black Friday," when it seemed likely that confidence might be utterly lost, whereas in fact it was maintained in a truly astonishing way. Lombard Street was given over to an excited crowd who did not, however, withdraw their deposits, if they had any, and the day passed off with most trifling results as compared with the fears that pervaded the minds of many experienced persons. But the panic of 1857 was in one way more striking and more serious than that of 1866, inasmuch as it was as widespread in America as it was in the United Kingdom, and in fact began in New York. But these differences are not of first-rate importance. The grand distinction between the two panics is that already mentioned, viz. that in the former no warning was taken, and the panic was followed in a few years by another equally severe, while, in the latter case, the lesson seemed to have been taken to heart, the excessive credit was cut down, and the era of panics seemed to have passed away. Why this should be so is not very clear. Some say that the disappearance of Overend, Gurney, & Co., and their friends is one great cause of the change. Without refusing to give some weight to this fact, it is difficult to suppose that this can be the only cause of so remarkable a contrast. It seems more rational to say that the tremendous lessons of 1857 and 1866 were not lost on the financial or the mercantile world, and that, as a result, credit has been maintained on a far sounder footing than in former years.

This confidence in our present position was, it is true, somewhat rudely shaken during the year 1890. As already stated, although we were not visited by an old-fashioned panic, the events of 1890 bore no small resemblance to those of former years, and, but for much judgment and skill displayed by the directors of the Bank of England, the crisis of 1890 might have easily ended in failures and panic far more serious than those of any former years. It is probably quite true that the tremendous lessons of 1857 and 1866 were not lost on the financial

or the mercantile world, and that credit was maintained on a comparatively sound footing for many years. There has been abundance of enterprise since 1866, but those who have been familiar with the money market for thirty years will, we think, agree that a much larger proportion of business is now transacted on a cash basis, and without recourse to credit, than was possible a quarter of a century ago. But though this is so, and, in ordinary business, there may be less danger of "abuse of credit" than there was when the country was much less "capitalised" than it now is, the very abundance of means may have given rise to an inclination towards excessive confidence, as if the capital available for loans of all kinds had no limit. This feeling may also have been intensified by the great accumulation of capital in the hands of "trusts" or "investment companies" eager for profit, and not always so much alive as are individuals to the danger of great mistakes.

But, probably, the most important distinction which marked the position of 1890 as compared with 1857 and 1866 will be found in the condition of the Bank of England. When alarm began at the latter end of October 1857, the reserve of the bank was under £5,000,000, and at the end of April 1866 it was under £6,000,000. In one day in 1866 £4,000,000 left the bank in notes and coin, in consequence of the failure of Overend, Gurney, & Co. Such a position was dangerous, and the publication of such returns, combined with the raising of the rate of discount to nine and ten per cent, was sure to aggravate alarms. But in 1890 the reserve stood at £14,500,000 when it became known that the great house of Baring had gone into liquidation, and that its liabilities would be paid by the bank. The position of the bank being so strong, and it being known or rumoured that the action of the bank was approved and supported by the government, panic did not arise, except as to the price of securities directly affected by this great failure, or by failures in America, and no mercantile disaster of the least consequence occurred, nor was the rate of interest charged on discounts excessive. In fact, there was no general discredit. Of course there was uneasiness, it being known that other houses must have lost heavily through South American complications, but banking and other business went on as usual, and prices of produce were not seriously affected.

There were none of the usual symptoms of panic, except in the Stock Exchange, and the contrast to those who had lived through 1857 and 1866 was very remarkable. In those years people feared that the bank would be unable, without an increased power of issue, to deal with the emergency, and it was never absolutely certain when, if at all, the government would come to the aid of the bank. In 1890, thanks

to the forethought of the bank in providing herself with an addition to her bullion by a loan, her position was so strong at the critical moment as to prevent the occurrence of any general alarm. Men did not rush to supply themselves with money one day, in fear that they might find it difficult to procure it on the following day, but attended to their businesses without excessive anxiety as to the supplies of capital. Caution prevailed, but not panic, and the distinction is a very clear one.¹

As to the effects of crises and panics, there is perhaps but little to be said. It has been already pointed out that trading people soon recover their spirits and their confidence when the panic is once well over. So it comes to pass that prices which, before and during panics, have been in some instances severely depressed, quickly rise to their former level, and men cease to consider the money market in their dealings, being no longer afraid of monetary trouble as to the discount of bills, or otherwise. The statistics of our trade seem to confirm this view. Spite of panics, our aggregate trade has gone on increasing, with fluctuations no doubt, but not with fluctuations which seem to point to panic as the great disturber of our commerce. We have had divers "depressions" in trade, often very difficult to account for, and they are generally followed by improvement and even speculation, often little expected, and arising no one knows why. But certainly, in recent years, neither depressions nor elevations can be traced to the effects of panic. Vast changes have taken place, thanks to "many inventions," and prices have fluctuated beyond all precedent without any very marked oscillations in credit. The supply of loanable capital since 1866 has been, on an average of years, ample, and this has no doubt lessened the tendency to panic amongst traders generally. But there have been these great fluctuations although the money market has been so stable, and this recent experience tends to confirm the opinion

that we should not attribute much permanent effect to the panics of former periods. No one is likely to forget the temporary effects of a panic if he has lived through one, but, as to permanent results, panics are probably not important.

Certainly the progress of the United States has not been materially hindered by their panic troubles, although they have been, like other American disasters, on a "magnificent" scale. 1873 and 1884 will not soon be forgotten in the States. The effects of 1873 are said to have been felt for five years, just as were the effects of 1837, but the country made extraordinary progress throughout, and seems now to be moving on more rapidly than ever. If there was a check, it is not very easy to say where it is to be seen. Probably the civil war had far more to do with causing such a check, if there were one, than even the panic of 1873.

It is interesting to observe that countries where panics are rare, as France and Germany, do not appear to make greater commercial progress than England and the States, where panics have been, comparatively, not infrequent.

In fact, in countries of great enterprise, and where credit attains a great development, it is obvious that there must be a danger of undue expansion followed by excessive alarms. Such people use up their means too closely, no doubt, but, on the other hand, they do far more business and acquire far larger profits from their enterprise than can be secured by people who are no doubt more prudent, but are less energetic. The very prudent nations escape panic, but they at the same time must accept a smaller return on their capital. They no doubt keep larger reserves than less cautious traders, but such reserves are expensive to maintain, and it may be well doubted whether in the long run more is not gained by the more enterprising peoples, even though they may subject themselves to occasional alarms of a serious and painful nature.

The general result seems to be that, however remarkable the phenomena of crises may be, they are not of great permanent importance, nor are they to be regarded as an inevitable consequence of an active and enterprising conduct of business. They are really spasmodic symptoms, and not symptoms of any serious and continuous disease which has to be brought under some legislative remedy. They illustrate the results of a temporary suspension of the laws which regulate the ordinary currency of a nation when confidence between man and man is lost, but events so exceptional defy regulation, and the cure for such evils will probably be found rather in the practical good sense of men of business than in any expedients invented by ingenious law makers.

It has, however, been suggested that some kinds of legislation may aggravate panic; as, for instance, the law of the United States of

¹ The contrast of the three great crises with reference to the reserves of the bank in its banking department, is shown by the following Table.

Notes in reserve in the Banking Department of the Bank of England.

1857		1866		1890	
Oct. 3	6,014,000	April 13	6,317,000	Oct. 16	10,275,000

[For returns from 18th November to 23rd December 1857, see note 1, p. 463.]

America as to bank reserves, and our own law as to the issues of the Bank of England. We certainly think that the experiences of 1847, 1857 and 1866 (to say nothing of 1890), show that such a law as ours, which gives no power of expansion to the bank, as such, no matter how grave may be the emergency, is one of very doubtful wisdom. It would, we believe, be far more reasonable to adopt something like the plan adopted by the German Bank law of 1875, whereby the bank can issue beyond the usual limit on paying at the rate of 5 per cent per annum to the government on all extraordinary issue, as a sort of penalty—an arrangement which ensures a reasonable charge to the public on such extra issues, and thus compels contraction of obligations by a sort of automatic process. Panic is thus avoided, while a wholesome warning is extended to the trading world, and the money market is brought under the rule of law, and is not, as with us, dependent in the worst times on the caprice of a Chancellor of the Exchequer, who may be a man ignorant of the dangers and difficulties of commerce, or who only knows them vaguely, as set forth in the books of mere theorists. W. R.

CRISES, PERIODICITY OF. In the world of physics the idea of "periodicity" of "cycles" is familiar. The twenty-eight years period of the sun is a simple illustration of a regular cycle.

The recurrence of commercial crises over a century, at intervals of ten or twelve years, has been frequently noticed by economists, and the suggestion made that possibly the physical law which, every ten or eleven years, brings good vintage years to Europe and droughts to India, may control the commercial fortunes of men. An enumeration of recorded years of acute commercial distress—1753, 1763, 1772-73, 1783, 1793, 1815, 1825, 1836-39, 1847, 1857, 1866, 1878, 1890—suggests periodicity. During these 140 years trade and banking have been carried on in war and peace, with a silver standard, with a gold standard, under a suspension of cash payments, in times of plenty, and in times of want; but the fatal years have come round with a considerable approach to cyclical regularity. While admitting that the commercial crises to which this generation has been exposed have been less acute than those which afflicted the close of the last and the beginning of the present century, the fact of their recurrence in something like periodicity remains—a fact which it is easier to record than to explain. Space only permits a statement of some of the more important crises, with a reference to works from which fuller information may be derived.

To commence with the beginning of this century, the question of the periodicity of cycles is discussed by Henry Thornton, whose well-known sagacity caused him to be greatly consulted on financial questions by William Pitt,

in his work, *An Enquiry into the Effects of the Paper Credit of Great Britain*, 1802. Thornton speaks of the crisis of 1793 as the first material one of the kind which had for a long time happened. He points out that the panic greatly abated, and mercantile credit began to be restored, so soon as the *intention* to issue exchequer bills was announced. He also mentions as worthy of notice that, though the failures had originated in an extraordinary demand for gold, it was not any supply of gold which effected the cure, but the idea of general solvency which was created by the promised issue of exchequer bills (pp. 49-51). He further mentions (p. 152) that the fluctuation in the balance of trade with foreign countries which we experience had also become larger than heretofore, in consequence of the greater extent of our population and commerce. "The scale of all things having increased, the scale of this balance may have increased also in a degree unexpected by the bank."

Tooke, in his *History of Prices*, vol. i. p. 176, gives a clear account of the progress of events leading up to the disasters of 1793. Tooke states that immediately preceding that crisis a great revulsion and derangement of commercial credit had occurred, due to a pre-existing and undue extension of credit and paper circulation.

In vol. ii. p. 5, in discussing the causes which led to the discredit of 1816, he explains that the speculation in exported commodities, which had its first rise in the prospect of the downfall of the power of Napoleon I. in Europe, reached its height in the spring of 1814, and that the tardy discovery that the effective demand of the continent had been over-rated precipitated the crisis of 1815-16.

The causes of the crisis of 1825 are discussed by Tooke (vol. ii. pp. 149-159). In 1822, the British 5 per cent had been reduced to 4 per cent; this had led to a general restlessness among those whose incomes were reduced, and a readiness to invest in foreign loans, the principal borrowing states being South American. The South American loans ultimately entailed a loss of nearly the whole of the sums subscribed. The exaggerated views of coming prosperity allowed full scope for an undue enlargement and abuse of credit.

The panic of 1836 is fully described by Tooke (vol. ii. p. 274). It is noticeable that whereas the disasters in 1825 were principally due to foreign speculations, those of 1835 were due to home speculations, an undue extension of credit arising from gambling in shares of railways, joint-stock banks, etc.

In vol. iv., speaking of the crisis of 1847, Tooke says: "In August 1845 the speculation assumed all the apparent characteristics of a mania. Symptoms of an approaching revulsion were, however, then clearly discernible."

It is noteworthy that the gradual develop-

ment and overgrowth of credit indicated by Langton, Jevons, and Mills, are clearly stated by Tooke.

A variety of causes brought about the serious crash in 1847—railway calls in excess of the means of the country, high price of corn, etc.; but the evidence of a culmination of previously developing causes is as clear on this occasion as on the others which have preceded and followed that date.

Mr. William Langton, of Manchester, speaking of periodicity says (*Transactions of the Manchester Statistical Society*, December 1857): "These disturbances are the accompaniment of another wave which appears to have a *decennial period*, and in the generation of which moral causes have no doubt an important part. The prompting cause of these convulsive movements appears to lie in the inordinate use of credit."

The doctrine of periodicity was held strongly by Professor Jevons, who carried his investigations into the subject over a great length of time, and with his noted ability. In a communication on the study of periodic fluctuations, British Association 1862 (Cambridge), Jevons says, "There is a periodic tendency to commercial distress and difficulty during these months (October and November). It is when great irregular fluctuations aggravate this distress, as in the years 1836-39, 1847, 1857, that disastrous breaches of commercial credit occur."

In elucidation of Jevons's allusion to "great irregular fluctuations," a quotation from his paper on "The frequent pressure in the money market," *Journal of the Statistical Society of London*, 1866, vol. xxix. p. 235, may be useful. "These changes arise from deficient or excessive harvests, from sudden changes of supply or demand in any of our great staple articles, from periods of excessive investment or speculation, from wars and political disturbances, or other fortuitous occurrences which we cannot calculate upon, and allow for." Still further developing the notion of periodicity, Jevons (*Political Economy*, 1878, Science Primers) says, "Good vintage years on the continent of Europe, and droughts in India, recur every ten or eleven years, and it seems probable that commercial crises are connected with a periodic variation of weather affecting all parts of the earth, and probably arising from increased waves of heat received from the sun at average intervals of ten years and a fraction."

The influence of solar radiation, and the possibility of a relation between the sun-spot period and the price of corn and other events, formed a subject of inquiry suited to the exact and scientific mind of Jevons. For this the reader may be referred to his *Investigations in Currency and Finance*, in which his detached papers are collected, and *Letters and Journal of W. S. Jevons*.

The invention of the term "credit cycle" may

be traced to Mr. John Mills of Manchester (Paper on "Credit Cycles and the Origin of Commercial Panics," *Transactions of the Manchester Statistical Society*, December 1867). Mr. Mills discussed the pathology of crises; and after alluding to "the occult forces which swell or diminish the volume of transactions through a procession of years," thus spoke of periodicity. "It is an unquestionable fact that about every ten years there occurs a vast and sudden increase of demand in the loan market followed by a great revulsion and temporary destruction of credit."

"The periodicity of commercial crises is at any rate a *fact*. The decades interposed between the great commercial crises are normal cycles of development of credit under certain existing conditions; that during each of these decades commercial credit runs through the mutations of a life, having its infancy, growth to maturity, diseased overgrowth, and death by collapse."

Mr. Mills enters into a minute examination of the life-history of a credit cycle in a communication made to the Manchester Statistical Society, *Transactions* 1871. Four years earlier, in his paper read before the Manchester Statistical Society in 1867, Mr. Mills had discussed the possibility of finding remedies for the periodic recurrence of commercial panics, in seeking for which he laid stress on the increased spread of information. Mr. Mills's anticipation appears to have been verified in some measure by the course of events.

[Max Wirth, *Geschichte der Handelskrisen*, 1883.—Clément Juglar, *Des Crises Commerciales et de leur retour périodique en France, en Angleterre, et aux États-Unis*, 1889.] G. H. P.

CROMBIE, ALEXANDER (1762-1842), born at Aberdeen, was for some time Presbyterian minister, and then schoolmaster, in London. He was known for his writings on etymology and syntax, especially for his *Gymnasium*, a book of exercises in Latin composition; but he wrote also on theology, philosophy, and political economy. Apart from his books, he seems to have had a wide personal influence. Major Torrens dedicated to Dr. Crombie his *Essay on Money and Paper Currency* (1812), and speaks of him with great deference in the *Essay on the External Corn Trade* (1815). In 1813 Crombie published, in the *Pamphleteer* (vol. x.) a *Letter to David Ricardo containing an analysis of his pamphlet on the Depreciation of Bank Notes*; but Ricardo did not regard him as a perfectly faithful exponent of his views. Crombie's *Letters on the Agricultural Interest* (1816) would seem to have been the last of his economical writings.

[Ricardo's letters to Malthus, 1887, Clar. Press, p. 82, sub dato 21st April 1815.] J. B.

CROME, AUGUST FRIEDRICH WILHELM (1753-1833), a distinguished German statisti-

cian and economist, was born at Sengwarden, in the territory of Kniphausen. He studied theology at Halle, and was for some time instructor of the hereditary prince of Dessau. From 1787 to 1831, he filled the chair of statistics and cameral science at Giessen. He is called by Roscher the "Haupt-theoretiker des Rheinbundes," having persistently defended that confederation, and maintained it to be "a liberation for Germany, alike beneficent to rulers and to the people." He expected that under its influence a better national economy would be introduced, founded on the principles of Adam Smith, "as improved by Soden, Hufeland and Jakob." In *Deutschland's Krise und Errettung im April und Mai 1813*, which appeared immediately after the battle of Lützen, just when the national rising against Napoleon was coming to a head, he attempted to show by statistical reasonings the madness of opposing the "great hero," as certain to lead to the ruin of the fatherland. This publication raised a storm which was only partially appeased by his treatise *Ueber Deutschland's und Europa's Staats- und National- Interesse bei und nach dem Congresse zu Wien, 1814*. His other principal works were, *Europa's Produkte*, 1782; *Grösse und Bevölkerung der Europ. Staaten*, 1785; *Ueber die Culturverhältnisse der Europ. Staaten*, 1792; and *Geographische Statistische Darstellung der Staatskräfte von den sämmtlichen zu dem deutschen Staatenbunde gehörigen Ländern*, 1820-1828. He translated into German (1795) the treatise entitled *Governo della Toscana sotto il regno di Leopoldo II.*, 1790, which was the work of that prince himself. Crome undertook the translation by Leopold's desire, and, in the comments which he added, he appears as an advocate of an enlightened and reforming absolutism, such as that of which the book is a history. He was also author of an autobiography. (See Roscher, *Geschichte der National-Oekon. in Deutschland*, p. 649). J. K. I.

CROSS DRAWING. Another term for the making of an ACCOMMODATION BILL (*q.v.*) When such an instrument has been wilfully put into circulation by a fraudulent trader, as if founded on a real transaction, the nicest penetration and judgment of experienced business men, such as bill-brokers and bankers, will sometimes be put to the test to discover the true origin and character of the instrument. Bills of this description are sometimes termed "Wind Bills," or "Kites," from their want of substantial basis.

[Hutchison, *The Practice of Banking*, vol. i. p. 125.]

CROSSED CHEQUE. The crossing of cheques is now regulated by §§ 76 to 82 of the Bills of Exchange Act 1882 (see CHEQUES, LAW OF).

CROWN DEBTS. Debts due from a subject to the crown have priority over all other debts,

and may be recovered by the summary process known as an *extent*. Every person who has money belonging to the crown is a crown debtor. Formerly, in order to enjoy priority, a crown debt required to be a debt of record or to be secured by deed, but since the 32 & 33 Vict. c. 46, which abolished the priority of specialty debts, any crown debt takes priority to all others. Crown debts do not affect land until a writ of execution has been issued and registered.

[Elphinstone and Clark's *Law of Judgments and Searches*, London, 1887.—*Prerogatives of the Crown*, by J. Chitty, London, 1820.]

J. E. C. M.

CROWN (ENGLISH). *Gold coin* (Henry VIII. to Charles II.)

Reign.	Year.	Rat- ing.	Weight.	Fine- ness.	Value in gold 916·6 fine, at £3 : 17 : 10½ an oz.
Henry VIII.	1527	5/	gr. 57·25	916·6	9/3½
Edward VI.	1549	5/	42·25	833·3	6/2½
James I.	1605	5/	38·725	916·6	6/3½
"	1605 (Thistle Crown)	4/	31·00	"	5/0½
"	1612	5/6	38·725	"	6/3½
"	1612 (Thistle Crown)	4/4½	31·00	"	5/0½
Charles I.	1619	5/	38·725	"	6/3½
	1627	5/	35·12	"	5/8½

Also double crowns (James I. to Charles II.) and half crowns in proportion.

Silver coin (Henry VIII. to present time).

Reign.	Year.	Rat- ing.	Weight.	Fine- ness.	Value in silver 925 fine, at 5s. 6d. an oz.
Henry VIII.	1542 (as a kind of medal)	5/	480·00	925	5/6
Edward VI.	1551 (for cir- culation)	5/	480·00	"	5/6
Elizabeth	1601	5/	464·50	"	5/3½
George III.	1817 (and sub- sequently)	5/	436·36	"	5/ or 5·81 frs.

Also half-crowns in proportion. A crown in white metal was struck in the reign of James I., but only a few were issued.

Crown (Scandinavian). The standard of value, but not a coin, 6·22278 grains of fine gold. Value, 1s. 1·215d., 1·389 franc.

Standard Gold Coins.

Denomination.	Weight.	Fine- ness.	Value in gold 916·6 fine at £3 : 17 : 10½ an oz.	Value in gold francs (900 fine).
Twenty crowns .	gr. 138·264	900	s. d. 22 0½	francs. 27·78
Ten crowns .	69·132	900	11 0½	13·89

Silver Token Coins.

Denomination.	Weight.	Fine- ness.	Value in silver 925 fine at 5s. 6d. an oz.	Value in standard silver francs (900 fine).
	gr.		s. d.	francs.
Double-crowns	231.485	800	2 3 $\frac{1}{2}$	2.67
Crowns	115.7425	800	1 1 $\frac{1}{2}$	1.33
Half-crowns (or so are pieces)	77.162	600	6 $\frac{1}{2}$	0.67
Forty ore	61.727	600	5 $\frac{1}{2}$	0.53
Twenty-five ore	37.346	600	3 $\frac{1}{2}$	0.32
Ten ore	22.376	400	1 $\frac{1}{2}$	0.13

F. E. A.

CROWN LANDS. In Saxon times the king owned three kinds of property in land: (1) private estate which he could dispose of by will; (2) demesne lands that could be alienated only by consent of the witan; (3) certain rights over his folkland. The folkland tended to become merged in the royal demesne (Stubbs's *Constitutional History*, i. ch. vi. § 59; c. vii. § 75), a process that was completed by the Norman Conquest (*Ib.* ch. ix. § 95).

From Domesday we learn that the income from royal lands amounted to £20,000 (Pearson's *Early and Middle Ages*, i. 385). An important portion of the royal demesne consisted of forests which were exempt from the ordinary law, and subject to royal regulations of great severity (Pearson's *Hist. Maps*, pp. 44-48; Ellis's *Intr.* i. 103-116). The crown was supposed to defray the expenses of the household, of the administration of justice, and of the military forces. Though the crown revenue was greatly diminished by the loss of the French possessions, it was increased by marriages and by the dissolution of the monasteries. The alienation of the crown lands to favourites led to the attempts of the barons to limit the king's power of giving (Stubbs, ch. xvii. p. 284), and to the passing of various statutes with the same object.

By the 1 Anne, c. 1, §§ 5-8; 10 Geo. IV. c. 50, § 127; and 1 & 2 Vict. c. 2, §§ 1, 2, the right of alienation was limited to leases for lives or a term of years. By the last-mentioned act the crown surrendered its hereditary revenues (see Rogers's *Economic Interpretation of History*, Oxford, 1888, ch. xix.) The management of the crown lands is entrusted to the Commissioners of Woods, and is governed by a series of statutes enumerated in *The Chronological Table and Index of the Statutes*, 10th ed., London, 1887. See also *The Landed Interest*, ch. x., by J. Caird, London, 1878.

The crown, it is said (Chitty, *Prerogatives of the Crown*, ch. xi., London, 1820), is owner of the foreshore between high and low water mark in ordinary tides, unless a grant in private ownership can be proved, but Moore, in his *History of the Foreshore*, London, 1888, maintains that the theory of the crown's ownership of the *ius privatum* of the foreshore did not exist until the reign of Elizabeth, and that its origin is due to successful attempts to extend the prerogative. See also

Hall's *Rights of the Crown and the Privileges of the Subject in the Seashore*, by R. L. Loveland, 2nd ed., London. Some writers also maintain that the crown owns all land under the marginal seas to the distance of a marine league, a view taken by a minority of the court in *R. v. Keyn*, L.R., 2 Ex., D. 63; but others deny such a right, conceding only a right of jurisdiction (see Hall's *International Law*, Oxford, 1880).

Forfeited estates formerly vested in the crown (see 33 & 34 Vict. c. 23), and the crown is owner of considerable private property in land. In theory, state lands in our colonies are vested in the crown, but control over them is vested in the colonial legislatures. All crown lands, including all private lands not disposed of, descend with the crown.

J. E. C. M.

CRUMPE, SAMUEL (1766-1796), Irish physician, deserved the prize awarded by the Royal Irish Academy to his essay *On the best means of providing Employment for the People*. The causes of Irish distress are ably analysed. Among the remedies is a bounty on the exportation of corn (p. 241). The author is prepared to prohibit the export of wool (p. 303).

F. Y. E.

[Dr. Crumpe's prize essay is described as "an excellent treatise"; Malthus, *Essay on Population*, bk. iv. ch. xi. note.]

CRUSADE. A Portuguese gold coin, bearing the design of a cross. It was current in England in Queen Mary's reign, and was valued at 6s. 8d.

F. E. A.

CRUSADES, ECONOMIC EFFECTS OF. The crusades cover a long period of time, from the 11th to the 13th century, and their early triumphs were followed by complete and disastrous failure. This long duel between the west and the east, between Christianity and Islam, exercised the most profound influence upon Europe: upon the position of popes, emperors, and kings; upon the relations between church and state; upon the progress of literature, education, and art. To the crusades are due the breaking up of classes and the rise of nations. No less marked was their influence upon the economic conditions of mediæval Europe. The fall of the western empire and the triumph of the Teutonic invaders had resulted in the complete separation of the east from the west, and in the annihilation of that maritime commerce which had been first inaugurated by the Phœnicians and developed by the Greeks. So completely had naval enterprise been neglected that the early crusaders had no alternative but to march overland to Constantinople and to cross the Hellespont into Asia. The first result of the crusades was to revive maritime trade in those countries whose geographical position fitted them for this, especially in the Italian coast towns and such cities as Marseilles and Barcelona. By the 13th century the Mediterranean had become once more the centre of a world-embracing

commerce; from its shores the products of the east were carried overland to the centre of Europe, thence to England and even to the Baltic coasts. The route by the Caspian and southern Russia, through which a scanty trade between Asia and Europe had been conducted in the dark ages, was henceforth almost entirely neglected.

Next to the development of trade due to the crusading movements must be ranked the advance of industry. The products of the east had to be purchased by those of Europe; thus an enormous stimulus was given to manufactures and agriculture. And not only were the old industries developed, but many new ones were actually introduced from the east. From Greece came the manufacture of silk and the cultivation of the mulberry. From Tyre the Venetians learnt the art of making glass, an industry which they retain still, long after the days of their decline. The crusaders introduced from Africa the cultivation of maize and the sugar-cane. In Damascus they learnt notable improvements in the working of metals, and the making of cloth.

The increase of trade and manufactures led to the growth and rise of towns, one of the most important results of the crusades. The greatest immediate profit was reaped by the Italian cities, Venice, Pisa, Genoa, Amalfi, etc. Increase of trade and manufactures also brought wealth to the German towns in the valleys of the Danube and the Rhine, to the communes of France, to the trading and manufacturing cities of Flanders, finally to the north German towns, which formed the famous HANSEATIC LEAGUE (*q.v.*) The traders required protection from lawless oppression and from piracy. This was acquired in the north by combination, in the south by the promulgation of the earliest codes of maritime law, and generally by the acquisition of municipal privileges and independence. The crusades owed their origin to the spirit of religion and of chivalry. They gave the popes a vast increase of secular authority; they led to the institution of religious orders, like the Franciscans, Dominicans, and Carthusians; and of the military orders of the Templars, Hospitallers, and Teutonic Knights. But their ultimate results were fatal to the interests which they at first promoted. The contact with the east gave the first stimulus to the freedom of thought which was destined to destroy the superstitions on which rested the religious unity of Europe. The rise of the burgher class was followed by the rise of the spirit of nationality—both fatal to the class institutions of feudalism and chivalry. The nobles who fought in the crusades were compelled to find money by the sale of privileges to the towns, of their lands to the highest bidder, of freedom to their serfs. The social changes thus produced destroyed the mediæval

system, and gave rise to those industrial relations which have been the dominant influence in Europe ever since.

CULPA. An expression of Roman law expressing the want of proper diligence. The Roman jurists distinguished between *culpa levis* and *culpa lata*, and mediæval writers introduced a third degree of culpa which they called *culpa levissima*. *Culpa lata*, i.e. gross negligence, was treated nearly in the same way as unlawful intention (*dolus*). In some contractual and other relations there was no absolute standard for the degree of diligence required; the persons concerned had to give the same amount of care as they were accustomed to give to their own affairs. The omission of this degree of diligence is called *culpa in concreto* by mediæval writers.

E. S.

CULPEPER, SIR THOMAS, the elder (1578-1662), author of *A Tract against the high rate of Usury*, 1621, which, "presented to the high court of parliament," conduced to the reduction of the legal rate of interest from ten to eight per cent in 1624. The tract was reprinted with additions in 1641. The author meanwhile "set forth another treatise to evince the necessity of reducing money from eight to six" (preface to the *Discourse of Sir Thomas Culpeper the younger*), namely *A Tract against the high rate of Usury*, 1640 (Brit. Mus., 1093 b. 98). The two treatises were reprinted together, with a preface, by Sir Thomas Culpeper the younger, 1688.

F. Y. E.

CULPEPER, SIR THOMAS, the younger (1626-1697), a worthy son of the elder knight, assailed usury in a *Discourse* dated 1688. Thomas Manley, gent., answered this discourse, maintaining that "as it is the scarcity of money (and many borrowers) that maketh the high rates of interest, . . . so the plenty of money and few borrowers will make the rates low." Culpeper retorted with *The necessity of abating Usury reasserted*, 1670. Some other publications on the same subject are ascribed to Culpeper (Wood's *Athen. Oxon.*, ch. iv. p. 447).

F. Y. E.

CULTURE, LARGE AND SMALL. The question of large or small holdings may be treated morally, socially, and economically. Here it will mainly be discussed in the latter aspect. It is the physical formation of a country which chiefly determines the size of holdings. It may be laid down as an axiom that, where the soil and climate are specially adapted for cereals and sheep, and where the physical configuration of the country admits of

large enclosures, there large holdings are the most productive. On the other hand, where districts are hilly, the soil rocky, the surface broken, where soil and climate are specially favourable to permanent grass, there small holdings are best. It follows that, as a rule, grass counties have most, and corn counties have fewest, small holdings. But there are exceptions. Near large towns, small holdings will necessarily pay best. A small holding is a relative term. It differs in size when the holding is a market garden, a grass farm, or an arable land. A man may make his living off a very small tract of market-garden land, or off 5 acres of grass. It is doubtful whether an arable farmer, solely dependent upon the produce of the soil, and not engaged in any other profitable occupation, can live on less than 40 acres. All holdings may therefore be considered small which are 50 acres or under. In England there were, in 1887, 294,729 small holdings, consisting in the aggregate of 3,559,000 acres (see *Journal of the Statistical Society*, February 1887. Paper by Major Craigie on the "Size and Distribution of Agricultural Holdings"). In England, small holdings are undoubtedly increasing. This increase arises from the fall in the price of cereals, the diminished capital of large farmers, the growing number of men who combine farming with other avocations. It cannot be questioned that grain, meat, and wool can be produced more economically upon large farms, and that dairy produce, pork, poultry, eggs, vegetables, are best suited for small holdings. Fruit-farming is not profitable for small farmers, because the initial outlay is large, the crops precarious, and the profits unreliable. In dairying small farmers enjoy no advantage over large. But in pigs, poultry, calf-rearing, vegetables, where minute care and attention secure safe and quick returns, the advantage is all in favour of small holdings. In these limited products, small farms are economically preferable to large, and chiefly for these reasons. While labour has increased in price and deteriorated in quality, small farmers hire no labourers and employ the best that is procurable—their own. Again, the depression in prices has most particularly affected the produce of large farms, and has fallen comparatively lightly on the produce of small holdings, which is also of a more varied kind. The eggs of large farmers are in one basket, and the bottom has either fallen out or is rickety. The eggs of small farmers are stored in several baskets and the bottoms are relatively secure. Again, small farmers, selling direct to consumers, not only feel the fall of prices less, but eliminate the profits of middlemen. Lastly, small farmers are under fewer temptations to extravagance. They are more frugal and more industrious. They are sparing

of everything except their labour, prodigal of nothing but themselves. Employing no hired labour, practising mixed husbandry, rearing stock instead of feeding them, often enjoying common rights, doing the work of two labourers and eating the food of one, small farmers weather storms which wreck their richer brethren. But it is a false argument that small farmers are necessarily more profitable to the community than large farmers, because the former pay higher rents. They undoubtedly pay higher rents; but they do so because the competition for holdings of this class is especially keen, because the expenses of buildings, approaches, hedges, and repairs are far heavier on small than on large farms, and because the land devoted to small farms is, as compared with ordinary agricultural land, what may be called accommodation land. In point of material comfort, wage-earning labourers in constant employment are better off than small farmers, whether they own or occupy the soil. It cannot, for instance, be questioned that the English agricultural labourer is better housed, better fed, and better clothed than the French peasant proprietor. Wherever a peasant proprietary prevails, except under most favourable conditions, the rural populations live hard, fare hard, and are on the border-line of starvation. In point of production, the product per acre in England exceeds that of any country on the continent except East Flanders. In point of agricultural science, English farming is, speaking generally, more advanced than in countries where the small culture of peasant proprietors prevails. Belgium affords a noticeable example of the stagnation which is produced by the multiplication of small cultivators. Half a century ago the agriculture of Belgium was the first in Europe. Since then the size of the farms has decreased, and the number of small farmers continuously increased. Enterprise and experiment diminished with the extension of *la petite culture*. Farming has rather retrograded than advanced; the stock, and especially the sheep, have decreased; the small farmer only raises, and only eats, pork. In point of pauperism, rural England has fewer paupers than countries where small culture is the rule. In Prussia the number of peasant heads of families exempted from direct taxation because their earnings are less than £25 a year, amounted in 1888 to nearly 7½ millions. In France 3 millions out of the 7 million proprietors are unable to contribute largely to state objects by reason of poverty. In point of encumbrances, the soil of England is less burdened with mortgages than the land of countries farmed by small cultivating owners. In France, for example, the real owners of the soil are local money-lenders, and in some departments 80 per cent of the land is said to be mortgaged. Small culture cannot be regarded

as an agricultural panacea. It can only thrive in England under the economic conditions mentioned above.

R. E. F.

CUM DIVIDEND. On the London stock exchange it is always understood that a share sold includes also the dividend which may have accrued upon it since the previous distribution, unless the bargain is made specifically *EX DIVIDEND* (*q.v.*) On Indian rupee paper, exchequer bills, and corporation bonds, however, the bargains are done “clean,” or exclusive of dividend, which the buyer has to pay to the seller at the conventional rate, according to the number of days since the previous distribution of dividend.

A. E.

CURATOR BONIS. A guardian appointed by a Scotch court to manage the estates of a minor or of a lunatic. His functions are to realise and protect the estate. He has no charge of the ward's person, except in so far as it is his duty to see the ward properly educated.

[Erskine's *Principles of the Law of Scotland*, 1880.]

J. E. C. M.

CURRENCY. This word is sometimes employed in the sense of circulating medium, sometimes in the sense of standard of value. Adam Smith says (book iv. ch. iii.), in the well-known *Digression concerning Banks of Deposit, particularly concerning that of Amsterdam*, “The currency of a great state, such as France or England, generally consists almost entirely of its own coin.” Here a standard of value is referred to, and the constancy of the “Bank Money” of the bank of Amsterdam is mentioned as one of its advantages. Adam Smith's comparison of the currency to the road which conveys the produce of a country to market (*Wealth of Nations*, book ii. ch. ii.), and J. S. Mill's description of it as “a machinery for doing quickly and commodiously what would be done, though less quickly and commodiously, without it” (*Principles of Political Economy*, book iii. ch. vii. § 3), illustrate the services which the currency performs. An ideally perfect system of currency, to be based on a system of tabulatory prices, is dealt with by Jevons, *Investigations in Currency and Finance*. Some idea of the same kind appears to have passed before the mind of D. Ricardo, *Proposals for an Economical and Secure Currency* (Ricardo's *Works*, 2nd ed. p. 397). His definition of a perfect currency is as follows: “A currency may be considered as perfect of which the standard is invariable, which always conforms to that standard, and in the use of which the utmost economy is practised.” A tabular standard of value was suggested by

Joseph Lowe to give a steady value to money contracts through reference to the prices of different articles. A similar method was recommended by G. Poulett Scrope, whose remark, “without stability of value money is a mere fraud,” goes to the root of the matter. The subject had also been considered by G. R. Porter. Mr. Giffen has more recently carried on the investigation. The idea of a standard of value to remain as far as possible constant, is included in the principle on which *CORN RENTS* (*q.v.*) are based (see also *CIRCULATING MEDIUM*; *INDEX NUMBERS*, etc.)

[Jevons, *Investigations in Currency and Finance*.—Ricardo's *Works*, ed. M'Culloch.—Joseph Lowe, *The Present State of England in regard to Agriculture, Trade, and Finance*, 1822.—G. Poulett Scrope, *Principles of Political Economy*, 1833.—Porter, *Progress of the Nation*, 1815.]

CURRENCY DOCTRINE OR PRINCIPLE.

A name given to a doctrine or opinion which supplies the basis for the method adopted by Sir R. Peel when regulating the paper currency by the Bank Act of 1844. It appears to have been first used by Mr. G. W. Norman, who, in his evidence before the House of Commons Committee on Banks of Issue, 1840, Q. 2018, speaking of the circulation, referred to “currency principles, according to which it would increase or decrease with increase or decrease of bullion.” The evidence of Mr. Gilbert, before the same committee, 1841, showed that he understood the term in a similar sense. Q. 932, “I mean by the phrase ‘currency principles,’ a bank which shall do nothing else but issue notes for gold, and gold for notes;” and Q. 933, “I do not at all admit that those are the correct principles upon which the currency should be administered.” Mr. T. Tooke, *History of Prices*, vol. iv. p. 167, and *passim*, agrees with Mr. Gilbert. The controversy was continued by others, among whom may be cited Mr. Jones Loyd (Lord Overstone), who, in his writings and in his evidence before the Select Committee, H. of C., 1840, and also before the Select Committee on Bank Acts, H. of C., 1857, expressed the same opinion, Q. 648, 1857, “The paper notes or certificates ought to be preserved at their proper value by making them, under all circumstances, conform in amount to the coins or metallic circulation which they represent.” Sir R. Peel employed the same opinion as the basis of the argument, on which he founded the reasons for the changes which he introduced in the banking system of the country, through the Bank Acts of 1844-45 (see speech in H. of C. on Bank Charter, 6th May 1844). The principles and the methods of action which Sir R. Peel supported on that occasion, were in opposition, as he admitted, to “the high authority of Adam Smith and of Ricardo,” who held that freedom of competition and immediate convertibility into coin

at the will of the holder, coupled, it should be understood, with such provisions as would secure the holder from loss under any circumstances, would prevent the notes of banks from being issued in excess. Sir R. Peel might have added that this opinion of his own was also in opposition to that of Mr. Huskisson. Sir R. Peel referred in the speech quoted above to the BULLION COMMITTEE REPORT (*q.v.*) which, it should be pointed out, was made during the period of suspension of specie payments, and recommended a return to payments in specie as a cure for the evils deprecated. Sir R. Peel was by far the most powerful supporter of this doctrine, which is of importance as laying down a principle unknown before—namely that it is essential that the bank notes circulating in a country should always conform in amount to the metallic circulation which they represent, see above—the result of the acceptance of which has been the separation of the banking department from the issue department of the Bank of England (see BANK OF ENGLAND). The doctrine has never, it should be mentioned, found general acceptance with economists. It marks the difference between those who regard bank notes as “money,” and those who consider them, in the words of Huskisson, as “circulating credit,” and a “substitute for money in the transactions of the community” (Huskisson on the *Depreciation of the Currency*). While insisting, and properly, on adequate security being given for the bank note, the currency doctrine leaves out of sight the operation of all other instruments of credit, equally effective in their way, as bank notes, on price and the movements of commodities.

[See books referred to under BULLION COMMITTEE.—Evidence before Committee on Banks of Issue, House of Commons, 1840-41.—Committee on Bank Acts, House of Commons, 1857.—Tracts and other publications on “Metallic and Paper Currency,” printed by Lord Overstone, 1837-57.—Speeches of Sir R. Peel on “Bank Charter,” House of Commons, May 6, 20, etc., 1844, etc.]

CURVES are amongst the most useful appliances which mathematics lends to the social sciences. The curves most frequently employed in this way are *plane* curves: such as AB in the annexed figures; referred to rectangular axes OX and OY in such wise that the curve represents the interdependence of two variable quantities OX and OY, the change in one of the variables OY which attends a change in the other variable OX. Two species of curve may be distinguished: (1) where the quantitative relation between the variables is not supposed to be numerically ascertained, the datum being of an indefinite character, as that OX continually increases with the decrease of OY; and (2) where the curve is the record of statistical observations.

(1) The first kind of curve is used in abstract

economics; where the data are in general quantitative indeed but not numerical, *e.g.* that the demand for a commodity increases as its price decreases. Jevons's hope of obtaining demand curves by statistical observation (*Theory*, Introduction, p. 23, 2nd ed.), may appear chimerical. There is one datum of the kind indicated which curves are specially adapted to represent, the property of *increase at a decreasing rate*, which is at the root of the two most exact theories in political economy, viz. the law of rent and the law of final utility. This important relation is simply expressed by means of a curve concave towards the axis OX such as AB in Fig. 1. In this case the quantity represented by the

line OY continually increases with the increase of OX, but the rate of increase continually decreases. The same idea may be expressed by

a descending curve such as AB in Fig. 2, if one quantity is represented by the *area* contained between the right lines OY, OX, *ap*, and the curve AB. This quantity continually increases with the increase of OX, but at a decreasing rate. To represent such relations curves appear a more potent aid than ordinary language, and perhaps even than algebraic symbols. Diagrams are preferred before symbols by Prof. Marshall (*Principles of Economics*, preface to first edition). “The use of the latter [diagrams] requires no special know-

ledge, and they often express the conditions of economic life more accurately as well as more easily than do mathematical symbols."

It may be observed, however, that, as compared with FUNCTIONS (*q.v.*), curves have a somewhat limited use. They are almost restricted to the simple case of two variables. Thus in the theory of rent, a curve happily represents the returns yielded by successive applications of doses of outlay, as in Jevons's illustration (*Theory of Political Economy*, ch. vi.) Or, according to a construction which De Quincey appears to have been the first to use, the successive parts of one co-ordinate Ox may represent qualities of land (arranged in a descending order), while the corresponding values of Oy stand for the returns made to equal capitals applied to each portion of land (cp. Prof. Marshall, *Principles of Economics*, p. 483, 2nd ed.) But, when it is attempted to combine these two constructions, as the present writer has done (*British Association Report for 1886*), the unfamiliar ideas of solids and surfaces are introduced; and clearness is sacrificed. To take another example (the DEMAND CURVES, *q.v.*) so much extolled by recent economists, are available only on the hypothesis that, while the price of the article under consideration varies, the prices of all other articles remain constant (Auspitz und Lieben *Theorie der Preise*). But this is a somewhat narrow hypothesis, excluding the important cases of "competing" and "completing" commodities (*ibid.*), as we may call those articles which are related either on the one hand, as beef and mutton, or on the other hand, as tea and sugar. In such cases a symbolic expression representing the advantage of the consumer as a *function* of his purchases is much more helpful than a curve. Again, in the theory of distribution the profits of the *entrepreneur*, depending on the one hand on the sales of finished products, and on the other hand on the expenses of production, wages, interest and rent, and so forth, is better represented by a function of several variables than by a curve. A curve may be best adapted to the Ricardian first approximation that the profits on successive doses of capital are equal. But it is not so easy to represent geometrically the modifications of this conception which a nearer view requires—that the profits of an *entrepreneur* are not proportional to the amount of capital employed, that the wages of a labourer are in a certain sense just equal to the product of his labour (Marshall, *Principles of Economics*, 2nd ed. vol. i. p. 566). Such theories appear to the present writer to flow more naturally from the analytical calculus of maxima and minima than from any use of curves. For further observations as to the use of curves in economics, see FUNCTIONS and MATHEMATICAL METHOD.

(2) Of the curves obtained by statistical

observation it suffices here to remark that they are for the most part derived from a discontinuous set of points, such as p, q, r, s , in Fig. 3 (or set of right lines joining those points). Here

Fig. 3.

the lengths px_1, qx_2, rx_3, sx_4 etc., represent the quantities of some variable under observation at finite (not infinitesimal) intervals of time, space, or other variable. Cases in which the registration is continuous, as in some meteorological observations, are rare in social statistics. (As to the use of curves in statistics see the GRAPHICAL METHOD and STATISTICS.)

F. Y. E.

CUSTODI, PIETRO (1771-1846), born near Novara. He was by profession a lawyer, but soon entered into journalism and directed the paper *Amico della libertà Italiana*. He became privy councillor and baron. The *History of Milan* by Pietro Verri was continued by Custodi; as an economist he is widely known as the editor of a collection of the principal Italian economists in fifty volumes. M. P.

CUSTODIA. An expression of Roman law denoting a special duty of taking care of a bailed object (see BAILEE). E. S.

CUSTOM — CUSTOMS DUTIES. Duties charged by law upon commodities imported into or exported from a country. The duties of customs "seem to have been called customs, as denoting customary payments which had been in use from time immemorial; they appear to have been originally considered as taxes upon the profits of merchants" (*Wealth of Nations*, bk. v. chap. ii. art. iv.) As early as 1336, however, complaints were made by the producers of wool, at that time the most important dutiable article, that the intended special taxation of merchants was not effected by customs duties, and from 1344, when the price of wool ceased to be fixed by law, such duties were for a long period supported by merchants, and opposed by the agricultural classes. In 1490, a "retaliatory" and additional duty imposed on malmsen wine imported from Crete "until the Venetians should abate their new impositions," was the first step in the long series of duties imposed for other than revenue purposes, and eventually mainly for the protection and encouragement of home industries. In

1815 when, as Mr. Dowell says, "taxation reached its zenith," the public demand that the enormous necessities of the government should be met as far as possible by the imposition of protective tariffs had resulted in a customs system of the most complicated and onerous description, and even when the burdens of war diminished, the reductions effected in the customs duties were small as compared with the diminution of the direct taxes. In 1842 Sir Robert Peel carried his first great measure of tariff reform, his policy being to utilise the direct taxes, and especially the income-tax, in order to remove the comparatively unproductive duties with which traders were met in every direction. In that year some 750 articles out of about 1200 were removed from the tariff, the loss to the revenue being not more than £1,200,000. Three years later, Peel effected a further revision, abolishing the duties on more than 400 articles, principally raw materials, and repealing all export duties, at an aggregate loss of £3,500,000. In 1846 the duties on corn and some other articles of food were discarded at a cost of £750,000. In 1853 Mr. Gladstone took a further step in the same direction, and, by the same means as his predecessor. In 1860 he proposed further reductions of import duties, and took what has been described as "the final step in the reform of one of the most comprehensive and complicated lists of prohibition and commercial restrictions, in the form of frontier or port duties, that ever hindered the development of the trade and manufactures of a nation." This final step involved a loss of revenue of £2,250,000.

The following table shows the net produce of customs duties in the United Kingdom in each tenth year from 1837 to 1887 inclusive:—

1837 . . .	£22,063,000	1867 . . .	£22,655,000
1847 . . .	21,656,000	1877 . . .	20,099,000
1857 . . .	23,276,000	1887 . . .	19,634,000

The following table shows in detail the net produce of the customs duties collected during the year 1887-8.

Chicory . . .	£71,000
Cocoa . . .	83,000
Coffee . . .	188,000
Tea . . .	4,613,000
Total duties on imported non-alcoholic beverages . . .	£4,955,000
Beer . . .	£10,000
Spirits . . .	4,225,000
Wine . . .	1,085,000
Total duties on imported alcoholic beverages . . .	£5,320,000
Dried Fruits . . .	539,000
Tobacco and Snuff . . .	8,714,000
Plate . . .	10,000
Other articles . . .	2,000
Other receipts . . .	94,000
	£19,634,000

The management of the customs revenue is conducted by a Board of three commissioners under the general control of the treasury. The cost and numbers of the customs department was estimated for the year 1888-89 as follows:

	Number employed.	Aggregate Cost.
Superintending establishment	216	£61,740
Port of London . . .	1546	260,600
District of Liverpool . . .	635	97,520
Other establishments . . .	2189	310,120
Law Departments . . .	9	9,665
Superannuations and other non-effective charges	198,275
	4595	£937,920

The customs department works in close relationship to that of the inland revenue, many of the duties collected by each are interdependent or countervailing, and the two departments, although nominally independent, transact much of each other's business. The arbitrary distinction between customs and excise existing in the public accounts is therefore of little value for many economic purposes. Each head alike includes duties on beer, chicory, spirits, and tobacco, and in 1887-8, out of a gross customs revenue of £19,791,335, the inland revenue department collected £1,935,591, whilst the customs department collected £3,662,696 out of a total gross excise revenue of £26,459,506.

The customs department performs many functions other than those proper to the collection of revenue alone. It is responsible, *inter alia*, for the measurement of the tonnage of vessels, the registration of ships, the collection of light dues, the receipt of wreck, the maintenance of fisheries conventions, the observance of quarantine regulations, the examination of merchandise marks, and the collection of import and export statistics.

An important feature of any well-organised customs system is that by which dutiable articles are allowed to be deposited in warehouses under bond for the due payment of the duties when delivered for consumption (see BONDED WAREHOUSES). The earlier economists strongly advocated the maintenance of such warehouses, mainly on the ground that the consumer escapes charges for interest on the duties paid by the merchant, but it is now evident that the system is of great and very varied utility. Not only is the payment of duty deferred, but it is not exacted at all on the waste occasioned by natural causes, and by the various operations allowed to be effected under supervision in bonded warehouses, prior to duty being charged. Bonded goods may be removed from warehouse to warehouse, or they may be re-exported or transhipped free of duty, which is in fact only paid when the goods are to be taken into consumption.

The incidence of customs duties, like those of other taxes on commodities cannot be accurately determined without taking into consideration the various conditions attending the production and supply of the article taxed, and its relation to the requirements of the consumer, and even when the incidence of such duties has been established, their effect in restricting international trade, or in diverting it from the channels in which it would naturally flow, must be ascertained before it can be seen whether the direct and indirect cost of the duties outweigh their advantages. It is usually considered that the burden of customs duties will fall eventually upon the consumer, whether they are charged on the export or on the import of the dutiable article, but in the case of export duties it usually happens that the restriction of trade in the dutiable article, or its diversion to other markets, diminishes the profit of the home producers and distributors to an extent far beyond the yield of the duty, and in the case of import duties it has been considered that some portion of the burden will at times be borne by the merchant by whom the duties are advanced, his ability to transfer it to the consumer being by no means absolute. (See COST OF COLLECTION OF TAXES.)

[*Annual Reports of the Commissioners of Customs.*—*Ham's Customs Year Book.*—*Dowell's History of Taxation and Taxes in England.*—*Hall's History of the Customs Revenue.*] T. H. E.

CUSTOM (HABIT)—ITS PLACE IN ECONOMICS. When the two are distinguished, habit is an unwritten law or tradition of our individual selves, custom is so for a society of men. Every custom has thus begun in some habit; and both custom and habit have a power analogous to *vis inertiae* as defined in Newton's First Law of Motion. Men continue in a state of rest or of uniform motion in a straight line, except in so far as they are led to change that state by force impressed on them. Where actions are determined by the necessity of physical, physiological, or even of ethical laws, they are not said to be done by habit or custom, the latter words being confined to such actions as are more evidently modifiable by human caprice. They are not used of nature but of second nature.

In men more than in other animals habits become customs, social functions creating social structures. The knowledge of the past is preserved, and in the case of scientific discoveries and mechanical inventions, for example, one generation of learners can begin at the point where the preceding left off, and convert into habit and custom what was at first a conscious effort and deliberate act of will. It is an essential condition of a skilled, *i.e.* of nearly every industry that practice makes perfect; and the standard of perfection becomes higher if the skill can be transmitted by teaching, and need not be acquired by each individual *ab initio*,

unaided. This applies even to the art of walking upright and the perception of distance by vision. The most familiar economical examples are those given by Adam Smith in his first chapters (see DIVISION OF LABOUR). To his already old text must be added the equally old commentary that the bent and fitness of the individuals must be consulted. Some are born to use tools; others can make better use of their eyes or voice than of their hands, etc. Wherever the bent lies, habit will be acquired fastest when the bent is followed. In the present condition of the working classes in Europe the sons are as a rule brought up to their father's trade; yet, owing to the frequent changes caused in a trade by new inventions, this practice can hardly lead to the growth of castes (see CASTE) such as prevail in the East. But even in our own country custom may often make a long stand against new inventions, to the great detriment of economy, *e.g.* in retention of fallows and opposition to reaping machines.

In the more complicated economical relations, where distribution is concerned, custom as elsewhere may be both a strength and a weakness to those bound by it. It may become an instrument aiding progress; or it may become a fetter. Customary rates of wages may be rates that neither fall so low nor rise so high as the rates that would be fixed by competition in open market, and so it is with customary rents and customary prices. What has always been paid acquires an apparent justification from usage; and this is found in the case of taxes, as appears in the very name Customs, where novelty and unpopularity as a rule go together. The times and ways of payment are largely fixed by custom more than by conscious regard to expediency. Wages, for example, are paid in the case of London workmen by the week, of many Scotch workmen by the fortnight, of domestic servants by the month, of many farm servants by the year.

When wages have been raised by a temporary cause, they may be maintained by custom, in the sense that the labourers' standard of living may be permanently raised. This result can hardly be secured without some form of combined action among the labourers. Combination implies criticism and initiative, and seems a necessary aid if custom is to be a strength instead of a weakness.

It is only roughly true that men are emancipated from custom in proportion to their education. They are seldom removed by it from the influence of fashion (see FASHION), which is simply a form of custom where the capriciousness of the unwritten law is not concealed, and where the matters concerned are supposed to be beyond exact utilitarian calculation. Fashion often determines not only what men eat and wear, but where they buy

and even to some extent what they pay. The goodwill of a business is simply this fashion considered from the purveyor's point of view. Thomas Telford the engineer formed part of the goodwill of the Salopian coffee-house at Charing Cross (see Smiles' *Life of Telford*). It is perhaps the tendency of an active commercial community to go from the one extreme, of regard for custom, to the other, regard for mere cheapness as measured by price without due account of quality. Modern improvements, such as railways, and telegraphs, and co-operative stores, play a great part in breaking down custom and causing a rough equality even in retail prices. In the wholesale markets, where both sellers and buyers are alive to their commercial interests, the power of custom is a smaller factor than in retail dealings. But in the stock markets and elsewhere it is still a factor (see e.g. Babbage, *Mach. and Manuf.*, 3rd ed. ch. xv. p. 145;—Ellis, "Influence of Opinion on Markets," *Economic Journal*, March 1892, pp. 109 seq.) It may be doubted if customary profit is so tangible a conception as it seemed to Adam Smith; yet in recent Continental Usury Laws it figures still very largely, as it did in the Middle Ages. Where instead of prices or profits conditions of bargaining are concerned, it is not only a factor but the main factor, for commercial law is simply the customs of merchants to which the state now gives legal effect. There is a sense in which nearly all statute law is custom, defined, and made consistent and it may be imposed on an unwilling minority, as in the FACTORY ACTS, *q.v.* To make custom our friend for life we bind him under penalties.

If prices are affected by custom, still more is the currency itself. Custom prevents our adoption of a decimal currency. No money is currency if it falls under suspicion, even groundlessly, like Wood's pence under Swift's attacks, and is refused in ordinary transactions. Money is unlike all other tools in depending almost entirely on custom, instead of mechanical fitness, for its efficiency. The general outward character of European coins has accordingly changed only by a series of variations which were, each,

very slight indeed at the time of their introduction. To be current, a coin needs to have a familiar look and resemble its predecessors in almost all respects. In paper money too, as in Scotch one pound and English five-pound notes, custom is essential to currency. Somewhat analogous is the recognition of articles as good because of a well-known trade mark.

There are many instances of the power of custom in political history. Good statesmanship is averse to an absolutely new departure, and makes only such changes as at least seem to be an outgrowth of old customs, and a return to some old Magna Charta instead of a new institution. There is no contradiction between custom and reflection. If the former by itself is inertia, the latter by itself is insubstantial, and its product ephemeral, like a learning that dispenses with memory and history, and trusts to unassisted original study. Though, especially in matters economical, deliberate reflection and calculation will inevitably subject all customs and customary institutions to the test of criticism, yet any new order will be built up out of the materials of the old, and will only itself be permanent by becoming customary.

[For the influence of custom on Prices, Wages, Rent, etc., see Richard Jones, *Political Economy*, ed. Whewell, 1859, *Distribution of Wealth* (1831).—J. S. Mill, *Polit. Econ.*, ii., iv. (1848).—T. F. Keary, *Numismatic Chronicle*, v. 165-98, vi. 41-95.—On custom and habit in general see Rümelin, *Reden und Aufsätze* (1881), ii. pp. 148 seq., *Das Wesen der Gewohnheit*, and compare Hegel, *Rechtsphilosophie*, § 151.—On custom as standard of living, see Malthus, *Essay on Pop.*, i., ii., iv., viii.—On fashion, see Hermann, *Staatswirtschaftliche Untersuchungen* (2nd ed. 1870), pp. 99, 100.—On custom as *Status* in distinction from *Contract*, see Maine, *Ancient Law*, *passim*.—On goodwill, etc., see Schäffle, *Die nationalökonomische Theorie der ausschliessenden Absatzverhältnisse* (Tübingen) 1867.] J. B.

DAIRE, EUGÈNE, born in Paris 1798, died there 1847. He commenced life as a collector of the *contributions directes*, a direct tax on individuals imposed on their incomes, at Arpajon (Seine-et-Oise), but was dismissed from his employment after the revolution of 1830, on account of the opinions held by a relation of his, which he himself, however, did not share. He was afterwards restored to his post at the request of the inhabitants of the place. In 1839 he resigned his office, desiring to apply himself to economic study. After some preliminary

attempts he discovered the direction in which his true vocation lay, and devoted himself to preparing the collection of the works of the principal economists, published by Messrs. Guillaumin. Of the fifteen volumes of this collection he edited six: *Les Economistes financiers du XVIIIe siècle* (Vauban, Boisguillebert, J. Law, Melon, and Dutot), *Les Physiocrates* (Quesnay, Dupont de Nemours, Mercier de la Rivière, Abbé Baudeau, and Le Trosne), the *Œuvres de Turgot*, the *Œuvres diverses de J. B. Say*, the first volume of *Mélanges* (David Hume, V. de Forbonnais,

Condillac, Condorcet, Lavoisier, and Franklin). Daire wrote, in these volumes, a special notice of each author. Some of these are of great value, for example, those of Law and Turgot. Equally important is his introductory exposition of "the theories of the Physiocrats," which gained him a prize of 1500 fr. (£60) from the Academy of Moral and Political Science. The news of this success only reached him on his deathbed. An able financier and a distinguished economist, Daire was too early lost to the science, of which, had his life been spared, he might have been a distinguished expositor. A. C. f.

DALBIAC, GENERAL SIR JAMES CHARLES (1776-1848), served with distinction in the Peninsular War, was Tory member for Ripon 1835-37. He published, in 1841 (London), *A few words on the corn laws, wherein are brought under consideration certain of the statements which are to be found in the 3rd ed. of Mr. M'Culloch's pamphlet on the same subject*. See M'Culloch, *Liter. of Pol. Econ.*, p. 80. He wrote also a *Military Catechism for the use of young Officers and non-commissioned Officers of Cavalry* (1817).

To the same author is perhaps to be attributed the following tract ascribed on the title page to "J. G. Dalbiac, of Buckham Hall, Uckfield" (Sussex). *Proofs of existing agricultural distress, and an endeavour to show the necessity of permanent and efficient protection to agriculture by permanent and efficient legislative enactments* (Lewes, 1820). The writer employs the form of a dialogue between a farmer and a manufacturer. He argues in the spirit of Western, whose "Resolutions" of March 1816 he quotes in his appendix. J. B.

DALRYMPLE, Sir JOHN, 4th baronet (1726-1810), was the eldest son of Sir William Dalrymple of Cranstoun. He was educated at Edinburgh and at Cambridge, and became an advocate at the Scottish bar in 1748. From 1776 to 1807 he was one of the barons of the exchequer. In 1757 he published an *Essay towards a General History of Feudal Property in England* (4th and enlarged edition, 1759, 8vo), praised by Hume (J. H. Burton, *Life*, ii. 37). Part of this work was revised by Montesquieu. Dalrymple printed in 1764 *Considerations on the Polity of Entails* (2nd ed. 1765, 8vo), a very able defence. His *Memoirs of Great Britain and Ireland, 1681-92* (3 vols. 4to, 1771-88, new ed. 1790, 3 vols. 8vo), largely based upon unpublished documents, is chiefly interesting from a biographical and anecdotal point of view. He received a visit from Dr. Johnson at Cranstoun in 1773 (Boswell, *Life*, 1887, v. pp. 401-404). He was given to chemical and industrial experiments, and in 1798 interested himself in teaching the making of soap from herrings. He was succeeded in the baronetcy by his fourth son, who became eighth earl of Stair in 1840.

His economic writings are:

An Appeal to Facts in a Letter to Earl Temple, London, 1763, 4to (includes an account of the money raised on loan for the public service from 1755 to 1762).—*The Question considered: Whether wool should be allowed to be exported when the price is low at home on paying a duty to the public?* London, 1781 (2nd ed. 1782, answered by Rev. N. Forster and two anonymous pamphleteers. The author gives various reasons why it should be permitted).—*Address and Proposals on the subject of the coal, tar, and iron branches of trade*, London, 1784, 8vo (written to attract the attention of speculators to the coal, ironstone, and limestone on his estate in Edinburgh).—*Address to the Landholders of England upon the interest which they have in the state of the distillery laws*, London, 1786, 8vo (proposes a tax on stills).

[*Dictionary of Nat. Biogr.*, xiii. 424-425; M'Culloch, *Literature of Political Economy*, 1845].

H. R. T.

DAMAGES. The technical name for a sum of money claimed by a person who has suffered injury or loss by reason of a breach of contract or of another's wrongful act or omission. In actions for damages it belongs to the province of the jury to assess the amount, but there are certain established rules, according to which they ought to find, and which the judge ought to explain to them, *e.g.* the rule relating to remoteness of damage, according to which the loss for which compensation is claimed must be something immediately connected with the breach of contract or wrongful act or omission, and must be such as the defendant would reasonably have contemplated as the result of such breach, act, or omission. The non-receipt of money promised to be paid on a certain date may prevent the promisee from making a profitable investment, or may even, through causing his insolvency, bring about the ruin of his prospects; but these are not the ordinary results of the non-payment of a debt, and no damages can therefore be claimed beyond the amount of the debt with interest. In a case of breach of contract for the sale of goods, the measure of damages is the difference between the price named in the contract and the market value of the like goods at the time when the contract was broken. As a general rule, damages are not awarded as a compensation for injuries which do not result in a pecuniary loss, but in exceptional cases it is admissible to compensate the plaintiff for wounded feelings or bodily pain, *e.g.* in actions for breach of promise to marry, in actions for defamation (libel or slander), in actions for assault, etc.

In some cases the conduct of the defendant may be such as to make it permissible for the jury to award damages in excess of the amount which would be sufficient to compensate the plaintiff for the injury suffered by him, *e.g.* trespass of a particularly insulting character, seduction under aggravating circumstances.

In such a case the damages are said to be "exemplary" or "vindictive." On the other hand the damages may be so small that they could not reasonably be looked upon as compensation for any injury. Damages of the latter kind, which in technical language are called "nominal damages," may occur in two classes of cases:—(1) When the plaintiff's intention is not so much to obtain compensation, as to make use of an action for damages as a convenient mode of procedure for asserting a right, *e.g.* action of trespass for the purpose of establishing a title to lands; (2) When the plaintiff, though technically in the right, ought not, according to the opinion of the jury, to succeed in the action, *e.g.* in action for defamation when the defendant through flaws in the evidence, has failed to establish his plea of justification, but has convinced the jury that the plaintiff's character is worthless. The expression "ordinary damages" is used in contradistinction to "nominal" or "exemplary" damages. In certain cases it is recognised by the law that the requirements of the plaintiff cannot be adequately satisfied by damages, and SPECIFIC PERFORMANCE (*q.v.*) is decreed. E. S.

DAMAGES, MEASURE OF. Damages are the pecuniary satisfaction which a plaintiff may obtain by success in an action. The rules by which such satisfaction is measured form a branch of law known as the Measure of Damages.

[See as to English Law, *Damages*, by J. D. Mayne and L. Smith, London, 1884; and as to American Law, *The Measure of Damages*, by T. Sedgwick, New York, 1874.] J. E. C. M.

DAMETH, HENRI (1812-1884), born at Paray-le-Monial (Saône-et-Loire), died at Geneva. He was in early life a devoted follower of FOURIER (*q.v.*), but became, through conscientious study, one of the most ardent popularisers of economic science. He published in 1842 a work entitled *Défense du Fouriérisme*, 1 vol. in 18mo; then in 1849, *Un mémoire sur la fondation des cités industrielles dites cités de l'Union*, in 8vo; after this he filled, from 1850 to 1855, the position of editor-in-chief to the *Avenir de Nice*. Becoming convinced of the soundness of economic theory he shook himself clear of the doctrines of Fourier, and published: *Le Juste et l'Utile*, 1859, 1 vol. in 8vo; *L'Économie politique et le spiritualisme*, 1862, 1 vol. in 8vo; *Introduction à l'étude de l'économie politique*, 1865, 1 vol. in 8vo; *Les Banques publiques d'émission*, 1866, 1 vol. in 8vo (in this he supported the freedom of banks); *Le mouvement socialiste et l'économie politique*, 1869, 1 vol. in 18mo; *La question sociale*, 1871, 1 vol. in 12mo; and finally *Les Bases naturelles de l'économie sociale*, 1872, 1 vol. in 18mo. He lectured with success, in 1864, on political economy at Lyons, in connection with the chamber of commerce of that city, and at the

Academy of Geneva, from 1865. His works are lucid in style and temperate in tone. He assisted MM. Victor Philippe, Jean Tisseur, and Alph. Courtois in founding the Society of Political Economy at Lyons (1866). A. C. F.

DAMNUM EMERGENS, *i.e.* the loss or injury resulting to one person in consequence of his having made a loan to another, was usually regarded by canonists and theologians in the later middle ages as justifying a demand for INTEREST (in the original and limited sense of that word, *q.v.*) The doctrine of compensation to the creditor arose out of an obscure passage in the Roman law; and the sharp distinction between *damnum emergens* and *LUCRUM CESSANS* (*q.v.*), which was for a long time rigidly observed by writers on the subject seems to have been first drawn by the greatest of the mediæval glossators, Accursius. But while the civil law recognised both these reasons as justifying a demand for compensation, Aquinas and many of the schoolmen accepted only *damnum emergens*. Until the end of the middle ages, moreover, the principle was maintained that compensation was only due when the period for which the loan was originally made had expired, and the debtor showed culpable neglect in fulfilling his obligations. The theoretical distinction between usury and interest tended, however, to disappear, owing to (1) the concession, which even Aquinas made, that such a recompense could be justly bargained for at the time of making the loan, (2) the concession that the payment might take the form of a certain percentage for each period of delay, and (3) the practice of making the original term, during which no payment for the use of the money was required, so short that the loan came to bear interest almost from the first. The final step was taken when some of the Protestant theologians, especially Melancthon, and many of the later Roman Catholic canonists, especially Navarrus, recognised the justice of contracting to receive interest even before there had been any delay, *i.e.* from the time the loan was contracted. As by this time *lucrum cessans* had also come to be accepted as a sufficient cause for the payment of interest, it was possible to meet all the necessities of the growing trade of the period without a violent breach with the doctrine of usury.

A characteristic example of the transitional literature of the 16th century is *The Arraignment and Conviction of Usury* by Miles Mosse, London, 1595. He sums up the matter as follows: "There are two manifest and essential differences between Usury and Interest, which do so distinguish the one from the other, as that they cannot possibly be confounded. One difference is this: Usury is an overplus or gain taken more than was lent; Interest is never gain or overplus above the principal, but a recompense demanded and due for the damage that is taken or the gain that is hindered through lending. Another difference is this:

Usury accrueth and groweth due by lending, from the day of borrowing, unto the appointed time of payment; Interest is never due but from the appointed day of payment forward, and for so long as I forbear my goods after the day in which I did covenant to receive them again." W. J. A.

[By far the best treatment of the subject is to be found in Endemann, *Studien in der Romanisch-kanonistischen Wirtschafts- und Rechtslehre*, vol. ii. (1883) ch. viii. §§ 1-3. For the views of the Reformers, see also Schmoller, *Zur Geschichte der nationalök. Ansichten in Deutschland*, etc. 1861, p. 98 [reprinted from *Zeitschr. f. d. ges. Staatswissenschaft*, Bd. xvi.] The subject is also slightly touched in F. X. Funk, *Zins u. Wucher*, 1868, and *Geschichte des Kirchlichen Zinsverbotes*, 1876. For brief accounts in English, see Ashley, *Economic History*, vol. i. part i. (1888), and Böhm-Bawerk, *Capital and Interest*, tr. Smart, 1890.]

DAMNUM FATALE (Scot.) Loss arising from inevitable accident beyond prevention by human prudence.

A. D.

DANEgeld. This is the first money tax of which we have any record in English history. Ethelred II. levied two shillings on every hide of land to provide a fund for buying off the Danes. His successors, even the Danish kings, retained this as an annual tax, long after the original pretext had disappeared. Edward the Confessor is said to have abolished the Dane-geld, but William I. again exacted it, though at three times the original rate, viz. six shillings for every hide. But under the Norman kings it was an occasional instead of an annual tax. That the impost was unpopular is proved by the assertion of Henry of Huntingdon that Stephen, on his accession, promised to abolish it. The promise was not kept, and the Dane-geld was regularly collected in the first seven years of Henry II.'s reign. By this time the tax had become a fixed sum from each county, and any surplus went into the pockets of the sheriffs who collected it. In 1163 Henry II. proposed to take the tax out of the hands of the sheriffs, and to bring it direct into the exchequer. The proposal was opposed by Becket, and from this time the term Danegeld disappears from the Pipe Rolls. It has often been asserted that Becket's opposition led to the abolition of the tax, but this is an error. The two shillings from the hide were frequently levied in the later years of Henry II. under the name of *hydagiūm*. They were collected under Richard I. in 1194, and in 1198 were raised to five shillings on the hide or carucate. Dane-geld and *hydagiūm* are merely two names for the same tax, which was collected from all free tenants, whether holding by knight-service or by socage.

[*Dialogus de Scaccario*, i. 11.—Stubbs, *Constitutional History*, vol. i.]

R. L.

DANGEUL, MARQUIS DE PLUMART (fl. 1750), was born at Mans, and became a commissioner of the *Cour des Comptes*. He was

à relative of Forbonnais, and, like him, devoted himself to the study of the works of the Spanish mercantilists. He translated one of these: *Le Rétablissement des manufactures et du commerce d'Espagne*, traduit de l'espagnol de Bernard de Ulloa, 1753. After this, at the suggestion of Gournay, he, as Turgot did, made himself acquainted with the works of Josiah Tucker, and following Tucker in the lines of free trade and development of commercial enterprise, he wrote his book *Remarques sur les avantages et les désavantages de la France et de la Grande Bretagne par rapport au Commerce et aux autres Sources de la Puissance des États*. Traduit de l'Anglois du Chevalier John Nickolls, Leyde et Paris, Estienne, 1754. This work is pseudonymous; the author admits that he borrowed the title and the introductory sections from Tucker's *Brief Essay on Trade* (1750). In it he expresses his regret at the want of interest in economic questions in France (p. 49), he states the difficult problems of agricultural and financial policy in which his country was involved; he describes the strength of the leisured and the wants of the labouring classes (p. 60), the effects of unequal taxation (p. 43), and the absenteeism of the nobles (p. 64), the centralisation of government, the multitude of holidays, and the low standard of the working classes (p. 25). On the other hand he praises English husbandry as being the true mine of riches (p. 101), and shows the practical and theoretic literary interest taken in English trade (p. 152). Dangeul, however, condemns, like Tucker, the monopoly of the home trade, exercised in England, by corporations and companies (pp. 205-216), as being opposed to the interests of the population and its growth. According to both, competition, entirely unfettered, is most advantageous for a nation's trade, as it diminishes the profits of dealers (p. 253) and assists the introduction of machinery in manufactures. Dangeul is an admirer of Decker's *Proposal* for a single tax on luxuries in lieu of duties and excises (p. 404); he also differs from Forbonnais in one very important point of taxation: he proposes to exempt the absolute necessities of life, considering that the taxation of these extinguishes the spirit of private property among the poor (pp. 407-409). In 1756 he wrote anonymously, *Écamen de la conduite de la Grande Bretagne à l'usage de la Hollande depuis la naissance de la république*, Paris et La Haye, 1756. The writings of Dangeul are interesting in so far as they are evidence of the practical influence of the now undeservedly neglected Dean of Gloucester, Josiah Tucker, the spiritual father of Gournay, Dangeul, Turgot, and also of Adam Smith.

[See Quérard, *La France littéraire*, t. vii. p. 218. —M'Culloch, *Literature of Political Economy*, p. 62. —Morellet, *Mémoires (inédits)*, 1823, t. i. pp. 37-38. —Tucker, *Instructions for Travellers*, 1757,

DARG. A Scottish term for a day's work. Cottars were formerly bound to give the labour of a certain number of days to their superior in lieu of rent: these days were called darg-days, i.e. days of work.

[*Scottish Dictionary* (Supplement), by John Jamieson, Edinburgh, 1825.] J. E. C. M.

DARIC. Ancient Persian coin of approximately pure gold, first struck about 1516 B.C. by Darius I., bearing the effigy of the king as an archer, but with no inscription. Double darics, struck about the time of the fall of the empire, bear Greek letters or symbols. F. E. A.

DARIEN COMPANY. The originator of this disastrous enterprise was William Paterson, the founder of the Bank of England. His idea was to found a company for colonising the Isthmus of Darien, and conducting overland the trade between the Atlantic and Pacific. By this means, he thought, the whole commerce between Europe and Asia might be diverted from the route round the Cape, and Scotland might supplant Holland as the great emporium for the wealth of the East. Without divulging the details of his scheme, he succeeded in exciting the speculative interest of his countrymen, and a bill to establish the new company was carried through the Scotch Parliament and received the sanction of the Lord High Commissioner on 26th June 1695. The "Company of Scotland trading to Africa and the Indies," was authorised to seize unoccupied territories in Asia, Africa, and America, to plant colonies, construct forts, wage war and conclude treaties; while the king was pledged to obtain reparation from any foreign state which molested the company. The company received a monopoly of the trade with Asia, Africa, and America for thirty-one years, and for twenty-one years their imports, except sugar and tobacco, were to be free from all duties. Scotchmen hastened to invest their scanty savings in the new venture, and £220,000 was actually contributed towards a nominal capital of £400,000. But Scotland was then a poor country, and the financial success of the scheme could only be secured by English support.

The hostility of England, in those days of commercial jealousy, was from the first a certainty. A new trading colony would certainly lead to war with the country whose monopoly was attacked, and the burden of such a war must fall upon England, as Scotland had neither army, nor navy, nor military revenue. England would never go to war to secure to Scotland trading privileges which would be injurious to herself. The English Parliament

protested against the scheme, and William III. recalled the commissioner who had given the royal sanction to the act. No English capital was subscribed, and it was even proposed to prosecute the directors of the company.

But English opposition, ascribed to national jealousy, only increased the obstinate determination of the Scotch to carry out the enterprise. In 1698 some 1200 colonists, including Paterson and his wife, sailed from Leith to Darien, where they took formal possession of the country under the name of New Caledonia, concluded treaties with native chieftains, established a representative parliament, and began to fortify New Edinburgh as their capital. The enterprise was almost insane in its rashness. The isthmus had been discovered and crossed by Spaniards nearly two centuries before, and they had only failed to settle there because it was too unhealthy for Europeans to live there. But Spain would never tolerate foreign intruders in the heart of her American provinces, and an expedition was being fitted out to expel the settlers when disease compelled the decimated remnant to sail to New York. Before this terrible news reached Scotland a second expedition had sailed to Darien, where they arrived four months after the departure of the first colonists, to find New Edinburgh a deserted ruin. With the courage of despair the new settlers landed, but their fate was already sealed by dissensions and disease, when the arrival of a Spanish fleet compelled the survivors to surrender and return homewards. The ill-feeling which this ill-starred undertaking excited between England and Scotland, and the risk of similar misunderstandings of the same nature, gave an impulse to the projects of a legislative union between the two countries which was finally effected in 1707.

[The best modern narrative of the Darien Expedition is to be found in Macaulay's *History of England*, vol. iv.] R. L.

DARWINISM is a name sometimes given to the theory put forward in Darwin's *Origin of Species* that the struggle for existence among plants and animals results in natural selection or survival of the fittest varieties. This theory is sometimes spoken of (e.g. in Maine's *Popular Government*, p. 37) as if it had been anticipated in Malthus's doctrine of population. But Malthus, though he insists on the fact of the struggle for existence among mankind, had no notion of its altering or improving the human race by causing the fittest varieties to survive. Darwin (*Life and Letters*, vol. i. p. 83), says that the idea of natural selection occurred to him on reading Malthus's *Essay*, not that he found it there.

Mr. Herbert Spencer and some writers who have followed him have used the theory as an argument against state interference with private property and industrial competition. They

urge that if the state interferes with the struggle for existence it will hinder natural selection, and thus obstruct the evolution of a superior race; "Now more than ever before," Mr. Spencer asserts, "people are doing all they can to further survival of the unfittest" (*Man versus the State*, p. 69). The socialist meets this argument by pointing out that "survival of the fittest" means survival of those who are fittest to undergo a particular struggle, not those who are the absolutely best, and if the struggle is abolished it will not matter whether people are fit for it or not (Sidney Webb, *Contemporary Review*, Dec. 1889, pp. 868, 869). Prof. Huxley says: "It is an error to imagine that evolution signifies a constant tendency to increased perfection" (*Nineteenth Century*, Feb. 1888, p. 163), and even if it were universally admitted that the absolutely best individuals of each generation do come to the top in industrial competition, it might still be questioned whether this results in the survival of the best families. Mr. Francis Galton urges very strongly that the Malthusian advice to delay the period of marriage is likely "to bring utter ruin upon the breed of any country where it is followed by the prudent, while the imprudent are left free to disregard it" (*Hereditary Genius*, p. 356). Now the wealthier and therefore presumably "fitter" individuals certainly marry later than the poorer (see MARRIAGE, RATE OF), and it cannot be said to be proved that the greater mortality among the poor is—or would be if there were no state interference—sufficient to counterbalance their earlier marriages and so to make them less effective continuers of the race than the wealthy.

The subject has not been much discussed by economists of any school, because the analogy between industrial competition and the struggle for existence among the lower animals is too imperfect to be of much service. It is contrary to sound economic traditions to look upon competition as a "private war" (Maine, *Popular Government*, p. 50), and on an improvement in the powers of labour as "sharpening our claws that we may fight our neighbours the more fiercely" (Ritchie, *Darwinism and Politics*, p. 31). Competition is not a struggle for a pre-existing determinate quantity of wealth, in which each man's gain is so much subtracted from the possible gains of all the rest. Though the success of one producer often damages other producers of the same commodity, it almost always benefits the community at large, and makes it not more difficult but easier to obtain the means of existence. Thus it happens that in countries where the industrial powers are most highly developed, individuals who have naturally the least industrial power, e.g. the blind, deaf and dumb, and paralytic, find it easier to make a living than they do in more backward countries.

There is a curious anticipation of Mr. Herbert Spencer's theory in Joseph Townsend's *Dissertation on the Poor Laws* (1786). "By establishing a community of goods, or rather by giving to the idle and vicious the first claim upon the produce of the earth, many of the more prudent, careful, and industrious citizens are straitened in their circumstances and restrained from marriage. The farmer breeds only from the best of all his cattle; but our laws choose rather to preserve the worst, and seem to be anxious lest the breed should fail" (p. 426 in Overstone's *Select Tracts*, "Miscellaneous").

E. C.

DATE OF DRAWING. As a general rule a bill of exchange is dated; the absence of a date does not, however, according to the law of the United Kingdom, make a bill invalid (Bill of Exchange Act § 3 [4a]). The holder may, in such a case, insert the true date of drawing, and the bill is then payable accordingly (*ibid.* § 12), the date appearing on the face of the bill being presumed to be the true date of drawing until the contrary is proved; a holder in due course has, in any case, the same rights as if the true date had been inserted (*ibid.* § 13). According to continental law the date is an essential requirement, and an undated document is not available as a bill of exchange (German Codes, 4 [6]; French Code de Commerce, § 110; Italian Codice di Commercio, § 251). If a bill is to operate as from a date previous to the actual issue, it may, according to the law of the United Kingdom, be dated accordingly (ante-dated), and if its operation is to begin as from a subsequent date, that date may be inserted—the bill is then said to be post-dated. It thus becomes possible to evade the stamp duty by post-dating a bill payable on demand, which has the same effect as if the bill had been drawn from the right date payable on the date which appears as the date of issue—in which case an *ad valorem* stamp duty would have been payable. The holder of a post-dated bill cannot, of course, present it for acceptance before the date appearing on its face. If a bill is drawn from a country in which the Greek calendar is used, the date of issue must be taken as the date according to the Greek calendar. Thus a bill drawn in St. Petersburg on the 1st November is treated as drawn on 13th November according to our computation. It is, however, customary to insert the two dates thus: St. Petersburg 1/13 November.

E. S.

DAVACH. Ancient measurement of land, N.E. Scotland; equal (average) to four "ploughgates," which amount to 416 Scotch acres, or 528.5 imperial acres.

[Cosmo Innes, *Scotch Legal Antiquities*.] A. D.

DAVANZATI, BERNARDO (1529-1606), born in Florence. This name will always be famous in the history of Italian literature, because, writing in prose, he attained to the same vigour and precision that Dante displayed in poetry. The writings of Davanzati are still

models of style. He undertook to translate Tacitus and to surpass him in conciseness, and asserts that, on an average, a hundred Italian words are required where Tacitus needs a hundred and eight Latin ones, and a French translation a hundred and sixty. Besides his translation of Tacitus, a history of the Reformation in England under Henry VIII., and minor academic essays, two economic writings, for which he merits here a mention, are extant. These are his *Lezione delle monete*, 1582, and his *Notizia dei cambj*, published in 1588, and included in Custodi's *Scrittori Classici*. To judge him correctly it must be considered that he was a contemporary of SCARUFFI (1582), of JEAN BODIN (1578), and of WILLIAM STAFFORD (1581), men who wrote their books half a century before PETTY and LOCKE were born (Petty, 1623-1687; Locke, 1632-1704). Davanzati begins by showing how "barter is a necessary complement of division of labour amongst men and amongst nations"; he then passes on to show how there is easily a "want of coincidence in barter," which calls for a "medium of exchange"; and this must be capable of "subdivision," and be a "store of value." He then goes off upon a historical digression on currencies, and on returning from thence recognises in money "a common measure of value." This leads him to a dissertation on the causes of value in general, in which respect his remarks are also worth mentioning, because he has clearly shown that utility and value are "accidents of things" and functions of the "quantity in which they exist." Proceeding to examples, he remarks "that one single egg was more worth to Count Ugolino in his tower than all the gold of the world," but that, on the other hand, "ten thousand grains of corn are only worth one of gold in the market," and that "water, however necessary for life, is worth nothing, because superabundant." In the siege of Casilino "a rat was sold for 200 florins, and the price could not be called exaggerated, because next day the man who sold it was starved and the man who bought it was still alive." Returning to his argument, he says all the money in a country is worth all the goods, because the one exchanges for the other and nobody wants money for its own sake. Davanzati does not know anything about the rapidity of circulation of money, and only says every country needs a different quantity of money, as different human frames need different quantities of blood. The rest of his treatise is directed against artificial deterioration of money. The mint ought to coin money gratuitously for everybody; and the fear that, if the coins are too good, they should be exported is simply illusory, because they must have been paid for by the exporter. Davanzati insists particularly on the injury the defrauding government is the first to experience when it tampers with the coin. In his essay

on exchanges Davanzati goes minutely into the mechanism of exchanges, but he evidently does not suspect the causes of the phenomenon nor its limits. Davanzati was by profession a merchant, and lived a part of his life in France.

[For a criticism of Davanzati, see Travers Twiss, *View of the Progress of Pol. Econ.*, 1847. Lecture i.]

M. P.

DAVENANT, CHARLES, LL.D. (1656-1714), economist and politician, son of Sir William Davenant, the poet, was born in London. He was educated at Cheam Grammar School, Surrey, and in 1671 matriculated at Balliol College, Oxford, but did not then proceed to a degree. After composing, at the age of nineteen, a tragedy under the title of "Circe," which had some slight success, he turned his attention to the law, and appears to have taken the degree of LL.D., but at what university is uncertain. He held the office of commissioner of excise from 1683 to 1689, and represented St. Ives, Cornwall, in the first parliament of James II. His first work of economic interest, *Ways and Means of supplying the War*, was published in 1695. In it he strongly objected to meeting war expenses by borrowing money, and advocated an excise as the best and fairest tax. He sat again in parliament, this time for Great Bedwin, in 1698, continuing to write on economic and political subjects. Under William III. he did not hold office, and criticised the financial policy of the government with some bitterness; but, on the accession of Queen Anne, he returned to official life as secretary to the commission appointed to treat for the union with Scotland. In 1705 he was appointed inspector-general of exports and imports, which office he held until his death.

As an economist, Davenant must on the whole be classed as an adherent of the mercantile theory. In opposition to the bullionists he points out that an energetic people with good seaports and a soil fertile in variety of commodities, can easily exchange its products for as much gold and silver as it may require. "Money," he says, "is the servant of trade—at bottom no more than the counters with which men in their dealings have been accustomed to reckon." He seems to have considered, however, that the possessors of money in specie were in a position of advantage compared with the possessors, and would-be sellers of commodities. "Those who stand possessed of the ready money have, in all times and all countries, given the law." Especially is this the case with perishable commodities, and articles of luxury, which should not be bought by any nation to a large amount, except for the purpose of being re-sold. On the last ground he strongly supported the East India Company in the controversies which raged about 1697 on the

subject of the importation of East India goods, and opposed the act which was passed in the supposed interest of English manufacturers, forbidding the wearing or use of Indian silks and muslins. Such a measure would only benefit the French silk trade and encourage smuggling. "The natural way of promoting the woollen manufacture is not to force its consumption at home, but by wholesome laws to contrive that it may be wrought cheaply in England, which will enable us to command the markets abroad." Europe was foolish enough to be ready to pay for luxuries from India; much wealth could be gained by the nation which would act as the go-between; and for England to refuse to reap the harvest would be merely to leave it to the Dutch.

In his earlier economic period Davenant shows distinct tendencies towards what might almost be called a free-trade position. "Trade is in its nature free, finds its own channel, and best directeth its own course, and all laws to give it rules and directions, and to limit and circumscribe it, may serve the particular ends of private men, but are seldom advantageous to the public. . . . The various products of different soils and countries is an indication that Providence intended they should be helpful to each other." In the works, however, which he published after his return to official employment, he did not venture to disturb current economic ideas, devoting himself to carrying on the statistical work of Sir William Petty and Mr. Gregory King, and attempting by an elaborate investigation to ascertain the precise position of England in regard to the balance of trade (see BALANCE OF TRADE, HISTORY OF THE THEORY). His views on taxation have been already alluded to. He thought that the incidence of taxation should be proportional to the tax-payer's ability to pay, and that taxes should bear chiefly on consumers of luxuries. He thought that "all taxes whatsoever were, in their last resort, a charge upon land." Trade with uncivilised countries such as Africa was, he thought, best carried on by a monopolistic corporation (see FOREIGN TRADE, REGULATION OF). As regards the labour question, he strongly advocated the compulsory employment of the able-bodied poor in manufactures, as a means to cheap production and the consequent command of foreign markets. Davenant's chief works were—

An Essay on the Ways and Means of Supplying the War, London, 1695.—*An Essay on the East India Trade*, London, 1697.—*Two Discourses on the Public Revenues and Trade of England*, London, 1698.—*An Essay on the probable means of making the people gainers in the balance of Trade*, London, 1699.—*A Discourse on Grants and Resumptions*.—*Essays on the Balance of Power*, London, 1701.—*A Picture of a modern Whig*, London, 1701.—*Essays on Peace at Home and War Abroad*, London, 1704.—*Reflections on*

the Constitution and Management of the Trade to Africa, London, 1709.—*Two Reports to the Commissioners for taking the Public Accounts*, London, 1712 and 1715. A collected edition of his works, edited by Sir C. Whitworth, was published at London in 1771.

[Stephen's *Dictionary of National Biography*, London, 1888.—Conrad, *Handwörterbuch der Staatswissenschaften*, Jena, 1888.—Guillaumin and Coquelin, *Dictionnaire d'Economie Politique*, Paris, 1858, and heading "East India Trade" in British Museum Catalogue.] A. H.

Davenant is perhaps best known to most readers by his employment of the estimate made by GREGORY KING (*q.v.*) of the effect of deficiency in supply on augmentation of price. The passage in which this is mentioned is as follows:

"It is observed that but one-tenth the defect in the harvest may raise the price three-tenths, and when we have but half our crop of wheat, which now and then happens, the remainder is spun out by thrift and good management, and eked out by the use of other grain; but this will not do for above one year, and would be a small help in the succession of two or three unseasonable harvests. For the scarcity even of one year is very destructive, in which many of the poorest sort perish, either for want of sufficient food or by unwholesome diet.

"We take it that a defect in the harvest may raise the price of corn in the following proportions:—

Defect.		Above the common rate.
1 tenth	} raises the price	3 tenths
2 tenths		8 tenths
3 tenths		1·6 tenths
4 tenths		2·8 tenths
5 tenths		4·5 tenths

So that when corn rises to treble the common rate, it may be presumed that we want above one-third of the common produce; and if we should want five-tenths or half the common produce, the price would rise to near five times the common rate" (*D'Avenant*, vol. ii. pp. 224, 225).

DAVIES, DAVID, D.D. (*d.* 1819?), graduated at Oxford, and was appointed rector of Barkham, Berkshire. When in 1775 and 1785 parliament ordered returns to be made of the poor rates throughout the kingdom, no inquiry was thought necessary as regards the actual circumstances of poor families. To remedy this omission, Davies collected budgets of labouring families in his own parish about Easter 1787. Of these accounts an abstract was printed; many copies were distributed with the help of friends throughout England, Wales, and Scotland. The valuable information collected in this manner is tabulated in the following work, and furnishes minute particulars as to the wages, food, etc., of agricultural labourers. The author offers various suggestions for the encouragement of thrift, with recommendations for rating wages by statute and according to the price of bread.

The Case of Labourers in Husbandry stated and

considered, in three parts: Part I. A View of their Distressed Condition. Part II. The Principal Causes of their Growing Distress and Number, and of the Consequent Increase of the Poor-Rate. Part III. Means of Relief Proposed. With an Appendix containing a collection of accounts showing the earnings and expenses of Labouring families in different parts of the Kingdom. Bath, 1795, 4to.

[M'Culloch, *Literature of Political Economy*, 1845, p. 285.—Sir F. M. Eden, *State of the Poor*, 1797, vol. iii.—A. Toynbee, *Industrial Revolution*. H. R. T.]

DAVILA, EL PADRE BÁUTISTA (17th century). In his *Resúmen de los medios prácticos para el general alivio de la Monarquía* (A short account of the practical means of the general Relief of the Monarchy), printed in 1651, Dávila advocates a single and progressive poll-tax. He thus aims to remedy the frightful state to which Spain had been brought by the bad administration of the "Rentas Reales" and by the vexatious exactions and dishonesty of the collectors. He also deals with the problem of the debased currency.

[Colmeiro's *Biblioteca de los Economistas Españoles* and *Historia de la Economía Política en España* (vol. ii. pp. 494, 575, 576).] E. Ca.

DÁVILA Y LUGO, DON FRANCISCO (17th century). Dávila's *Desengaños y Replicas á las Propositiones de Gerardo Basso* (Disproof of and Reply to the proposals of G. B.), Madrid 1632, is addressed to Philip IV., and strongly remonstrates against the adoption of a plan suggested by a Milanese writer, Gerardo Basso, who in his *Arbitrios y Discursos Políticos* (Madrid, 1627) had suggested the recoinage of the existing *Vellon*, debased small coins of silver and copper, which made up almost the whole of the existing currency in Spain. This recoinage was to be effected at the joint cost of the state and of the public, and reissued at a nominal value greatly superior to the intrinsic value. Dávila explains the objections to the tampering with the value of the currency and insists that the latter must be brought into strict correspondence with the currency of the neighbouring states. All monetary exchanges ought to be regulated according to a book of rates, which he considers that he alone is qualified to compile, and which must be based on the real metallic correspondence between the national and foreign coins in circulation.

[Colmeiro's *Biblioteca de los Economistas Españoles*.] E. Ca.

DAY, DAY WORK, AND DIET. A term given by the court at the prayer of the demandant or plaintiff, especially at the Exchequer for accountants of the crown to render their accounts (*Dialogus*, ii. 4). Also *Days of grace* were certain days allowed to the acceptor of a bill or to the maker of a note in which to make payment in extension of the term specified in the bill or note. They were so called because

at first allowed only as a matter of favour, perhaps originally through the mediation of the church, but this custom of the merchants has long been recognised by the law. Also a year-and-a-day.

In another sense, one day's entertainment or reception in lieu of service and rent, as in *Domesday Book*, where many such fee-farm rents are mentioned usually reserved to the king in so many days' or nights' provision, e.g. "so much honey as was sufficient for the king's family for half a day, and as much as was enough for a whole day" (*Spelm. Domesday*).

Also an allowance or diet for officers of state calculated according to the expenses of a day's journey or sojourn. A table of diets for the sheriffs of the English counties according to the number of days' journeys completed in attending at the exchequer at Westminster or at York is preserved in an ancient record (*Red Book of Exchequer*, fol. 14). Especially used of ambassadors or other agents of the crown (Audit Office Declared Accts., "Ambassadors," "Agents"). Also of soldiers, labourers, etc. paid by the crown (Q. R. Wardrobe Accounts, "Army," etc.) Diet is also used of a day's journey, formerly calculated as twenty miles, presumably for a horseman.

Also in agriculture of the day's work of one ploughman or cart, namely one "journey" (*journée*). Hence sometimes used as a specific quantity in grants of land (*Cart. Reading*, fol. 90d.) The extent of land ploughed in a day was variously computed, but was commonly fixed at four perches. In another sense a day-work was a recognised prædial service rendered by the villeins in most manors to the lord, and these "opera diurna" are enumerated in many customs, and often in connection with an allowance of food—"Et debent facere LX opera diurna, ut supra, in gardino, vel alibi, ut supra, capiendo LXX panes, ut supra." (*Cust. of Battle*, p. 10).

[*Spelman, Gloss.*—Cowel, *Interpr.*—Norden's *Surveyors' Dialogue.*—*Notes and Queries* (3rd series), iii. 512.—*Customal of Battle Abbey* (Camden Soc.).] H. Ha.

DAYS OF GRACE. These are the days which, in the case of bills of exchange, not being payable on demand, are added to the time of payment appearing on the face of the instrument. According to the law of the United Kingdom there are three such days of grace (see BILL OF EXCHANGE, LAW OF); but a bill may (by the use of the words "without grace" or some similar expression) stipulate that the day appearing on its face is to be the final due date. In most continental countries "days of grace," in the sense indicated above, do not exist; the holder may take out protest without waiting for any additional days; but he does not lose his right of recourse, if the presentation or protest is deferred for a certain

time (two days according to the German and Italian codes, §§ 41 and 296 ; one day according to the French code, § 162). These additional days, which may be called "days of grace at the holder's option" are convenient, as they enable the holder to exercise some leniency in favour of acceptors who, by reason of some accident, are not in possession of liquid funds on the exact day ; but the English days of grace have no practical object whatever, and only add an unnecessary complication in the computation of the time of payment. E. S.

DEAD FREIGHT. Compensation paid by the freighter of a whole ship for space remaining unoccupied when the cargo is not a full one.

A. D.

DEADLY, WARRANTICE AGAINST ALL (Scot.) Warranty against all mortals (*contra omnes mortales*). (See **WARRANTICE**.) A. D.

DEAD RENT. A rent reserved in a mining lease and payable whether the mine be worked or not. The object of such reservation is to secure the working of the mine. In some leases the dead rent and the royalty (see **ROYALTY**) are made payable cumulatively ; in others the dead rent merges in the royalty actually paid (*The Law of Mines*, by R. F. MacSwiney, London, 1884).

[As regards the amount and economic effects of dead rents, see *Mining Royalties*, by W. R. Sorley, London, 1889, and *The Reports of the Royal Commission on Mining Royalties*, c. 6195 of 1890, c. 6331 and c. 6529 of 1891.] J. E. C. M.

DEAD'S PART (Scot.) The portion of a man's free movable estate which he is at liberty at common law to bequeath by will ; that is, if he have neither wife nor child, the whole ; if he have either wife or child, one half ; if he have both wife and child, one third. In other words, the wife is entitled to one equal share ; the child or the children jointly to another equal share ; the testator is limited to one equal share, the deceased's share, or "dead's part." This common-law scheme of distribution may be modified by ante-nuptial contract of marriage (see **MARRIAGE SETTLEMENT**), or, after the marriage, by formal renunciation of their legal rights by the wife or children respectively. A. D.

DEADWEIGHT ANNUITY. A terminable annuity the creation of which was sanctioned in 1822, in lieu of certain naval and military pensions payable out of the public funds. The phrase was originally employed by Cobbett.

The distressed condition of agriculture in 1822 led Lord Londonderry's government to propose various measures for the lessening of the public burdens. Amongst them was a scheme for the creation of an annuity of £2,800,000, for a period of forty-five years, in lieu of the "dead expense" or "dead weight" of the naval and military pensions and half-pay amounting altogether to about £5,000,000

a year, which had arisen out of the recent wars. It was claimed that the government were justified in distributing this charge equally over a period of years, instead of awaiting the gradual extinction of the burden by the death of the pensioners. The scheme was opposed by Ricardo, amongst others, on the ground that it was a covert attack upon the sinking fund, and a relieving of the then taxpayers at the expense of posterity, but it eventually became law (3 Geo. IV. c. 51). In 1823, the Bank of England agreed to purchase £585,740, part of the proposed annuity, paying for it the sum of £13,089,419, spread over the six years 1823-28 (4 Geo. IV. c. 22), but this was the only sale effected, and the original act was repealed in 1828 (9 Geo. IV. c. 79) on the unanimous recommendation of the House of Commons ; thus the whole of the annuity, except the £585,740 per annum sold to the Bank of England, was cancelled. In July 1839 the Bank of England invited tenders for the purchase of their annuity, with a view to counteract a long-continued drain upon the stock of bullion, but the biddings fell short of the minimum advertised price, and the annuity continued to be paid to the Bank until 1867, when it expired.

[In addition to the Acts above named, Hansard, 2nd Series, vol. vii. pp. 164, 280, 316, 737, 1319, 1396, vol. xix. p. 646 ; Tooke's *History of Prices*, vol. iii. 88, 100-1, vol. iv. 333 ; and the *Report of the Select Committee on Banks of Issue* (No. 602 of 1840), may be consulted.] T. H. E.

DEALER (STOCK EXCHANGE). A dealer is a man who, in concert with others, makes what is called a market. He stands ready to buy or sell certain stocks, or shares, or bonds and, when a stockbroker approaches him with a demand for a quotation, the dealer (or jobber, as he is still called in and about the stock exchange) replies by mentioning two prices, the lower being that at which he will buy, and the higher that at which he will sell. For instance, when quoting the price of consols, he offers to buy each £100 stock at 98, or to sell at 98½. There is no legal obligation upon him to quote prices or to deal after quotation, but it is part of the etiquette of the stock exchange, which is quite as much a club as a market, that the dealer should follow up his quotation by buying or selling as the case may be up to the value of £1000. Indeed, were a jobber to give a quotation and then refuse to deal at either price named in the quotation, he would fall into disrepute, and perhaps be reported to the Stock Exchange Committee for General Purposes. In theory the dealer is supposed to be ignorant of and indifferent to the desire of the broker who accosts him—that is, he is supposed to be ready to sell or to buy—but in practice a shifty dealer will try to delay giving his quotation until he has discovered, or thinks he has discovered, the intentions of the person who

has come to him. If he thinks that the latter wishes to buy he raises his selling price; if he has reason to believe that the party wishes to sell, he quotes as low a buying price as possible, unless the state of his book makes it his interest to deal freely. Dealers sometimes transact business among themselves, for at the end of a day it may happen that dealer A has contracted to buy more stock than he can pay for, while dealer B has, on the other hand, contracted to sell more of the same stock than he can possibly deliver. Then A and B come together, and each relieves the pressure upon the other dealer's "book." In short, they institute a kind of clearing-house among themselves, writing off liabilities to sell against liabilities to buy. It need not be said that the dealers who compose a market have many opportunities for discovering facts which may lead them to a correct conclusion as to the drift of prices in the market. At the end of one week they will discover that the public has been absorbing a certain stock so freely as to limit the supply on the market. A week or two later they will have found that the tide has turned, and once again they are enabled to take measures. The dealer is a product of division of labour. He gives his time and attention exclusively to the consideration of one or two securities, and gradually accumulates in his own mind a record of the forces which go to raise or depress that group of securities in the market. He also preserves a kind of continuity, and acts as the middle link between the buyer of a stock who may be at Penzance, and the seller who may be at Middlesbrough. If it were not for the dealer or jobber, a man with stocks or shares to sell would have to run about, or employ a broker to run about, from place to place, offering these shares and remaining, perhaps, in the dark as to what is a good average market price. Thus the dealer forms the nucleus of a perpetual fair, and whereas a horse fair, for example, is often only an annual function, persons in the neighbourhood of the town in which it is held being almost compelled to keep their cattle until a fair takes place, the attendance of a concourse of dealers on the stock exchange makes it always possible to buy or sell the stocks in which they are concerned. In active times the price quoted by a dealer is usually more "close"—that is, the interval between the buying and selling quotation is narrow—whereas in dull times the dealer hesitates to offer anything like a middling quotation for fear of inability to cover or "undo" his bargain by a resale or a repurchase at such a price as would leave the dealer a turn or profit.

A. E.

DEARNESS, ARTIFICIAL. When action is consciously and deliberately directed to enhance the price of some commodity in some market above the competitive level, any resulting dearness may be called artificial.

We are not here to consider natural monopolies, for the dearness produced by these may be regarded as in a sense normal; and the end of the monopolist is not dearness, but high net profit, which may in some circumstances be produced by cheapness.

Nor can we conveniently consider under this head such artificial monopolies as copyright in books, or works of art, or patents for inventions. Dearness so produced is in a sense artificial, as deliberately created by the state. But the price of such things is not on the average higher than is necessary to induce the author or the inventor to work for the community.

The protection of home products by duties on imports may produce artificial dearness, but is more conveniently considered separately under the head **PROTECTION**.

The cases in which *demand* can be artificially created are not important. Laws such as the English law in the reign of Elizabeth for the eating of fish on Wednesdays and Fridays, and the charitable endeavours of leaders of fashion to foster local manufactures, *e.g.* Irish poplins, have had this end and possibly this effect. The effect of false rumours is generally transitory and followed by an equivalent or greater reaction. But the issue of misleading reports and fraudulent balance sheets may maintain the shares of banks and companies at an artificial level for years, as in the case of the city of Glasgow Bank (1878). Again a government may use its power as a purchaser to enhance the price of commodities for the benefit of a section of its subjects, or for the profit of influential persons. The laws passed in 1878 and 1890, to regulate the purchase of silver for currency purposes in the United States, had this effect if not this object.

Artificial dearness can only be permanent when the individual, or association, or public authority engaged in enhancing the price has either practical control over the most important of all possible sources of *supply*, and thus can limit the output, or has absolute control over the market of *demand*.

The East India Company and, in later days, the Indian government, has had such practical control over the sources of supply of a specially high quality of opium. We are told that the company used this power in a very arbitrary way to limit the supply of their opium (Adam Smith, bk. iv. ch. vii.) And the Indian government has placed this restriction on a regular basis with such profitable results that a monopoly revenue of some seven millions sterling is drawn from this source (see **OPIMUM**). But the market is not under English control, and a war with China has been, and might again be, necessary in order to maintain it. Meanwhile the rate of profit is diminishing through increased consumption of Chinese opium, which, although inferior, is a competing substitute.

The Dutch East India Company has had, since 1607, sovereign control over the Molucca Islands, once almost the only sources of supply for certain highly valued spices. Discovering by experience that a small increase of supply creates a more than proportional fall in the price of such commodities, they rigorously limited the supply by destroying a part of the plants in their own islands, and by extirpating as far as possible the clove and the nutmeg in the islands where they had no settlements (Adam Smith, *l.c.*) In abundant seasons they also destroyed a large part of their own produce. In modern times the monopoly of the spice trade is no longer in the hands of any nation.

Mines and salt mines have been commonly regarded in Europe as state monopolies. Until modern times the price has been thus maintained at an artificial level. Where the whole sources of supply are, as in this case, collected in one hand and foreign competition is excluded, it is not necessary to restrict the output. The price can be fixed, and the demand at that price will determine the output.

Somewhat similar are the state monopolies of matches, tobacco, etc. which exist in France and other European countries. They are highly profitable to the state, but the consumer has to put up with inferior quality. More convenient in the latter respect are customs duties, supplemented by equivalent excise, or levied on commodities not produced at home. These also produce artificial dearth for the profit of the state. But the rate of taxation does not measure the increase in price. It may be less or more according to the law which the production of the commodity obeys (see DIMINISHING RETURNS, and INCREASING RETURNS). Export duties can only be levied with permanent advantage to the state when a country has a natural monopoly of a commodity, or produces it under exceptional advantages. So with English wool in the thirteenth and fourteenth centuries. Such duties result in artificial dearth of the commodity, which is generally accompanied by a reduced demand and may ultimately destroy the trade. A bounty on exports has the opposite effect, and raises the price for a time at least to the home consumer.

A trading body, not fortified in a monopoly by the power of a state, can rarely obtain such control over all the sources of supply of any commodity in any market, as may be possessed by a public authority or a chartered company. The attempt has been made in recent times by great associations of capitalists, trading and producing bodies known as syndicates and trusts. The Standard Oil Trust in the United States was formed in 1881, to control three-quarters of the total petroleum refining power of the States, and exercised also, as it is alleged, influence over the output of crude petroleum, and the carrying corporations. It is not suggested that the

trust enhanced the price of refined petroleum above its previous level, but the considerable profits of the trust suggest that it partly prevented a natural decline. The Sugar Refining Company, which united under one control the chief sugar refining establishments in the States, is admitted to have raised the price of refined sugar two cents a pound. But in spite of their overwhelming power, neither of these two great associations was able to control the whole of the producing power and effectually keep down the output. Though protected in their own country they could not control the foreign trade, and there remained even at home a small body of outside competitors and a vast power of potential competition which might at any time, if tempted by exaggerated profits, have come into the field. In the case of the Cotton Bagging Trust, a syndicate of consumers, known as the Farmers' Alliance, was formed in opposition. The moderation with which trusts have been generally conducted has not saved them from unpopularity. In some States such combinations have been pronounced illegal, and attempts have been made to crush them by legislation.

One of the best conceived of such schemes was the English Salt Union formed in 1888, to control the supply of salt from the English mines. The effect of their action was immediately seen in the decline of English exports of salt from 898,000 tons in 1888 to 667,000 tons in 1889, with a rise in values from £486,000 to £539,000, thus illustrating a well-known law which is the strength of those who attempt to forestall necessities. In September 1888 the price of lump salt delivered free in Cambridge was 26s. a ton, in July 1889, 48s., July 1890, 52s., July 1891, 36s. The company paid in the first year 10 per cent on its ordinary shares, in 1890, 7 per cent, and in the first half of 1891, 5 per cent only. The 7 per cent preference shares in October 1891 stood at a discount. Excellent as are the sources of supply controlled by this company, necessary and universal as is the use of salt, its bulk comparatively small and the burden per head light, the rise in price cannot fail to affect the export trade, and the greater the rise in price the greater the inducement to competition, which for the great export trade is serious and even in England may become active. The difficulties of a trust increase with its success and with the duration of its success (on the whole subject, see a Foreign Office Report, 1890, c. 5896-32).

Even more hopeless is the task when the attempt is made to enhance price over a considerable period, with no control over the output, by buying up the stock in the market. The copper syndicate started in France towards the end of 1887, with a capital of 4 millions sterling, and the resources of the

Comptoir d'Escompte at its back. Copper was then and had long stood at about £40 a ton. Demand for copper was reviving. The operations of the syndicate raised copper to £85 in January 1888, and to £99 a ton in September of the same year. They had contracts with all chief copper-producing companies binding the syndicate to take over all their copper up to a certain amount at a certain price. But they had not the power to keep down the output, which increased from 224,000 tons in 1887 to 262,000 tons in 1888.

During the period the visible supply increased from 45,000 tons to 118,000 tons. Meanwhile consumers were minimising their purchases. Copper is not a necessary of life, and in March 1889, when the resources of the society and of the Comptoir d'Escompte were exhausted, the society itself held 130,000 tons.

In April 1889 the price of copper was back at £40. As a speculative venture the syndicate had very favourable prospects. But its ill-regulated attempt to artificially enhance and maintain the price failed, through want of power to keep down the output in proportion to the reduced consumption.

In the middle ages local markets were sometimes so far isolated by difficulties of communication and carriage that a very considerable difference in price would be long in attracting supplies from other markets. Such exceptional markets may occasionally have been looted by speculators, whose resources were large in proportion to the market. In dealing with necessities, it would be enough to buy up a large part of the available supply, to withhold, export at a loss, or even destroy a part, in order to realise substantial profits (see Jevons, *Theory of Political Economy*, 1879, 167 *seq.*, and the estimate there quoted, which, though resting on an insufficient inductive basis, is the guess of a shrewd man of much experience). Such events may have occurred to justify the popular hatred of FORESTALLERS and REGRATERS and *Accapareurs*, and the legislation on the subject from the *lex Julia de Annona* downwards. But the enterprise could rarely be attempted with success, and Adam Smith (bk. iv. ch. v.) did good service in pointing out the useful function of corn dealers as mitigating the severity of a scarcity, and in condemning all such legislation. It is very difficult to believe that a *pacte de Famine*, in eighteenth-century France, can have been successful, unless by the aid of legislation restrictive of trade.

The modern market for necessities is co-extensive with the world. The modern harvest continues from January to December. No combination of capitalists has yet arisen which could even threaten an artificial scarcity of food, unless in a strictly protected country, or a country where modern means of

communication have not been developed. On the other hand, to produce in a sensitive market a transitory enhancement of price does not require great resources. The device is familiar on the stock exchange and the produce market. But to make this manœuvre profitable the influence of example is necessary. When a leading financier buys largely, small speculators rush in to profit by the boom, and the master may unload at the expense of his imitators. If this expectation is not fulfilled the market must be depressed by the operator's sales, as much as it was raised by his purchases. On the whole, such fluctuations tend to depress average prices by discouraging legitimate purchase for consumption or investment, though they may be profitable to individuals.

At an exceptional conjuncture, when the supply of some necessary runs low, the action of some corner or ring may stimulate normal demand into frenzy. This was the case in New York in September 1869, when £22,000,000 sterling in gold were locked up in the treasury and the available market supply fell to £3,000,000 sterling. The currency being inconvertible, this supply might have been sufficient for normal needs. But it was easy for a few speculators to control the whole, and exact a ruinous price from purchasers whose needs were pressing. A ring was formed and in one day the premium on gold was forced from 40 to 60 per cent. The excitement was so great and the dealings so large that the gold clearing-house was unequal to the strain. The further rise of gold was only stopped by government sales of gold. It is, however, easier to create such movements than to profit by them. The means taken on this occasion by the conspirators to protect themselves are said to have been outside the limits of legitimate trade.

When speculators are rashly bearing a stock of which the real supply is small, a corner may sometimes be formed to lock up the whole, and prices are then forced up to an abnormal level, for the bears cannot find stock to deliver on settling day (see BACKWARDATION; CORNER; RINGS).

The so-called cotton corner of 1889, on the collapse of which (September 30th) "Septembers" fell thirty points in one day, was rather a case of exaggerated speculation for the rise than a genuine case of artificial dearth.

The mutual relations of individuals are becoming less important to economics than the mutual relations of great associations. The labour market has been lately swayed by great combinations, not unlike those which attempt to control the production of commodities. The object of their action is to enhance the rate of wages, and in so far any dearth of labour produced may be termed artificial. But bargaining is one of the normal functions of the economic man, and the desire to obtain the

best terms possible one of the ordinary forces that determine prices. It seems best therefore to confine the term, in the labour market, to any dearth that may be produced by the exclusion of certain men from certain labour markets, by limitation of apprenticeship, or by intimidation of outside competition. The attempt is subject to the difficulties already mentioned. The greater the artificial enhancement of price the greater the attraction to outside competition, whether of man with man, or producer with producer, or port with port, or country with country.

The various modes in which it has been attempted to enhance price artificially have been surveyed, according as the enhancement has been permanent, temporary, or what may be called momentary. The success of the attempt depends upon the nature of the commodity dealt with, the extent of the market of supply, and of demand, and the character of the resources commanded. Price may be momentarily enhanced by taking advantage of peculiar circumstances of the market. It may be temporarily enhanced by buying up the stock, but such attempts cannot be successful unless it is possible to exclude extraneous supplies, or unless such supplies are by the circumstances of the case excluded. If this be so, in the case of necessities there is hardly any limit to the possible enhancement of price. In other commodities consumption is minimised and substitutes employed. Permanent enhancement requires either a practical monopoly of the sources of supply, which is apt to break down if the strain be severe, or such command over a market of demand as only a government can exercise. The safeguard of the community against the tyranny of great capitals rests in the practical difficulty of keeping great voluntary combinations together, and of finding a commodity indispensable, without substitutes, of which the sources of supply are absolutely limited.

DEARTH. See FAMINE.

DEATH DUTIES. The collection of a tax on the occasion of the transference of property from the dead to the living has been made a means of raising public revenue from very early times. Adam Smith cites as examples the *vicesima hereditatum* of the Romans, the duties payable by heirs under the feudal law, and the Dutch tax on successions. Duties of this class now rank, with common consent,

amongst the most legitimate and least detrimental to individual interests of all descriptions of taxation.

Adam Smith discusses the arguments for and against these duties at considerable length (*Wealth of Nations*, bk. v. ch. iii.), and points out that they are, or may be made, "perfectly clear and certain," "the time of payment is . . . sufficiently convenient," and "they are levied at very little expense." On the other hand he considered them unequal, on the ground that the frequency of transference was not always the same in property of equal value, and he also thought that so far as they diminish the capital value of property they "tend to diminish the funds destined for the maintenance of productive labour." The latter point was emphasised by Fawcett (*Manual Polit. Econ.*, bk. iv. ch. ii.), but Mill (*Principles*, bk. v. ch. ii. § 7) attached no importance to the objection in a wealthy country. He considered that "the amount which would be derived from a very high legacy duty in each year is but a small proportion of the annual increase of capital in such a country; and its abstraction would but make room for saving to an equivalent amount." Prof. Sidgwick adopts a similar view, and says that the bad effect of such duties "is not at all likely to be at all equal in proportion to the similar effect that would be produced by extra taxes on income; in fact, the limits of taxation on inheritances will be practically determined for the financier rather by the danger of evasion through *donationes inter vivos* than by the danger of checking industry and thrift." (*Principles*, bk. iii. ch. viii. § 11).

Mill regarded legacy and inheritance duties as taxes in respect of which it was both expedient and just that the principle of graduation should be adopted (*Principles*, bk. v. ch. ii. § 3), but Prof. Nicholson contests this view and expresses the opinion that "graduated taxation, even in the modified form proposed by Mill, would tend to check production on a large scale" (*Encyclopædia Britannica*, art. "Taxation"). The levy of a larger percentage on a larger sum has, however, received distinct recognition in the scale of death duties in force in the United Kingdom.

Prof. Nicholson (*ibidem*) says that "it is obvious as regards incidence that taxes of this class are the most direct of all taxes, in the sense that they cannot be transferred to other persons by the beneficiaries"; to which he adds, that the principal difficulties connected with them arise in connection with the canon of equality of taxation.

The death duties levied in the United Kingdom date from the year 1694, when a fixed duty of 5s. each was imposed on all probates of wills and letters of administration. This duty was increased four years later to 10s.,

but in both cases the charge was more analogous to the stamp duties levied on instruments of a legal character than to the death duties as we now know them. In 1779 Lord North, taking note of the observations of Adam Smith, proposed that the charges should vary according to the amount of the estate, the maximum duty to be a fixed sum £2:10s. on each estate of £300 and upwards. In the following year these charges were supplemented by a graduated duty on receipts given for legacies. Frequent changes in the scale of probate duties were made between 1779 and 1815, the maximum charge being gradually augmented, and in the latter year a distinction was drawn between the duties levied on testate and intestate estates. During the same period the legacy duties were also increased, and their payment made more secure. The most important alterations were those proposed by Pitt in 1796, when executors were made responsible for the payment of the duty, and the charge was levied at different rates varying according to the consanguinity of the legatee to the testator. These rates were enlarged in 1804 and again in 1805. No complete record of the yield of the death duties exists prior to the year last named, but they then produced £495,000, a sum which had increased to £882,000 in 1810, and to £1,298,000 in 1815.

In 1842 the Irish probate duties were brought up to the level of those levied in Great Britain, but, with this exception, the death duties remained unaltered for thirty-eight years. The amount they produced, however, steadily increased, rising from £1,696,000 in 1820, to £2,189,000 in 1830, £2,192,000 in 1840, and to £2,343,000 in 1850.

In 1796, Pitt had endeavoured unsuccessfully to obtain a tax on successions to landed property, analogous to that on legacies of personal estate, and it was reserved for Mr. Gladstone, in 1853, to bring within the scope of the duties all successions to property, by reason of death, whether the property was real or personal, and whatever the nature of the title to receive it. Mr. Gladstone found it essential to make considerable differences between the new duties and the old ones, alike in the amount to be paid and the manner of payment, and his estimate of the produce of the duties he imposed proved excessive, their yield never having amounted to one-half of the sum, £2,000,000, which he thought they would realise. Some slight modifications of the death duties were made in 1859 and in 1864, and six years later Mr. Lowe proposed, but without success, to so rearrange them as to secure an additional £1,020,000 a year, but it was not until 1880 that any substantial changes were made. Meanwhile the aggregate produce had risen from £2,547,000 in 1853 to £3,561,000 in 1860, £4,953,000, in 1870,

and to £6,400,000 in 1879, figures which strikingly exemplify the growth of the national wealth.

In 1880, Sir Stafford Northcote revised the scale of probate duties, and a year later Mr. Gladstone followed his example and, at the same time, abolished the distinction between the duties payable in respect of testate and intestate successions, transferred the duty from the probate or letters of administration themselves to a detailed affidavit of value to be lodged with the application for representation, and repealed the 1 per cent legacy or succession duty payable by direct lineals wherever the increased probate duty was paid. On the same occasion Mr. Gladstone afforded relief to small estates not exceeding £300, alike in the amount to be paid and the mode of payment, whilst a new duty, styled the "account duty," was imposed as an equivalent to the probate duty in certain circumstances in which the payment of the latter was avoided. The yield in the year 1880-81, under Sir Stafford Northcote's scheme, was £6,826,000, and in 1882-83, when Mr. Gladstone's proposals first took full effect, the receipts were £7,438,000. Five years later the produce had risen to £8,242,000. In 1888 Mr. Goschen proposed that the exchequer should surrender one moiety of the probate duty for the benefit of various local authorities, and he accompanied this proposal by an addition of a $\frac{1}{2}$ per cent to the 1 per cent rate of succession duty and of $1\frac{1}{2}$ per cent to the higher rates. In 1889 Mr. Goschen imposed a new duty, analogous to the probate and succession duties, which was termed the "estate duty" by reason of its limitation to estates or successions of £10,000 and upwards. The result of the rearrangements of 1888 and 1889 are yet not fully apparent, but as against £8,242,000 received by the exchequer from the death duties in 1887-88, the receipt in 1890-91 was £7,443,000, the additional sum of £2,414,000 collected from the same source in that year being received on account of local authorities and not of imperial funds.

It will now be convenient to describe, under their respective heads, the death duties at present levied in the United Kingdom.

(1) *Probate, Administration and Inventory Duties.*—Prior to the issue of any grant of probate or letters of administration of the estate of any deceased person, the law requires the applicant to deliver an affidavit containing detailed particulars of the value and description of all the property belonging to the deceased which the executor or administrator has the right to recover *virtute officii*. The property must therefore be personal estate, or be legally impressed with that character, as in the case of real estate contracted to be sold, or real estate forming part of the assets of a partnership. Leaseholds are personal property and must be

included in the affidavit, but, except in circumstances such as those referred to, "real estate" is not within the scope of the duty. Debts payable out of the estate, together with reasonable funeral expenses, may be deducted from the assets, and the duty is charged upon the net amount of the estate according to the following scale.

Net value of the Estate.	Rate of duty.
Above £100 and not above £500	£1 for every £50 or fractional part thereof
" £500 £1000	£1:5s. for every £50 or fractional part thereof
" £1000	£3 for every £100 or fractional part thereof

The duty is denoted by means of a stamp on the affidavit, and provision is made for the delivery of a "corrective affidavit" where an adjustment of the duty originally paid is found necessary. In the case of small estates not exceeding the gross value of £300 a fixed duty of 30s. may be paid, the grant of representation being obtained through the agency of the officers of inland revenue on payment of a fee of 15s., in lieu of the fees ordinarily charged in the Probate Division of the High Court. In Scotland, where the procedure at death differs from that in force in England and Ireland, the duty is payable on the inventory which is required to be exhibited in that country. Where property is situated in more than one of the three kingdoms, arrangements are made by which one grant of representation suffices.

The probate, administration, and inventory duties produced the sum of £2,414,000 for imperial purposes, and a similar sum for local purposes, in the year 1890-91. Taken as a whole, and regardless of their destination, they form by far the most important branch of the death duties—nearly 49 per cent of the total produce. The yield exceeded £500,000 for the first time in 1814, £1,000,000 in 1837, £1,500,000 in 1863, £2,000,000 in 1872, £3,000,000 in 1880, and £4,000,000 in 1883. The net produce of £4,827,000 for the year 1890-91 was the largest on record, duty being then paid in respect of property of the net value of £165,329,000, an additional £1,060,000 being made up of small estates paying no duty. These sums were comprised in 67,247 separate estates divided as follows:—

Net value of Estate.	No. of Estates.	Value.
Not above £1000	52,276	£ 12,639,000
Above £1000 and not above £50,000	14,522	90,477,000
Above £50,000	449	63,273,000
	67,247	166,389,000

No important objections are now made to the manner in which these duties are levied. The

restriction of their incidence to certain descriptions of property is referred to under the head of succession duty.

(2) *Legacy Duty*.—This duty, originally a stamp duty on receipts, is now more fitly described as "a tax upon movable property; its incidence depends upon the domicile of the deceased owner, and its amount upon the value of the bequest or succession, and upon the degree of consanguinity existing between the deceased and the legatee." It is payable at the following rates:—

Lineal issue or lineal ancestor	1 per cent
Brothers and sisters and their descendants	3 "
Uncles and aunts and their descendants	5 "
Great uncles and aunts	6 "
Any other person	10 "

The duty is payable when the legatee comes into the possession of his legacy, and owing to the complexity of the manner in which property may be disposed of by a testator, the rules for its assessment are of an exceedingly complicated character. The duty is paid in money, although a stamp is impressed on certain forms of account in order to denote the discharge of the liability. There are certain exemptions in favour of the Royal Family, learned societies, and Irish charities; and all property in respect of which probate or inventory duty has been paid is free from the charge of legacy duty at 1 per cent.

The legacy duty produced £2,626,000 in 1890-91, and it then comprised nearly 27 per cent of the aggregate yield of the death duties. The receipts amounted to £546,000 in 1809, £1,070,000 in 1822, £2,154,000 in 1867 and £2,935,000 in 1877. This last-named sum has never been exceeded, the extension of the exemptions in 1881 having stopped the growth of the duty in recent years.

Considerable difficulties arise in the collection of the legacy duty by reason of the length of time which may elapse between the death of a testator and the receipt of a legacy by a beneficiary under his will. But these difficulties cannot well be avoided if a consanguinity scale is maintained, and the retention of such a scale is now almost universally supported by public opinion. All present and future claims for legacy duty under a will may be compounded for by agreement, but it is believed that this course is not adopted to any large extent.

(3) *Succession Duty*.—This duty supplements and completes the duty on legacies. It charges "all successions to property, real as well as personal, whether the title be under settlement or will, by descent, intestacy, or survivorship." The rate payable depends, as in the case of the legacy duty, on the consanguinity of the person from whom the succession is derived, the following being the scale now in force:—

Lineal issue or lineal ancestor	1½ per cent
Brothers and sisters and their descendants 4½	"
Uncles and aunts	6½ "
Great uncles and aunts	7½ "
Any other person	11½ "

The capital sum upon which these rates of duty are calculated is ordinarily arrived at by ascertaining the net annual value of the succession after deduction of necessary outgoings, and by calculating the worth of an annuity for an amount equal to such net annual value, for the life of the successor, according to the annuity tables set out in a schedule to the Act 16 and 17 Vict. cap. 51. Thus if the annual income of an estate be £350, and the necessary outgoings £50, the successor being thirty-five years of age, the duty is calculated on £4725, that being the assumed value of an annuity of £300 at that age. The amount so assessed is payable either by eight equal half-yearly instalments, the first being due twelve months after the succession opens, or, as an alternative, by three annual instalments of one-eighth of the duty and by a fourth instalment equal to the amount of the remaining five-eighths. Like the legacy duty, the succession duty is payable in money, although a stamp is impressed on the account required to be brought in. Certain small successions are exempt from duty, and provision is made to prevent the charge of both legacy and succession duty on the same succession.

The succession duty produced £565,000 in 1858-59, and twenty years later the produce was £725,000. In 1884-85 the duty yielded £930,000, the maximum sum collected prior to the increase of the duties in 1888. The produce for 1890-91 was £1,209,000.

The succession duty has been frequently criticised on the ground that the charges it imposes on real property are less than the corresponding ones on personal estate. This inequality was to some extent redressed by the legislation of 1888, but the mode in which the duty is assessed and the manner in which it is paid still favour settled personalty and, to a greater extent, realty. This inequality is, however, defended by reference to the exceptional pressure of the income tax on landed property, and to the incidence of local and imperial taxation generally.

(1) *Ademption Duty*.—This duty was devised by Mr. Gladstone in order to meet cases in which the payment of probate duty was avoided, *inter alia*, by the execution of a deed having no effect during life, by gifts in anticipation of death, or by investments in joint names. It is little more than a necessary protective adjunct to the probate duty, and is payable at the like rates. It realised £26,000 in 1883-84. Separate figures are not now published.

(5) *Estate Duty*.—A special duty of 1 per cent imposed on all personal estates of £10,000 and upwards, passing by will or intestacy, and

on all successions of a like amount. In the case of free personalty the duty is paid by means of stamps on a special form required to be brought in with the affidavit of value delivered for probate duty purposes. In the case of settled personalty or realty, the estate duty is assessed and collected in much the same manner as the succession duty, but the value on which the charge is made is somewhat less favourable to a successor who acquires an absolute interest in real estate. The duty is a temporary one, being imposed for seven years only, in aid of certain special expenditure on the navy. The net produce in 1890-91 was £1,194,000.

DEATH-RATE

Analysis of Contents.—Definition and division of the subject. I. Death-rate as a factor in the natural increase of population, p. 493. II. The causes of variation in death-rate; (a) such causes as age and sex; (b) such as vice, unhealthy occupations, indigence, insanitary residences, p. 494. III. Death-rate, as indicating (by its decline) national prosperity, p. 497. IV. In relation to insurance, p. 497.

DEATH-RATE may be defined as the ratio between the number of persons dying, out of a certain population, in a unit of time, generally a year, and the number of the population. But as the number of the population cannot be supposed constant for any considerable time, there is some difficulty in rendering precise the conception which has been indicated. To remove the difficulty completely the use of the differential calculus would be required, but it is not necessary to call in that aid except for certain actuarial calculations. For the less technical inquiries which are the object of this article the general idea which the definition above given conveys is sufficiently clear.

The death-rate is the most important ratio or coefficient in vital statistics. While co-ordinate with birth-rate as a factor in the natural increase of population, death-rate is more important than BIRTH-RATE (*q.v.*) on the following grounds. The investigation of the causes which affect death-rate is more directly connected with a practical art, that of preventing disease. Again birth-rate by its variation gives a more equivocal sign of national prosperity or the reverse, than death-rate. A rise in birth-rate

may be due to increased improvidence or illegitimacy, as well as to material prosperity; whereas a fall in death-rate can hardly admit of any other than a favourable construction. Again the chance of death is an object of wider and deeper interest than any other datum in vital statistics; and a great practical business, that of insurance, is based on these probabilities. These points of comparison being taken as headings; it may first (I.) be observed that the natural increase, being the difference between birth-rate and death-rate, is not necessarily small where death-rate is large, or large where death-rate is small. Thus the death-rate for Russia in recent years, 35.7 per mille (Marshall, *Principles of Economics*, bk. iv. ch. iv. and authorities there cited), exceeds the average of Europe, 28 per mille, by a fourth, yet the natural increase for Russia, 13 per mille, is above the average for Europe. Again the death-rate for England is below, the natural increase above, the average for Europe.

Other examples are given in the article on BIRTH-RATE; where it was pointed out that large birth-rates are frequently attended by, but do not cause, large death-rates.

II. The question there raised is to be more fully considered here under the head of causes of variation in death-rates. (a) One such cause is difference of age. If the population of any country is divided into groups of different ages, the death-rates for the different groups differ enormously. Thus (according to the English Life-Table, No. III., which may be regarded as a standard) the mortality for infants under one year old is in England 165.6 per 1000 (*Vital Statistics. Selections from the writings of William Farr*, by Noel A. Humphreys, p. 491), while it is only 5.2 per 1000 at the age-period 10-15 (*ibid.* p. 487). After that period the death-rate increases with the age. At the period 75-85 it has become 140 per 1000, and is still greater at later ages; the death-rate of second childhood equals that of infancy. The general law is happily indicated by Addison in his Vision of Mirza (*Spectator*, No. 159, 1st September 1711), where the human race is imagined passing over the flood of eternity by a bridge, supported on as many arches as there are years in man's life. "Hidden pitfalls were set very thick at the entrance of the bridge, so that throngs of people no sooner broke through the cloud but many of them fell into them. They grew thinner towards the middle, but multiplied and lay closer together towards the end of the arches."

It follows from this law that in a population where there is a particularly large proportion of infants or old persons the general death-rate, the mortality "at all ages," as it is called, is apt to be high. Now in an increasing population, as compared with a stationary one, the number of births continually augmenting, the

number of infants is particularly large. Hence it is plausibly argued that an increasing population, just because it is increasing, will have a high death-rate; that high birth-rates, *per se*, make high death-rates; other things, and in particular the mortality at each age-period, being supposed the same.

But here, as so frequently in statistics, first appearances are fallacious. It is true, no doubt, that in an increasing population there is a particularly large proportion of infants subject to a high mortality. But it is also true that, in such a population, the proportion of persons at those advanced ages at which the mortality is high is apt to be particularly small as compared with the numbers in the period of healthy adolescence (Farr, *Vital Statistics*, "Deaths," Humphreys "On the Value of Death-rates," *Journal of the Statistical Society*, 1874, vol. xxxvii.)

From these considerations it appears that great care must be exercised in allowing for the influence of age on mortality before drawing inferences from the death-rate as to the sanitary condition of a population. To take an extreme instance, suppose that the death-rate for the inmates of a prison were the same as that for the general population, this at first sight might appear a satisfactory state of things. But when it is considered that the prison population consists of adults, a class of which the mortality under ordinary conditions might be expected to be half that of the general population, the conclusion becomes very different.

To take a less simple case. The death-rate in many towns is particularly high. But it has been argued that this is not an unfavourable symptom, for that it is due to the presence of a great number of infants. But the truth is, that the inference from the high death-rates becomes *a fortiori* unfavourable when proper account is taken of the ages of the urban population.

A usual method of exhibiting such conclusions is to construct what is called a "normal" death-rate for any group under consideration; by supposing the persons at each period of age in that particular population to be affected with the mortality prevalent at that age in the general population (or any other population taken as standard). Thus in the case of three counties containing large towns, instanced by Mr. Humphreys in his instructive paper above cited, the actual death-rate was 26.5.¹ But the normal death-rate, or that which might have been expected, if the mortality at each age was the same as for the general population, was only 22.2.¹ Also the actual death-rate for three rural counties was 19; while the normal death-rate was 23.8. The two pairs of figures, whether compared with each other or

¹ Taking the simple average of the death-rates given for each of the three counties.

with the standard death-rate for a *stationary* population, which Mr. Humphreys gives as 24·47, show that the unfavourable inference concerning the urban as compared with the rural counties is stronger than at first sight appears. The original figures, 26·5 and 19, differ only by 7·5. But we may regard the excess of the mortality in the urban over the rural counties as virtually nine; if we take into account that the former normally would have been *less* by nearly two than the latter.

A more exact method of drawing such comparisons is to express the mortality of each section as a ratio of its actual to its normal mortality. This plan is adopted by Mr. Humphreys in his article on "Class Mortality Statistics," in the *Journal of the Statistical Society* for 1887. The following figures (extracted from Mr. Humphreys' Table IV., *loc. cit.*, p. 281) relate to the mortality in two classes of the Dublin population :

Description of Class.	Recorded death-rate per 1000.	Standard death-rate according to English Life-table.	Coefficient of comparative mortality.
Professional Class .	19·8	25·2	632
General Service Class .	36·8	21·3	1659

The first column gives the actually observed mortality at all ages for the more and less favoured class. The second column gives the corresponding *normal* mortalities (obtained on the hypothesis that the numbers at each age were those observed for Dublin, and the mortality at each age that observed for England). The third column gives the coefficients expressing the force of mortality; being each the ratio of normal to actual mortality, multiplied by 1000, or expressed as a *per mille*. It will be observed that the evidence of difference in healthiness afforded by the first column becomes *à fortiori* in the third column. The mortality of the "general service" class appears to be nearly twice as great, and is nearly three times as great as that of the professional class.

The cause of variations in death-rate which has been considered, namely difference of age, may be placed in a category of causes which are of practical importance, largely on the ground that it is necessary to allow for their action in order to estimate the effect of another class of causes which it is more within the scope of human art to alleviate. This distinction is nearly identical with Dr. Farr's of "causes inherent in the population, and causes outside the population" (*Vital Statistics*, p. 159 *et seq.*) Another cause belonging to the first category is sex. The full effect of this cause

may be seen on inspection of a life-table. At the early ages the difference between the mortality of the two sexes is marked. At the zero-point of age it appears that the proportion of male to female still-born children is 139 : 100. For the period 0·5 the proportion of mortality is 72 : 62 (according to Dr. Farr's Life-Table for England and Wales). At the age of adolescence female mortality gains upon male; but again lags behind at later ages. The disturbing effect which this cause exercises on inferences drawn from the general death-rate is not so considerable as the effect of age. Mr. Humphreys in his paper "On the Value of Death-rates" already referred to (*Journal of Stat. Soc.*, xxxvii. p. 444), contrasting the English towns which have the greatest and the least proportion of male to female inhabitants, argues that the extreme perturbation of the general death-rates which may be expected from this cause is not more than two *per mille*.

Here may be mentioned the effect on mortality of the variations of the seasons. Of the four quarters of the year the first is the most fatal; next comes the fourth; the mortality of the second quarter is for this country on an average in excess, but occasionally below, that of the third quarter (Reports of the Registrar-General, tables showing death-rates in each quarter of the years since 1838). A very elegant graphical representation of such vicissitudes is given by M. Levasseur (after M. Janssens) for Belgian infants, in the *Jubilee volume of the Statistical Society*, 1885, p. 232. Quetelet's investigations of seasonal mortality in Belgium are particularly instructive (*Physique Sociale*, liv. ii. ch. v. § 8). He shows that the curve of death-rate at different seasons varies for different ages; and that very generally it presents two maxima, one in winter the other in summer. Besides the obvious importance attaching to such observations, they are valuable as enabling us to avoid perplexity in investigating other causes. The Registrar-General, in the investigation which will be presently noticed concerning the death-rate in different occupations, has very properly selected the samples (of deaths) on which his conclusion is based from all seasons indifferently (*Supplement to the 45th Report of the Registrar-General*, p. 29). A sophist by taking the samples for one occupation from a healthy season, and for another occupation from an unhealthy season, might have brought out almost any conclusion which he wanted.

Other causes, not admitting of such exact measurement, are race and climate (including properties of soil, water, etc.)

Also it may be expected that the mortality of unmarried persons will, *ceteris paribus*, be particularly large. The married have the advantage at almost all ages, as is shown by Dr. Farr (*Vital Statistics*, p. 441, and references

there given). But it is a nice question whether celibacy can be regarded as a cause of high death-rate. The high death-rate attending celibacy may be a case of *post hoc non propter hoc*; the finest individuals being selected for marriage; while "men with a weak constitution, ill-health, or any great infirmity of body or mind will not often wish to marry, or will be rejected" (Darwin, *Descent of Man*, pt. i. ch. v.)

(b) The causes which have been mentioned require to be taken account of by those who would avoid perplexity in investigating another set of causes which are perhaps of more direct practical interest: as being capable of remedy by human effort. This second category of causes may be divided under four heads: (1) vice, (2) unhealthy occupations, (3) indigence, and (4) insanitary residences,—agencies which are apt to be entangled with each other as well as with the first set of causes.

(1) There is much truth as well as exaggeration in Sussmilch's dictum ascribing the chief differences in mortality to "the manner of life, the moral circumstances, virtue and vice, indolence and industry." One example is the great mortality of illegitimate children. Dr. Farr cites instances in which the death-rate of illegitimate infants is double that of the legitimate (*Vital Statistics*, p. 198). A similar excess of mortality among illegitimate children is shown by Quetelet (*Physique Sociale*, bk. ii. ch. vii. § 2), Wappaeus (*Bevölkerungs Statistik*, pt. i. p. 214), and other continental statisticians. The vice of drunkenness is also conspicuously fatal. On this subject some of the most recent observations together with a reference to the best authorities will be found in the *Report on the connection of disease with habits of intemperance* by the collective investigation of the British Medical Association, edited by Isambard Owen. Among the earlier authorities may be mentioned Nelson, who in his *Contributions to Vital Statistics* fully proves the connection between deep drinking and high death-rate; bringing out the remarkable fact that spirits are more fatal than malt liquors (*Contributions to Vital Statistics*, p. 218). Another authority particularly free from suspicion is the Registrar General, whose statistics with respect to occupations (Supplements to Reports for 1865, 1875, and 1885) point unmistakably to a connection between drink and death. The mortality of hotel-keepers and their servants is appalling, about three times as great as that of the most healthy classes. Among the diseases to which the classes mentioned and several others succumb, "alcoholism" plays a large part (Supplement to Report for 1885, p. xxx. *et seq.*)

At this point, however, the action of the cause which has been considered is intermixed with that which we have distinguished as cause (2), unhealthy occupations. It is difficult to pronounce with respect to the mortality in some

occupations how much thereof is occasioned by unresisted temptation to drink, how much is due to other circumstances. Thus in the case of drivers ("Cab, Omnibus, Service," *loc. cit.*), the bill of mortality due to "alcoholism" is particularly large; but the same class also succumb in numbers to phthisis and diseases of the respiratory system, which may no doubt be connected with the exposure incident to the occupations in question.

(2) The observations referred to prove the influence of occupation on health in many cases to be real and considerable. The number of deaths observed in 1881-82—more than 400,000; the scrupulosity above noticed with which these samples have been selected impartially from healthy and unhealthy seasons; the allowance for the effect of age (expressed in the last column of table J, *Supplement to the 45th Report* 1885, p. xxvi.), are very convincing. The suspicion of accident is precluded by the general agreement between the statistics for 1861-62, 1871, and 1880-82. The same occupations constantly come out low or high in the scale of mortality. At one end of the scale are clergymen with a co-efficient of death-rate or "comparative mortality figure" 556, gardeners and farmers with co-efficients respectively 599 and 681, with at the other end of the scale hotel-keepers and their servants, for whom the corresponding figures are respectively 1521 and 2205, also chimney-sweepers, workers in earthenware (1742), and the residual class of general labourer (2020). (See J. T. Arldge, M.D., *The Hygiene, Diseases, and Mortality of Occupations*, 1892.)

(3) In the last case and probably some others, a further cause—indigence, comes into play. The term indigence must be construed strictly as want of necessities, "inadequate warmth and food" (Farr). Mere absence of riches is not fatal to life, as Nelson's statistics with respect to members of friendly societies show (*Contributions to Vital Statistics*; cp. Wappaeus, *Bevölkerungs Statistik*, pt. i. p. 201). The very different consequences of actual indigence may be traced in certain statistics of class mortality among the population of Dublin compiled by Dr. Grimshaw, and discussed by Mr. Humphreys in a paper already referred to (*Journal of the Statistical Society* 1887, vol. 50). In the same paper reference is made to the observations made by Mr. Ansell and Hodgson and others, proving that the more favoured classes enjoy greater vitality. Especially with respect to infant mortality is the poverty of the poor his curse. The death-rate for infants under 5, in the "general service" class of the Dublin population, was 110 per mille, in the "professional" class 22 per mille (*ibid.* p. 282). So the mortality of peers' and clergymen's children is three times less than the mortality of infants of the same age in large towns (Farr, *Vital Statistics*, p. 159). These conclusions are confirmed by numerous

observations on the comparative death-rate in the poorer and more flourishing parts of towns; some of which are cited by Wappaeus (*Bevölkerungs Statistik*, pt. i. p. 200).

(4) Here, and indeed generally, mere indigence, the want of necessities, is aggravated by a fourth cause, insanitary conditions of residence, or, in Dr. Farr's more exact language, "exposure to poisonous effluvia and destructive agencies." The interaction of these two causes is strikingly exhibited in a recent article in the *Giornale degli Economisti*, "Nuova Politica Sanitaria, in Italia" (March 1891); where it is contended that the sanitary measures carried out in Italy defeated their own end. For the taxpayer, deprived by the burden of taxation of the necessities of life, becomes thereby more exposed to the shafts of disease. In our terminology cause (4) might be reduced, and yet the effect would be more fatal if concurrently cause (3) were aggravated.

The nature and variety of insanitary conditions are ably discussed by Dr. Farr (*Vital Statistics*). A vast mass of experience as to the evil effect of crowding is summed up by him in the simple formula that the mortality of districts is as the twelfth root of their densities (*Vital Statistics*, p. 175). In symbols

$$\frac{m}{m'} = \left(\frac{D}{D'} \right)^{\cdot 12}.$$

The fact that in an earlier

paper the sixth root was proposed, and that in the formula the index $\cdot 12$ does not signify the twelfth, but rather the eighth or ninth root, is not suggestive of extreme precision. At any rate the law makes no claim to be more than empirical. It is not fulfilled by the experience of the crowded Peabody Buildings; where the mortality is less than for London generally (Newholme, *Journal of the Statistical Society*, 1891). It is interesting to inquire whether the causes of death which admit of reduction are being reduced by science; or:—

III. More generally, and without reference to causation, whether a decline of death-rate attends the progress of civilisation. The most extended series of observations is that which the Swedish census presents (quoted in the 25th vol. of the *Journal of the Statistical Society*, and by Wappaeus, *op. cit.*, p. 229). Looking at these we may now say with even more truth than Malthus said: "The gradual diminution of mortality since the middle of last century is very striking." According to Dr. Farr "the mortality of the city of London was at the rate of 80 per 1000 in the latter half of the 17th century, 50 in the 18th, against 24 in the present day" (*Vital Statistics*, p. 131).

On the other hand the returns for France and Russia, extending over a long period of years, which Wappaeus adduces (*ibid. cit.*), do not show a marked decline. And it is remark-

able that the death-rate for England and Wales has remained virtually unaltered for the greater part of the time over which the record extends, from 1841 to 1871. Since that period indeed a decline has set in, ascribed by some to improved sanitation.

There is some difficulty in estimating the gain which has been made in recent years, owing to the circumstance that while the death-rates at some (the earlier) ages decreased, at other (later) ages the death-rates increased. Such at least was the relation when the statistics bearing on this point were first discussed by Mr. Humphreys in his valuable paper in the *Journal of the Statistical Society* for 1883; since that date the gain in vitality at different ages may have become more uniform (cp. Report of the Registrar-General for 1885, Supplement).

IV. The significance of the recent change in death-rates may best be appreciated by glancing at that aspect of the subject which in the arrangement here adopted has been placed last; namely, that which relates to life insurance. The business of insurance is beyond the scope of this article. But the theory of life-tables on which that business rests must be understood in order to make a right use of mortality statistics, even for the general purposes here contemplated.

The simplest view of the matter is that according to which a population is regarded as "stationary"—a steady influx of life through the channel of birth, a steady efflux at each age, at a rate proper to each age. To compare the vitality of two populations thus conceived, there are available several measures besides the common death-rate hitherto considered. One consists of that age which is such that just as many persons die before it as live after it; the "equation of life" as it is called. For instance in the life-table constructed for the healthy districts of England and Wales by Dr. Farr, this meridian point is at the age 58 nearly. It is an even chance that a new-born infant will, or will not survive that age. Similarly may be determined the age to which it is an even chance that a person aged 10 or 20 years will live. Thus Mr. Neison finds that for males aged 10 in the rural districts of England and Wales, the equation of life is 58·375 years; in the city districts the corresponding figure is 51·743 (*Contributions to Vital Statistics*, p. 100). This eminent statistician holds that "the equation of life . . . appears to be the best mode to determine the comparative value of life in different classes or different districts" in certain cases (*ibid.*) at least.

Another measure of vitality, however, has obtained more vogue, namely, the average duration or so-called "expectation" of life, or "mean after-time" as Dr. Farr proposed to call it. For instance, the mean after-time for males at birth, according to the English life-

table No. 3, is 44.4 years; at the age of 11 (the prospect of living having improved for those who have cleared the dangers of infancy) the mean after-time is 51 years nearly.

The following is an instructive example of the uses to which this co-efficient lends itself. Observing the age at which a number of sovereigns or other notables, as popes, during a series of generations had acceded, we can compare the average length of their reigns with the average length of life deducible from a standard life-table; and thus ascertain that the lives of men are lengthened "with the process of the suns."

This example illustrates what is implied in the idea of an average duration, the putting together and treating as commensurate quantities the lives lived by different persons. In fact, actuaries often consider not so much the mean life as the sum of lives, the "years lived" by a whole population. It is thus that the gain in vitality referred to under the last heading is measured. Considering the infants born in any one year in England and Wales numbering say 859,000, the registrar-general calculated that the years to be lived by this generation will, in virtue of the change in death-rates at various ages which have occurred during recent years, be more numerous by some *two million years of life* (Report of the Registrar-General for 1885, Supplement; cp. Humphreys, *Journal of the Statistical Society*, 1883). Of the millions of lives thus yearly gained, by far the greater part are lived at the ages 25 to 60, which are most "careful," most conducive to the defence and enrichment of our country.

So far with reference to a stationary population, abstracting the fact that the actual population is continually increasing. But the logic of the subject and its fallacies would be imperfectly treated without noticing the modifications which this fact introduces. In a stationary population it is evident that the mean duration, or "expectation," of life is identical with the mean age at death; and a little attention will show that each of these co-efficients is identical with another measure with which we are here more particularly concerned, namely, the number of persons out of whom one dies per annum, the *inverse death-rate* as we may call it. But when population increases these identities are broken up. The inverse death-rate becomes a little greater, the mean age at death becomes much less than in a stationary population. Thus the mean expectation of life being, in Dr. Farr's time, 41 for England and Wales, the inverse death-rate was 1 in 43; the mean age at death about 29. The neglect of these distinctions has proved fatal to the work of amateurs who have attempted to use measures of mortality more delicate than the common death-rate "at all ages." The indications given by this last are less fallacious, as has been shown above

(under the heading of age and sex), than might have been supposed. Yet it is desirable to supplement if possible this rough measure by arranging our observations in the form of a *Life Table*.

[The authorities on this subject are almost as numerous as the writers on statistics. As a lucid statement of the principal facts for the leading nations of the world the *Confronti Internazionali per gli anni 1865-83*, issued by the Ministero di Agricoltura, Industria, e Commercio, Rome, may be specially mentioned. Works which instructively place a number of facts in the light of theory are:—Quetelet's *Physique Sociale*.—Wap-paeus, *Bevölkerungs Statistik*.—Mayr's *Gesetz-mässigkeit in Gesellschaftsleben*.—Haushofer's *Lehr- und Handbuch der Statistik*.—Westergaard's *Theorie der Statistik*, and other books cited in the text. For some of the finer logical points which have been touched, Dr. Farr's *Vital Statistics*, edited by Mr. Noel Humphreys, should be studied; and Mr. Humphreys' own papers in the *Journal of the Statistical Society* for 1874, 1883, and 1887.]

F. Y. E.

DEBASEMENT OF COIN, HISTORY OF THE. Coins may be debased in three ways—(1) a debasement in total weight; (2) a debasement in fineness; (3) a debasement by increasing the rating or nominal value, the coins continuing at the same standard weight and fineness. The effect of the last may also be brought about unintentionally by a fall in the value of the precious metals, and herein lies the secret of much of the debasement of the middle ages.

The first historically recorded debasement is that effected at Athens by Solon (B.C. 594) to redeem the poorer citizens from debt. By his advice the weight of metal in the silver drachma or standard Athenian coin was reduced more than 25 per cent, thus enabling 100 drachmæ to be coined out of the mina or unit of weight instead of only 73 as previously (Plutarch, *Solon*, c. 15). Creditors were compelled to take these light coins as full payment, and were thus obviously defrauded; but perhaps in this case the end may have justified the means (Grote, *Hist. of Greece*, pt. ii. ch. xi.; Boeckh, *Metrologie*, ch. ix.) It must be admitted too that, as a rule, the Greek states were not often to blame in this respect, partly perhaps because their philosophers inculcated sound principles (Lenormant, *Contemp. Rev.*, Feb. 1879), but more probably owing to their small size. This naturally caused a large proportion of their money transactions to be international, and in foreign trade coins can only be exchanged for their value as bullion whatever their rating as legal tender within the issuing state; debasements therefore would be avoided for mere convenience where the foreign trade was of primary importance.

In the large and constantly growing Roman state no considerations of this sort existed, nor,

as far as we know, was the subject of money at all adequately studied; on the contrary, a continuous series of debasements lends colour to the opposite view. The history of these is professedly given by Pliny (xxxiii. 13), but the evidence of actual coins that have been discovered makes it probable that his account is incomplete. According to his view the Roman coinage, which originally had the "as" or pound of copper for the unit of value, remained unchanged till the First Punic War. The coined "as" was then reduced suddenly to 2 uncie or ounces, that is, to $\frac{1}{2}$ th of its former weight. About this time 10 asses made a denarius and 2 $\frac{1}{2}$ a sestertius; but during the Second Punic War the unit was further reduced 50 per cent, and asses were coined weighing only 1 oz., 16 of which made a denarius and 4 a sestertius. Finally, by the Papirian law, B.C. 191, the "as" was made to weigh only $\frac{1}{2}$ oz., but it is hardly necessary to regard this as a debasement of the standard, for by this time silver was also largely current. The silver, however, was in its turn debased, and the denarius, which had weighed $\frac{1}{2}$ d of a lb., was reduced to $\frac{1}{4}$ th. In B.C. 91 a plated coinage was issued, but was soon withdrawn. The denarius, however, continued to fall, and under Nero weighed only $\frac{1}{16}$ th of the lb. In the same reign the gold aurei, which had originally been coined at 40 to the pound, had become debased 12 per cent. Under Alexander Severus these coins got the name of solidus, corrupted afterwards into the French "sou." Constantine fixed them at 72 to the pound, but the mere name gives a measure of their subsequent debasement in the West. In the Byzantine empire, on the contrary, this standard was long preserved, and seems to have still existed in 1204 when the Crusaders captured Constantinople.

In the dark ages gold again fell into disuse, and endless variations took place in the silver standards set up by the numerous barbarian rulers. The first monarch with the power and the will to alter this was Charlemagne. He introduced a silver solidus $\frac{1}{20}$ th of a lb. in weight and divided into 12 denarii, but his death in 814 cut short the attempt to get it uniformly adopted throughout his empire. Its use, however, gradually spread, and in England, since the conquest, has formed the basis of our monetary system. Charlemagne's liber, solidus, and denarius are the origin of the £ s. d. we still use, and William the Conqueror's only coin, the silver penny, really did weigh $\frac{1}{16}$ th of the lb. This, the so-called Tower pound, was $\frac{1}{2}$ oz. lighter than the Frank pound, but the English standard of fineness (11 oz. 2 dwt. of pure silver to 13 dwt. of alloy) was very high.

The history of the English debasements does not begin till 1300, when Edward I. reduced the weight by cutting the pound into 243 pence. This bad example was soon followed;

by 1344 the number had increased to 266, and in 1352 it rose to 300. Early in the next century the pound weight of silver was valued at £1 $\frac{1}{2}$ or 360 pence, which by the reign of Edward IV. became 450. In 1526 Henry VIII. abolished the Tower pound as the unit of weight and substituted the French pound troy, weighing $\frac{3}{4}$ oz. more; he, however, continued to reduce the weight of the penny, 540 being coined out of the new pound, equivalent to 506 $\frac{1}{4}$ out of the old. Further, he was the first king to tamper with the fineness. This began in 1543, when he increased the amount of alloy in the pound from 18 dwt. to 2 oz., following this up by an issue of coins in 1545 containing 50 per cent of alloy. Under Edward VI. the money became still worse, and in 1550 the greatest amount of debasement ever known in England was attained, when a pound of metal containing no more than 3 oz. of pure silver was coined into as many as 864 pence. This lasted only two years. In 1552 an improvement began, which, though not completed till the great recoinage by Elizabeth in 1560 (Froude, *Hist. of Eng.*, vol. vii. ch. vi.), in the end reduced the number of pence cut from the pound to 720, and restored the standard English coins to their old degree of fineness. The latter has been maintained ever since, but it was not till 1600 that the weight was definitely settled. Silver was then coined at 744 pence to the pound, and this continued in spite of some famous proposals for debasement (Macaulay, *Hist. of Eng.*, ch. xxi.) so long as silver remained the standard. Ever since the 14th century gold has been coined in England, but for the greater part of the time only as a subsidiary coinage. It is consequently unnecessary to discuss the numerous debasements and changes of rating to which the earlier coins were subjected in the endeavour, usually a fruitless one, to preserve a proper proportion between the two precious metals. England, however, by the end of the 17th century had become so rich, and gold so much used, that it gradually assumed the superior position. In 1717 a recoinage took place in which the change was legally recognised, and ever since our standard coinage has been gold. When, therefore, in 1816, the silver pound was ordered to be cut in 792 pence, no debasement, properly speaking, occurred, as the object was to make the coins tokens. Since gold has been the standard, there has been no intentional debasement, but a great recoinage was necessitated in 1774. The present money system is regulated by the Coinage Act 1870, 33 & 34 Vict. c. 10.

In Scotland the system of coinage was originally borrowed from that of England, and the two remained identical as late as 1355, in which year Edward III. intentionally debased the English silver in imitation of David II. Subsequently, however, the Scotch kings, under

the influence of French ideas, so multiplied their debasements that they left the English far behind. By 1390 English money was worth twice as much Scotch, and the latter eventually ceased to be current by tale in England. In 1600 £36 Scotch were coined from the pound of silver as compared with 62s. English. The greatest debasement in fineness occurred between 1576 and 1579, but the amount of alloy in the pound never rose above 4 oz. The two coinages were again assimilated at the union in 1707.

In Ireland regular coinages were first introduced by John in 1177, and regular debasements by Edward III. By 1465 the Irish shilling was worth only 9d. English. Three years later 960 pence were coined from the pound and a reaction set in, but in 1520 the coins were again so bad that payment by weight became general. As in England Henry VIII. debased the fineness, and even Elizabeth transferred Edward VI.'s worst debasements to Ireland when she restored the English coinage; James I. attempted to restore the old Irish fineness (9 oz. silver to 3 oz. alloy) and decried Elizabeth's shillings to 2d., but the bad money drove out the good. Complaints of scarcity became constant, and in 1651 all sorts of tokens and foreign coins were in circulation. In 1689 James II. raised the rating of all coins $8\frac{1}{2}$ per cent, as a war measure against William III., and this remained permanently in force till 1825. It, however, failed to bring in the necessary funds, and in 1690 he issued a coinage of old guns, broken bells, nails and pewter pots. In the next century there was little improvement, but much dissatisfaction; the case of Wood's copper coinage is the most famous. In 1804 twenty-one shillings of the best Irish silver were not worth nine English; in fact, the debasements only terminated when the Irish and English coinages were assimilated in 1825. On the continent France may be taken as the typical country, and there the debasements were far worse than in England, as no central power was for a long time developed. In 1315 thirty-one barons claimed the right of coinage besides the king, and mutual rates of exchange were arranged for their coins. Dante has (Par. xix.) singled out Philip le Bel as the typical false moneyer, but many other sovereigns were quite as bad. The standard which the people always claimed was that of St. Louis, who in 1226 cut the marc of 8 oz. into 58 solidi or sous, but unfortunately this was afterwards very rarely attained. During the long wars with England the country practically became bankrupt, and the kings dealt recklessly with the coinage. In 1360, when John was captive, the silver marc was once rated at 240 sous, but this was only a temporary measure, and before the end of the year the marc had again fallen to 100

sous. In 1454, when the English were finally expelled, the marc was coined into 175 sous, but quieter times only brought more regular debasements. In 1575 the sou had become so small that silver livres, worth 20 sous each, took their place as the ordinary money of account. $17\frac{1}{4}$ of these, equivalent to 345 sous, were coined from the marc. They soon, however, sank in value, each Bourbon king in succession reducing the weight till 1789, when as many as 52 were coined from the marc. In other words a livre of this date weighed only $\frac{1}{3}$ of the liber of Charlemagne though bearing the same name. During the Revolution even the name was discarded and the synonym "franc" substituted. In all other countries the history has been the same. In modern Germany the mark is only worth a shilling. In Spain the maravedi, originally a gold coin worth 14 shillings, is now a small copper coin not worth a farthing. In Portugal the reis, too small at last for use, are calculated in hundreds. No country, however, has been worse than France.

[A fairly full general outline of the debasements in classical British and French coins may be found in Macleod's *Dict. of Pol. Econ.*, vol. i., "Coinage." For France the standard book is Le Blanc's *Traité Historique des Monnoyes de France*; for England Lord Liverpool's *Coins of the Realm*.—Conigliani, *Note storica sulla Questione giuridica dei pagamenti monetarii* (1891).—Galiani, *Della Moneta*, bk. ii. vi. iii. ii.—Adam Smith, *Wealth of Nations*, i. xi.—Del Mar, *Money in Ancient Countries* (1885).]

W. J. C.

Debasement of coin "in its proper sense means a reduction of fineness," according to an authority quoted by Prof. Walker (*Money*, p. 187). In a wider sense the term denotes also the reduction of the quantity of pure metal in the coin by diminishing its weight while preserving its customary fineness; whether that diminution is effected at the mint, or after mintage by abrasion, clipping, or sweating. For example, Henry VIII. practised debasement proper when, by introducing an increased proportion of alloy, he lowered the fineness of silver to nearly a third of what it had long been before he began tampering with it. Debasement in the wider sense was committed by Edward VI. when he "not only continued the issue of base money commenced by Henry, but lowered the quantity of mixed metal" in each coin (Rogers's *History of Agriculture and Prices*, vol. iv. p. 734). (See ALLOY.) Another example of the less specific sense is afforded by the "debased state of the currency," "previous to the recoinage of 1696," to use Ricardo's words (*Reply to Bosanquet*, p. 96). Elsewhere Ricardo speaks of the metallic currency being "debased by wearing or clipping." (*High Price of Bullion*, p. 26). The term is to be taken in its wider sense in Ricardo's important proposition: "However debased a coinage may

become, it will preserve its mint value, that is to say it will pass in circulation for the intrinsic value of the bullion which it ought to contain, provided it be not in too great abundance"; and provided that, as Prof. Walker adds, it is not discredited (Ricardo, *Political Economy*, ch. xxvii.; *Reply to Bosanquet*, ch. vi.; Walker, *Money*, p. 199). The first of these conditions is not likely to be fulfilled in the case of debasement proper. Governments which debase are likely to over-issue. Striking instances of this abuse are given by Rogers in his *Historical Glossings* (i. pp. 95-97 quoted by Prof. Walker, *loc. cit.*)

F. Y. E.

DEBENTURE. The word "debenture" has been judicially defined as "a document which either creates a debt or acknowledges it" (Justice Chitty in *Levy v. Abercorris Slate and Slab Company*, 37 Chancery Division, on p. 264); every document which answers that description is a debenture, and the use of the word in itself confers no rights whatever on the holder. It is very important that this should be generally understood, as there is a vague belief in the minds of many persons that a debenture must always be secured by a charge on some property, or at least entitle the holder to priority over other creditors. There are certain classes of debentures, issued by virtue of certain acts of parliament, which confer special privileges on the holders (as, for instance, the mortgage debentures issued under the Land Debentures Acts of 1865 and 1870, as to which see *MORTGAGE BANKS*, or the debentures issued by local authorities under the Local Loans Act, 1875, as to which see *LOANS, LOCAL*); but, speaking generally, the rights of the holders of any particular issue of debentures must be ascertained from the instrument or trust-deed or other document referred to in the same. Debentures issued by foreign or colonial governments or municipalities, as a general rule, do not confer any special privileges on the holders; they are simply promises to pay the principal sum on a given date and interest at a certain rate in the meantime. Debentures of companies registered under the Companies Acts, on the other hand, are now mostly secured by a mortgage of some particular property, or by a charge on the whole undertaking. The latter is called a "floating charge" and does not prevent the company from disposing of its property by sale or mortgage in the ordinary course of business, but it is generally provided that as soon as default is made in the payment of interest or principal, or as soon as the winding-up of the company is ordered or resolved upon, the debenture holders may enforce their security, which thus attaches to the whole of the company's property existing at that moment, but subject to any mortgages or charges created for the purposes of the company's business while it was a going concern. If any property is to

serve as a security for debentures in a way which makes it impossible for the company to alienate it at any time, there must be a regular mortgage of such property to trustees acting for the debenture holders by a separate trust-deed. A trust-deed by which movable goods are mortgaged must be registered as a bill of sale, but a debenture issued by an incorporated company which contains a charge on such goods need not be so registered (see *BILL OF SALE*). Debentures containing a charge or mortgage are sometimes called mortgage debentures.

It should be pointed out that the law of most foreign countries does not recognise mortgages of immovable property unless they be registered according to the law of the place, and also that according to most systems of foreign law, movable property cannot be charged in favour of a creditor while remaining in the debtor's possession. Holders of debentures secured by foreign property should remember these facts and not be surprised if, in trying to realise their security abroad, they find themselves in conflict with foreign mortgagees or judgment creditors or a foreign trustee in bankruptcy; and when trustees are acting for the debenture holders, they should be careful to perfect their security as much as possible, by complying with the formalities required by the law of the place where the property is situate.

The special acts of British railway companies generally incorporate the provisions of the Companies Clauses Act, 1845, with respect to the issue of debentures (§§ 38-55), but these provisions leave a wide margin as to the rights of debenture holders, which mainly depend on the special act, authorising a particular issue, or on the conditions attached to it by the company.

A debenture must always be repayable at some time; a fixed date may be appointed for that purpose, or the gradual repayment of the debentures of a particular issue by yearly drawings, or in a certain order of succession, may be provided for. In many cases the company or corporation issuing debentures reserves the right of redeeming the same before the date fixed for repayment, either on the happening of a given event (*e.g.* the sale of the property) or entirely at the borrower's option. There are also so-called "perpetual debentures," which are usually made payable only in the event of winding-up or default on the part of the borrower in the paying the interest.

Debentures may be issued to bearer or to the registered holder, or they may be transferable by indorsement. Debentures to bearer *prima facie* are not "negotiable instruments" (see *COMMERCIAL INSTRUMENTS*). The question in each case turns upon the conditions of the particular issue and on the usage of the stock exchange.

As debentures to bearer are now subject to a stamp duty of 10s. per £100, which must be

paid by the borrower, whilst the stamp duty payable on the transfer of a registered debenture is payable by the transferor, companies have of late years preferred to issue registered debentures.

[As to debentures issued by companies under the Companies Acts, see Lindley on *Company Law*.—Palmer, *Company Precedents*.—Buckley on the *Companies Acts*. As to debentures issued by railway companies, see Hodges on *Railways*.—Brown and Theobald on *Railway Companies*. As to the negotiability of debentures, see also Chalmers, *Bills of Exchange*, 4th ed. p. 319.]

E. S.

DEBENTURE STOCK. No general definition can be given of this term, as a distinction must be drawn between two different kinds of debenture stock.

(a) Debenture stock issued by companies incorporated under the Companies Acts differs from debentures in form but not in substance. A debenture is an instrument embodying the contract between the company and the holder, and generally creating a charge on property. "Debenture stock," on the other hand, is only a name for the debt which it represents, which debt is created and secured by a trust deed between the company and the persons who act as trustees for the holders of debenture stock. By the effect of this deed the holders of debenture stock are, as a rule, placed in the same position as the holders of debentures secured in the usual form, and in cases where a general charge is to be given, it is usual for companies to issue debentures for the amount of the debenture stock to be held by the trustees as a collateral security for the payment of the debenture stock and the interest thereon.

Debenture stock of this kind usually takes the form of so-called "perpetual debenture stock," that is to say, the holders are not entitled to claim repayment of the principal sum until the winding-up of the company, or until default has been made in the payment of the interest; but it also frequently happens that a date is fixed for repayment; any of the ways in which redemption or repayment may be provided for in the case of a DEBENTURE (*q.v.*) is also permissible in the case of debenture stock.

Each individual holder of debenture stock receives a certificate stating that he is the holder of a certain amount of stock, and that the redemption of the said stock and the payment of the interest thereon is secured by a deed dated from a certain date, and made between certain parties. Stock certificates may be issued to bearer, but this is of rare occurrence, the rule being that the names of the stockholders are registered. In such a case it may be provided that any portion of the stock may be transferred, or fractions of one pound may be excluded, or it may be stipulated that

all sums transferred must be multiples of £5 or of £10, or of any other sum. The possibility of transferring any portions of the stock is one of the advantages of debenture stock as compared with debentures, and probably one of the principal reasons why the issue of debenture stock by companies has become so popular within the last few years. Debenture stock certificates to bearer are subject to an *ad valorem* stamp duty payable by the company. See the books on companies quoted *s.v.* DEBENTURE.

(b) Debenture stock issued by a British railway company or other company obtaining a special act incorporating the Companies Clauses Act, 1863, is with the interest thereon a charge on the undertaking of the company, and the interest of such debenture stock has priority over the dividends or interest on any ordinary shares or stocks. If any interest remains unpaid for thirty days after the date on which it is payable, stockholders whose total holding amounts to a certain sum, may obtain the appointment in England or Ireland of a receiver, and in Scotland of a judicial factor, and any stockholder may also recover the arrears by action against the company. The stockholders are not under any circumstances entitled to claim repayment of the principal sum paid up in respect of the debenture stock, and they cannot, under any circumstances, become entitled to the possession of any part of the property of the company. On the other hand it is not in the power of the company to redeem the stock, unless they obtain a special act of parliament for that purpose.

It has been said that "debenture stock of this kind is nothing but preference stock with a special preference" (Court of Appeal in *Attree v. Hawe*, 9 Chancery Division, on p. 349), but this statement was made with reference to a special point, and was not intended to convey the meaning that there is no essential difference between debenture stock and preference stock. This has been pointed out by Mr. Justice Chitty (*in re Bodman*, Law Reports (1891), 3 Chancery, on p. 138); he says: "the holder of debenture stock is a creditor of the company with a security in the assets of the company . . . debenture stock is borrowed money capitalised for purposes of convenience." The fact that debenture stock issued by a British railway company, or other similar company, is never repayable, while the debenture stock of a company incorporated under the Companies Acts must always be repayable, though not necessarily on a fixed date, constitutes a material difference. Stock of the first kind is in the nature of a perpetual annuity, whereas stock of the second kind is a debt secured in the same way as a debt for which debentures are issued.

The holders of British railway debenture

stock receive certificates registered in their respective names, and transfers are made in the same way as the transfer of ordinary railway stock. See the books on railway companies quoted, *s.v.* DEBENTURE, also Lindley on *Company Law*. E. S.

DEBIT. That side of an account on which everything in the nature of a debt is entered. The word is also used to denote the entries so made, *i.e.* a debt. J. E. C. M.

DEBITUM FUNDI (Scot.) "A debt owed by the land itself," in whosoever hands it may be; a real burden or lien preferable to all rights of the proprietor, and enforceable not only against the vassal himself, but also by a "real action" against the lands themselves. By law the feu-duties and some other feudal duties due to the superior, are in this category; and by agreement, "annual rents," debts secured on land, reserved burdens, and the like may be made *debita fundi*, and may by registration secure a preference postponed to the superior's rights (see POINDING OF THE GROUND). A. D.

DÉBOUCHÉS, THÉORIE DES, generally regarded as the main original contribution of J. B. Say to economic science. This *theory of outlets or of vent* affirms that a general glut or general over-production is impossible. If all products could be had for nothing, men would everywhere spring into existence to consume them. Products are bought with other products. Therefore each product is more in demand as other products increase and bid against it. In other words, as the same product constitutes the producer's demand and the consumer's supply, a general excess of supply over the general demand is absurd. Moreover, human desires expand indefinitely. So long as these are unsatisfied there can be no over-production except from lack of purchasing power arising from under-production on the part of the would-be purchasers.

Hence it is concluded that to maximise production is the interest of all; that industry is *salutaire*; and that cosmopolitanism in commerce is true wisdom, imports stimulating the sale of indigenous products. This theory, Say predicted, "will change the politics of the world" (*Traité*, 5th ed. 1826, I. ciii.)

The theory was resisted by MALTHUS and SIMONDI (*q.v.*), but was supported by James Mill and Ricardo, whose friendship grew out of this agreement, as we learn from J. S. Mill (*Principles*, 1875 ed., III. xiv.) The last-mentioned writer's examination of the theory, though enforcing the strength of the main position, leaves still something to be desired. Arguments are used which take no account of the relativity of demand to price, the imperfection of the world market, or the element of time necessary to create new habits of production or consumption or to raise up a new

generation of consumers. The case is, however, conclusive against those whose view involves the fallacy of a general fall of values, or who mistake the phenomenon of a commercial crisis, in times of contracting credit, for over-production. The remedy, says J. S. Mill, for "what may be indiscriminately called a glut of commodities or a dearth of money, is not a diminution of supply, but the restoration of confidence."

[For modern opposition to Say's theory, see Uriel H. Crocker, *Excessive Saving*, Boston, U.S.A., 1884, and in *Harvard Quarterly Journal of Economics*, April 1887 and April 1892.—Edward F. Sweet, "Over-Production," *Chicago Times*, 26th April 1880.—Mummery and Hobson, *Physiology of Industry*, 1889.—See also *Report of the Royal Commission on the Depression of Trade and Industry*, 1885, and for alterations in price and standard of value, Appendix B, by R. H. Inglis Palgrave.] H. H.

DE BROUCKÈRE, CHARLES, born at Bruges in 1796, died at Brussels in 1860. One of the most eminent and honest of Belgian politicians. He served from 1815 to 1820 with the army of the Low Countries, and after this engaged in the business of banking. He then commenced his political career as a deputy in the second chamber of the states-general, in which he sat among the opposition. After the Belgian revolution of September 1830, he was appointed a member of the national congress, resisted the republican party, declared himself in favour of a monarchy and of the exclusion of the family of Orange-Nassau from the throne. In conformity with these views he voted for the Duke of Nemours, in opposition to the Prince of Saxe-Coburg; but when the latter was elected king, and reigned as Leopold I., he supported him warmly, first directing the finances, and then acting as minister of war. After holding other offices, he returned, for a period of eight years, to private life, engaged in business, was appointed, in 1847, burgomaster of the city of Brussels, which office is considered equal to the position of a minister of state. He was also elected a member of the chamber of representatives, and held both these posts till his death. Besides this he lectured on economic science, on which his views were so liberal that they included free trade. His only work in economics is called *Principes généraux d'économie politique*, 1851, 1 vol. in 18mo, an able though a short production. A. C. f.

DEBT.

Debt, p. 503.

Debt, Imprisonment for, p. 504.

Debtor and Creditor, Law of, p. 505.

Debtor's Summons, p. 506.

DEBT. A "debt" may be defined as an obligation to pay a sum certain in money, with or without interest. But it is to be noted that,

by English law, when goods are sold, or work and materials are supplied without any stipulation as to price, there is an implied obligation to pay a reasonable price for them. If the parties differ, the amount payable can only be ascertained by litigation, which in substance, though not in form, resembles an action for damages.

Putting aside recognisances, and statutory penalties, recoverable by civil process, debts may be divided into three classes, namely, judgment debts, specialty debts, and simple contract debts. When, by the judgment of a court of competent jurisdiction, a person is ordered to pay money, the judgment creditor may usually enforce his rights either by the process of the court which gave the judgment, or by bringing an action on the judgment as if it were an ordinary debt.

A specialty debt is a debt created by an instrument under seal. Formerly specialty debts had priority over simple contract debts, but recent legislation has now practically effaced this distinction, and the main difference between the two classes of debts consist in this; (a) a specialty debt may in general be created without consideration, as for example by a voluntary bond, and (b) the period of limitation for a specialty debt is twenty years, while in the case of a simple contract debt it is six years.

Any debt, other than a judgment or specialty debt, whether evidenced by writing or not, is called a simple contract debt. It is to be noted that the term applies not only to obligations to pay arising from agreement between the parties, but to cases where the law implies such an obligation apart from agreement. These quasi-contracts, as they are sometimes called, fall chiefly under two heads. First, when a person is compelled to discharge the liabilities of another, he becomes the creditor of that other person for the money so paid. For instance, if one of two sureties pays the whole debt due from the principal debtor, he can recover the proportionate share from the other surety as a debt. Secondly, when a person has wrongfully received money, the party entitled to it can generally recover it as a debt. For instance, if an account by mistake be paid twice over, the second payment can be recovered as a debt due from the person who received it.

As a general rule debts do not, according to English law, carry interest. The obligation to pay interest arises only (a) by agreement, or (b) by mercantile usage, as in the case of debts secured by bills or notes, or (c) by statute. Scotch law is more favourable to claims for interest, see *INTEREST* (see also *DEBTOR AND CREDITOR, LAW OF; RECEIPT*). M. D. C.

DEBT, IMPRISONMENT FOR. Most civilised countries have now got rid of imprisonment for debt. It was abolished in France in 1867, in Belgium in 1871, in Switzerland and Norway

in 1874, in Italy in 1877, and in Scotland in 1880. But in England the system is in full force. It is true that in 1869 a statute was passed bearing the title "An Act for the Abolition of Imprisonment for Debt, for the Punishment of Fraudulent Debtors, and for other purposes" (32 & 33 Vict. c. 62), but it appears from the county court returns of 1889 that during the preceding year 201,335 applications were made to commit judgment debtors to prison, 54,995 warrants of committal were issued, and 6429 debtors went to prison. The fact is the act in question merely regulates imprisonment for debt, but in no wise abolishes it (see § 5). Imprisonment on mesne process has been abolished, but when a suitor has recovered judgment for debt, damages, or costs, he has two courses open to him. He may proceed either against the property or against the person of his debtor. If he elects to proceed against his person he takes out what is called a "judgment-summons" calling on the debtor to appear before the court on a day named, to be examined as to his means, and to show cause why he should not be committed to prison for having neglected or refused to pay the sum specified in the judgment or order. The summons may be taken out in the county court, whether the judgment be in that court or the high court. At the hearing, if the creditor proves, or the debtor admits, that the latter either *has or has had* since the judgment the means of satisfying it, the court may order him to be committed to gaol for a period not exceeding six weeks. The imprisonment does not operate as a satisfaction of the debt, but on the other hand the debtor cannot be twice imprisoned for the same sum of money. The debtor can at any time obtain his release by paying the debt and costs. While in prison the debtor, like any other prisoner, is kept there at the public expense. Execution against the person therefore differs from execution against property, for in the latter case the creditor has to pay the costs of the execution if they cannot be recovered from the property of the debtor. When a judgment is ordered to be paid by instalments, default in paying any instalment constitutes a ground for committal. Suppose then a debt of £2 is ordered to be paid by instalments of 4s. a month, a common order in the county courts. Theoretically for this debt of £2 the debtor might be committed ten times for periods of six weeks each. Practically the discretion vested in the court would prevent so harsh an application of the law. It has recently been held that a married woman cannot be committed for non-payment of a judgment debt, for under the Married Women's Property Act, 1882, the contracts of a married woman do not bind her personally, but merely bind her available separate estate if any. By one of the eccentricities of modern legislation a

married woman, who has a husband to rely on, is thus put in a more favourable position than a single woman or widow who has no one to help her. From the figures cited above it appears that not more than 3 per cent of the applications to commit result in the actual imprisonment of the debtor. This result is due to a peculiar mode of administering the act of 1869 adopted by most of the county courts, namely the system of suspended orders. It can best be illustrated by an example. Suppose a workman whose standing wages are 25s. a week is summoned for non-payment of a judgment debt of £2 which is three months old. It is clear that since the date of the judgment he has had more than £2 wherewith he could have paid the debt, but on the other hand he probably cannot pay £2 forthwith. The creditor is entitled to his order of committal, but he has no desire that his debtor should go to prison. His only wish is to get his money. The court therefore makes an order committing the debtor, but directs that the warrant of arrest shall not issue as long as the debtor pays a certain weekly or monthly instalment into court, say 5s. a month. This mode of enforcing the act was probably not contemplated by the legislature, but after being questioned by the court of appeal, its validity has been finally affirmed by the House of Lords.

The policy of the act of 1869 is defended on the ground that without it debts would be practically unrecoverable from the working classes, who as a rule have little or no property available for seizure under an execution. Against this argument it is urged that imprisonment for debt encourages a system of factitious credit which is injurious alike to debtors and creditors. All sound credit should rest on one of two bases, namely property or character. If a man has neither property nor character it is better that he should not be able to obtain credit by what is practically a mortgage of his body. The recovery of debt by means of imprisoning the debtor is usually a tedious and expensive process. The creditor is for a long time kept out of his money, and the impecunious debtor has heavy costs to pay in addition to the debt. The tradesmen who deal with the poor no doubt fix their prices with reference to the difficulty in recovering the money, and the result of the present system is to raise normal prices as regards the honest poor who pay their way. The question of imprisonment for debt was inquired into by a select committee of the House of Commons in 1873, who reported strongly against the existing procedure, and suggested various amendments in the law, but no action has hitherto been taken on their report. It is to be noted that under the Bankruptcy Act of 1883 a debtor can file his own petition, and that as soon as a receiving order is made against him he is protected from

proceedings under § 5 of the Debtors Act 1869. The same result follows if an administration order is made by a county court in the case of a small debtor, whose total liabilities do not exceed £50.

[See the subject further discussed in Glasson's *Histoire du Droit de l'Angleterre*, vol. vi. § 296, and *Fortnightly Review*, September 1888.]

M. D. C.

DEBTOR AND CREDITOR, LAW OF. The salient points of the English law of debtor and creditor may be noted under two heads, *firstly*, the rights and obligations of creditors and their debtors; and *secondly*, the means for enforcing those rights and obligations.

When a debt becomes due, it is the duty of the debtor to pay it without waiting for any demand. Hence it has been held that an action may be maintained on a promissory note payable on demand, without showing any presentment to the maker. The control of the courts over costs prevents this rule from working any practical injustice. If no place of payment has been fixed either by custom or agreement, it is in general the duty of the debtor to seek out his creditor for the purpose of paying him, unless the latter be "beyond the seas," that is to say out of England.

In most continental countries a creditor is entitled to draw a bill on his debtor for the amount of his debt, but in England the obligation to accept or pay a bill of exchange only arises from agreement between the parties. It is to be noted that when a man has an account at a bank, the banker is not a trustee of his customer's funds, but the relationship between them is simply that of debtor and creditor, with a superadded implied obligation on the part of the banker to honour his customer's cheques to the extent of the balance to his credit.

A creditor is not bound to give change to his debtor. It is the duty of the latter to tender the exact amount of his debt in legal currency as defined by the Coinage Act, 1870 (see **LEGAL TENDER**). Hence it follows that the creditor, apart from agreement, is not bound to take a cheque or other negotiable instrument in payment of his debt. Bank of England notes are legal tender, except when tendered by the bank itself.

By the common law the relationship of debtor and creditor is regarded as a strictly personal one. Hence, as a general rule, if a third person voluntarily pays the creditor without the debtor's consent or subsequent ratification, the payment is ineffectual. It neither liberates the debtor nor creates any obligation against him. The law merchant has introduced certain exceptions, as, for instance, the payment for honour of a bill of exchange. These exceptions are doubtless borrowed from countries where the rule of the civil law prevails, according to which *debitorem ignarum*,

sive etiam invitum, solvendo liberare possumus.

In accordance with the principle that the obligation created by a debt is a personal one, the common law did not recognise the assignment of debts; but now by § 25 of the Judicature Act, 1873, when a debt is assigned absolutely, by writing under the hand of the assignor, and notice in writing is given to the debtor, the assignee is entitled to receive the debt or to sue for it in his own name.

In countries which follow the civil law, mutual debts extinguish each other by what is known as "compensation," but English law acknowledges no such rule. If parties who have cross accounts choose to strike a balance, the balance is recoverable as a debt, but that is by virtue of the agreement. Again by virtue of the Judicature Act 1873, any claim may now be answered by any cross-claim that the defendant may have; for instance, a claim for rent may be met by a counter-claim for damages for trespass, but it is purely optional with the debtor whether he sets it up or not.

There is yet another rule which seems peculiar to the English common law. It has been held that where there is an undisputed debt, payment of a lesser sum cannot discharge the debt, even though the lesser sum be accepted by the creditor in satisfaction of the whole. The alleged reason is that there is no consideration for the abandonment of the balance. The courts, feeling the hardship of the rule, have narrowed its application as much as possible, and have confined it to money payments. For instance, if a creditor, to whom £100 is owing, agrees to take from his debtor the promissory note of a third person for £50 in satisfaction of the debt, the debt is discharged; and it has even been held, in a case of somewhat doubtful authority, that the debtors' own cheque may have the same effect, though a payment by him in cash would not.

Passing now from the creditor's rights to his remedies for enforcing them, the ordinary mode of enforcing a debt is by action. If, however, the debtor has committed one of the overt acts of insolvency known as "acts of bankruptcy," proceedings in bankruptcy may be taken against him. A corporation or company under the Joint Stock Companies Acts cannot be proceeded against in bankruptcy, but if it be unable to pay its debts, the creditor may petition to have it wound up. In the case of an ordinary debtor, if the debt do not exceed £50, the creditor may sue for it in the county court, where the procedure is cheap and summary. If the debt exceeds £50 but does not exceed £100, the action must be commenced in the high court, but either party can apply to have it removed into the county court. If the debt exceeds £100 the high court is the only court competent to adjudicate on it, unless the

cause of action has arisen within the jurisdiction of one of the few local inferior courts, such as the Mayor's Court of London, which have unlimited pecuniary jurisdiction within certain local limits. When the creditor has obtained judgment he may enforce his rights in three different ways. First he may under certain conditions proceed against the person of his debtor (see DEBT, IMPRISONMENT FOR). Secondly, he may proceed to realise his debt from the property of his debtor by means of execution against that property, and thirdly, he may by the assistance of the court attach any debt owing by a third person to his debtor.

M. D. C.

DEBTOR'S SUMMONS. Under the Bankruptcy Act 1869, bankruptcy proceedings were commonly initiated by what was known as a "debtor's summons." Any creditor for £50 or upwards could take out a summons in the bankruptcy court, calling on his debtor to pay the sum due within seven or twenty-one days, according as the debtor was a trader or a non-trader. If, subject to certain qualifications, the debt was not then paid, an act of bankruptcy was deemed to have been committed, on which a petition might be presented. The system was grossly abused, and a select committee of the House of Commons in 1880 recommended its abolition. The Bankruptcy Act 1883 gave effect to this recommendation, and substituted the procedure by "bankruptcy notice" founded on the final judgment of a court of justice, on which no stay of execution had been granted, thus eliminating all questions as to really disputed debts.

A debtor's summons must be distinguished from a judgment-summons, under which a creditor, who has obtained judgment, seeks to enforce execution against the person of his debtor (see DEBT, IMPRISONMENT FOR).

M. D. C.

DEBTS, PUBLIC. In primitive society, where commerce is small and manufactures are scanty, the tendency of both sovereign and subjects is to hoard rather than to invest the surplus products not immediately consumable. The elementary state of credit and the difficulties in the way of the exchange of commodities impel both public authorities and individual members of the community to make provision against special contingencies, and when such provision fails, force is resorted to in order that collective and private wants may be satisfied. As, however, commerce and manufactures expand, consumption becomes easier and more attractive both to sovereign and people, and the means of, and inducement to, profitable investment increase. Under these conditions there is a growing disinclination to do more than provide for the current expenses of the government, and when extraordinary exigencies arise, extraordinary measures for raising the funds have to be resorted

to. These measures are rendered the more easy by reason of the expansion of credit and exchange to which they are in a great degree due. Hence Adam Smith, who treats this phase of the subject at some length, remarks (*Wealth of Nations*, bk. v. ch. iii.): "The same commercial state of society . . . produces in the subjects both an ability and an inclination to lend. If it commonly brings along with it the necessity of borrowing, it likewise brings with it the facility of doing so;" whilst Prof. Adams, in whose work on *Public Debts* the most complete presentation of the economic aspects of the subject of this article is to be found, observes that "the funding system seems to be capable of wide acceptance only among people whose labour is of a high grade of efficiency and who have developed for themselves representative government."

At the outset, borrowing by the state, even when incurred for extraordinary purposes such as war, took the form of a mere anticipation of revenue rather than of permanent indebtedness. In the United Kingdom, in the reign of William III. and the earlier part of that of Queen Anne, various loans were raised on the assumption that they would be discharged out of the proceeds of taxes which were at the same time imposed for periods varying from 5 to 10 years, and it has been and is still the constant practice of the government to borrow in anticipation of revenue, it being practically impossible so to adjust the collection of taxes as to meet at the due dates throughout the year the payments requiring to be made from the Exchequer. The limits within which loans can be contracted under such conditions are, however, necessarily narrow; in our own country the increasing requirements of the government soon led to the adoption of a less onerous system, and, as Adam Smith points out, "taxes which before had been anticipated only for a short term of years were rendered perpetual as a fund for paying, not the capital, but the interest only of the money which had been borrowed upon them by different successive anticipations." When this point has been reached the funding system may be said to attain its full development.

Two of the principal causes which have led to public borrowing have already been alluded to—temporary necessity and special emergency. A third remains—the construction of public works, in some instances the most potent of all. When capital is required to be expended in order to provide works which will be a source of benefit and profit to the community over a long period of years, the taxpayers of a single year are unwilling, and indeed unable, to bear the whole of the burden, and in proportion as the conception of the province of the state is enlarged, the public debt incurred in order to provide the capital requisite for its undertakings is necessarily augmented.

Economists have discussed in considerable detail the advantages and disadvantages of public borrowing, as compared with the only alternative possible under a constitutional government—the increase of taxation. It is urged on the one side that a public debt affords a convenient form of investment, especially to those investors who, desiring full security for their investment rather than a high rate of interest, are anxious to obtain a public guarantee. It has also been shown that a public debt may be made the means of materially assisting the establishment and provision of banking facilities; and, as an argument against the repayment of an existing debt, it has been contended that its pressure "is necessarily decreased from year to year by the gradual depreciation in the value of the monetary unit in which all obligations are expressed," and that even when this cause is not operative "all the practical effects of debt reduction may be realised through the natural growth and prosperity of the nation." None of these considerations, however, appears to outweigh the disadvantages of public indebtedness *per se*, even when it takes the most convenient form which can be devised; but they require to be taken into account in determining whether the creation or maintenance of a public debt is preferable to the retention of existing taxes or the imposition of new ones.

The weight of the intrinsic objections to public borrowing depends to a considerable extent upon the purposes for which debt is contracted. In this connection it is to be noted that many of the objections to the funding system which are pointed out by Adam Smith and other early economists, and their predictions of its disastrous consequences, proceed on the assumption that the contraction of debt by the state implies the destruction of capital, and not its profitable investment. Even, however, when borrowing is resorted to in order to provide funds for the purposes of war, it may well be that the net result to a nation may be entirely favourable, for, as McCulloch eloquently observes, "the integrity and increase of our dominions, the protection of our rights and liberties, and our triumphs by land and sea, are the real equivalents of the public debt and of all the blood and treasure we have spent in warlike enterprise, and they are quite as ample and conduce as much to our prosperity as a nation as if they had been realised in an increase of population and wealth; no sacrifices can be too great that are required to preserve national security and independence, and a loan expended on armies or fleets employed for such a purpose is quite as well and profitably employed as if it had been laid out on agriculture, or in promoting manufactures or trade."

Prof. Adams, in the work above referred to, discusses the objections to public debts under

the three heads of their political, social, and industrial effects. Under the first he points out that the result of borrowing is to conceal from the nation the full effects of the policy and course of action pursued by the government, an argument which in a somewhat different form is urged by Adam Smith, who regarded the borrowing of money as the removal of an adequate check on the undertaking and continuance of war. It may, however, be observed that if borrowing be not resorted to, the difficulty of providing funds by reason of the impatience of the taxpayer may easily prevent, under a democratic system of government, the adoption of a policy in all respects advantageous. A further political objection presents itself in the case of weak states, the autonomy of which may be endangered by the contraction of foreign loans. Under the head of social effects, the same writer expresses the opinion that public debts "exert a social influence in rendering permanent such class relations as spring from disparity of possessions, and they introduce conflicting interests between citizens." It is, however, to be doubted whether this result of the creation of debt is long maintained when it takes an extremely mobile form, as in our own country.

The industrial effects of borrowing are those which will ordinarily have the greatest influence in determining whether a public loan should be contracted, and on this point Prof. Adams may again be cited. "Public loans influence industrial affairs through the medium of capital, but the character of this influence depends upon the nature of the loan, upon the conditions under which it is contracted, and upon the fund of capital from which it is filled. So long as the placement of a debt by the state does not affect the market quotations of commodities, the full extent of its influence is to divert capital, which might otherwise have gone to extend existing industries, to the purposes of the government. But the moment the state offers unusual inducements the price of commodities is thereby affected. Future loans must therefore be contracted on a rising market, and by taking this step the government enters upon a policy which contains the germ of industrial disturbance and social injustice. . . . At the same time there is a wide margin between a slight increase of the normal rate of interest and an offer of excessive inducements; and although the industrial and financial principles are the same in either case the practical results may be very different. It is therefore, impossible, to determine how far a government is justified in raising the rate on public bonds, unless the probable results of this method of securing money be compared with what must follow from running the taxing machinery at a higher rate of speed." McCulloch arrived at substantially the same conclusion. "The

policy of raising the supplies for a war by means of a loan or by an equivalent increase of taxation, cannot be decided on general principles, but must always be determined by reference to the state of the country at the time. Whenever there is no risk of prejudicing industry by increasing taxation, that plan should be preferred, and although a loan should be required to obviate too rapid an increase of taxation, the inconveniences attending the accumulation of debt are so very great, that every practicable effort should be made to raise the revenue to the highest limit to which it can be safely carried, and to make it defray a part, at least, if not the whole, of the extraordinary expenditure."

As to the manner in which public debts should be contracted, there is now but little difference of opinion amongst economists. It is an axiom that "floating debts should be sparingly used," by reason of the disturbing influence which they exercise upon the money market, and *vice versa*, by reason of the difficulties which a government may experience in keeping such debts on foot. It is also agreed that whenever a debt is large enough, it should take a varied form in order to suit the varying requirements of investors. On this point, however, it is to be observed that it is essential that each class of debt should be large enough to be readily marketable if it is of a negotiable character. The question of whether stock should be issued at par with interest at the full current rate at which the money can be borrowed, or at a discount at a lower rate of interest, has been the subject of considerable discussion, and it cannot be said that any general rule has been laid down. Many investors are very willing to accept a low rate of interest for their money if they see in front of them an increment of value, and it may be important to the borrowing power to satisfy its present requirements at as low an immediate charge as possible. There can be no doubt, however, that the system has frequently resulted adversely to the state. McCulloch (*Dictionary of Commerce*, art. "Funds") states that "in consequence of the prevalence of the practice, the principal of the debt now existing amounts to nearly two-fifths more than the sum actually advanced to the lenders," and the balance of opinion is now distinctly in favour of the issue of stock at par, wherever possible. The course pursued by the British municipal corporations confirms this conclusion.

Many of the considerations presented with regard to the advantages and disadvantages of borrowing as compared with the imposition of taxation apply equally to the repayment of debt. It is probable that the evil effects of an ill-devised system of taxation altogether outweigh the consequences of the existence of debt, and that surplus revenue may be much more

wisely devoted to the revision of the former than the repayment of the latter. When, however, this has been accomplished the gradual liquidation of the debt increases the financial strength of a country and its ability to meet future contingencies when they arise. This object requires therefore to be kept in view in determining the mode in which public debt is contracted, and it is usually accomplished by the periodical drawing of bonds, or as in our own case by the conversion of debt into terminable annuities. This latter course is materially assisted by the constant growth of the funds coming under the control of the government in the shape of savings bank deposits or moneys in Chancery, which can safely be made the subject of financial operations of the character referred to. In many instances, however, and especially in the loans of local authorities, repayment is agreed to be made *en bloc* at a given date, the necessary funds for the purpose being accumulated in the interim. The rate at which a public debt should be repaid, and the period during which it should subsist must be determined by the general considerations above summarised, but in the case of loans contracted for the construction of public works, especially by local authorities, it is obvious that regard must be had to the character of the works and the length of time during which their full utility is likely to endure.

[Nearly all the general treatises on Political Economy refer to this subject. In addition, Adams on *Public Debts*, London, 1888.—Leroy-Beaulieu, *Traité de la Science des Finances*.—Fenn on *The Funds*, London, 14th ed., 1889, and the articles "Funding System" and "National Debt" in the 8th and 9th editions of the *Encyclopædia Britannica* may be consulted.—C. F. Bastable, *Public Finance*, London, 1892. See also ANNUITY; CONVERSION; FUNDING SYSTEM; NATIONAL DEBT; and SINKING FUND.] T. H. E.

DEBT, PUBLIC, STATEMENT OF (Government indebtedness). In the following tables a statement is given of the national debts—(1st) of Great Britain and her Colonies, and (2nd) of all the foreign countries of the world which have created such liabilities. It is impossible to bring all the statements down to a fixed date; but the returns are all comprised within the two years 1890-91, and £6,505,375,562, which is the total of the two tables, may be stated to closely represent the national indebtedness of the world at the close of 1890. Side by side will be found the population of these countries at the same date as nearly as possible, and a statement of the debt per head. But any bald statement of the capital is misleading. Where a debt carries 6 per cent interest it is a far greater burden than where it carries only 2½ per cent, or not much more than 1 per cent, as in the instance of Turkey; and the interest is therefore added as a guide to what the burden

of the debt really amounts to. But even the interest is not a guide to the burden of a country's national debt. By many countries large sums have been raised for the construction of railways, and some of these public works make a return sufficient to cover the interest on the national debt. The endeavour has been made in cases where the figures are available to show what portion of the interest has been made good by the earnings of reproductive works, and the net burden met out of national taxation. It would occupy far too much space to describe the results indicated. They must be allowed to speak for themselves. Suffice it to say that interest has been included *which should be paid* where countries are in default, with a note to that effect; that inconvertible paper currencies are included in the total debts; and where interest is payable in a materially depreciated paper an allowance has been made. Amongst the debts have been included the amounts raised by separate states—such as those comprising the United States, the Argentine Confederation, and the Canadian Dominion—but not county or city indebtedness of any description.

As compared with a previous estimate made in 1882 (Fenn on *The Funds*, 13th ed., 1883—Introduction), when the debts were found to aggregate £5,394,000,000, the increase is shown to be £1,111,000,000, and that in spite of the reductions in United States, British, and other debts. But South American and Colonial borrowing has been heavy in the interval, and many foreign countries have increased their debts. In the ten years 1862 to 1872, the national debts of the world increased as much as £2,000,000,000, whereas between 1872 and 1882 the increase was only £789,000,000. But between 1862 and 1872 there were three great wars, and some smaller ones.

[Statistical Abstract of the Principal and other Foreign Countries. Secretary of Legation Reports.—*Almanach de Gotha*, 1892.—*The Statesman's Year Book*, 1892.—Fenn on *The Funds*, 1889 and 1892 (the last-named edition in the press).—Nineteenth Annual General Report of the Corporation of Foreign Bondholders.—*The Victorian Year Book*, 1890-91.—*The Seven Colonies of Australasia*, 1892 (Sydney).—*The Year Book of Canada*.—Generally, the official statistics of foreign countries.]

DEBTS, PUBLIC, LOCAL, GREAT BRITAIN AND IRELAND. *England and Wales*.—Side by side with the national debt of the United Kingdom a very large amount of debt has been contracted by the local authorities, which should not be lost sight of in any estimate of the public indebtedness of the country. The growth of this debt has been rapid, and the proportion which it bears to the national debt has greatly increased. The following figures, which refer to England and Wales alone, show this clearly.

Country.	Population.	Debt (1890-91.)	Debt per Head.	Interest.	Covered by Reproductive Works.	Net Burden of Interest.

* Guaranteed Capital, Railways, etc.

† Includes population of colonies and possessions without debts. New African Protectorates not included.

‡ Interest estimated at 4½ per cent.

Where debts are in silver, the depreciation has been allowed for.

Outstanding loans of local authorities in England and Wales at the end of the financial years 1874-75, 1881-82, and 1888-89.

Year.	Amount of loans outstanding.
1874-75	292,620,100
1881-82	151,704,640
1888-89	195,442,397

The liabilities of local authorities in respect of their outstanding loans had therefore in-

creased by £102,622,297, or 110·6 per cent, in 1888-89 as compared with 1874-75. Of this increase £55,884,540 is attributable to the seven years from 1875-76 to 1881-82, and £43,737,757 to the seven years from 1881-82 to 1888-89. The loans raised during the fifteen years amounted to £171,584,112. A considerable part has been repaid in that time. It should be borne in mind, with respect to the above loans, that they have been incurred

Note.—It is very difficult to state the exact sinking fund of the Home National Debt. Nominally £1,271,642 is annually so applied. But a considerable portion of the annual charge on the Terminable Annuities is in reality sinking fund, and out of a total charge of £25,000,000, probably £6,100,000 is applied to the reduction of capital.

for purposes of public utility as, for harbours, docks, and piers, for waterworks, gasworks, markets, from most of which a considerable revenue is derived. Others, such as those incurred for schools, though not yielding an immediate return, have yet been raised for highly useful purposes. The proportion which the local indebtedness bears to the rateable value of the several districts in respect of which it has been incurred varies greatly in

different localities. The annual rateable value of England and Wales for the purposes of the poor-rate, according to the valuation lists in force at Lady-day 1889, was £150,485,974.

The relative proportions which the debts of local authorities bore to the national debt at the end of the financial years 1874-75 and 1888-89 are shown by the following figures.

Years.	National Debt.	Local Debt.	Proportion of Local Debt to National Debt.
	£	£	per cent.
1874-5	768,945,757	92,820,100	12
1888-9	698,430,571	195,442,397	28

The following statement shows, so far as it has been found practicable to apportion them, the amounts outstanding in respect of the principal purposes for which the loans of the local authorities had been raised.

*Loans outstanding (England and Wales),
year 1888-89.*

Local Authorities.

Waterworks	£36,697,897
Harbours, Docks, and Piers	30,733,291
Highways, Street Improvements, and Turnpike Roads	28,736,070
Sewerage and Sewage Disposal	18,948,237
Schools	17,669,430
Gasworks	14,772,825
Poor Law purposes	6,984,886
Markets	5,386,888
Public Buildings, Offices, etc. (not included under other headings)	4,229,877
Bridges and Ferries	4,086,283
Artisans and Labourers' Dwellings Improvement Schemes	3,851,164
Lunatic Asylums	3,612,031
Parks, Pleasure Grounds, Commons, and Open Spaces	3,185,620
Land Drainage, Embankment, and River Conservancy	3,175,226
Cemeteries and Burial Grounds	2,489,149
Tramways	1,309,152
Police Stations and Gaols	1,006,621
Private Improvement Works	944,657
Baths, Washhouses, and Open Bathing Places	852,333
Hospitals	641,820
Fire Brigade	446,381
Libraries and Museums	427,164
Cattle Diseases Prevention Act, 1866	98,641
Slaughter-houses	92,711
Public Lighting	48,920
Loans charged on Church Rates	9,100
Allotments	2,940
Other purposes	5,003,083 ¹
	195,442,397

¹ This sum includes loans which have been raised partly for some of the works specifically enumerated, but which it has not been found practicable to apportion as between those works and other purposes.

The local taxation returns from which these figures are obtained, relate to the accounts of the local authorities of England and Wales. These authorities are very numerous. They include 647 Boards of Guardians and the Overseers of the Poor of 14,761 Parishes; the County Authorities of 66 Counties, Divisions of Counties, and Liberties; the Corporations of 287 Municipal Boroughs; 274 Town Councils acting as Urban Sanitary Authorities; the Commissioners of 37 Improvement Act Districts; 691 Local Boards; 30 Joint Boards; 573 Rural Sanitary Authorities; 50 Port Sanitary Authorities; 983 Burial Boards; 19 Boards of Commissioners of Baths and Wash-houses; the Conservators of 2 Commons; the Commissioners of Free Libraries in 15 Parishes; the Trustees for 18 Bridges or Ferries; the Lighting and Watching Inspectors of 178 Districts; the Commissioners of 5 Markets and Fairs; 40 Metropolitan Vestries and District Boards;² a body of Paving Commissioners acting under a Local Act for Ely Place, Holborn; the Commissioners of Sewers of the City of London; the Metropolitan Board of Works; the Commissioners of Police of the Metropolis; the Corporation of London; the Commissioners of Sewers of 50 Districts constituted under the 23 Henry VIII., c. 5, or Part I. of the Land Drainage Act, 1861; 219 Drainage, Embankment, and Conservancy Boards; 45 Salmon Fishery Conservancy Boards; the Churchwardens of 17 Parishes in which Church Rates were still leviable; 85 Harbour, Pier, and Dock Authorities; 362 Highway Boards acting for 7129 highway parishes; 40 Rural Sanitary Authorities exercising the powers of Highway Boards for 738 highway parishes; 6464 Surveyors of separate highway parishes; 12 Turnpike Trusts; the Commissioners of Highways for the Isle of Wight; and 6 County Roads Boards in South Wales. In addition to the above, are 2238 School Boards, and the Managers of 10 School Districts, 2 Sick Asylum Districts, and the Metropolitan Asylum District, making a total of 28,233³ authorities.

The management of the local debt of the country is thus divided between a vast number of persons, and, as is usually the case where individual responsibility is lost sight of, administration is lax. For the system of administration, see LOCAL GOVERNMENT.

Scotland.—The local debt of Scotland in 1889-90 was £25,380,723, divided as follows:—

*Local Loans on Security of Rates, Dues, or
Property (Scotland), year 1889-90.*

Local Authorities.

Parochial Boards	£824,610
School Boards	3,194,725
Burgh Authorities	11,417,877
Commissioners of Supply	101,797
District Fishery Boards	Nil.

² Including the Local Board of Health for Woolwich.
³ In a few cases local authorities neither received nor expended any moneys during the year, and these cases are not included in the above number; on the other hand, where a Local Board has become a Municipal Authority during the year, the same district is included twice.

Roads and Bridges Trusts—

Countries	276,898
Burghs	393,265
Country Road Trusts	21,676
Heritors for Ecclesiastical Purposes	12,230
Harbour Authorities	9,136,745
	<u>£25,380,723</u>

The rateable value of Scotland for 1889-90 was £23,583,775.

Ireland.—The local debt of Ireland in the year ended in 1890 was as follows:

Local Authorities.

Towns under Town Councils	£2,790,830
Town Authorities under Special Acts	1,045,796
Towns under Act of 1854	247,563
Towns under Act of 1829	32,937
Harbour Authorities	2,465,190
	<u>£6,582,316</u>

The local debt of Great Britain and Ireland was therefore, at the dates mentioned, as follows:

England and Wales, 1888-89	£195,442,397
Scotland, 1889-90	25,380,723
Ireland, 1890	6,582,316
	<u>£227,405,436</u>

This amount should be added to the national debt in estimating the indebtedness of the country. The Local Debt bears now a proportion of about 30 per cent to the National Debt and is continually increasing. Other countries show the same tendency. According to Prof. Bastable, *Public Finance*, 1892, p. 627, the debt of the French *Communes* was more than £30,000,000 in 1878—not including Paris. The debts of that city were over £98,000,000 in 1890. The debts of the Italian *Communes* were £35,300,000 in 1885. The local and municipal debts of the United States were \$822,100,000 (£164,000,000) in 1880. The growth of the debts of this description is extremely rapid, and no very accurate general statements are attainable.

DE CARDENAS DI MAQUEDA, DIEGO RAFFAELE, lived in the second half of the 18th century. He belongs to that set of people who,

if two are discussing what four and four is, and one says "eight" and the other "ten," will drop in an intermediate opinion, and think it might be "nine." Liberty of commerce, particularly of corn, is wrong, so is state interference; the truth is, of course, between the two—a little liberty and a little regulation by the state. For De Cardenas, the causes of dearth in the kingdom of Naples are three: scarcity of production as a rule; large harvests exceptionally; then government interference. The one only remedy in his opinion is the creation of public store-houses, and the giving power to the government to decide annually what portion of the harvest might be exported. The corn in the public store-houses ought to be saleable by a system of warrants.

The title of his work is *Governo economico intorno ai grani*. Napoli, presso Gaetano Tardano, 1784. M. P.

DECENTRALISATION. Few terms are used more at random or are harder to define than decentralisation. It is the reverse of CENTRALISATION (*q.v.*) If centralisation be defined as the centring of all the powers of government in the hands of a single person, or body of persons, and presumably in a single place, namely the capital of the state, decentralisation may be defined as the distributing the powers of government among various persons or groups of persons, and presumably in various places of which the capital is only the most important. Complete centralisation and complete decentralisation are alike impossible. Complete centralisation is impossible, because the central authority must under all circumstances leave much to agents and subordinates, and cannot wholly deprive them of a discretion in executing their functions. Complete decentralisation is impossible, for this would imply the perfectly independent action of many authorities, in other words the dissolution of the body politic. The decentralisation which is possible without destroying the state may take different forms. The functions of government are distinguished as legislative, judicial, and executive or administrative. All these functions, or only one or two of them, may be decentralised. All are decentralised to a considerable degree in such a commonwealth as the United States of America. Legislation is centralised in most states which are not federal, *e.g.* in the kingdom of Italy or in the French republic. Administration is decentralised in England to a far greater degree than in France, since English local authorities enjoy a far larger independence than do French local authorities. On the other hand the administration of justice is far more centralised in England than in France. By means of the system of circuits a very small number of superior courts has been made to serve the wants of the whole kingdom. In France, under the monarchy, there were

thirteen parliaments or high courts of justice, and although these have disappeared, the number of courts and of judges has been much increased in the present century. Thus we see that it is possible for different functions of government to be decentralised in different states.

Again the political significance of decentralisation differs according to the nature of the function decentralised. Of all the functions of government, legislation is the most momentous. Its centralisation is therefore intimately connected with the unity of the state. The legislative decentralisation in federal states, arises from the fact that these are aggregates of smaller states, which, although willing to combine for certain purposes, are unwilling to forego individual existence and at least nominal sovereignty. Judicial decentralisation usually owes its origin to the desire for cheap and speedy justice, which can be had only by bringing a court of justice within convenient reach of every one who wishes to go to law. Administrative decentralisation usually arises from a totally different impulse, from an instinct of self-government, a desire to execute the laws for oneself rather than to have them executed by officials.

The good or bad consequences of decentralisation differ with the different modes of decentralisation, as well as with the circumstances of each community. Legislative decentralisation is seldom strongly desired or long maintained, unless in states spread over a vast area like the British empire or the United States, or divided by differences of race or religion like the Austro-Hungarian monarchy or the Swiss republic. Legislative decentralisation has the advantage of allowing a freer play to national or quasi-national characteristics. It has, however, the disadvantage of leaving the less civilised parts of a state to persist in their barbarism. It has also, in states under popular government, the disadvantage of opening a field to politicians of low moral and intellectual type. Judicial decentralisation is good in so far as it renders justice cheap and rapid, but bad in so far as it tends to produce judges undistinguished either for learning, for ability, or for character. Few states have attained the right medium in judicial decentralisation. In England it has not been carried far enough; in France and in America it has been carried much too far. Administrative decentralisation is good in so far as it places the administration in the hands of those whom it immediately affects, calls forth their public spirit, and exercises their political capacity. It is bad in so far as it entrusts administration to men who have not competent intelligence or are not conspicuous enough to fear public opinion. In short, decentralisation is good, not as an ultimate end, but as a means of good government and of national training. Its effects are strictly relative to all the con-

ditions of the state decentralised. In what directions and to what extent decentralisation should be carried in any given commonwealth, can be determined only upon mature examination of all the circumstances and cautious trial of what is possible. There are few general propositions on the subject which cannot be shown to be unsound or at least incorrect by familiar historical instances.

[Upon the theory of this subject the reader may consult De Tocqueville's works, especially *De la Démocratie en Amérique*, and Mill's *Representative Government*; for illustrations of the working of decentralisation, Bryce's *American Commonwealth*,—especially the chapters relating to the state and municipal authorities; for a statement of the degree of administrative decentralisation now existing in England, the volumes on Local Government and Poor Relief in the English Citizen Series.]

F. C. M.

DECIMAL SYSTEM (COINAGE, WEIGHTS AND MEASURES). Viewed from an economical standpoint, the non-adoption in a compulsory manner of any decimal or metric system of current money, weights, and measures, throughout the British Empire is one of the most glaring examples of national waste, financially and educationally, that the spirit of unwillingness to face the trouble of a change from old ways has ever inflicted. Over and over again this has been pointed out to parliamentary committees, to successive prime ministers, chancellors of the exchequer, presidents of the board of trade, and other high executive functionaries, but in vain so far as any practical action is concerned. Not only scientific men and professors, mathematical and politico-economical, but commercial men and chambers of commerce, and educational experts at home, and British consuls abroad, have urged in the most convincing manner that our weights and measures and money are, as a whole, utterly unintelligible to the large majority of foreign persons with whom it is our desire and interest to further extend our trade, and that this renders English price lists and circulars a mere dead letter to many who might otherwise become customers, and greatly handicaps British industries in export trade. It has also been fully demonstrated that the loss of valuable time, and the imperfect intelligence developed, by teaching the young an antiquated non-decimal system, is a fearful extravagance even in a country like ours which can afford to spend eight millions annually in the cause of education, some considerable part of which would be saved if a proper decimal system were substituted for the present effete and unscientific want of system. If such a change be adopted by the legislature, then, within a very limited time there would gradually be no necessity to teach, in board or other schools, the present puzzling, because incoherent with each other, denominations of money, weights, and measures that are behind

the age and internationally discredited. Our space does not admit of more than a few remarks under each head of importance in any comprehensive view of this question.

I. *Origin of the decimal system.* Our fellow-subjects in Hindostan were the precursors of the Arabians, and it is believed also of the Chinese, in the discovery and use of the decimal system of notation. Writers of authority on the early history of mathematical science concur in remarking that the Arabians, who were the real introducers of the system into Europe, borrowed it from the Hindoos. In Arabian arithmetical works which date back more than a thousand years the decimal system is called the Indian method of computation, the *Hindasi*, or Indian arithmetic.

II. *Use of the system in ancient times.* So far as Europe is concerned it was not until the close of the 18th century that any effective decimalisation of coin, weight, or measure took place. In fact the theory itself of decimal fractions was unknown until nearly the end of the 16th century. Calculations of the value of annual rents or of capital sums, receivable for a certain term of years or at the expiry of a given time, at any particular rate of interest, or, in other words, the ascertainment of their discounted present worth, had continued to be attended with so much complexity that the search for some remedy for this led to more easy and effectual means of computing such values being sought by Simon Stevin of Bruges. This illustrious man of science invented the theory of decimal fractions, in the construction of tables showing the values of such annuities and periodical payments; and with far-seeing foresight predicted the enormous boon his new-found science would prove to mankind, in practice as well as theory, for all future time. The discovery was first printed in Flemish and in French some three years after the tables. In French it is included in the second, but separately-paged, part of his duodecimo volume on arithmetic, printed at the press of Christophe Plantin, at Leyden, in 1585. The fame and practical utility of "*La Disque*" or "*De thimble*," as Stevin entitled it, echoed throughout Europe. In no country was it better welcomed than in England, or received earlier attention by way of translation and of extension. In this treatise it was suggested that not only all weights and measures should be decimalised, but money also, by the latter being struck in future in various countries into "commencements." Stevin's term for units, and then subdivided into "primes" (tenths); "secondes" (hundredths); "tierces" (thousandths); and so on. This was tantamount, so far as England was concerned, to taking the pound sterling as the unit or *commencement*, the florin or two-shilling piece as the *prime* or tenth of the unit, the 10 mil piece or cent as the *seconde* or

hundredth of the unit, and the 1 mil piece as the *tierce* or thousandth of the unit. All this is practically identical with the pound and mil scheme, so well known to the British parliament and public at the present date.

At the beginning of the 16th century, it is well evidenced by the book on arithmetic by Cuthbert Tonstall, bishop-elect of London, printed in 1522 at London and Paris, that not only in England and France commercial accounts were kept according to a vigesimal and duodecimal subdivision of pounds and livres into twenty shillings or sols, and of shillings and sols into twelve pence or deniers, but that such was the general practice amongst the merchants of other commercial states of Europe. And so it continued in France until the era of the great revolution. But that from that time until now France and every other country, except England, should have one by one altered to a decimal system is the most undeniable proof that the advantages of a decimal system over all others must have made themselves felt and understood and acted upon by all except our own country.

III. *The decimal system in France.* Although the United States of America had decimal subdivisions of the dollar into cents and half cents, by its legislation in 1786, whilst the great metric reform in the coinage of France was not made before 1791, the change by France from her old vigesimal and duodecimal division of the livre tournois or old franc into the new decimal and metrical franc and centimes, has been the real turning-point whereby all other European countries except our own have been led to decimalise their coinage either wholly or in part. Those which, like the several nations comprised in the Latin monetary union, have adopted the French coinage system in its entirety, have of course the full advantage of a wholly homogeneous system wherein weights of coin and all other weights and measures have a definite mutual scientific relation to each other. But even those which, like the German empire or Russia, have merely decimalised a not strictly metric unit, as for instance the mark or rouble, have derived much substantial advantage from the substitution of decimal for other systems.

IV. *History of the decimal movement in England.* This country was specially, indeed exclusively, invited by the French government at the very inception of the idea in 1790 to send commissioners to Paris to join with theirs in the metric and decimal reform. The antagonism to almost anything French which prevailed here at the time prevented England from joining this movement, much to our national loss, as it has already retarded for a century our participation in its advantages. Let us hope that the new century, now approaching with fast strides, will not find our executive still of the same slow and halting minds as we shall presently show they have been in the

present century. It would be well, with the present progress of education, that they should meet the year 1901 with a greater disposition towards uniformity in this question with the more scientific theory and practice of other great nations which have long experienced the benefits that accrue from it. The matter has in the meanwhile been before the English commercial and scientific world, and the House of Commons, over and over again. So early as in 1824, when the anti-Gallican spirit had begun to tone down, Sir J. Wrottesley (afterwards Lord Wrottesley) moved in the House of Commons for inquiry into the possibility of coining the subdivisions of the pound sterling decimally, that is, into double shillings or florins, and into 1000 farthings or mils, instead of 960 farthings as heretofore. The government rejected the plan as inconvenient, although they admitted its advantages. In 1841 royal commissioners were appointed to restore the standards of weight and measure destroyed at the fire which burned down the houses of Parliament. They reported unreservedly in favour of a decimal subdivision of the pound sterling, and upon the facility of interposing between the pound and the shilling a new coin equivalent to two shillings, and of considering the farthing, now passing as the $\frac{1}{240}$ th part of a pound, as the $\frac{1}{1000}$ th part of that unit, of establishing a coin of value equal to $\frac{1}{1000}$ th part of the pound, and of circulating, besides these principal members of a decimal coinage, other coins bearing a simple relation to them, including coins of the same value as the present shilling and sixpence. In 1843 a second royal commission, consisting of the same members as the former one, with the addition of a few more scientific men, was appointed. They proposed that the recommendations of the first commission should be carried out. The government however shelved the matter, and took no action whatever. In 1847 Sir John Bowring moved in the Commons for an address to the Crown in favour of the coinage of silver pieces of $\frac{1}{10}$ th and $\frac{1}{100}$ th of the pound. The government fell in with this view, but in a tentative manner only. They came to a resolution, and acted upon it, that the first step in the decimal system should be to establish a coin equal to $\frac{1}{10}$ th of a pound. This was the origin of the modern English florin, stamped *one tenth of a pound*, the mintage of which was immediately commenced and has continued until now. In 1853 the commissioners appointed ten years before wrote to Mr. Gladstone, then Chancellor of the Exchequer, strongly urging the government to issue coins related to the millesimal subdivision of the pound sterling, and of the value of $\frac{1}{1000}$ th, $\frac{1}{10000}$ th and $\frac{1}{100000}$ th of a pound (differing little from the farthing, the halfpenny, and the penny), and that these might be extensively used by the public without present inconveni-

ence, while the inscription of their values, as estimated in the decimal scale, would afford the means of shortly introducing that scale throughout the entire system. These were sensible suggestions and about the best that can now be offered. They admit, however, of one important improvement which we have personally repeatedly urged, namely, that the coinage of the new farthing (one mil), the new halfpenny (two mils), and the new penny (four mils); should be struck in *nickel*. A small-sized, unmistakably distinct series of new coins of that metal would obviate all confusion or trouble with the concurrent old bronze coins, for such time at least as the latter might have to circulate with the new nickel coins until the bronze coins were called in. A transition period would have to be faced, and it would practically decide in which direction the reform is to work, by the voice of the public, based on the adjustment of its common wants in which every one is interested on both sides of the question, as debtor and creditor, consumer and producer, of commodities and conveniences measured by the penny and its subdivisions. The great question would be whether penny fares and postages and the price of any article, or service, now measured by the penny or $\frac{1}{240}$ th of a pound, should be measured in future by the 4 mil piece or $\frac{1}{60}$ th of a pound, or by the 5 mil piece or $\frac{1}{48}$ th of a pound. The halving and quartering of the 5 mil piece present awkward fractions, but the 4 mil piece with its perfect halving and quartering is dynamically equally convenient with the present penny, and it has the positive advantage of tending to economy by expenditure of $\frac{1}{240}$ th, instead of $\frac{1}{240}$ th part of a pound, often answering the same purpose, and preventing waste by its more minute subdivisions. Mr. Gladstone, in 1853, declined to act upon the recommendations of the commissioners, but consented to a select committee on decimal coinage. The twenty-five witnesses examined were unanimous in recommending it, and, with one exception, supported the pound and mil scheme. The committee itself reported that having well weighed the comparative merits of the existing system of coinage and the decimal system, and the obstacles which must necessarily be met with in passing from one to the other, they desired to repeat their decided opinion of the superior advantages of the decimal system, and to record their conviction that the obstacles referred to are not of a nature to create any doubt of the expediency of introducing that system as soon as the requisite preparations shall have been made for the purpose by means of cautious but decisive action on the part of the government. Our readers should note this well-advised verdict, that after weighing the advantages and disadvantages as between the present vigesimo-duodecimal coinage and the proposed decimal coinage, they pronounce, as

we take it any man of practical and theoretical knowledge would do, in favour of the decimal system, so that, as we have now got about forty years more education into the understandings of our people than when the commissioners met in 1853, it may be taken for granted that they were right in their view. But it neither pleased Mr. Gladstone nor his government, and the taking of any action by them was the last thing thought of in appointing the commission. The public had, however, even in 1853, its attention so roused by the favourable report of the select committee that all kinds of rival plans were submitted for discussion at meetings of societies and in printed pamphlets. There was so much doctrinaire attachment still existing even to the last thread of the strange web of our singular coinage system, that champions set forth the existing farthing, halfpenny, penny, ten pence, twenty pence, four shillings, eight shillings, crown, ten shillings, even the long-abandoned guinea, as better bases than the pound sterling in a decimal system. Even the American dollar and the French franc had their advocates. The farthing, halfpenny, penny, and the ten-penny schemes were perhaps the strongest-supported of these opposition methods, but all four of them fail by disturbing the pound sterling to an impracticable extent, as they make this time-honoured unit change into one of £1 : 0 : 10, instead of, like the pound and unit scheme, leaving it quite undisturbed. In 1854 the late Sir William Brown of Liverpool, a practical commercial man, after having well considered the question in concert with the "Decimal Association," of which he was chairman, and amongst whose members were the most accomplished men of the day in trade as well as in science, moved three resolutions in the House of Commons: (1) That in the opinion of the House, the initiation of the decimal system by the issue of the florin has been eminently successful and satisfactory. This was carried by 135 to 36. (2) That a further extension of the system will be of public advantage. Carried unanimously. (3) That an humble address be presented to her Majesty to complete the decimal scale with the pound and florin, as suggested by two commissions and a committee of the Commons, by authorising the issue of silver coins to represent the value of the one-hundredth part of a pound, and copper coins to represent the one-thousandth part of a pound, to be called cents and mils respectively, or to bear such other names as to her Majesty may seem advisable. This was withdrawn, as, with its usual tactics on this question, and on the then alleged interests of the poorer classes, and other such plausible pretences, but really with the view of again strangling the reform, the government agreed to appoint a royal commission, which consisted, in the result, of three men being appointed

commissioners who were bitter enemies to any change, two of them, Lord Overstone and Mr. Hubbard (afterwards Lord Addington) being, to our certain knowledge, given to saying that they had made their money, as bankers and merchants, under the old system, and that as that was good in the past, it would be good enough in the future. The inevitable result of the commission, notwithstanding they had the testimony of men of advanced scientific intellect, and of high commercial reputation, before them in favour of the decimal system of coinage, and especially of the pound and mil scheme, was unfavourable. The royal commission arrived at twelve, on the whole, antagonistic resolutions. It was, however, admitted that the pound and mil scheme is the only form in which, under the then state of public feeling in this country on the question, the introduction of the decimal principle into our coinage could be contemplated with any reasonable probability of sufficient support. It was also alleged that there appeared to be no approach to unanimity of opinion, on the question of the introduction of decimal coinage, in the commercial or other classes of the community. This is, however, only the usual stereotyped sort of phrase in which governmental *non possumus* is wont to be wrapped up. But if we are to wait until the *plebs* move as one body in such a cause we may indeed sit still and await the Greek kalends. Light must be diffused upon it, but the reform is practicable over, and not by, the heads of the million. The "Decimal Association," founded to fan the sacred flame of the movement in its favour, faded out of view by the removal through death of such active friends of it as Sir William Brown, Professor De Morgan, Sir John Bowring, etc. Then on its dissolution another body, with like objects, the "Metric Association," was founded, and although neither money nor pains were spared by its members, of whom the writer is one of the few survivors, in educating the public to the advantages of the decimal and metric systems, by meetings, deputations, pamphlets, and conferences of all kinds with educational and scientific notabilities, still, that association also came to an end, as human nature tires at last in the thankless task of pushing forward reasoning on subjects of argument that are necessarily, in the order of things, abstract and theoretical in form, although they are, in this particular instance, also both real and practical and within the possible range of not very distant adoption. On the ruins as it were of the first two associations, a third "Decimal Association" has been founded, and has succeeded in gaining a more influential co-operation from the chambers of commerce than was formerly possible. It remains to be seen if it can attain its objects better than its predecessors, the associations of the past generation.

It has this advantage over them, that public education of the masses has now made vast progress, and places the latter in a far better position to accept and welcome a decimal reform than when some of us laboured in the same cause in years long gone by. It would seem, notwithstanding, that although individuals may improve in their grasp of the question, ministers do not. A Palmerston, a Gladstone, or a Goschen are all much the same in their desire to put a spoke in its wheel, which may pass on the burden and responsibility of the change to some distant future. Having attended all the deputations in a long series of years which have ventured to trouble the Treasury and Board of Trade with the expression of wishes for present action upon it, we can say we have never discerned even the faintest glimmer of sympathy, in any minister, for the movement. If it were felt in their inner non-official conscience, it was stifled by the knowledge that not only would the cry of reform to a decimal system, either of coinage or of weights and measures, or of all of them, gain them no political votes, but perchance might lose them a few, from the feeling that it would cost the masses trouble and thought, and the collecting and spending branches of the executive the same, and some ingenuity of arrangement besides, if any change in the present antiquated system be brought about. There is unfortunately an excess of timorousness here. If actual experience be a guide, the example of a great country like the German Empire having decimalised its coins, weights, and measures, within quite recent years, proves that a nation, certainly not better if so well educated as England in these days, can carry out such a reform in a limited space of time without any real difficulty, and much to its advantage both in the multifarious daily dealings of home life and in its trade intercourse with the rest of the world.

F. H.

DECIME. French bronze token coin of the nominal value of 10 centimes, or one-tenth of a franc. Weight 10 grammes or 154·3 grains. English value ·96 penny.

F. E. A.

DÉCIMES. In France, as in other countries of Europe, the clergy long contended for the privilege of exemption from taxes. It was a favourite and frequent assertion that they owed nothing to the state but their prayers. The kings were naturally unwilling to dispense with the contributions of the wealthiest corporation in the realm. From the time of the crusades the clergy were frequently induced or compelled to make occasional grants to the crown, usually for some definite object, and often sanctioned by the pope. It was not till the middle of the 16th century that these grants, under the pressure of Huguenot schemes of confiscation, became permanent and regular taxes. In 1561, by the contract of Poissy, the clergy undertook

to pay 1,600,000 livres a year for six years. This contract was renewed in 1567, and ultimately the *décimes*, as they were called, became a regular payment, granted every ten years by a *grande assemblée* of the clergy, attended by four deputies from each province. To settle all disputes about the assessment and collection of this payment a *bureau général des décimes* was erected in 1580 in each of the eight metropolitan sees of France.

Though the consent of the clergy to the grant of taxes became more formal than real, they retained the assessment and collection in their own hands. Necker goes out of his way to praise the system they had adopted in the 18th century. The *décimes* formed a direct tax upon all clergy except the charitable orders. For the purposes of assessment the clergy were divided into eight classes, in which attention was paid to other considerations than mere difference of income. Thus the first class was composed of the non-resident officials such as the abbés and secular priors; whereas the archbishops and bishops only came in the second class. The other classes were mainly arranged according to income, the lowest consisting of curés with 500 livres a year. The first class paid a fourth of income, the second a sixth, and so on down to the last, which paid only a twenty-fourth. But the arrangement was not strictly carried out, and the collegiate clergy succeeded in throwing an ever-increasing burden upon the curés.

The *décimes* were not paid by the *clergé étranger*, i.e. the clergy in the provinces added to France in the 17th and 18th centuries. In four of these provinces the clergy paid the ordinary secular taxes, and in the rest a composition for them.

[Necker, *De l'administration des finances de la France*, tome ii.—Gasquet, *Précis des institutions politiques et sociales de l'ancienne France*.] R. L.

DECKER, SIR MATTHEW (1679-1749), merchant, and economic and trade writer, was born in Amsterdam and came to London in 1702. His business life was eminently successful, leading the way to great wealth and many honours. He was a director of the East India Company, member of parliament for Bishops Castle, high sheriff of Surrey in 1729, and was created a baronet 20th July 1716. His estates were large, and he is reputed, by mistake, to have been the first to produce pine-apples in England, one of which was served up at a great banquet at Richmond when he entertained George I.

His importance as a writer rests on two treatises:—

1. *Serious Considerations on the several high duties which the Nation in general, as well as Trade in particular, labours under, etc., with a proposal for preventing the removing of goods, discharging the trader from any search, and*

raising all the Publick Supplies by one single tax. 1743 (name affixed to 7th edition 1756).

2. *An Essay on the Causes of the Decline of the Foreign Trade, consequently of the value of the lands in Britain, and on the means to restore both.* 1744 (said to have been begun 1739).

Decker's authorship of the last-named treatise has been impugned by M'Culloch on grounds both external and internal. On the authority of Fauquier, *Ways and Means*, p. 56 (1756), he assigns it to Richardson. He further considers the dissimilarity of the systems respectively expounded as evincing an obvious difference in authorship. With regard to external evidence it may be noticed that the evidence rests on the assertion made by Fauquier which is followed by Chalmers in 1782. Against this may be placed Postlethwayte's authority (*Great Britain's True System*, pp. 163-175); a letter from Lord Townshend to Tucker speaking of the treatise as Decker's in 1752 (*Hist. MSS. Com. Report*, xi. App. 4); and lastly, the 2nd edition printed in Dublin in 1749, which has Decker's name on the title page as author.

Turning to the question of internal evidence, it is necessary to point out that there is very little ground for M'Culloch's observations with regard to incongruity. So far, indeed, is this from being a remarkable feature that the opposite may rather be said to be the case, the scheme expounded in the second treatise, of general licenses for consumption, being an expansion of the scheme of particular licenses for the consumption of tea, treated of incidentally in the first (*Serious Considerations*). The tone of the two is similar, and the grievance complained of the same.

To sum up the matter it may be said that the internal evidence is strongly in favour of the two treatises being written by the same man, and as there is no ground for supposing that Decker did not write the *Serious Considerations*, etc., a work always attributed to him, he must be credited with the authorship of the second treatise also, unless the external evidence be directly opposed. So far, however, is this from being the case that its balance is largely in his favour.

Next, we may turn to the contents of these two works. The first, the *Serious Considerations on the High Duties*, etc., opens with long comments on the inducements offered by heavy custom duties to smuggling ("running"), which will take place in defiance of all attempts at suppression. Such a condition of things bring about two chief evils, civil disorder and perverted morality. Decker then notices the great advantage which would be brought about by a repeal of the import duty on tea, and the substitution of a license duty on households wishing to consume tea. But the great scheme developed in this treatise consists in the replacement of all custom duties by an excise

on houses. This he would impose in proportion to the rating, with total exemption for the poor. Its chief advantages are, he urges, (1) just and certain incidence, (2) convenience in time of collection, (3) economy. He thus forestalls the four canons of taxation enunciated by Adam Smith.

The second work, *Decline of the Foreign Trade*, is in every way more important than the foregoing. While proceeding on the same lines and aimed at the same evil, it has a wider and more liberal scope. It seeks to attain its end by measures which would affect the conduct of trade throughout the whole kingdom. Although the title is pessimistic in the extreme, it must be observed that the drift of the whole treatise is rather to show the possibility of improvement than to assert any absolute decline. In other words England might be made much greater than she is. At the outset he has to confront a particular aspect of the question dealt with in the foregoing work. The proposal to abolish customs and to make England a free port was met by the objection that such an alteration would destroy the value of the land. This he desires to controvert, and in order to do so really divides his work into three parts. The first part is devoted to a detailed criticism of the fiscal difficulties under which England is labouring; the second part to showing the intricate connection between the trade of a country and the value of the land; while in the third part Decker displays the great sources of wealth and prosperity possessed by England, and shows how the references he suggests would permit her to avail herself of these, her natural strength. Some attention must be paid to each of the foregoing.

The first part treats of the causes of difficulty. These are (1) present taxes, (2) monopolies, (3) ill-judged laws, (4) heavy burden of the national debt. It may be noticed that he criticises the East India Company with great severity, and urges very strongly the repeal of the navigation laws, which have, he says, evil effects on trade and shipping alike. The criticisms and complaints comprised under the foregoing headings group themselves round two great matters of grievance:—

(a) The undue and artificial exaltation of certain branches of trade.

(b) The enhancement of the price of labour.

In the second part, Decker claims that the value of the land is diminished by what foreigners take from others instead of us, by what the poor have given them instead of buying, by the scarcity of people and the scarcity of money.

The third part opens with a description of the natural advantages which England possesses over her two chief rivals, France and Holland. Decker shows how the uniqueness of her position, the wealth of minerals she possesses, the fertility of her soil, the moderation of her government,

and the daring of her sailors combine to give her a position which no other nation can claim. He then proceeds to unfold his proposals. These are eleven in number and are fiscal, economic, and political. Of course one of them is the general repeal of import duties and another the abolition of bounties. To replace the revenue derived from the former of these he advocates a tax on the consumption of things which are not strict necessities. The tax, as he develops it, partakes of the nature of an income tax with considerable exemptions, since indulgence in different luxuries is supposed to indicate the possession of a certain income. Thus the unambitious drinker of tea is to be taxed on an income of £25, the owner of two coaches and six on one of £8000.

Such are the contents of these two works, which, taken together, supply a body of practical economic doctrine, set off by illustration of fact, of such weight and importance that their author must rank as one of the most important of the precursors of Adam Smith.

[*Nat. Dict. Biog.* and auth. cited, especially ref. in *Gent. Mag.* The works have been very insufficiently treated of, though A. Smith refers to "the well-known proposal of" Decker in bk. v. c. 2, *W. of N.*] E. C. K. G.

DECLARATION OF PARIS. The name given to an important international agreement which was signed at Paris in 1856. During the maritime wars of the 17th and 18th centuries England had acted upon the rule that it was lawful to capture the goods of an enemy in the vessel of a neutral, while the goods of a neutral in the vessel of an enemy were not under ordinary circumstances good prize of war. During the same period it had been the traditional policy of France to confiscate neutral goods found in enemies' ships. Thus, when in 1854 England and France entered into an alliance against Russia, there seemed to be no escape for neutral commerce. The prospect caused much perturbation among merchants, and a considerable amount of pressure was brought to bear by neutral governments upon the allied powers. Accordingly in March 1854 Great Britain declared that "Her Majesty will waive for the present the right of seizing enemy's property laden on board a neutral vessel, unless it be contraband of war." France notified at the same time that she would not capture neutral goods found in an enemy's ship. And further, both states announced that they would not make use of privateers (see *INTERNATIONAL LAW*, section on *Laws of War*). At the close of the war the powers assembled in conference at Paris, agreed upon a "Declaration concerning Maritime Law," which embodied and made permanent the concessions granted during the struggle. The Declaration was adopted on 16th April 1856, by Great Britain, France, Austria, Prussia,

Russia, Sardinia, and Turkey; and all maritime states except the United States, Spain, Mexico, and Venezuela have since acceded to it. Its enacting clauses run as follows:

1. Privateering is and remains abolished.
2. The neutral flag covers enemy's goods with the exception of contraband of war.
3. Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag.
4. Blockades in order to be binding must be effective, that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy.

It was further agreed that no signatory power should be at liberty in its dealings with non-signatory powers to enter into arrangements contrary to the foregoing articles.

The Declaration of Paris is one of the greatest triumphs won by commercial interests over the strict rules of maritime warfare. Its importance resides in its first three articles. The fourth did no more than formulate a principle that had been acknowledged for more than a century. Taken literally it requires an impossibility; for no blockade (see *INTERNATIONAL LAW*, section on *Laws of Neutrality*), however strict, can always "prevent access to the coast of the enemy." But the explanations given by statesmen at the time and afterwards made it clear that the words were meant to be understood in a reasonable sense as merely prohibitory of ineffective or "paper" blockades (Dana's note 233 to Wheaton's *International Law*). The first article struck at a most objectionable practice. The current of opinion had long been running strongly against the use of privateers. Nelson had declared that they were only one degree removed from pirates. It may be hoped that their prohibition by the Declaration has permanently banished them from civilised warfare. But the new device of a volunteer navy bears some resemblance to ancient privateering. During the Franco-German War of 1870-71, the Prussian government invited private shipowners to fit out their vessels for attacks upon French men-of-war, and offered temporary commissions to the officers of such ships. The project was never carried into effect. France denounced it as a violation of the Declaration of Paris; and publicists and lawyers have differed widely as to its admissibility. Its legality must depend upon the nature and degree of the control exercised over the volunteer cruisers by the naval authorities of the state to which they belong (Hall, *International Law*, part iii. ch. vii.) But there can be no valid reason for questioning the position of vessels bought by private persons and handed over to the government as an addition to the fleet, or of merchant ships built under an agreement that they may be taken by the government and fitted out as commissioned cruisers in the event of war.

The second article of the Declaration has provoked an enormous amount of controversy. Taken along with the third it amounts to a new departure in the law of maritime capture. Up to 1856 the great naval powers had been divided between the old principle that the liability of goods to capture should be determined by the character of their owner, and the more modern principle, introduced by the Dutch in the days when they were the great carriers of the world's merchandise, that the character of the ship in which the goods were laden should settle their fate. The plenipotentiaries assembled at Paris in 1856 combined the two principles and adopted that application of each which was most lenient to commerce. A great outcry was raised in this country because the government accepted the rule "Free ships, free goods" (see *Hansard*, vol. cxlii.) Many of our leading statesmen, among them the late Earl Derby, the late Earl Russell, and the late Earl of Beaconsfield, expressed opinions hostile to this part of the Declaration; and a popular agitation against it was maintained with great vigour by the late Mr. David Urquhart. On the other hand it was supported by such high authorities as the late Lord Palmerston, the late Earl of Clarendon, and Mr. Gladstone. The truth seems to be that, while Great Britain remains neutral, her commerce, and especially her carrying trade, is favourably affected by the Declaration, but, should she be engaged in a great maritime war, the enormous volume of her exports and imports would offer a most vulnerable mark for the attack of the swift cruisers of the enemy, whose trade would seek safety under neutral flags. This being the case, it seems worthy of consideration whether we should not go a step farther, and agree to the exemption of all private property from maritime capture, unless it is contraband of war or destined for a blockaded port (Lawrence, *Essays on some Disputed Questions in Modern International Law*, vii.)

The Declaration of Paris is practically irrevocable. Commercial interests are much more powerful now than they were in 1856; and the pressure they can bring to bear upon governments is amply sufficient to prevent a withdrawal of the privileges then gained. Strictly speaking the Declaration is not binding on the powers which have declined to sign it. But those of them who have been engaged in war since 1856 have invariably observed its rules. Spain and Mexico have signified their approval of the second, third, and fourth articles. The United States would have signed the Declaration, when invited to do so by France immediately after the Conference of Paris, had the first article been extended so as to forbid the capture of private property at sea unless it were contraband. The opposition of the British government prevented the acceptance of this

amendment; and consequently the great American republic held aloof. But in its civil war of 1861-65 every article was acted upon, including the first. Thus there is an uninterrupted prescription of thirty-six years in favour of the Declaration. Every year that passes without a breach of the rules gives them an authority derived from usage and precedent. Should they remain unbroken much longer, they will become part and parcel of the *corpus* of International Law.

T. J. L.

DECLARATION OF WAR. Formerly it was the practice to make a formal declaration of war either by letter of defiance or by heralds. The modern custom is to issue a manifesto, but any act of hostility will mark the beginning of a state of war. The property of enemy subjects residing in the belligerent country is not liable to seizure, and is protected in many cases by treaties. Existing contracts between subjects of the two states are either suspended or extinguished according to their nature, whilst all fresh trading or other intercourse, and every species of private contract is forbidden.

[W. E. Hall, *International Law*, Oxford, 1890.]

J. E. C. M.

DECLARED AND REAL VALUES. For the purpose of compiling the trade statistics periodically presented to parliament it is required of every importer or exporter of goods that an entry should be made at the custom-house of the port of arrival or departure, containing amongst other particulars those of quantity and value. These values are now termed "declared" in distinction from former values denoted as "computed real" and "official." The earlier form was the latter of these three, and so styled because there were "fixed official rates" founded on the ascertained prices which all known articles bore in the year 1694, with the addition of such new articles as sprang up afterwards at the prices they each bore in the first year of their introduction. This method was discarded from the "trade" accounts in 1854, but continued to be used in the "finance" accounts until 1870, when it was dropped altogether.

In 1854 the import values assumed a new aspect, and became known as "computed real." The average prices which had prevailed during each month were obtained from experts, and applied to the quantities returned by the customs officers as having been brought to account

during the past month. This system gave place in 1871 to one by which the importer was required on the first entry of his goods—which took place before they left the ship—to state the quantity, so far as that could be estimated by weight or measurement, and the value also of each parcel as it arrived. This is termed the “declared value,” and is that shown in the monthly and annual statements issued from the board of trade and custom-house.

For the exports the “official” values were prepared in like manner up to 1870, but for other reasons merchants were at a much earlier period required to declare the value of their respective shipments, and thus the “declared value,” obtained as in the year 1798, has continued up to the present time.

Since 1870 the published values rest solely upon the authority of the persons by whom the several entries are passed; subject to such control as can be exercised by the customs authorities from a close inspection of such imports as, being liable to duty, are weighed or measured, and a cursory examination of such as are free from any charge in the shape of duty. There is also the power which the clerks engaged in the compilation of statistics possess of calling upon the importers to prove the accuracy of their statements by the production of the invoices or other documents in their possession. For the exports of British goods the values are also obtained from the declarations of the shippers, rendered some few days after the vessels in which they are exported have sailed.

For the purpose of comparison between recent and earlier years it is necessary to bear in mind the reversal of previous rules as to the period when the appraisement took place. It used, for the imports, to be after the goods had been landed and been subjected generally to the test of the markets in which they were bought and sold. It is now, before they have been even seen by the owners or consignees. For the exports the valuation used to be prior to their being sent for shipment, and when the quantity that could be received on board was uncertain. Now the declaration is made after they are beyond the reach of inspection, but when the shipper is presumed to have full knowledge of their cost. Thus the values given for imports are now estimates made by those through whose hands they pass, of what they ought to be worth. Those for the exports should be the actual amounts for which they have been obtained. Formerly, that is since the abrogation of “official values,” that for the imports was ascertained after many or most of them had been dealt with; for the exports at a time when the shipper to a great extent knew only the orders he had given, but not the extent to which they had been executed.

Another point which needs to be borne in

mind in the institution of a comparison between imports and exports is, that the moment of valuation is that of arrival in the one case, and departure in the other. Thus the valuations for imports includes all the charges which they have incurred for transit from the place of production, that for the exports excludes everything accruing after they leave the place of shipment.

It is obvious that in both cases the accuracy of the valuation depends upon the extent to which the facts are known to the person by whom the customs entry is made, and the care he bestows upon the estimate or record which he makes; and in neither is there any reason why these should not be as close an approximation to the truth as was secured at any former time, or in the records of other countries. In the absence of any motive for wilful error it is not probable that they are intentionally misstated. The chief danger lies in the fact that the entry may be made upon insufficient information, and there is a tendency to adopt average prices without due regard to the fluctuations which are continually taking place. To procure absolute accuracy would entail such a minute inspection and calculation as would tend much to impede trade transactions and be the occasion of great expense. The chief security consists in the multitude of small entries which go to make up the large totals, and in the many agents, acting independently of each other, by whom the particulars are gathered. Thus individual errors may be supposed to correct each other. Confidence may be reposed in the results obtained, at least for comparison of one period with another, if not for the perfect accuracy of each especial year or month. Although compiled from different sources and varying methods, there should be no breach of continuity in the records of the “computed real” and the “declared” values, but no fair comparison can be made in either case between the present records and those formerly known as “official.”

DECREASING RETURNS. See DIMINISHING RETURNS.

DECREE OF REGISTRATION (Scot.) A Scotch contract usually contains a clause of

consent to registration for preservation and execution; this may be followed by registration in the court books, and an extract of the deed from the court books is equivalent to an extracted judgment of the court, not *in foro*, but enabling summary execution to be obtained, unless an action of suspension be raised to challenge the validity of the deed registered.

A. D.

DEDUCTIVE METHOD. By the deductive method is meant a method of reasoning which begins by investigating the principal forces determining a given class of phenomena, and the general laws in accordance with which these forces operate, and then goes on to trace the consequences which ensue from their action and interaction under specified conditions. It proceeds, therefore, from the more general to the less general. The conclusions reached may indeed possess a high degree of generality considered in their relation to actual concrete facts; but they are particular, relatively to the very wide generalisations which constitute the premisses.

Recourse is had to the deductive method in cases where the method of direct induction is rendered specially fallible by reason of the great complexity of the phenomena under investigation. There are, therefore, *prima facie* grounds for availing ourselves of its aid, if possible, in the social sciences; since, as Mill observes, "of all effects, none depend on so great a complication of causes as social phenomena" (*Logic*, bk. vi. ch. 7, § 1). If we can effect a mental isolation of the principal forces in operation, then the problems to be solved will be simplified, and it may be possible to deal separately with their different aspects. The deductive method must not, however, be identified with pure deduction. In its complete form it is found to consist of three steps. There is, first, the selection of premisses; secondly, the deduction of consequences; and thirdly, the verification of consequences by comparison with what is observed actually to occur. The final step has for its object not merely to test the accuracy of the deductive reasoning in itself, but also to determine the relevancy of the premisses to the actual phenomena upon which the reasoning is intended to throw light.

It is at once clear that if the deductive method is to be of practical utility in any science, it must start from a basis of observation. Thus in political economy its premisses must not be chosen arbitrarily, but must correspond broadly with the general characteristics actually displayed by men in their economic dealings with one another, and with the circumstances in which they are placed. The premisses are, therefore, partly psychological, and partly obtained by an investigation of the physical and social environment in which men's economic

activities are exercised. It is not necessary, however, that the propositions assumed in regard to men's motives or their material and social surroundings should be true universally or without qualification. To attempt any exact correspondence with what has been called the "full empirical actuality" would be to sacrifice generality, and to involve ourselves afresh in those complexities of actual economic life from which it is the special object of the deductive method temporarily to escape. The requirements are, first, that the motives taken into account shall be exceptionally powerful in the economic sphere, and so far uniform in their operation that the kind of conduct deduced from them may correspond with what actually happens in the great majority of cases; and, secondly, that the circumstances under which the motives are supposed to operate shall be of a representative character, either as regards economic life in general, or, at any rate, as regards a special aspect of it over a given range.

It follows that the deductive method involves a process of abstraction. A condition of affairs is assumed in which the operation of "disturbing causes"—such as never fail to be present in actual experience—is eliminated. The extent of the abstraction admits of all degrees, and what are to be regarded as "disturbing causes" will vary in different instances. In the most abstract reasonings of economics, attention is limited to general principles which are entirely, or almost entirely, independent of social institutions and economic habits, as, for example, the law of diminishing utility—namely, that the additional satisfaction which a person derives from an additional increment of any commodity diminishes as the stock of the commodity already in his possession increases. In other cases account may be taken of quite special conditions, such as a monopoly conferred by government, or temporarily established by effective combination. The abstraction frequently takes the form of assuming a stationary condition of affairs, in which the natural progress of economic life, with its multiplicity of changes and infinitely complex interactions, is supposed to be in certain respects arrested, so that some particular agency may have free play to work out its own proper effects unimpeded and under known conditions. In order to express this assumption, deductive political economy is sometimes said to study society statically, whereas actual society is dynamic. The analogy implied in the use of these terms is suggestive; but it must not be pushed too far.

Attempts have sometimes been made definitively to enumerate the premisses of deductive political economy; and there are no doubt a few premisses—such as the law of diminishing utility, already referred to, and the hypothesis of free and effective competition—which occupy a central position in economic theory. Any

exhaustive enumeration is, however, impossible ; since, in order to suit fresh cases, old premisses may at any time be modified and new ones introduced. And it is important not to lose sight of the fact that in having recourse to the deductive method the economist is not rigidly tied down and limited in his choice of assumptions. Even Cairnes, who formulates somewhat narrowly what he regards as the ultimate and fundamental principles of economic reasoning, also recognises subordinate causes influencing human conduct in the pursuit of wealth, which may at a later stage be incorporated amongst the premisses of the science.

When recourse is had to the deductive method, the application of conclusions to actual economic phenomena is of course dependent upon the realisation of the conditions assumed in the premisses. The conclusions, moreover, are almost always subject to the proviso that the causes specially under consideration shall be allowed to work out their effects undisturbed ; and they must accordingly be regarded, not as positive predictions of what will be found to occur in every individual instance, but as statements of tendencies which are not unlikely to require a wide range of experience and the lapse of a considerable interval of time in order that their operation may be clearly manifested. For these reasons deductive political economy is said to be a hypothetical science ; but this must not be considered to imply unreality or want of correspondence with the actual order of economic phenomena. For so long as the premisses are not chosen arbitrarily, but take account of the most uniform and powerful of the forces in operation, the conclusions reached will be of fundamental importance from the practical, no less than from the scientific, point of view. The description "hypothetical" should, therefore, not be applied to political economy with any disparaging implication. In the same sense in which it is applicable to political economy, it is also applicable to such sciences as mechanics and astronomy.

In order to avoid misunderstanding and error in the use of the deductive method, it is necessary that the assumptions which constitute the basis of the argument should be clearly enunciated ; and, further, that the conclusions reached should not be applied to any given state of society without a special investigation of the relevancy of the assumptions to the actual condition of affairs. It has been already pointed out that deductive political economy obtains its ultimate premisses from observation. But it follows from what has just been said that this is not the only function fulfilled by observation in the employment of the deductive method. Observation also determines the limits within which given assumptions are approximately realised, and indicates the kind of allowance that should be made for the effects of "disturb-

ing causes." It, moreover, shows in what directions premisses must be modified in order that they may be adapted to special economic conditions ; and, finally, it serves to illustrate, test, and confirm the inferences that have been deductively obtained. In the process of verification, however, it is always necessary to bear in mind the special character of these inferences. In so far as they relate only to what will happen in the long run, time must be allowed for effects fairly to manifest themselves ; and in any case it must be remembered that a general tendency cannot be either established or refuted by an individual instance.

In the application of the deductive method to economic problems many recent economists have availed themselves of the aid afforded by diagrams and mathematical symbols ; and it may be observed in passing that when this is the case the precautions essential to the right use of the method are less likely to be overlooked. For the employment of mathematical methods necessitates a full analysis and clear statement of the premisses upon which the reasoning is based ; and no one is likely to imagine that the results reached can be applied offhand to the solution of practical problems. (See DIAGRAMS ; GRAPHICAL METHOD ; MATHEMATICAL METHOD.)

The deductive method has been the traditional method of English economics, and the part which it plays in building up economic doctrines has been specially emphasised by Mill in his *Unsettled Questions of Political Economy* and in his *Logic*, and by Cairnes in his *Logical Method of Political Economy*. Upon this point Jevons also expresses his agreement with them. "I think," he says, "that John Stuart Mill is substantially correct in considering our science to be a case of what he calls the physical or concrete deductive method ; he considers that we may start from some obvious psychological law as, for instance, that a greater gain is preferred to a smaller one, and we may then reason downwards, and predict the phenomena which will be produced in society by such a law. The causes in action in any community are, indeed, so complicated that we shall seldom be able to discover the undisturbed effects of any one law, but, so far as we can analyse the statistical phenomena observed, we obtain a verification of our reasoning. This view of the matter is almost identical with that adopted by the late Professor Cairnes" (*Theory of Political Economy*, 1879, p. 18).

In opposition to this view, writers belonging to the more advanced wing of the "historical school,"—for example, Kries and Schmoller in Germany, and Cliffe Leslie and Ingram in England,—either reject altogether the use of the deductive method in economics, or hold that the part which it has to play is unimportant and soon exhausted. Thus amongst the pre-

vailing errors of economists, Professor Ingram includes "that of exaggerating immensely the office of deduction in their investigations." "We can," he allows, "sometimes follow the method which Mill calls the *a priori* deductive, that is, we can, from what we know of the nature of man and the laws of the external world, see beforehand what social phenomena will result from their joint action; but though the economists of the so-called orthodox school recognise no other method, we cannot really proceed far in this way, which is available only in simple cases." Hence it is argued that "the *a priori* deductive method should be changed for the historical" (*Statistical Journal*, 1878, pp. 617-626). Similarly, Cliffe Leslie lays it down that "the abstract and *a priori* method yields no explanation of the laws determining either the nature, the amount, or the distribution of wealth." "On the other hand," he says, "the philosophical method must be historical, and must trace the connection between the economical and the other phases of national history" (*Essays*, 1888, p. 189).

It would occupy too much space to attempt here a discussion of the various arguments by which the assailants of the deductive method attempt to make good their position. It may, however, be observed that the problems which they have mainly in view are apt to be different from those which the deductive economists have mainly in view. They are, for example, not unfrequently thinking of historical or semi-historical problems, which no one would seriously maintain to be capable of a deductive solution,—as, for example, the changes in kind which wealth undergoes in different states of society. For further illustrations of this point reference may be made to Cliffe Leslie's essay *On the Philosophical Method of Political Economy*.

Critics of the deductive method are, moreover, apt to misinterpret the nature of the conclusions to which alone it professes to lead. "The deductive economist's theory of profits and prices," says Cliffe Leslie, "will be found to claim to be true, under all circumstances, in the case of every individual in trade and of every particular article, and to foretell the exact rates at which goods will be sold. His theory of taxation is an application of his theory of profits and prices; and it proceeds on the assumption that prices will actually conform to the cost of production, so nicely in every particular case, that every special tax on any commodity will be recovered by the producer from the consumer, with a profit on the advance" (*Essays*, p. 329). It is certain that no authoritative writer of the deductive school has ever intended to lay down such doctrines as these. The doctrine, for example, that taxes on commodities are, under ordinary conditions, paid by consumers, relates solely to what will happen in the long run, and writers like Mill and

Cairnes have never for a moment imagined that every individual instance will afford a verification of it. Cairnes is very emphatic upon this point. Referring to the doctrine of cost of production, he says—"Is it meant that freely-produced commodities invariably and without exception exchange for one another in proportion to their respective costs of production? If this is what the doctrine means, the assertion is clearly untrue. In what sense, then, is the statement true, that cost of production regulates the value of freely-produced commodities? The answer is, it is true hypothetically—in the absence of disturbing causes; or, to express the same thing in a different form, the doctrine expresses not a matter of fact, but a tendency" (*Logical Method*, pp. 93-4).

Both friends and foes of the use of deduction in economic inquiries have too often implied that the use of one method excludes the use of other methods. But this is far from being the case. In political economy the inductive and deductive methods are of varying relative importance in different departments of inquiry. But in every department the value of either is increased in so far as it can be supplemented by the valid employment of the other. Increased accuracy and abundance of observations and improved opportunities for making valid inductions will never render deduction superfluous, but will, on the other hand, provide it with a broader and better established basis, extending the range of its applicability, leading to its further developments, and increasing the practical utility of its conclusions. The object of the present article is to explain the nature of the deductive method, and for a detailed consideration of other methods reference must be made to HISTORICAL METHOD, INDUCTIVE METHOD, etc. But whatever method may be immediately under consideration, it is most important to point out that the recognition of its utility does not imply the denial of the utility of other methods in their proper place and under proper conditions.

It will constantly be found that economists are less narrow in their actual method of setting about the solution of economic problems than they are in what they write about method. Mill, for example, while sometimes speaking of the inductive method as if it were altogether inefficacious in economics, himself gives a typical example of its use in the discussion of the economic aspects of peasant proprietorship, which occupies so prominent a place in his political economy. Cliffe Leslie, on the other hand, continually has recourse in his own economic reasonings to that deductive method which he elsewhere so vehemently attacks. Some striking instances of this will be found cited in an article on "Economic Method" by Professor Sidgwick in the *Fortnightly Review* for February 1879.

There are indications that in the future the controversy as to the place of the deductive method in political economy will be less prominent than it has been in the past. A compromise is being effected, and economists are coming to substantial agreement. Thus, writers who carry on the tradition of the so-called classical school fully recognise that induction as well as deduction has an important part to play in the building up of economic doctrines. Professor Marshall, for example, writes—"Induction and deduction go hand in hand. The progress of economic reasoning depends on the study of economic facts, and, on the other hand, that study itself requires to be guided and directed by the scientific knowledge which is the outcome and abstract of a previous study of facts. Every new study of facts adds to our knowledge of the action of economic causes, it enables us to form a better judgment as to the effects which any cause is likely to produce, whether acting singly or in combination with others; and it puts us in a better position to detect the hidden causes of results which come under our notice. But the study, to be serviceable, must be careful and thorough, and must be so arranged as to isolate the action first of one cause and then of another, and make a careful examination of each" (*Principles of Economics*, 1891, p. 88). On the other hand, economists whose natural sympathies tend in the direction of the historical school are emphatic in their statements that the deductive method is very far indeed from being superseded. "These, then," says Professor Wagner, "are the two methods: on the one hand, deduction from psychological motives—first and foremost, deduction from the motive of individual advantage, then from other motives; on the other hand, induction from history, from statistics, and from the less exact and less certain, yet indispensable, process of common observation and experience. With both methods we are to approach the various problems of political economy, and to solve them so far as we can. Which method is most to be used depends on the nature of the particular problems; but it depends also on the turn of mind, very likely on the accident of training and education, of the individual investigator" (*Quarterly Journal of Economics*, October 1886, p. 124). Professor Cohn, again, expresses very clearly the view that deduction and induction are to be regarded as supplementary, not as antagonistic, methods. "Our general consideration of the nature of induction," he remarks, "has taught us that this method by itself alone, without deduction, is blind. Any historical or statistical collection of facts can have a meaning, only when it is made from a point of view suitable to the subject which is to be considered. This material, collected from a

definite point of view, can again only be made of use for the discovery of a causal connection by being brought under the light of a previously-prepared hypothesis. The hypothesis is tested by this new material with regard to its reliability, while in its turn it throws new light upon the material. Thus a tentative advance from the most uncertain suppositions to ever more firmly established assumptions, is brought about by progressive observations" (*System der Nationalökonomie*, vol. i. p. 33).

[On the subject of the present article, see also ANALYTICAL METHOD, A PRIORI REASONING, etc. Some discussion of the deductive method and of economic method in general will be found in most systematic works on political economy. Special reference may, however, be made to the following: Bagehot, *Economic Studies*, essays i. and ii.—Block, *Les Progrès de la Science Economique*, Introduction.—Böhm-Bawerk, "Historical versus Deductive Political Economy" (*Annals of the American Academy of Political and Social Science*, October 1890).—Cairnes, *Character and Logical Method of Political Economy*.—Cherbuliez, *Précis de la Science Economique*, Introduction.—Cohn, *System der Nationalökonomie*, Introduction.—Cossa, *Guide to the Study of Political Economy*.—Cunningham, *The Use and Abuse of Money*, ch. i.—Dunbar, "The Reaction in Political Economy" (*Quarterly Journal of Economics*, October 1886).—Ingram, *History of Political Economy*, and *Address as President of Section F of the British Association*, 1878.—Jevons, *Theory of Political Economy*, ch. i.—Keynes, *Scope and Method of Political Economy*.—Cliffe Leslie, *Essays in Political Economy*, especially essays xiv. to xvii.—Lunt, *Present Condition of Economic Science*.—Marshall, *Present Position of Economics*, and *Principles of Economics*, bk. i. ch. vi.—Menger, *Die Methode der Politischen Oekonomie*.—Mill, *Unsettled Questions of Political Economy*, essay v., and *Logic*, bk. vi. ch. ix.—Roscher, *Principles of Political Economy*, Introduction.—Sax, *Das Wesen und die Aufgaben der Nationalökonomie*.—Von Scheel, "Die Politische Oekonomie als Wissenschaft" (in Schönberg's *Handbuch der Politischen Oekonomie*).—Schmoller, *Zur Literaturgeschichte der Staats- und Sozialwissenschaften*.—*Science Economic Discussion* (essays by H. Ely, etc.).—Sidgwick, *Principles of Political Economy*, Introduction, ch. iii., and *Scope and Method of Economic Science*.—Senior, *Political Economy*.—Wagner, "Present State of Political Economy" (*Quarterly Journal of Economics*, October 1886).]

J. N. K.

DEED (Scot.) Any formal written instrument, properly authenticated, stating the terms of any agreement, contract, or obligation, which must be definite, possible, and lawful. It may be unilateral or bilateral, etc.; it may be gratuitous, for no consideration is necessary; and "sealing" is entirely in desuetude, though anciently necessary in matters above £100 Scots (£8:6:8), and only dispensed with by statute 1584 in the case of deeds which were also to be registered. A. D.

DEED OF ARRANGEMENT. A deed of arrangement (under the 50 & 51 Viet. c. 57) is an instrument in writing "made by, for, or in respect of, the affairs of a debtor for the benefit of his creditors generally (otherwise than in pursuance of the law for the time being in force relating to bankruptcy)."

The definition of a deed of arrangement given by the act is very wide. It includes (1) an assignment of property (to one or more trustees for realisation and distribution among creditors); (2) a deed or agreement for a composition; (3) and (where creditors obtain any control over a debtor's property or business, a deed of inspectorship or other instrument entered into for the purpose of carrying on or winding up a business; (4) a letter of license given by creditors authorising a debtor, or by a debtor authorising some one else, to manage or dispose of his business with a view to the payment of his debts. The essential feature of the deed in each case is that it must be for the benefit of the debtor's creditors generally, and of the act that such deeds must be registered and open to public inspection. The object of the act, therefore, is not to sanction deeds of arrangement which would otherwise be illegal, or to interfere with or control the administration under such deeds, but simply to secure due publicity. Prior to 1887 such deeds were simple agreements governed by common law and not by special statute. By the above-mentioned act, which came into operation on the 1st of January 1888, deeds of arrangement became subject to certain statutory conditions, the absence of which renders them absolutely void. The act does not otherwise affect their status, or give any validity to them which they would not otherwise possess. They are not required to be in any particular form, and remain voluntary agreements binding only on such persons as accede to them, and enforceable only in accordance with the provisions which they contain. In this respect they are essentially different from the deeds of arrangement and schemes of arrangement which have been legalised under former bankruptcy acts, and more particularly under the acts of 1849, 1861, and 1869. The latter enjoyed certain special privileges, and were binding upon all the creditors of a debtor when adopted by a certain majority in the manner prescribed by law. They also differ in the same manner from the "schemes of arrangement" under the Bankruptcy Acts of 1883 and 1890, which when assented to by a certain majority become binding on dissenting creditors, subject to approval by the court after an investigation into the debtor's conduct (see *BANKRUPTCY*).

The chief condition imposed upon the validity of deeds of arrangement by the act of 1887 is that they shall be stamped and registered in the bills of sale department of the central office

of the supreme court if in England, or in the bills of sale office of the high court of justice if in Ireland, within seven clear days after their first execution either by the debtor or by any creditor. Registration is effected by filing with the registrar copies of the deed accompanied by affidavits verifying the same and containing an estimate of the amount of property and liabilities included thereunder, the total amount of composition (if any), and the names and addresses of the debtor and his creditors. The leading particulars of the deed are then entered in a register, and this register together with the deed itself is open to inspection by any person, whether he be a creditor or not, on payment of the prescribed fee of 2s. 6d. While all deeds are thus registered in the central office in London, separate registers are kept in the county court of the district in which the debtor's place of business or residence is situated, when such place of business or residence is outside the London bankruptcy district. In these cases the registrar at the central office transmits a copy of the deed to the registrar of the county court, who is required to file and to permit inspection of the same in the like manner and on the like terms as in the case of the central register.

The publicity secured by the act has undoubtedly been of great benefit to the trading community. Prior to its passing, an insolvent trader, if he could induce all his creditors to assent, was often in a position to effect a secret arrangement of his affairs, which left him for some months and even years full liberty to trade and incur fresh obligations while he was still under the burden of old ones which remained undischarged, and which were ultimately paid or compounded for out of the proceeds of assets subsequently acquired on credit. Such arrangements were often disastrous to the new creditors who, when their debtor finally passed into the bankruptcy court, had the mortification of finding that the goods which they had thus parted with to an apparently solvent trader had simply been used for the purpose of paying off old liabilities under a secret arrangement with the old creditors. This practice is now rendered more difficult owing to the necessity which the Deeds of Arrangement Act imposes of registering such deeds, and the facilities which it provides for inspection. The publicity thus given is readily utilised through the medium of trade societies for the benefit of the trading community.

An indirect benefit arises from the information afforded with respect to the condition of trade throughout the country, and the total amount of national losses by insolvency. Prior to 1888 no means existed for estimating the amount of these losses except in regard to cases administered under the Bankruptcy Act, although it was known by traders that

a considerable number of such arrangements annually took place, especially in certain trades such as the grocery, drapery, etc. The following statistics relating to the number and scope of the deeds of arrangement registered under the act during the past three years are taken from the annual report of the inspector-general in bankruptcy for the year ending 1890.

Year.	Number of Cases.	Liabilities.	Assets.	Estimated net loss to Creditors.
		£	£	£
1888	3495	4,803,481	2,416,755	3,192,311
1889	3337	4,773,947	2,718,721	2,961,466
1890	3097	4,360,271	2,352,941	2,791,644

Though these figures are not so large as the corresponding figures under the Bankruptcy Act, they show the considerable extent and important character of the insolvency annually dealt with under this head.

A deed of arrangement is only binding upon the creditors who assent to it, and if it comprises an assignment of a debtor's property to a trustee for the benefit of his creditors generally, it is an act of bankruptcy. Any creditor who does not accede to it can therefore proceed against the debtor by ordinary process, and may, if he establishes a debt of upwards of £50, present a bankruptcy petition against him; and if an order of adjudication is made in pursuance of a petition presented within three months after the date of the deed, the latter may be set aside and become void at the instance of the trustee in the bankruptcy. Any person who has dealt with the estate included in the deed, whether as trustee or otherwise, thereupon becomes personally liable as a trespasser for any loss sustained by his intervention. After this period of three months the deed cannot be challenged under the Bankruptcy Act, although it is still liable to be set aside, under the statute of Elizabeth (13 Eliz. c. 5), if it can be established that it was entered into for the purpose of defrauding creditors. Although therefore no creditor is bound by the deed unless he assents to it, he practically loses his remedy as against the debtor's property, unless he can prove fraud, or unless he takes steps to preserve his rights by a bankruptcy petition within three months from the date of the deed; and although he can after that period make the debtor bankrupt, he is not likely to derive much satisfaction from that course, as the debtor will probably obtain his discharge subject to a period of suspension, while the creditor may lose any dividend which he might have received under the deed of arrangement.

There are several important differences between a liquidation under a deed of arrangement, and one under the Bankruptcy Act. The following are the most important.

1. Under the Bankruptcy Act every debtor must undergo a public examination in court. Under a deed of arrangement no examination takes place, either in court or otherwise, except such as individual creditors choose privately to institute, and the debtor chooses to submit to, prior to the execution of the deed.

2. The release of the debtor from his obligations is subject under the Bankruptcy Act to certain statutory limitations, and to the approval of the court. Under a deed of arrangement the release is generally the main consideration received by the debtor for executing the deed, and is effected either by the instrument itself or in such method as the latter may prescribe. A release, however, is not necessarily an essential feature of the deed; in fact the deed is sometimes entered into merely for the purpose of giving the debtor time to pay his debts in full.

3. The trustee in bankruptcy can set aside various preferences given by the debtor within certain periods prior to the date of the bankruptcy petition which would not be capable of being impeached as fraudulent at common law. Under a deed of arrangement the trustee has no such power.

4. A trustee in bankruptcy is required to give security to the board of trade and to pay moneys received to the credit of the bankruptcy estates account with the Bank of England. Under a deed of arrangement no security is required unless prescribed by the deed, and moneys remain under the control of the trustee unless otherwise directed by the deed.

5. In bankruptcy, a trustee's accounts are subject to regular audit by the board of trade; under a deed of arrangement there is no audit except such as may be provided by the terms of the deed.

6. A trustee in bankruptcy is not only bound to file detailed copies of his accounts in court and with the board of trade, but to send a summary of his receipts and payments to every creditor. Under a deed of arrangement the trustee is under no obligation to send any account to creditors (unless specially provided for by the deed). By § 25 of the Bankruptcy Act of 1890, however, trustees under deeds are now required to send copies of their accounts annually to the board of trade, where they can be inspected by any creditor on payment of a fee of one shilling.

While it is obvious that deeds of arrangement thus lack many of the safeguards provided in the interests of the creditors and of the public in the case of bankruptcy proceedings, it is sometimes easier under them to carry on the business of a debtor who has become involved in temporary difficulties with a view to payment of a composition, than would be practicable under the latter. The result may thus be more beneficial both for the debtor and for his creditors.

(It appears admitted on all hands that the present state of the law with regard to deeds of arrangement is not quite satisfactory. On the one hand they are open to great abuse at the instance of unscrupulous debtors, and on the other they are sometimes rendered impossible by the act of a single creditor, in opposition to the will of the general body of creditors. Various suggestions have consequently been put forward for the amendment of the law, and upon this subject the inspector-general in bankruptcy, in the report already quoted from, says:—"To give any majority of creditors the power to condone the offences which the Bankruptcy Act condemns and punishes would be to degrade commercial morality into a question of barter and to undo much of the benefit which the act has conferred upon honest and prudent trade. What appears to be required, therefore, is to give any dissenting creditor the power to bring a deed of arrangement which affects his interest before the court, and to give the court the power when satisfied that it has been assented to by a certain majority of the creditors, that no offences under the bankruptcy law have been committed, and that no judicial investigation is necessary, to make the deed binding upon all the creditors. With a measure passed on these lines safeguarding on the one hand the interests which the bankruptcy law was designed to protect, and providing on the other against obstructive tactics on the part of an unreasonable minority, it might be fairly hoped that the controversy between the advocates of private arrangements on the one hand and bankruptcy on the other would be closed, and that the two systems might be regarded as forming together a complete code of bankruptcy procedure.") J. S.

DEED POLL. A deed executed by one party only. It is so called because the top of the parchment was "polled" or shaved quite even instead of being "indented."

[Stephen's *Commentaries on the Laws of England*, bk. ii. pt. i. ch. xvi.] J. E. C. M.

DEFALCATION. The term defalcation is commonly used to describe the action of a clerk or servant who wrongfully appropriates to his own use money which he has received on account of his employer. A defalcation in this sense, although morally equivalent to theft, differs from theft in the circumstance that the money has never come into the possession of the person entitled to it, and so has not been taken out of his possession by the offender. Defalcation is, however, a popular rather than a legal term, and is often used with no very definite signification. The legal equivalent of defalcation, as above described, is **EMBEZZLEMENT** (*q. v.*)

F. C. M.

DEFENCE. Name of a pleading in an action by which the defendant replies to the plaintiff's claim as set out on the indorsement on the writ or in the statement of claim. It must, like every other pleading, "contain only a statement in a summary form of the material facts" on which the defendant relies. If it has been settled by counsel it must be signed

by him, and if it contains more than 720 words it must be printed. The defence may consist (1) in a denial of the facts alleged by the plaintiff; (2) in a denial of the legal conclusions drawn by the plaintiff from the facts stated by him; (3) in an admission of the facts stated by the plaintiff coupled with an allegation of other facts which take away the plaintiff's right (*e.g.* a contract is admitted, but it is alleged that it was obtained by fraud, or that it has been performed before action brought, or that the plaintiff has released his right). Allegations of fact in the statement of claim, if not denied specifically, or stated to be not admitted, are taken to be admitted by the defendant (except in the case of an infant or lunatic defendant).

E. S.

DEFENCE, COST OF. The feudal system distributed property and influence in proportion to the obligation to take part in defence. Its armies were essentially militias. The growth of monarchy, with tendency to identify the state with the personal ruler, threw the cost of defence mainly on the revenues of the sovereign, obtained by taxes in lieu of the feudal dues. War came to be regarded as the personal affair of the king, and the efforts made in war were limited by the size of the standing army which he was able to maintain. In this period the art of war became a distinct profession or trade, and the superiority of a standing army over a militia was soon recognised, nowhere more clearly than in the *Wealth of Nations*, where the two were well distinguished. "The practice of military exercises," wrote Adam Smith, "is the sole or principal occupation of the soldiers of a standing army, and the maintenance or pay which the state affords them is the principal and ordinary fund of their subsistence. The practice of military exercises is only the occasional occupation of the soldiers of a militia, and they derive the principal and ordinary fund of their subsistence from some other occupation." Adam Smith, however, clearly perceived that "a militia which has served for several successive campaigns in the field becomes in every respect a standing army." The French revolution identifying the nation with the sovereign, brought the whole nation into arms. The force thus developed, though at first a mere militia, fulfilled Adam Smith's prediction and easily crushed the comparatively small armies maintained by the neighbouring monarchies, and compelled them, too, to recognise that defence is the business not merely of the sovereign but of the nation. This view has been revived by more recent events, and at the present day defence is conducted as far as possible by the employment of the whole of the national resources.

The loss of productive energy and of capital caused by war far exceeds the pecuniary expenditure of the belligerents. It includes also

material destruction on a great scale, the interruption of trade, the cessation of industry, the loss by death, or disablement from wounds or disease, of a great number of workers. The economic losses are usually great in proportion to the duration of the war; they are also as a rule greater on the defeated side. Accordingly, in order to avoid defeat, to shorten the duration of a possible war, and to render attack improbable except for grave motives, preparations are made during peace, which are amongst the principal objects of government expenditure.

The modern continental system combines the advantage of a militia—the soldier's sustenance not being a lifelong burden to the state—with that of a standing army, which consists in superior professional skill. The leaders and instructors (officers) and their assistants (non-commissioned officers) are professional soldiers, at all times paid and maintained by the state. The rank and file are ordinary citizens, compelled to devote to the exclusive practice of military exercises the minimum time within which skill in arms and perfect discipline can be acquired. This period varies in the continental practice between two and three years, with an exception in some cases in favour of well-educated recruits, who serve one year only. The object is to make a capable soldier of every healthy adult male. But no state has yet been willing to incur the expense of training the whole of the men born in any one year—the "annual contingent"—for the full period. Complete or partial exemption is therefore granted, usually to those whose productive services have a special value. The performance of military service is held to rest on a primary obligation and not on contract, so that the trifling money allowance made to the private soldier is not properly described as pay. This organisation produces for defence an army comprising the majority of able-bodied men between the ages of twenty and forty, but it maintains in time of peace only a fraction of this great number at the public cost.

In Great Britain the obligation to military service is in abeyance, and a standing army of a modified 18th-century type is maintained side by side with an old militia and a new militia—the volunteers. The standing army is recruited by voluntary enlistment on the basis of contract for pay. The contract is for twelve years, of which, in exceptional cases three, usually seven or eight, are spent with the colours; during the remainder pay is received in return for the liability to be recalled upon mobilisation. The militia and yeomanry are also voluntarily recruited, officers and men receive pay for each day served, usually twenty-eight days in each year. The volunteers receive no pay. In militia, yeomanry, and volunteers alike the instructors (adjutants) and their assistants (non-commissioned officers), assigned to them from

the regular army, receive continuously the full pay of their respective ranks, with extra allowances.

The total defence expenditure of the British empire exceeds £52,000,000 a year. The *Statistical Abstract* shows for the year ending 31st March 1891 an expenditure for the United Kingdom as follows—

The army	£17,935,023
The navy	16,249,929
Coaling stations, etc.	1,023,000

Total	£35,207,952
-----------------	-------------

The Indian government spent upon defence in the year ending 31st March 1890: (R. 220,250,800) = £15,202,821 (converting the rupee as 1s. 4½d.) (of which £3,957,703 were expended by the home government). Besides this the colonies expend for their own defence nearly £2,000,000 a year.

The naval expenditure, £16,000,000, compares with £8,000,000 spent on the French, and nearly £4,500,000 on the German navy. The British navy is more powerful than either of those named, but experts doubt whether the superiority in strength is proportionate to extra cost, and whether a larger proportion of the whole expenditure should not be devoted to maritime defence. For the apportionment the cabinet alone is responsible, and it is probable that no attempt has ever been made to regulate it according to a definite view of the requirements of war.

The Indian army is maintained under peculiar conditions, and cannot be compared with European armies. It numbers about 73,000 British and 145,000 native troops, but it is believed that in case of land attack upon India an addition of at least 30,000 British troops would be required for the safety of the country. The apportionment of British troops between the home and the Indian armies is a function of the cabinet, and the doubt which was expressed with regard to the navy exists here also.

The cost of the British as distinct from the Indian military forces on the basis of the *Statement explanatory of Estimates for 1891-92* is:

I. Personnel of regular army—		
(a) 141,321 regimental officers and men	£11,876,500	
(b) 60,233 reserve	566,120	
(c) General staff*	263,600	
(d) Educational*	104,600	
		£12,810,820
II. Stores and supplies other than personal equipment and provisions—		
(a) General charge	£2,385,250	
(b) Ordnance store department*	70,150	
(c) R. E. department*	108,500	
(d) Ordnance Committee, etc.*	160,900	
		2,724,800
III. Various "militia" forces—		
(a) 109,546 United Kingdom militia	£1,380,200	
(b) 10,830 yeomanry	101,080	
Carry forward	£1,481,280	£15,535,620

Brought forward	£1,481,280	£15,535,620
(c) 221,048 volunteers	985,610	
(d) 3,384 Channel Islands militia	18,730	
(e) 1,102 Malta, St. Helena, and Bermuda militia	16,260	
	2,501,880	
IV. War Office		319,990
[The total cost of the War Office is not borne upon army estimates. It amounts to £361,500.]		
* Non-effective charges distributed over above items marked *		57,060
Total		£18,414,550
From this are deducted contributions from—		
India	£530,000	
Colonies	252,250	
Egypt	87,000	
	869,250	
Net total from British Taxation	£17,545,300	

Deducting from the gross total the cost of the various militias, we get the cost of the regular army with its reserve, £15,912,670.

For this sum the British administration maintains a peace force with the colours 137,000 of all ranks and a reserve 60,000, a total strength for war of 197,000 men.

The German army, with a peace force of 490,000 officers and men, has a war strength of 2,000,000 fully-trained men, besides 100,000 with one year's training and 150,000 with ten weeks' training. The total estimated expenditure for 1890-91 was £33,762,134. The French army, with a peace force of 550,000, has for war rather more than 2,000,000 fully-trained men, about 700,000 men with one year's training, and about 700,000 with a training of some ten weeks. The total expenditure on this army according to the *Budget demandé pour 1891* was £33,338,834.

Thus France and Germany obtain, at about double the English peace outlay, more than ten times the English number of trained men at the outbreak of war. The yield of numbers for war depends partly on the strength of the annual contingents trained in peace, partly on the relative duration of active service and of reserve obligation. In Germany, which offers the type of the continental military system, an active service of nominally three, but practically two years, is followed by a liability lasting sixteen years. Thus the German peace force includes three contingents, while the war force comprises eighteen. In the British army the peace force includes, roughly speaking, seven contingents and the war force twelve. But in seven years' actual service the waste of men is large, and the contingents passed into the reserve become reduced in numbers. The British reserve is paid, but has hitherto received no further training. The German reserves receive a brief occasional training, but involve no other expense.

The greater cost of the English peace force arises partly from the endeavour to attract recruits by the offer of pay—a shilling a day with

twopence a day deferred pay; of the shilling, about eightpence being absorbed by necessary expenses of food and clothing—from a more expensive scale of clothing, feeding, and living, and from the fact that in England wages and salaries are on an average much higher than in Germany. Moreover, the British army keeps garrisons in North America and the West Indies, in the Mediterranean, South Africa, Ceylon, the Straits Settlements, and China. These garrisons absorb about 36,000 men, costing nearly two and a quarter millions, while the receipts from the colonies and Egypt amount to only £340,000. Then a whole army corps is kept in Ireland. The frequent movement of troops thus necessitated causes some expense. The cost of management is excessive. There is a perhaps needless, and certainly complicated, system of audit within the war office. Lastly, the expenditure of the departments is nowhere co-ordinated in accordance with a prescribed standard of readiness for war, or of economy. In Germany the doctrine of duty applied to defence enables the scale of living and clothing to be kept down to what is necessary. The private soldier practically receives no pay, his 4½d. a day being hardly enough to provide food necessary in addition to what is supplied by the government. The pension list is relieved by the practice of employing discharged non-commissioned officers in the civil services, notably in the state railways and the post and telegraph offices.

A peace army costing thirty-two millions, and withdrawing from productive labour four or five hundred thousand men, involves, of course, a heavier burden of taxation and a larger loss of productive energy than one which costs half as much and keeps unproductive only a hundred and forty thousand men. But it may be doubted whether the continental system involves any other economic loss different in kind from that which accompanies the British standing army. The soldier with the colours is, while his service lasts, withdrawn from production. The economical loss under this head depends on the number so withdrawn. If the number is small a selection can be made of those who would be inefficient producers. If it becomes considerable more efficient producers must in any case be taken, whether the enlistment is voluntary or the service a duty. The soldier is not merely a non-producer, but a consumer. It is evident from the figures that he consumes in proportion to numbers much more largely in England than in France or Germany. In Germany, at least, he is to some extent utilised as a producer, clothes and shoes being in many cases made by the soldiers, and thus the demand on the taxpayer reduced. That the soldiers so employed as workmen are not paid for their work is perhaps an injustice, but hardly a loss to the nation. Further, the

continental system, taking recruits at the age of twenty and dismissing them at twenty-two or twenty-three, withdraws them from industry before their services have become very valuable, and returns them to it with their industrial capacity unimpaired. It is widely believed that the British soldier, on passing into the reserve after seven years of military life, has lost much of his industrial value. But the evidence given to Lord Wantage's Committee showed that in 1891 the majority of the reservists were in regular employment.

The German one-year "volunteers" serve at their own expense, thereby escaping the rest of the nominally three but practically two years' term. They are required to give proof of superior education. They correspond in attainments and amount of personal expenditure with British volunteer officers.

The cheapest kind of military force, but the least effective, is that described by Adam Smith as militia, of which the members are not supported by the state nor withdrawn from industrial life, but receive their military training in occasional brief periods with or without pay. To this category belong the Swiss army and the British militia, yeomanry, and volunteers. In Switzerland military service from twenty to forty-four is the duty of every citizen, and those who do not fulfil it are subject to a poll-tax of 6 francs a year and an "exemption tax" of $1\frac{1}{2}$ per cent on capital and income. Those who serve belong for twelve years to the *Élite*, and for twelve to the *Landwehr*. The *Élite* have a forty-five days' training as recruits and four subsequent trainings of sixteen days each. The *Landwehr* have two trainings of five days each. Pay is given for each day's training. The net cost for 1889 was frs. 17,685,804 (= £707,432), since increased on account of the recent outlay for fortifications. The numbers in 1890 were: *Élite*, 126,444; *Landwehr*, 80,796; total, 207,240. The Swiss militia is organised as a complete army, with infantry, cavalry, field and garrison artillery, commissariat, transport, and medical service. The English militia and volunteers are merely a number of regiments of infantry and of garrison artillery, with neither the organisation nor the supplementary services required for an army. The volunteers have also seventy-nine batteries "of position," which, though really well trained, are not fit for field service. The yeomanry cavalry are not sufficiently trained to be of any military value whatever. While, therefore, the Swiss militia is perhaps an adequate defence for a small mountainous country, much improvement in organisation will be needed before reliance can be placed upon the English volunteers and militia for a sudden emergency. The political economy of defence has perhaps never been fully treated. Useful figures, showing the cost of wars from 1688 to the pre-

sent day, are given in an appendix to *The National Budget* by Mr. A. J. Wilson. The question of conscription and the cost of armies is examined, not very satisfactorily, in a paper by Capt. Ardagh in vol. xx. of the *Journal of the Royal United Service Institution*. More accurate information was given by Gen. H. Brackenbury in the *Second Report from the Select Committee on Army and Navy Estimates*, 1887, but this evidence suffers from the unsystematic way in which the questions were asked. The best account of defence expenditure is contained in a paper read by Sir Charles Dilke to the Royal Statistical Society, 16th December 1890, which has been freely used in this article. The contribution from Indian taxes towards the cost of the British army at home has increased from £700,000 in 1890-91 to £850,000 in the estimates for 1892-93. This item is discussed in *Imperial Defence* by Sir Charles W. Dilke and Spenser Wilkinson, pp. 183-185. A good analysis of the German military budget is contained in the *Revue Militaire de l'Étranger* for January and February 1890. The figures given in official estimates are almost always arranged with a view to conceal the essential information. For the British empire no balance-sheet has ever been published showing clearly either the whole military and naval expenditure, the purposes which it is calculated to attain, or the revenues from which it is derived.

[See Giffen, *Cost of Franco-German War in Essays on Finance*, and Bastable, *Public Finance*, 1892, ch. ii. on "The Cost of Defence."] s. w.

DEFERRED PAYMENTS. The phrase "standard for deferred payments" is applied by Prof. Walker to the function of money which Jevons describes in the following passage and its context: "Every person making a contract by which he will receive something at a future day, will prefer to secure the receipt of a commodity likely to be as valuable then as now. This commodity will usually be the current money, and it will thus come to perform the function of a *Standard of Value*" (Walker, *Money*, p. 10; Jevons, *Money*, p. 14).

The term "deferred payments," when used in connection with "tabular standard" (or similar phrases), as by Prof. Walker in his *Money*, p. 159, refers specially to those "long-enduring debts and transactions," those "contracts extending over long series of years," which Jevons and others have proposed to regulate by a standard more permanent than money.

[Jevons's *Money*, p. 325; *Currency and Finance*, pp. 122, 297 (see INDEX NUMBER, TABULAR STANDARD).] F. Y. E.

DEFERRED STOCK. On the stock exchange the securities which have been issued by a government or corporation take different ranks. Thus an English railway company is

able first for the interest on its debenture stock; next, for that on preferred stock, if earned; next, for dividend on the ordinary stock, and finally for dividend on deferred stock should any exist. In America the shares of railways usually represent the "deferred" interest of the original constructors in the profits of the railway; mortgage bonds, and perhaps preference interest, having first to be satisfied out of net profits. Most of the American railroad shares known to the London stock exchange represent nothing more solid than hope deferred or a very long time, but these are not known so what they really are, viz. deferred shares. In late years it has been largely the practice of trust companies to issue preferred and deferred stocks, the former being entitled to a given rate of interest preferentially, while the deferred portion of the capital takes the residuary profit in the shape of a dividend. Deferred stock is usually created to meet the demand of speculators who favour a security which is exposed to violent fluctuations. If an English railway, which has issued deferred stock, be responsible for a serious accident, the holders of deferred stock, who previously had a chance of a dividend, may see the prospect of dividend entirely plucked out for a time. The deferred stock of an English railway company is peculiar. It is the result of an option given to the holders of ordinary stock. For example, holders of London, Brighton, and South-Coast Railway ordinary stock have been allowed to divide each £200 of ordinary capital into £100 of B or preferred stock bearing 6 per cent, if such a dividend be earned, and £100 of A or deferred stock, which receives the surplus. Thus, when a dividend of 7 per cent is announced on Brighton Railway ordinary stock, a holder of £200 stock gets £14; but, if he has divided his stock, he gets £6 on £100 preferred capital and the surplus £8 on £100 deferred capital. There are investors who buy only the deferred stock, regarding themselves as residuary legatees of a fine estate; others avoid such a stock as being too speculative. The division was made to meet different tastes and suit different temperaments and deferred railway stock is simply the result of that division.

A. E.

DEFICIENCY ADVANCES. Under sect. 12 of the Exchequer and Audit Departments' Act, 1866, the treasury are required at the close of each quarter to prepare an account of the income and charge of the consolidated fund, including under the latter head the charge for the public debt due on the fifth, and in the case of the October quarter, on the tenth day of the succeeding quarter. This account is forwarded to and examined by the comptroller and auditor-general, and that officer is authorised, if any deficiency is shown, to certify the amount thereof to the Banks of England or Ireland, and those Banks are thereupon author-

ised to make advances during the succeeding quarter, on the application of the treasury, to an amount not exceeding in the aggregate the amount of the deficiency. The deficiency advances thus made are secured on a simple I.O.U. of the government, and are paid off gradually, as the state of the exchequer balance admits. They bear interest at a rate agreed upon, for each occasion, between the chancellor of the exchequer and the Bank, this interest being paid after the whole advance has been cleared up. The formal correspondence between the chancellor of the exchequer and the Bank respecting these advances is annually presented to parliament. [See e.g. Parl. Paper, No. 52 of 1892.] The quarterly account is usually printed in the *Times* newspaper, and is of a very technical character. The net deficiency shown in the account for the quarter ending 30th June 1892, was £3,248,599. (See also **DEFICIENCY BILLS.**)

T. H. E.

DEFICIENCY BILLS. A term used to denote the exchequer bills formerly issued for the special purpose of being given to the Banks of England and Ireland as security for the advances required to make good the deficiency on the consolidated fund. The issue of these bills was regulated by the Act 57 Geo. III. c. 48, sects. 6-14, which provided that if upon making up the accounts of the income and charge of the consolidated fund for each quarter, it appeared to the treasury that the produce of that fund was not sufficient to defray the charges thereon, it should be lawful for the treasury to direct that exchequer bills should be made out for such sum or sums as should be sufficient to make up the deficiency. The interest to be borne by the bills was not to exceed the rate of "three pence halfpenny per centum per diem"; the Banks of England and Ireland were empowered to advance moneys on the credit of them; and they were to be placed as so much cash in the offices of the tellers of the exchequer. The Act above referred to was repealed by the Exchequer and Audit Departments Act, 1866, which substituted for them a similar but somewhat simpler institution known as **DEFICIENCY ADVANCES** (*q.v.*)

T. H. E.

DEFICIT. In public finance, an excess of expenditure over income, either (a) actual or (b) estimated. Unless, of course, the occurrence of a deficit is deliberately contemplated—and the practice of making provision annually for the requirements of the coming year is opposed to such a course—an actual deficit is ordinarily due either to the failure of taxation to realise as much as was anticipated, or to the necessity for meeting extraordinary and unexpected expenditure, as in the case of war and warlike preparations. Where a deficit is only estimated, it can be, and frequently is, made good by an increase of taxation, unless an addition to the

public debt is deliberately sanctioned, or some fund or available asset is appropriated to meet the deficiency. Both descriptions of deficit are usually the subject of reference in the budget speech of the chancellor of the exchequer, and it is essential to discriminate between the two in any consideration of the finance of an administration.

The following table shows the estimated and actual deficits shown in regard to the finance of the United Kingdom since the year 1842-43. The column headed "unrevised estimate," shows the estimated deficit, prior to any revision of taxation; the next column headed "revised estimate," the deficit, if any, after such revision.

Year.	Chancellor of the Exchequer.	Deficits.		
		Unrevised Estimate.	Revised Estimate.	Actual.
		£	£	£
1842-43	Goulburn	2,469,000	..	2,421,776
1847-48	Wood	3,092,285
1848-49	"	..	2,031,256	269,378
1852-53	Disraeli	2,125,000
1854-55	Gladstone	2,840,000	3,543,000	6,196,808
1855-56	Lewis	16,560,519	18,895,000	22,723,854
1856-57	"	13,961,000	9,373,000	3,254,605
1857-58	"	247,346
1858-59	Disraeli	3,990,000
1859-60	Gladstone	4,867,000
1860-61	"	9,400,000	1,286,000	2,558,885

1879-80	"	2,945,000	..	2,840,698
1882-83	Gladstone	..	200,000	..
1884-85	Childers	..	1,043,000	1,049,772
1885-86	"	14,932,000	2,832,000	2,642,543
1886-87	Harcourt	543,599

[For a detailed review of the finances of the years in which deficits have been estimated or have occurred, see Northcote's *Twenty Years of Financial Policy*, London, 1862; and Buxton's *Finance and Politics*, London, 1888. See also BUDGET.]

T. H. E.

DEFINITIONS. Whately, in his ninth "Introductory Lecture on Political Economy" (published 1832), observes that in a science in which terms already in common use are employed there is greater danger of neglecting questions of definition than in a case where the technical terms are quite new to the student, and, therefore, obviously demand explanation. The need of any general maxims regarding the definition of economic terms does not seem to have been felt till after the appearance of Ricardo's chief work. Adam Smith, who gave few cut-and-dried definitions, had generally used words in the sense which they bore in ordinary language and had endeavoured to explain and illustrate this sense. But Ricardo,

sometimes disregarded common usage altogether, and attributed entirely new significations to economic terms. For instance, he defined the rise and fall of wages, rent, and profit in such a way that wages and rent might "fall" when they had "increased one-half" and "three-fourths" (*Principles*, ch. i. § 7, in Works, p. 31). Such latitude was sure to offend. Malthus's conservative mind revolted against it, and in his *Principles* (1820) he protested that economists were not at liberty to define their terms just as they pleased (p. 26). In 1827 he laid down in his *Definitions in Political Economy* some "rules which ought to guide political economists in the definition and use of their terms." The object to be kept in view, he says, is such a definition and application of economic terms "as will enable us most clearly and conveniently to explain the nature and causes of the wealth of nations" (p. 4). This object will be best attained, he thinks, by using terms, whenever it is possible, in the sense in which they are used in the common conversation of educated persons. When it is necessary to make distinctions which are not made in common conversation, the previous practice of economists, and especially of Adam Smith, should be followed, and further changes only admitted when it can be clearly proved that they would decidedly contribute to the advancement of the science (p. 5). Cairnes, in his lecture "Of the place and purpose of Definition in Political Economy" (Lect. VI. in *Logical Method of Pol. Econ.*, 1857), repeats these rules in substance, but, less conservative than Malthus, insists strongly on the necessity of gradually improving the definitions of economic terms as knowledge of the science increases. In a frequently-quoted part of his lecture he develops a proposition laid down by Malthus (in *Principles*, p. 25) to the effect that economic distinctions may properly resemble the distinction between animal and vegetable in being founded on differences of degree. Sidgwick (*Pol. Econ.*, I. ii. § 1) observes that the two questions what is commonly meant by a term and what meaning can most conveniently be given to it must not be confused. He also urges powerfully that the process of searching for a definition is extremely useful altogether apart from the discovery of a satisfactory one.

It must not be forgotten that the practical usefulness of political economy depends chiefly on its wide diffusion, so that the formation of an economic language understood only by specialists is highly undesirable. For the promotion of the material welfare of a people few things can be more useful than patient inquiry into the actual meaning of terms like wealth, income, capital, rent, wages, profits, when used in common language by ordinary people. As soon as ambiguities and inconsist-

encies are commonly perceived, language may be trusted to find some way of ridding itself of them without the assistance of formal definitions.

Great confusion has often resulted from the practice of defining mere words and neglecting the phrases or terms of which the words constantly form a part. For instance, many definitions of "wealth" are far from deciding what is meant by "the wealth of a nation" or "the wealth of an individual." E. C.

DEFOE, DANIEL (1660 or 1661-1731), was the son of James Foe, a retired London tradesman and a nonconformist. At the age of fourteen, Daniel was sent to a school at Newington Green, kept by Mr. Morton, an ejected nonconforming minister. Having completed his education, he went into business. Keenly interested in politics, he took up arms during Monmouth's rebellion in 1685, and joined the Prince of Orange's army in 1688.

In consequence, perhaps, of not giving all his mind to business, he failed in 1692 for £17,000. He compounded with his creditors, but subsequently paid them in full. He had already made one or two essays in literature, and about this time composed his essay upon *Projects*, which displays his practical and inventive turn, recommending the establishment of a national bank, savings banks, friendly societies, an amendment of the law of bankruptcy, and improvements in education. His first hit as a political writer was with a doggerel poem, the *True-born Englishman*, published in 1701, which ridiculed the exclusive national pride of Englishmen, and their grudge against the Dutch. It gained for Defoe the favourable notice of William III. Thenceforward he found constant employment as a journalist. In 1702 his ironical pamphlet, *The Shortest Way with the Dissenters*, led to his conviction for libel. Released from prison in 1704, he wrote first for Harley, then for Godolphin, and for Harley again on his return to power. But Defoe was again committed to prison in 1713, on account of certain writings directed against the Jacobites. Soon afterwards he received a pardon, and although convicted in 1715 for a libel on Lord Annesley, he was not sentenced, but was again taken into the service of the government. Somewhat later he produced a series of works of special economic interest, *The Tour through Great Britain*, published 1724-26; *The Complete English Tradesman*, published 1725-27; and the *Plan of English Commerce*, published 1728. He had combined literature with business, and was fairly prosperous in his later years. But he seems to have met with misfortune, now not clearly ascertainable, before his death in 1731. He married at least once, and left two sons and four daughters.

Defoe was one of the most versatile and voluminous of English writers. Exclusive of

his contributions to journals, 254 distinct works are ascribed to him by his biographer Mr. Lee, who rejects as spurious many others which have been ascribed to Defoe. Some of those enumerated, however, appear to be reprints. Journalist, pamphleteer, verse-maker, novelist, and moralist, he ranged freely over the varied interests of practical life. By virtue of his lively interest in concrete things, his varied information, and his vigorous style, he is an important authority for economic history, especially for the condition of the industrial and commercial classes in the first part of the 18th century. In no sense a scientific writer, he has made no contribution to economic theory. But his inventive genius occasionally suggested improvements in the economic mechanism of the nation, and his lively imagination sometimes placed economic truths in a singularly vivid light. As an instance, we may take from *Robinson Crusoe*—incomparably the ablest of his novels—Robinson Crusoe's reflections on the inutility of the gold and silver which he found on the wreck of the Spanish ship and in the wreck of his own ship, and which to him was not wealth at all. "I smiled to myself at the sight of this money: 'O drug!' said I aloud, 'what art thou good for? Thou art not worth to me, no, not the taking off the ground: one of those knives is worth all this heap: I have no manner of use for thee.'"

[The life of Defoe has been written by Wilson (publ. 1830), by Chadwick (publ. 1859), by Lee (publ. 1869).—See also Professor Minto's *Life in English Men of Letters*, and Mr. Leslie Stephen's *Life in the Dictionary of National Biography*.]

For a complete list of Defoe's writings so far as ascertained, see Lee's *Life*. Those which possess an economic interest are as follows: *An Essay upon Projects*, 1697 (not in fact published until March 1698), 2nd edition 1702.—*The Villainy of Stock-jobbers Detected and the Causes of the late Run upon the Bank and Bankers Discovered and Considered*, 1701.—*Giving Alms no Charity, and Employing the Poor a Grievance to the Nation* (a criticism of Sir Humphrey Mackworth's Bill for establishing in every parish a manufactory for the employment of the poor), 1704.—*Remarks on the Bill to prevent Frauds committed by Bankrupts*, 1706.—*An Essay upon Public Credit*, and *An Essay upon Loans*, 1710.—*An Essay on the South Sea Trade*, 1711.—*An Essay on the Treaty of Commerce with France*, 1713.—*Mercator, or Commerce Revived* (a paper published thrice a week, advocating the commercial policy of Harley and St. John), of which the first number appeared 26th May 1713 and the last 20th July 1714.—*Considerations upon the Eighth and Ninth Articles of the Treaty of Commerce and Navigation*;—*Some Thoughts upon the Subject of Commerce with France*; and *A General History of Trade*, all published in 1713.—*Anatomy of Exchange Alley*, 1719.—*The Chimæra, or the French*

Way of Paying National Debts Laid Open, 1720. — *A Tour thro' the whole Island of Great Britain*, vol. i. 1724, vol. ii. 1725, vol. iii. 1726, republished 1727 (subsequent editions being all more or less altered). — *The Complete English Tradesman*, vol. i. 1725, vol. ii. 1727. — *Parochial Tyranny*, 1727. — *A Plan of the English Commerce*, 1728, second edition 1730. — *An Humble Proposal to the People of England for the Encrease of their Trade and Encouragement of their Manufactures*, 1729. F. C. M.

DEGREE OF UTILITY. This phrase was first made current by Jevons in his *Theory of Political Economy*, 1871. Its precise significance will be best elucidated by an analogy. "Degree of utility" stands in the same relation to "total utility" as "velocity" to "space traversed." Suppose we have a body projected vertically upwards from rest, at a given speed. We may inquire *first* at what height the body will be found at any moment after its projection, and *second* at what rate it will be moving at any point of its course, and clearly the rate of its movement is the rate at which its height is increasing (whether positively as it rises, or negatively as it falls). This rate may be measured in feet per second, or in miles per hour, or in any other suitable unit, but in any case it varies from point to point and does not continue the same during any period, however short.

We must now extend the idea of measurement to such economic conceptions as "satisfaction" and "utility." Measurement consists essentially in determining the ratio of the magnitude investigated to some other magnitude adopted as a standard; and a "satisfaction" would accordingly be measured if we could determine its ratio to some standard satisfaction, or, which amounts to the same thing, some standard dissatisfaction. Thus if I wish to measure the satisfaction derived by a hungry man from the consumption of a certain quantity of bread, I may inquire how much labour he would perform, under stated conditions, rather than go without it; or what he would pay for it sooner than go without if an unscrupulous monopolist exacted from him the extreme famine price. Thus if we take any standard we choose we can, ideally at least, conceive of any concrete "utility" or "satisfaction" being measured in it. But we must remember that such measurements are based on the relative magnitudes of different satisfactions, etc., to one and the same person, and do not profess to give us means of comparing a satisfaction experienced by one mind with a satisfaction experienced by another; for no one can say that the standard unit of satisfaction selected means the same thing to two different men. Nor shall we find that any such absolute measurement is needed for the purpose in hand.

Having premised so much, we may now work out the economic analogue of the pro-

jected body. Suppose we take such a commodity as bread supplied to a hungry man. *Firstly*, we may inquire what amount of satisfaction the man has derived from the consumption of any given quantity of bread; in which case we shall be investigating the "total utility" or "value in use" of that quantity of bread, to that man, under those conditions. *Secondly*, we may inquire at what rate (per ounce, per pound, etc.) the consumption of the bread is conferring satisfaction upon the man at any point in the course of his meal; and in that case we shall be investigating the "degree of utility" of the bread. This "degree of utility" will of course vary from point to point. When the man was at his hungriest he would be deriving relatively great satisfaction per ounce of bread consumed, and towards the end of his meal, when nearly satisfied, his satisfaction per ounce would be relatively small; and, theoretically, it will not remain constant during any period, however short. Now this "degree of utility" is obviously the rate at which the "total utility" is increasing; just as the velocity of a rising or falling body is the rate at which "space traversed" or "height" is increasing.

The precise relation of velocity to space traversed, and of degree of utility to total utility, is expressed mathematically by saying that the former are the "differential coefficients," "first-derived functions," or "fluxions" of the latter; and, graphically, if the latter are expressed by areas the former will be expressed by lines. In the figure, if we imagine the line

cd moving from O in the direction of the arrow head, at a uniform rate, to represent the lapse of time, and if we imagine the area $aOcd$ to represent the space traversed by the projected body in the time Oc , then the intercept cd will be the differential coefficient of $aOcd$, and will represent the velocity of the body, or the rate at which it is rising, at the point of time represented by c . Perhaps this will be sufficiently obvious to the non-mathematical reader if he reflects that velocity represents the rate at which height is increasing, as time lapses, and observes that the length of the intercept cd likewise determines the rate at which the area

$aOcd$ increases as the vertical line moves in the direction of the arrow-head.

Now let the movement of the vertical from O represent the consumption of the bread, so that Oc represents the amount consumed up to any given point of the meal; and let $aOcd$ represent the total satisfaction derived from the consumption up to the point reached, then cd will still be the differential coefficient of $aOcd$, and will represent the rate per unit (ounce, etc.) at which the consumption of the bread is now increasing the total satisfaction reaped by the consumer. That is to say cd represents the degree of utility of bread at the point c , the amount represented by Oc having already been consumed.

It should be observed, however, that when we are dealing with economic quantities, the line ad will probably never be a straight line, but always a curve of more or less complexity; and it will seldom or never be possible to determine its actual form with any precision.

The main interest naturally attaches to the degree of utility of that increment of a commodity which the consumer expects to obtain next, or which he may have to relinquish, that is to say the last increment he has secured or the next he hopes to secure. This is called by Jevons the "final degree of utility" (*q.v.*) Under this heading, FINAL DEGREE OF UTILITY, references to the most important books on the subject will be found. All that need be said here is that the analogy of the moving body insisted on above was developed by Professor Léon Walras of Lausanne, and was first suggested by his father A. A. Walras (see FINAL DEGREE OF UTILITY).

P. H. W.

DE LA COURT. See COURT, PIETER DE LA.

DE LAJONCHÈRE (beginning of the 18th century), a French engineer, was one of the numerous schemers who flourished in the times of Law and the South Sea Company. After having written on the fortification of large towns, and on a *Projet d'un Canal de Bourgogne pour la Communication des deux Mers* (1718) he published his *Système d'un nouveau Gouvernement en France* (Amsterdam 1720). Although De Lajonchère expressly denies having followed Vauban's *Déme Royale*, he starts from the same initial principle, only, as was aptly remarked by Dupin (*Économiques*, iii. 216), he urges it in an extravagant manner. He advocates one sole tax, to be paid without privilege or exemption, by all Frenchmen without distinction, to consist of a percentage collected in money or in kind, on the general produce of the ground, mines, quarries, etc., by a "Compagnie du Commerce," to be formed for the purpose. This company was to have the monopoly of foreign trade, its shares being given as reimbursement of the price of all the offices sold by the king's predecessors and of the capital of the rents due to towns or individuals. The

corn collected by the company was to be sold at a permanently fixed price. The company was also to be entrusted with the recoinage and "diminutions" of the metallic currency, which were to bring it down to what De Lajonchère calls "its intrinsic value."

[See art. (*Journal des Économistes*, 9th Feb. 1863) "Un Émule de Law," by de Lavergne.]

E. Ca.

DE LA MARE, NICOLAS (1639-1723), originally a *procureur-général*, later on a *conseiller commissaire* of the Châtelet in Paris, was not an original thinker, but a most industrious, clear, and conscientious compiler, and his *Traité de la Police* (Paris, 1722-1735, 4 vols. in folio, 2nd ed.) is a copious mine of information. The second volume (book v.) deals with the regulation of food in general, and of corn in particular. In it will be found, "according to their order, all the laws, ordinances, and decrees, which have provided for this subject with as much force as wisdom." This sentence, taken from the preface, is completely characteristic of the scope of De la Mare's work, and of his commentaries. They were begun in 1677 at the request of the president of the Parliament of Paris, M. de Lamoignon, and an abridgement was made in 1758 and 1769 by La Poix de Fréminville in his *Traité de la Police*. This, however, does not enable the reader to dispense with consulting the original. E. Ca.

DEL CREDERE. A factor, broker, or mercantile agent who undertakes to become surety for the solvency of the customer with whom he transacts a sale, receives for this an extra commission called a *del credere* commission.

A. D.

DELEGATION. Description used by continental bankers of a document drawn in the form of a letter of credit but intended to pass from hand to hand like a bill of exchange. These documents are used on the continent for the purpose of evading the stamp laws; English bankers are, however, in the habit of treating them as ordinary bills of exchange. They are generally sent out for acceptance provided with the bill stamp and presented after the expiration of the days of grace. It is by no means certain what effect would be given to the acceptance of such a document in a court of law, but as they are generally addressed to banks and commercial houses of good standing, and are drawn at very short dates, the question is not likely to arise.

E. S.

DELFIĆO, MELCHIORRE (born in the latter half of the past century at Leognano, died about 1835 at Teramo), is generally remembered only for his *Memoria sulla libertà del Commercio*, which has been included by Custodi in his *Scrittori Classici*; but this does not quite do justice to Delfico, although undoubtedly his pamphlet on free trade is his principal contribution to economic science. Delfico was not only

an *absolute* free trader, but also what would now be called an "absolute individualist," believing in the beneficial effects of unlimited liberty of the individual in any sort of economical activity. Landed proprietors, merchants, and *entrepreneurs* in the interest of the community ought to be left to themselves and allowed to do with their property whatever they pleased.

Delfico, in his *Riflessioni sulla vendita dei feudi* and in his *Lettera al Duca di Cantalupo*, defends the abolition of feudal rights over landed properties and their sale; he sees in them an impediment to the proper cultivation of the land, which gives greater returns when the proprietor is able to do with it what he likes. For the same reason he insists on the abolition of obnoxious rights like those consisting in the right of the community to graze its cattle on the lands of the proprietors, which renders all sorts of plantations impossible (*Memoria per l'abolizione della servitù del pascolo and Discorso sul Tavoliere di Puglia*). All Delfico's other writings are occupied principally with different aspects of the free-trade question. He argues that a dearth of food would never happen if there were free trade, and that the means to which governments usually have recourse to avoid it, or to abate it, aggravate famine by making production unsafe and deterring merchants from risking their capital.

Although these doctrines were not new, coming ten and twenty years after Smith's criticism of the protective system, Delfico merits remembrance as a thoroughgoing follower of liberal doctrines in a time when as yet they were very rare.

The writings in which Delfico defends the principle of liberty and absolute property are in order of date the following:—*Memoria sul Tribunale della Grascia e sulle leggi economiche nelle provincie confinanti del Regno*, Napoli, 1785.—*Memoria sulla necessità di rendere uniformi i pesi e le misure del Regno*, Napoli, 1787.—*Memoria per l'abolizione o moderazione della servitù del pascolo invernale, detto dei Regi stucchi, nelle provincie marittime di Abruzzo*, Napoli, 1787.—*Discorso sul Tavoliere di Puglia e su la necessità di abolire il sistema doganale presente e non darsi luogo ad alcuna temporanea riforma*, Napoli, 1788.—*Riflessioni su la vendita dei Feudi*, Napoli, 1790.—*Lettera a Sua Ecc. il sig. Duca di Cantalupo*, Napoli, 1795.—*Memoria sulla libertà del commercio*, Accademia di Padova, 1797.—*Ragionamento sulle carestie*, Accademia di Napoli, 1818.—*Espressioni della particolare riconoscenza della provincia e città di Teramo, dovuta alla memoria dell'immortale Ferdinando I.*, 1833.—*Annali civili del regno delle Due Sicilie*, vol. i.

M. P.

DELICTUM. Expression of Roman law denoting a wrongful act—not being a breach of contract—which gave the aggrieved party the right to claim damages. The term corre-

sponds in a certain measure to the expression *TORT* (*q. v.*) used in English legal language.

E. S.

DELIVERY (OF BILLS OF EXCHANGE). According to the law of the United Kingdom, a contract on a bill of exchange is incomplete and revocable until delivery of the instrument. The drawer of a bill of exchange may, after having accepted it, cancel the acceptance as long as the bill has not been returned to the holder, unless he has actually informed the holder that the bill has been accepted (Bill of Exchange Act, § 21). This is not so according to German law; a German acceptor having once affixed his signature to the bill is irrevocably bound (German code, § 21). The delivery required by English law need not consist of an actual transfer of possession, but may be a constructive delivery (see **DELIVERY** of chattels). As according to the regulations of the English post-office a letter, after being posted, cannot be recalled by the sender, the posting of the letter constitutes a delivery. In some other countries, the sender may stop the delivery of a letter; where this is permissible the delivery would only be final when the letter has reached the address to which it has been directed.

E. S.

DELIVERY (OF DEEDS). See **DEED**.

DELIVERY (OF CHATTELS). In all systems of ancient law legal results are attained by solemn and overt acts only. To admit of the possibility of altering rights of ownership or of creating obligations enforceable by judicial process without the use of recognised formalities is a refinement which undoubtedly is familiar in the later stages of Roman jurisprudence, but which was slow to penetrate into Germanic countries. The principle of allowing the law to protect facts and relations created by the mutual consent of the parties concerned—sometimes authenticated by written documents, but in many cases without writing or formality of any kind—is now thoroughly established in all civilised countries; but traces of the older modes of thought are still conspicuously impressed on modern law, and more particularly on the systems of law administered in English-speaking countries. The old common law rule was that no change of ownership could be effected without a formal delivery to the new owner, called "livery of seisin," an expression afterwards used in the case of land only. Land is now transferred by deed, and "livery of seisin" is a thing of the past, but delivery is subject to the exceptions to be presently mentioned, necessary in all cases where property in chattels is to pass from one person to another. Delivery, according to modern views does not, however, necessarily involve a visible change of possession. There may be a *constructive* delivery, as where a person holding goods in one capacity (*e.g.* as agent for A)

begins to hold them in another capacity (e.g. as agent for B—this is a delivery from A to B); or there may be a symbolical delivery (e.g. the delivery of the keys of a warehouse where certain goods are may operate as a delivery of the goods). The delivery of documents of title relating to goods (e.g. a bill of lading) has generally the same effect as the delivery of the goods. The exceptions to which reference has been made above are the following: the property in chattels can now be transferred without delivery—(a) by DEED (q.v.); (b) by a sale, where the parties expressly or by necessary implication agree that the change of property is to take place immediately on conclusion of the bargain (a sale of this kind is known by the technical name of bargain and sale). The exceptions comprise a large class of transactions, but modern legislation, in view of the dangers resulting from secret changes of ownership—which enable insolvent traders to make a show of property not available for their general creditors—has, by means of the Bill of Sale Acts (see BILL of SALE) introduced new safeguards (see the elaborate judgment of the court of appeal in *Cochrane v. Moore*, Law Reports, 25 Queen's Bench Division, p. 57; also Benjamin on Sales).

E. S.

DELIVERY, GOOD. On the stock exchange stock is said to be delivered when it is actually supplied to the buyer, and the delivery is good or not according to the rules of the stock exchange, and the nature of the contract between the buyer and the seller. Contracts are largely made in a manner too rough and ready to permit attention to every stipulation. That is understood, and when a dispute arises the Committee of the London Stock Exchange is appealed to, and the decision often turns upon the question whether the stock or share tendered by the seller constitutes a "good delivery." If, for example, the numbers on the shares delivered are not the numbers which have obtained an official quotation on the stock exchange, the delivery is bad and not good. If, for another example, the shares in an American railway do not bear the proper stamp imposed in this country, the delivery again is not good, but is not irremediably bad. The term "good delivery" covers compliance with the official rules and reasonable conditions on which business is transacted in the stock exchange, but, in practice, the question only arises in two cases—first, when the numbers of the securities do not agree with those for which an official quotation has been granted, and second, when the bond has been tampered with by the holder. This often happens through coupons being carelessly cut off, or having the name of the holder written on them in ink, or through being torn or damaged.

A. E.

DE LUCA, GIOVANNI BATTISTA (1814-83), was born at Venice, became a lawyer in Naples,

and was made cardinal by the pope Innocent XI. De Luca is best known as a lawyer, but he wrote also on economical and fiscal questions in his two treatises: *Theatrum veritatis et justitiæ*, Romæ, 1669; and *Il Principe cristiano pratico*, Roma, 1679.

As an economist he is a "mercantilist" of the very narrowest species. International commerce, in his opinion, is only a means of getting money from foreigners; raw materials are to be allowed to be imported, but their export is to be prohibited, because only when they are transformed by national industry will they procure a favourable balance of commerce. Money is not to be falsified by the prince, but its export, and also the export of bullion, is to be prohibited, except for the acquisition of those wares which cannot be produced by the country. Famines are to be guarded against by a subtle system of regulation.

In normal times agriculture is to be aided and importation of foreign produce to be prohibited. In case of famine all are to sell their produce to a public office (*Ufficio annonario*), a sort of store for corn under government administration, which is not to pay for it immediately, because in similar calamities "men tend to become communists." Supporting economical doctrines such as these, De Luca shows himself to have been inferior to a great many of his contemporaries, who had already seen through the grossest errors of the mercantile system. In financial questions he takes a better position. First of all he has a clear idea of the historical relativity of institutions, so that when he discusses the question, whether direct taxes are to be imposed with the consent of parliaments, he insists upon this being decided differently in different nations, and with due regard to the different customs and political maturity of the various nations.

Taxes in general, he considers, ought to be levied in such a manner that people pay them insensibly, that tax collectors cannot exact more than the government receives, that all citizens, without privilege and exemption, come to bear a proportionately equal burden, and that no tax be imposed when not absolutely necessary for the existence of the state. De Luca distinguishes correctly the revenue from the private property of the sovereign, and makes a most minute examination of all the different descriptions of crown rights. He defends the state monopoly of salt and tobacco.

M. P.

DEMAND. By "demand" in political economy is meant what may be more distinctively called *effective demand*, that is, not the mere desire for anything, but desire accompanied by the offer of something valuable in exchange. When, therefore, there is a demand for any commodity or service, there must be a supply of some other commodity or service, which is

proffered in exchange for it; and when two persons are engaged in exchange, what the one demands the other supplies, and *vice versa*. It follows that demand and supply considered as aggregates are strictly interdependent, and that neither can increase or diminish without necessitating a corresponding increase or diminution of the other. This simple consideration disposes of the fallacy that there may be an over-supply of commodities in general. At the same time, the two different aspects of the phenomenon of exchange are clearly to be distinguished from one another. Demand depends upon men's desires to satisfy their wants by acquiring a command over new goods or services, supply upon their willingness to undergo efforts or part with goods already in their possession. Some of the older economists, *e.g.* Ricardo, tended to concentrate attention upon the conditions determining the supply of commodities, to the comparative neglect of the analysis of demand. This aspect of the problem has, however, been brought into special prominence in recent years by the full discussions of "utility" and "subjective value," which are characteristic of Jevons and the Austrian school. The importance of a full consideration of the side of demand as well as of supply also receives ample recognition in Professor Marshall's *Principles of Economics*.

Assuming the use of a medium of exchange which represents general purchasing power, the question has been raised whether the demand for any commodity should be measured by the quantity of the commodity demanded or by the quantity of purchasing power offered in exchange for it. Cairnes, criticising Mill, considers that on scientific grounds we are bound to select the latter of these alternatives. There is not, however, any fundamental difference between the two when properly interpreted. The quantity of any commodity which people are willing to buy, and the amount of money which they are willing to spend upon it, are, generally speaking, equally indeterminate so long as nothing is said as to the price at which it is to be had. If, then, we measure demand by quantity demanded, it can only be with reference to some particular price or schedule of prices; and hence some specific quantity of purchasing power offered is necessarily implied. But the same is true, *mutatis mutandis*, if we start from the quantity of purchasing power offered. For example, to say that at half-a-crown a pound you will buy six pounds of tea is precisely equivalent to saying that at that price you will spend fifteen shillings on tea. It may sometimes be more convenient to adopt the mode of expression preferred by Cairnes; but usually the other alternative is simpler and less liable to lead to error, since supply and demand can in this case be more directly compared and equated. The demand for any

commodity at a given price may then be measured by the amount that would be purchased if obtainable at that price; and the supply at a given price may be correspondingly measured by the amount that would be offered for sale at that price. If the amount instead of the price is regarded as the independent variable, then the *demand-price* for a given amount of any commodity may be defined as the price just required to attract purchasers for that particular amount; and correspondingly the *supply-price* as the price just required to cause that particular amount to be offered for sale.

It is clear, however, that the circumstances of demand will be very incompletely expressed, if given with reference to some one particular price only or some one particular amount only. We need what Professor Marshall calls a *demand-schedule*, in which the demand at varying prices is recorded. For example, it may be that in the early spring a person will buy one basket of strawberries at ten shillings a basket, two at seven shillings and sixpence, three at six shillings, four at five shillings, and so on. A statement of this kind is said to constitute his demand-schedule for strawberries at the time in question. If the requisite knowledge were forthcoming it would be possible to draw up a schedule of the same kind representing the total demand for any commodity within a given range and over a given period. The variation of demand with price may also be expressed diagrammatically, and the exposition of the general theory of supply and demand may be much facilitated thereby (see DEMAND CURVES).

With improved statistics of consumption, towards which valuable contributions might be afforded by shopkeepers' books and the great co-operative stores, it might be possible to draw up empirical demand-schedules representing approximately the actual variation of demand with price for certain commodities in general use. As Cournot remarks: "If we suppose the conditions of demand to remain the same, but the conditions of production to change, because the expenses of production are raised or lowered, or monopolies put on or suppressed, or taxes increased or diminished, or import duties imposed or removed, then price will vary, and the corresponding variations in demand will give us our empirical tables" (*Principes de la Théorie des Richesses*, § 56). But, as is also recognised by Cournot, the conditions of demand rarely do remain the same for any considerable length of time. There are constantly in progress independent changes, such as changes in fashions and habits, in the purchasing power of money, in the wealth and circumstances of consumers, and the like, which cause the demand at a given price itself to vary. Since, therefore, the statistical calculation would have to cover a

more or less prolonged period of time, it would always be liable to be vitiated by the effects of such changes as the above, except in so far as these effects could themselves be estimated and allowed for.

For theoretical purposes, however, the inquiry into the variation of demand with price is of the greatest value and importance, independently of any exact empirical constructions. Without elaborate statistics it is possible to determine a *law of demand* to which all demand-schedules will conform, namely, that—other things being equal—a rise in price will be accompanied by a diminished demand and a fall in price by an increased demand. Looked at from the other side, the law may also be expressed by saying that the greater the amount of any commodity offered for sale in a market the lower will be the price at which it will find purchasers.

The above law of demand is a corollary from the law of diminishing utility, namely, that the additional satisfaction which a person derives from an additional increment of any commodity diminishes as the stock of the commodity already in his possession increases. For it clearly follows from this law of diminishing utility that if the general purchasing power of money remains unchanged, then, as the amount of a thing which a person already has increases, the price that he is just willing to give for an additional increment will diminish.

It is an important question how far continuity may be assumed in the variation of demand with price, so that any alteration in the latter, however slight, cannot fail to be accompanied by some alteration in the former. Such an assumption clearly cannot, in general, be justified so far as the demand of individual consumers is concerned. Individual changes in demand will almost always be discontinuous; in other words, there will almost always be more or less wide limits of price within which demand will be constant. The price of coal, for example, might go on rising for some time without leading any given householder to reduce his consumption of coal, although he would probably take steps to economise to a material extent when the rise in price reached a certain point. It is different, however, when we consider the *aggregate demand* for a commodity in general use. Individuals of all degrees of wealth and all varieties of taste will now contribute towards the result, and it becomes a fair assumption that every change in price will affect the demand of certain of them, even if it leaves the demand of others unaffected. It may further be assumed that, as Coignet puts it, "demand does not pass suddenly from one amount to another without passing through the intermediate amounts." The assumption of continuity becomes, for obvious reasons, specially important in the mathematical or diagrammatic treatment of the law of demand.

In speaking of demand as varying with price, it is not of course intended to imply that there is any exact proportion in which the one rises or falls as the other falls or rises. No two commodities are likely exactly to resemble one another in this respect, and even in the case of the same commodity there will be differences at different points. Thus, supposing price to fall fifty per cent, demand might in some cases be increased two or three hundred per cent; it is possible, for instance, that quite a new class of consumers might now be induced to buy the commodity, or it might be worth while to put it to quite a new use. In other cases, the increase in demand might not exceed ten or fifteen per cent, the wants of old purchasers being quickly satiated, and not many new purchasers being attracted. In the former case, demand is said to be very elastic; and in the latter case very inelastic. Professor Marshall gives the following definition: "*The elasticity of demand* in a market is great or small according as the amount demanded increases much or little for a given fall in price, and diminishes much or little for a given rise in price" (*Principles of Economics*, vol. i. 1891, p. 160); and he afterwards lays down, as a general law of variation of the elasticity of demand, the principle that as a rule the elasticity of demand of any given class of consumers for a given commodity is great for medium prices, and small for those which, relatively to the means of the consumers in question, are very high or very low. For so long as price remains very high considerable elasticity is out of the question, while it may, on the other hand, fall so low as to reach what may be called satiety point, consumers already buying as much as they practically care to consume. It is important to recognise that at any given point the demand of one class of consumers may be elastic, while that of other classes is inelastic. In the case of game, for example, the demand of the upper middle class at the present time in England is probably very elastic, while it is much less so on the part of the rich, whose consumption would not appreciably be affected except in the case of very great scarcity, and on the part of the lower middle and working classes, for whom any moderate fall would still leave the price too high.

Unless we confine ourselves to very short periods of time, demand-schedules are themselves liable to modification. For the conditions of demand are constantly changing; and this, as we have already seen, is one of the chief difficulties in the way of obtaining accurate empirical data in regard to the variation of demand with price. A change of fashion, for example, might cause the demand for lace to be greater at every point throughout the list of prices. A spread of teetotalism would, *ceteris paribus*, have a similar effect upon the

demand-schedules for certain kinds of drink ; and an increase of population upon the demand-schedules for most kinds of food. In all these cases there may be said to be a *rise in the demand-schedule*.

In connection with this point, attention may be called to an ambiguity generally attaching to expressions that relate to variations in demand. The law of demand above laid down is the statement of a variation of demand with price which is manifested in every demand-schedule ; and it may perhaps be said to relate to a static condition of things, in which there is supposed to be no change in the number of purchasers or in their circumstances or tastes. But we may pass to the hypothesis of a dynamic condition, in which such changes as these do take place. We then have to recognise, as just pointed out, that the amount of any commodity demanded at a given price is itself subject to variation, or that, in other words, demand-schedules may themselves rise or fall. By an "increase of demand," therefore, may be meant either, first, the extension of demand which results under static conditions from a fall in price, or, secondly, an increase in the quantity demanded at a given price which may occur under dynamic conditions. Professor Sidgwick, who explains this ambiguity very clearly, remarks that it will be convenient to have two unambiguous terms to distinguish the two different kinds of change in demand ; and he accordingly proposes to speak of the former kind of increase as an *extension* of demand, and of the latter as a *rise* or *intensification* of demand. For the opposites of "extension" and "rise" respectively, he uses the terms "reduction" and "fall" (*Principles of Political Economy*, 1887, p. 179).

[The articles on FINAL UTILITY, SUPPLY, and SUPPLY AND DEMAND, EQUILIBRIUM OF, should be read in connection with the present article. The subject of *demand* is discussed in all systematic works on political economy ; but the reader may be specially referred to Marshall's *Principles of Economics*, bk. iii.]

J. N. K.

DEMAND CURVES represent the relation between the effective demand for a commodity and the terms on which it can be obtained. The simplest form is where one axis, as OY in the annexed figure, represents price, and the other axis, OX, the quantity of a commodity demanded by a certain individual at that price. Thus at the price Oq the quantity Op is demanded. The curve thus representing the dispositions of a single person may be termed an "individual" demand curve, as contrasted with the "collective" demand curve appertaining to a group of persons such as a market or a nation. The collective curve for a group may be derived from the individual curves of the persons forming the group by adding, for each price, the amounts demanded by all the individuals at

that price, and taking this sum as the abscissa of the collective curve ; the ordinate as before representing price. The collective curve may be represented by Fig. 1, if the scale is altered

so that a unit of the abscissa should represent a larger amount of commodity than when the figure stood for an individual demand curve. This method of representing demand by a curve was introduced by Cournot in his *Principes Mathématiques de la Théorie des Richesses*, 1838. It is remarkable that he began and ended with the collective demand curve, instead of deriving it from the individual curve like many recent writers. Another kind of demand curve is formed by taking one axis as before to represent the quantity of the commodity demanded, while the other axis represents, not as before, the price of each unit of commodity, but the total amount of money (or other article of exchange) corresponding to each amount demanded. Thus in Fig. 2 the curve denotes that

for the amount of money (or any other specified article, say x) Op , there is demanded the amount Oq of the article y . This construction was first introduced by Prof. Marshall in a paper read before the Cambridge Philosophical Society, 1873 (to which reference is made in the preface to the first edition of the author's *Principles of Economics*.) The construction is specially suitable to the case where there is a certain symmetry

between the conditions of supply and demand, as in international trade. It will be observed that the curve in Fig. 2, which has been described as the demand curve with respect to the article *y*, may also be regarded as the supply curve with respect to the article *x*; since it represents the amount of the article *x* which the party or parties under consideration are willing to supply for each amount of *y*. This kind of demand curve, like that which was first described, may be divided into two species, individual and collective. Another kind of demand curve is used by Prof. Walras in his *Éléments d'Économie Politique Pure*.

The demand curve is a potent aid to abstract theory. It expresses better than ordinary language the relation between price and quantity demanded; of which in general we know only that the quantity varies inversely with the price, but are ignorant what is the law of variation. This ignorance is sometimes not complete; we may know that for the same fall in price the demand increases much more rapidly in the case of one commodity than another; or for the same commodity at different prices. This difference of ELASTICITY is elegantly expressed by the shape of the curve. In the case represented by Fig. 1 the demand is very elastic in the neighbourhood of B, very inelastic in the neighbourhood of A and C. The case thus represented is a very general one. In Prof. Marshall's words "the elasticity is small when the price of a thing is *very high* relatively to their means [those of the class of purchasers under consideration], and again when it is *very low*; while the elasticity is much greater for prices intermediate between what we may call the high level and the low level." The use of some such device as the demand curve is required for the perfect apprehension of the theory of value. The relation of "individual" to "collective" demand curves best expresses the dependence of the objective fact of price on the subjective dispositions of individual persons. The position of equilibrium towards which the "higgling of the market" tends is best represented by the intersection of a demand with a SUPPLY CURVE (*q.x.*) Ordinary language does not well discriminate the change in price due to a change in the quantity of commodity supplied, the dispositions of the parties remaining the same, from that change which is due to alterations in taste. The latter sort of change is expressed by the shifting of the demand curve from *right* to left (or conversely), so that to every quantity of commodity there corresponds a higher (or lower) price. The demand curve is employed by Prof. Marshall in the proof of several *recondite*, not to say "paradoxical" theorems. "If a given aggregate taxation has to be levied ruthlessly from any class, it will cause less loss of CONSUMER'S RENT (*q.x.*) if levied on necessities than if levied on comforts."

Principles of Economics, bk. v. ch. xii. § 4, note, 2nd ed., cp. *ibid.* § 6). The doctrine that "the maximum satisfaction is generally to be attained by encouraging each individual to spend his own resources in that way which suits him best" is seen by the aid of the demand curve to be inaccurate.

The theory of the demand curve must be received with the following cautions and reservations. First (1) it should be observed that there are "many classes of things the need for which on the part of any individual is inconstant, fitful, and irregular," for instance "wedding cakes, or the services of an expert surgeon" (Marshall, *Principles of Economics*, bk. iii. ch. iii., § 5, 2nd ed.) The individual demand curve in such a case is discontinuous. But the corresponding collective curve will be less irregular. "The fickleness of the individual is merged in the comparatively regular aggregate of the action of a large number of people" (*Ibid.*) Again (2) in comparing the elasticity of demand curves for different commodities care must be taken about the units both of money and commodity. The same dispositions on the part of purchasers will appear more or less "elastic," according as they are expressed in hundred-weights or tons, in pounds or shillings. An ingenious method of avoiding this fallacy is given by Prof. Marshall (*Principles of Economics*, bk. iii. ch. iv. § 1). Again (3) demand curves as usually understood involve a postulate which is frequently not fulfilled; namely, that while the price of the article under consideration is varied, the prices of all other articles remain constant. This postulate fails in the case of rival commodities such as beef and mutton. The price of one of these cannot be supposed to rise or fall considerably without the price of the other being affected. The same is true of commodities for which there is a "joint demand" as for malt and hops. And in the case of a necessary of life the price cannot be supposed to increase indefinitely without the prices of other articles falling, owing to the retrenchment of expenditure on articles other than necessities. The price of clothes has been known to fall during a famine (F. Newman, *Lectures on Political Economy*). It is true indeed that the postulate which has been stated might be dispensed with. But this can only be done at the sacrifice of two of the characteristic advantages which demand curves offer to the theorist. First, unless this postulate is granted, it is hardly conceivable that, when the prices of several articles are disturbed concurrently, the collective demand curve may be predicted by ascertaining the disposition of the individual—a conception which, as employed by Prof. Walras (*Éléments d'Économie Politique*, Att. 50), aids us to apprehend the workings of a market. Secondly, when the prices of all commodities but one are not

supposed fixed, there no longer exists that exact correlation between the demand curve and the interest of consumers in low prices which Prof. Marshall has formulated as "consumer's rent." In considering this relation care must be taken to distinguish between demand and desire. The effective demand of the rich and poor man for oatmeal may be the same. But the intensity of desire is not the same, if the one uses the article to feed his horses, the other for his own frugal meal. Again (4) there is an artificial rigidity in demand curves which imperfectly corresponds to the flux character of human desires. One cause of change is the formation of new habits; the disturbance of the demand curve thus caused is well represented by Messrs. Auspitz and Lieben (*Theorie des Preises*). The increased use of petroleum is not to be ascribed simply to the fall in price, the demand curve being supposed constant, but rather to the fact that "petroleum and petroleum lamps have become familiar to all classes of society" (Marshall). One important cause of alteration in demand curves is the increase of the consumer's purchasing power. The case in which that increase is only apparent, being due to a rise in prices (and the converse case), may be specially distinguished. Owing to the variability, it may be doubted whether Jevons's hope of constructing demand curves by statistics is capable of realisation. In the financial year 1890-91, after the reduction of the tax on tea effected by Mr. Goschen, the quantity of tea consumed per head was greater than in the previous year. Is it possible to determine whether this change is due to the cheapening of the article—the demand curve being supposed the same—or to an alteration of the demand curve caused partly by a change of taste and partly by an increase in prosperity? Some suggestions for evading these and other difficulties will be found in the third book of Prof. Marshall's *Principles of Economics*.

For further considerations and fuller references, see MATHEMATICAL METHOD. F. Y. E.

DEMAND SCHEDULES. See DEMAND.

DEMESNE. Before the statute "Quia Emptores" (1290), a person wishing to alienate land did not entirely sever his connection with the land; he remained the feudal tenant of the king or superior lord, and continued to perform the duties which the tenure imposed upon him, but was at the same time the feudal lord (mesne lord), of the new tenant. That portion of the manor which the lord did not grant to freehold tenants in the way just described was called his demesne; it was either under the immediate management of the lord or it was let out to persons in a subordinate position called "villani" who held at the lord's will, but gradually acquired a customary right to fixity of tenure. The successors of the "villani" are the copyholders of the present

day (see COPYHOLD). That part of the crown lands which was not granted to any feudal tenants but remained under the management of royal stewards is, in a similar way, called the "royal demesne," and part of the hereditary revenue of the crown was formerly derived from it. Since the accession of George III. this revenue has been appropriated by parliament, the sovereign receiving a fixed annual sum (see CIVIL LIST) in exchange. E. S.

DE METZ-NOBLAT, ALEXANDRE (1820-1871), born at Colmar, died at Nancy. His first occupation was the law, and he was called to the bar. But he preferred the profession of literature, and soon displayed a predilection for economic study. His principal work, published first in 1853 (2 vols. in 8vo), was entitled *Analyse des phénomènes économiques*. This, after receiving some not very important alterations, was republished as *Les lois économiques*, the first edition in 1867 (1 vol. in 8vo), the second in 1880 (1 vol. in 12mo). This work is, practically, a complete treatise on political economy; the author was professor of this science from December 1864 at Nancy, a chair which still exists. Here De Metz-Noblat made the mistake of failing to keep religion sufficiently apart from economic science—but he was a man truly liberal in spirit. He was a disciple of Malthus, and his works deserve to be read even at the present day. A. C. F.

DEMISE. Used as a substantive noun and as a verb in the same way as the word "lease," and denoting the letting of land or premises for a number of years. E. S.

DEMOGRAPHY. This word, already unanimously adopted of late years by continental nations, has only recently sought naturalisation in England. It still remains to be seen whether the attempt will only be partially, instead of entirely, successful. The word "*Démographie*" was invented by Dr. Achille Guillard, and occurs in the title of his book *Éléments de Statistique Humaine ou Démographie Comparée*, Paris, 1855, intended to be "an exposition of this new science as illustrated by the most authentic documents relating to the condition, the general movement, and the progress of population in civilised countries." It should be observed that statistics are very properly made the very soul of this so-called new science by Guillard, although he might have found a more apposite epigraph to his book than the somewhat crude one from Proclus, "How sublime human understanding has been in the creation of number."

Guillard ventures further to define demography as the natural and social history of the human species, or as the mathematical knowledge of populations, their general movements, their physical, social, intellectual, and moral condition. All this is, however, merely a new name for something very old. Writers in

almost every country have, in the past three centuries, foreshadowed the existence of normal, or mathematical, laws of population. What they failed in, as compared with writers of our own times, was the want, for which they had no help, of adequate or authentic illustrative statistics. Thus our own Petty and Graunt, in the 17th century, had to rely upon very scanty parochial and other registration of births and deaths, restricted also to the metropolitan area, in their very ingenious general inductions respecting the laws of population. In certain instances such statistical observations, partial and few as they may have been, sufficed to suggest to great minds the method of deducing a mathematical law. Thus with De Witt in constructing a table of annuities in Holland in 1672, and with Halley later on in doing the same in a more complete way from the Breslau observations. In the 18th century population statistics came to be more abundantly available, and stimulated the composition of such works as those of Price, Malthus, etc. in England, Süssmilch in Germany, Moreau in France. In the present century we have had abundance of labourers in the same (shall we call it demographic?) field—Milne, and Farr, and numerous others, in England. The same in France and Germany, etc.—for instance, Quetelet, Legoyt, Block, Levasseur, Engel, and Berg. All these have contributed so much to a knowledge of the principles which regulate the laws of the movements and increase of population in its various aspects, that but little is left to constitute demography a new science.

The word demography has, to a certain extent, been familiarised to English ears by the occurrence in 1891 of a Congress of Hygiene and Demography in London. This is a peripatetic body, and its previous sessions had been held in continental capitals. Notwithstanding some admissible advantages accruing from such occasional meetings as these, it can scarcely be pretended that much fresh knowledge as to statistical and mathematical deductions respecting population was added by them to the general stock; there was more room in them for the general outside public than for scientific experts. Hence arose a frequent degeneracy into occupying time with hypotheses regardless of statistical evidence, a repetition of such eccentricities as contributed not a little to the final collapse some years since of the Social Science Association. A better organisation in some respects, although still by no means a perfect one, for discussing the population and census statistics of great countries, or, in other words, demography in its most important aspects, exists, however, in the International Statistical Institute, composed almost wholly of representative experts, limited as to number, from almost all European countries and from the United States, who meet biennially in differ-

ent countries; for example, last year's session was held at Vienna, and the one for 1893 is fixed to be at Chicago.

F. H.

DEMOIVRE (or DE MOIVRE), ABRAHAM (1667-1754), an eminent French mathematician, born at Vitry, after the revocation of the Edict of Nantes retired to London, where he supported himself by giving private lessons in mathematics. A life of privation, in which mathematical discoveries were the principal events, terminated in London 1754. The scientific eminence of Demoivre is evidenced by Newton's habitual saying "Go to Mr. Demoivre, he knows more than I about these matters." Pope bears witness to his fame in a well-known verse,

"Sure as De-moivre, without rule or line."

[Of the spider, *Essay on Man*, ep. iii. l. 104.]

Demoivre not only improved the theory of the calculus of probabilities by his *Doctrine of Chances*, but also extended its application by his *Annuities upon Lives*. Many of the methods now employed by actuaries may be traced back to this great mathematician (see Farren, *Historical Essay on . . . Life Contingencies*, p. 46). Demoivre is, however, most remembered by statisticians for his hypothesis that the probabilities of living any number of years after the age of twelve (see *Annuities*, 1st ed. Problem II.) decrease in arithmetic progression up to the age of eighty-six (taken as the extreme limit of human life). The formula may be thus simply written: lx (the number alive at any age x see LIFE-TABLES) is proportioned to $86 - x$ (cp. *Assurance Magazine*, vol. iii.) This law, roughly corresponding to the observations, long served as a good working hypothesis, and even still affords useful exercises (see Sutton, *Life Contingencies*). Demoivre also entertained the hypothesis that the probabilities of life decrease in a geometrical progression (*Annuities*, 1st ed., Problem III.), an assumption which lends itself better to the calculation of joint contingencies, but, being less agreeable to the facts, has not found currency.

The first edition of the *Doctrine of Chances* (preceded by an earlier contribution to the calculus of probabilities, *De Mensurâ Sortis*) appeared in 1718; the third, purporting to be "fuller, clearer, and more correct than the former," in 1756. The first edition of the *Annuities upon Lives* appeared in 1724-25, the fourth in 1752. The treatise appears with some modifications, being the "most improved edition" according to Bailey, at the end of the third edition of the *Doctrine of Chances*, with the secondary title, the *Doctrine of Chances applied to the Valuation of Annuities*.

[References to Demoivre will be found in most of the leading works on Assurance and cognate subjects. The following may be specially mentioned: R. Price, *Reversionary Payments*,

arranged and enlarged by W. Morgan (1812), ch. iv. ; F. Baily, *Doctrine of Life Annuities and Assurances*, preface ; W. Sutton, *Life Contingencies*, ch. vi. *et passim*. See also the *Assurance Magazine*, vols. iii., xii., xiii., xv. This magazine, in the vol. for 1869, contains an interesting generalisation of Demoivre's hypothesis. Some traits of Demoivre's personality are recorded in the *Mémoire sur la vie et sur les écrits de M. Abraham de Moivre*, par M. Maty.] F. Y. E.

DEMOLOGY. See DEMOGRAPHY.

DEMONETISATION. The discontinuance by a government of the use of a coin, and its official withdrawal from circulation, are known as its demonetisation. A recent instance of such an operation was furnished in this country by the complete withdrawal from circulation of *all* pre-Victorian gold coins ; carried out under the provisions of the Coinage Act, 1889, and the royal proclamation of the 22nd November 1890.

The coins received and exchanged at the mint between 13th December 1889 and 28th February 1891, were of the value of £2,334,573 in sovereigns, and £128,575 in half-sovereigns, of which £12,776 in sovereigns and £712 in half-sovereigns were received through the Sydney Mint, and £30,168 in sovereigns and £2015 in half-sovereigns through the Melbourne Mint.

The value of the deficiency of weight of these coins, as well as of that due to the metal of which the coins were composed being slightly below the legal standard of fineness, is given below—

	Sover- eigns.	Half- sover- eigns.	Total.
Deficiency in weight	£42,352	£6,353	£48,705
Deficiency in standard	2,403	129	2,532
Total deficiency	£44,755	£6,482	£51,237

The average deficiency of weight of the sovereigns was 2·236 grains, and that of the half-sovereigns 3·046 grains ; while that due to the incorrectness in standard fineness amounted to an average of 0·246 penny per £ sterling.

Prior to the issue of the above-mentioned proclamation, guineas and half-guineas were still "legal tender" for payments, although none had been coined since the adoption of the gold standard in the year 1816, and they had long since disappeared from circulation. These coins are now, therefore, legally, as well as actually, removed from the currency of the country.

The demonetisation of a coin must always involve loss ; except perhaps in the case of a token piece, which, through a rise in the price of the metal of which it is composed, has become of greater intrinsic value than that at which it is legally current. The profit, however, which a government might realise in such a case could only be small, as, should the price

of the metal rise to any appreciable extent above that of its nominal value as coin, holders would dispose of it through ordinary commercial channels, and the government would be unable to attract the coins into its coffers without offering a premium on their issue price. In ordinary circumstances the demonetisation of a token coin must entail some loss, while, in the case of a standard piece, the deficiency through wear in the weight of the coins is alone sufficient to make the operation unprofitable.

If the countries of the Latin Monetary Union were to adopt a gold standard, instead of the present *étalon boiteux*, the consequent demonetisation of the standard silver five-franc piece would, at the present price of silver (May 1892), entail considerable loss. That coin contains 22·5 grammes of fine silver, which, with (English) standard silver at the (gold) price of 40d. per ounce, would be worth 31·28d. only, whereas it is now rated at 47·62d. (5 francs at 25·20 fr. = £1). The loss therefore would amount to a little more than 1s. 4d. per piece. A similar result would accompany the demonetisation of the standard silver dollar of the United States ; a coin which when first issued yields a considerable SEIGNORAGE (*q.v.*) to the state. In connection with this subject the fact should not be lost sight of that whereas metal in the form of coin is of a known standard, and is received without question as to its fineness, ingots must be assayed in order to ascertain their purity, and this operation, involving both expense and delay, naturally tends to make the exchange value of coin stand at a somewhat higher figure than that of unstamped bullion.

F. E. A.

[For demonetisation in sense of ceasing to use a metal as a standard, see STANDARD OF VALUE.]

DEMONSTRATIVE LEGACY. A legacy of a portion of a particular fund, as, for example, where a testator bequeaths £1000 out of his reduced three per cents. If the fund out of which it is payable fail, the legatee is nevertheless entitled to have the legacy paid out of the general assets, and even if the general assets are insufficient to pay all the legacies, the legatee is entitled to his legacy in full.

[Williams on *Executors* (pp. 11-65), London, 1879.] J. E. C. M.

DEMURRAGE. Compensation payable to a shipowner for detention of a ship in a port beyond time stipulated in the CHARTER PARTY (*q.v.*) E. S.

DENARIUS. Roman silver coin first struck 269 B.C., seventy-two being coined to the pound. Design—obverse, the head of Roma and the letter X indicating ten *asses*; reverse, the Dioscuri on horseback, charging. From 217 B.C. eighty denarii were struck to the pound. In 100 B.C. a new type was introduced, and from 93 B.C. many different kinds were in use.

[Wm. Till, *An Essay on the Roman Denarius*, London, 1837.—J. Y. Akerman, *A descriptive Catalogue of rare and unedited Roman Coins*, London, 1834.—Also see *Encyclopædia Britannica*, 9th ed., vol. xvii., art. Numismatics, § ii.—Roman Coins, p. 652.] F. E. A.

DENARIUS DEI (*God's penny*). Earnest money which passed at the making of a bargain. This was regarded as a binding transaction by the custom of the merchants (*Carta Mercatorum*, 31 Ed. I. c. 4). It had several local uses and names. Originally, perhaps, a penny given to the church or to the poor at the conclusion of a bargain. Also mentioned as a port-due, an exaction forbidden, however, by statute. In this sense the term is usually corrupted as *Adieu*—the customer's "farewell" or "good-speed."

[Maitland in Selden Soc., ii. 130; Hall, *Cusoms*, ii. 166.] H. HA.

DENIER (Coin). The word *denier*, originally merely the French rendering of the Latin *denarius*, was adopted by the early kings of France as a name for a coin of pure silver, the weight of which was originally about one penny-weight (or *denier*). In the reign of Charlemagne (768-814) it weighed about twenty-seven or twenty-eight grains, in the reign of Charles le Chauve (843-877) thirty-two grains, and in that of Hugh Capet (987-996) about twenty-four grains. A small amount of copper was first added to the metal of which these coins were made in the year 1103, and from that time onwards the amount was continually increased. In the year 1577 deniers were struck which were composed of pure copper.

In the reign of Louis IX. (1226-1270) a coin of fine gold, called a "*Denier à l'Agnel*" was struck, as well as two kinds of silver deniers called respectively "*Denier Tournais*" and "*Denier Parisis*." From this time the word *denier* was used as the name for several coins, the identity of which was determined by qualifying words, such as, "*de l'or à l'Escu*," "*de l'or au Fleur de Lis*," "*Parisis*," etc.

The following is a list of some of the more important issues of coins bearing the name *Denier*:

GOLD COINS.

Reign.	Coin.	Weight.	Fineness.
Louis IX. (1226-1270)	<i>Denier à l'Agnel</i>	94 grains	Fine
Philippe le Bel (1285-1314)	<i>Denier à l'Escu</i>	71 grains	Fine
Philippe de Valois (1327-1350)	"	71 grains	Fine
"	"	71 grains	28 carats
John (1350-1394)	"	71 grains	22 carats
"	"	71 grains	24 carats
"	"	71 grains	18 carats
"	<i>Denier au Fleur de Lis</i>	77 grains	Fine

The coinage of "*Deniers à l'Escu*" was discontinued in the year 1354.

SILVER COINS.

Reign.	Coin.	Weight
Philippe le Bel	{ <i>Denier Tournais</i> <i>Denier Parisis</i>	17½ grains
Louis Hutin		17 grains
Philippe le Long		17 grains
Charles le Bel (1321-1327)	<i>Denier Parisis</i>	17 grains
Philippe de Valois (1327-1350)	"	18½ grains
	"	27½ grains

F. E. A.

DENIER (Tax). The *Denier à Dieu* (see **DENARIUS DEI**) was originally a small extra sum paid on the conclusion of a sale or bargain and applied to a charitable purpose. It has since come to mean a ready-money payment handed over to bind a bargain, especially in the engagement of labourers, servants, or lodgings.

R. L.

DENIER (as denoting Price). The word *Denier* is now obsolete in French as the name of a coin, but it has survived in many phrases of common use. The peasant, in France, who borrows money still describes the rate of interest as *denier-vingt* or *denier-dix* as the case may be (one in twenty or one in ten), instead of saying 5 per cent or 10 per cent. M. Leroy-Beaulieu among other economists sometimes employs the same expression conversely, as when suggesting that the valuation of land should be raised from *denier-vingt* to *denier-vingt-cinq* or from twenty to twenty-five times the rental. In his *Traité de la Science des Finances*, referring to Pitt's plan for the redemption of the land tax, in 1798, he says: "The price of 3 per cent consols was 50, that is to say sixteen to seventeen times the annual interest; in other words, they were negotiated at *denier seize* or *denier dix-sept*, but landed property sold at *denier trente* or thirty times the revenue," etc.

Shares in mining companies founded before the French Revolution are still called *deniers*, the total capital being represented by 240 to 300 *deniers* according to the variations in the value of the *livre* from twenty to twenty-five sols, the sol being twelve deniers. If calculated at twenty sols the part proprietor of a company was said to possess one, two, or ten deniers, meaning $\frac{1}{240}$, $\frac{1}{120}$, or $\frac{1}{24}$ of the total stock. The capital of the great Anzin collieries, which date from 1757, is formed of 288 deniers or full shares, the value of one of which was a few years back as high as £50,000. They are, however, now divided for negotiation into hundredth parts called *centièmes de deniers*, which are quoted under that name on the mining exchange. The widow's mite is still *Le denier de la Veuve*; Peter's Pence, *Le denier de St. Pierre*; public money, *les deniers publics*, etc. (see also **DENARIUS**.)

T. L.

DENIERS DE CALAIS (or *Devoirs de Calais*)—Calais dues or Calais toll; a fine of 19d. per sack of wool paid to the crown by

merchants for license to export staple commodities elsewhere than to Calais.

[Hall, *Customs*, i. 87, 231-278 ; ii. 220-224.]

H. Ha.

DENIZEN. An alien who has been made a British subject by letters patent and not by the usual certificate of a secretary of state. A denizen has not the full rights of a subject. He could always hold lands by purchase or devise, but until the Naturalisation Act, 1870, he could not inherit. Even now he cannot be a privy councillor or a member of either House of Parliament, nor can he hold any office of trust, civil, naval, or military.

[*Report of the Royal Commission on the Laws of Naturalisation and Allegiance*, 1869.—*Nationality*, by Sir A. J. E. Cockburn, London, 1869.]

J. E. C. M.

DENNY, WILLIAM (1847-1887), member of a well-known firm of shipbuilders at Dumbarton, on the Clyde, was not only eminent in the skilled work of his profession, and as a model "captain of industry," but full of promise as a writer on social and economical questions. His *Life* by Professor A. B. Bruce (Hodder and Stoughton, 1888) presents, *inter alia*, a multitude of valuable notes from his various letters and speeches, on such matters as the organisation of a workshop, the encouragement of invention, the uses of apprenticeship, the functions of the board of trade, the character of working men, and the prospects of the labouring classes. He had a strong dislike of "absentee employers," and, having served as apprentice himself, had knowledge of the whole situation such as few other employers could possess. From a comparatively optimistic view of the relations of employer and employed and the influence of competition in industry, he passed gradually to a more critical attitude and less sanguine convictions on these subjects. In his address on "The Worth of Wages" (publ. Bennett, Dumbarton, 1876), he stated the arguments for piece-work so cogently and exhaustively that his own conversion, ten years or so later, to a different view was all the more remarkable. He had believed that the wages of piece-work are self-regulating, but he became convinced, after a larger experience, that they are not so—except in "cases where rates can be fixed and made a matter of agreement between the whole body of the men in any works and their employers"—but, on the contrary, they "are liable, under the pressure of heavy competition, to be depressed below a proper level" (Letter to Mr. John Rae in *Life*, p. 113). In reading his address on the "Industries of Scotland" delivered at Dumbarton, December 1878, with special reference to the competition of the Tyne with the Clyde in the matter of shipbuilding, we need to remember this change of opinion, though, like a good reasoner, he always so states his arguments that we can judge for ourselves. J. B.

DENOMINATIONAL CURRENCY. See COLONIAL CURRENCY.

DENOMINATIONS OF BANK NOTES.

The denominations in which bank notes are issued appear to depend mainly, if not entirely, on custom and convenience. The chief question of policy is as to the issue of notes corresponding in denomination to coins in circulation, especially to the coin, whatever it may be, which forms the unit of the currency. It is obvious that to the extent to which such notes circulate they must displace coin. It is possible that some part of the coin thus withdrawn may be hoarded, but it is more probable that it will be made use of in some way out of the country. The notes not being exportable, it is probable that the coin will be used for the purchase of commodities from abroad, and thus the issue of such notes may lead directly to the depletion of the stock of coin. On the question of convenience the points of most importance in regard to the issue of notes of small values, are, on the one hand the convenience of portability, on the other the discomfort of a currency frequently mutilated and dirty, with the possibility of infection, and of loss or destruction. The prevalence of forgery depends largely on the denominations of the notes issued. Greater caution is shown in dealing with a £5 note than in taking one for a fifth or tenth of that sum. Besides, the chance of detecting a forgery is greatly diminished when the note is dirty or worn by use. The maintenance of a currency of small notes, having extensive use, in a clean and slightly condition, would involve an expense exceeding any profit possible to be derived from its issue, except where current rates of interest are very high and where no important stock of bullion is held to meet the notes. The expense would also probably outweigh any economy arising from diminished abrasion of the coin. The actual loss from abrasion of the English sovereign is about one-tenth of a penny per annum, while the cost of printing a note has never been estimated below one penny, and has been found in practice to be frequently double that sum (see ABRASION). The following table gives the lowest denominations of notes issued in some of the principal countries of the world, though not in all cases in active use.

		£	s.	d.
Italy	50 centesimi=	about	0	0 5
Austro-Hungary	1 florin	=	0	2 0
France	5 francs	=	0	4 0
United States	1 dollar	=	0	4 2
Germany	5 marks	=	0	5 0
Norway	5 kronor	=	0	5 2
Sweden	5 riksdalers	=	0	5 6
British India	5 rupees	=	0	10 0 nominal
Belgium	20 francs	=	0	16 0
Holland	10 florins	=	0	16 8
Scotland & Ireland	1 pound	=	1	0 0
England & Wales	5 pounds	=	5	0 0

It does not appear from these figures that the denominations of bank notes are dependent on or indicative of the poverty or wealth of a

country. But some closer connection in this respect might possibly be found in the extent to which the smaller denominations preponderate, although of course other local circumstances may have some share in determining this matter. We may contrast the note circulation of France and Belgium in 1879.

DENOMINATOR, COMMON. The term "common denominator" is applied by Jevons to the function of money which he thus describes: "In a state of barter the price-current list would be a most complicated document, for each commodity would have to be quoted in terms of every other commodity. . . . Between 100 articles there must exist no less than 4950 possible ratios of exchange. . . . All such trouble is avoided if any one commodity be chosen, and its ratio of exchange with each other commodity be quoted. The chosen commodity becomes a *common denominator* or *common measure of value*" (*Money*, p. 5). Jevons here uses "denominator" as equivalent to measure of value—the term which he more frequently employs.

According to Prof. Walker a distinction should be drawn between denominator and measure of value. "Curiously-coloured bits of paper with a government stamp upon them, which it is felony to imitate," and without "intrinsic value," may serve the purpose of a common denominator, but not that of a common measure of value (Walker, *Money*, pp. 9, 280-288). (See MEASURE OF VALUE.) F. Y. E.

DEODAND. Any personal chattel which was found to have been the immediate cause of the death of any reasonable creature, was anciently forfeited to the crown, to be given to God, as by distribution in alms to the poor. It seems to have been originally intended as an expiation for the souls of such as were snatched away by sudden death, just as the apparel of a stranger found dead went to purchase masses for his soul (Thorpe, *Anglo-Saxon Laws and Institutes*). This may account for the rule of law that no deodand was due when an infant under the age of discretion was killed by a fall from a cart or horse, or the like, not in motion; whereas if an adult person were so killed the thing was forfeited. If, however, the horse, cart or other thing in motion killed an infant it was deodand, as the misfortune was then partly owing to the negligence of the owner, who was thus rightly punished. If a thing not in motion were the occasion of a man's death only that part which was the immediate instrument was

forfeited; but if it were in motion all that went to make the wound more dangerous was forfeited. Thus if a man, climbing up the wheel of a cart, fell and was killed, only the wheel was deodand; but if the wheel ran over his body, not only the wheel but the whole cart and load was deodand. It mattered not whether the owner of the thing was concerned in the killing or not, for if a man were killed with a sword the sword was deodand although not belonging to the man who used it. For this reason we find in old indictments for homicide the instrument of death and its value presented by the grand jury to enable the king to claim the deodand. Deodands were not due for accidents happening on the high seas out of the jurisdiction of the common law, neither did any deodand accrue in the case of felonious killing, but cases occur in which ships were valued for deodand by reason of accidents at sea. A Latin phrase attributed to Bracton has, by mistranslation, given rise to erroneous statements as to what constituted a deodand. "*Omnia quæ ad mortem movent*," evidently meaning all things which tend to produce death, has been rendered "move to death"; thus giving rise to the theory that things in motion only were to be forfeited. Deodands were finally abolished altogether by statute 9 & 10 Vict. c. 62. H. H.

DEPARCIEUX (or **DE PARCIEUX**), ANTOINE (1703-1768), born near Nismes, raised himself from the rank of a peasant by his mathematical ability, which was at first exerted in the construction of sun-dials. A tranquil life devoted to science—applied mathematics chiefly—terminated at Paris, 1768.

Deparcieux's contributions to vital statistics give him a place in this dictionary. He constructed life-tables based upon two sets of observations, relating respectively to persons who had taken part in the French TONTINES (*q.v.*), and to the inhabitants of religious houses—monks and nuns. It appeared that the religious celibates had the advantage in respect of longevity at the earlier, but not at the later periods of life. It also appeared that the *expectation of life* at every age was greater for nuns than for monks. Deparcieux seems to have been the first to define expectation of life (which he termed *vie moyenne*), and to construct separate life-tables for males and females. Deparcieux's treatment of statistics commands the suffrage both of the mathematician and the general reader. "I do not see how he could have made a better use of his data," says the specialist Milne; while the lively Voltaire is believed to have taken Deparcieux as the model of "the geometer" who discourses so instructively in *L'homme aux quarante écus*.

Deparcieux is sometimes called *the elder*, to distinguish him from his nephew, Deparcieux the younger, who wrote on the same class of subjects as his uncle, but with less effect.

Essai sur les probabilités de la durée de la vie humaine (1746).—*Reponse aux objections* . . . (1746).—*Addition à l'essai* . . . (1760).—These works are in the library of the British Museum, entered in the catalogue under the head, *Parcieux*. The *Reponse* is bound up with the *Addition*. DE PARIEU. See PARIEU, ESQUIROL DE.

DEPARTMENT. A separate branch or division of the public administration.

The varying character and the great extent of the administrative functions of the state necessarily require for their efficient discharge a similar division of labour and concentration of specialised knowledge and skill to that which is arranged in any well-organised industrial undertaking. It is not too much to say that without the most elaborate division and sub-division of official duties, and their concentration within appropriate areas, executive government would be impossible. In addition to the advantages which ordinarily follow the specialisation of function, an *esprit de corps*, or desire to look with a single eye to the efficiency of a particular department, is fostered amongst the more responsible members of its staff. Such a result is of the greatest possible value to the public at large, although it is probable that in our own country it has been gained at the expense of the necessary "integration," and that too little regard has been paid to the necessity for that "intimacy and firmness of the connections between the separate parts" upon which the well-being of organisms, physical, industrial, or social, must depend. In the desire to avoid increase of expenditure, or the undertaking of duties not quite in line with its own special functions, a department will at times be unwilling to perform services which would be of advantage to the community, and apart from the cabinet or the treasury—the one too much pressed with business of the first importance, the other looking at all questions mainly from the financial side—no means of rectifying the separatist tendency exists.

As may be supposed from the varying requirements of the public service, the actual division of the administration into departments

varies from time to time. Some of them, as in the case of the treasury, the privy council office, the home office, and the foreign office, are of old standing, whilst others, as in the case of the office of the secretary for Scotland and the board of agriculture, have only recently been constituted. A reference to the particulars given in the annual estimates for civil services will afford interesting evidence of the extension of the functions of government in this country in a comparatively recent period.

The statement as to the "accounting departments and services" prefixed to the estimates shows that, leaving out of account the war office, the admiralty, and the three revenue departments—customs, inland revenue, and post office—the main divisions of the public service were sixty-four in number, of which nine were exclusively Scotch and seventeen Irish. Of these five may be said to exist for the control and service of the remainder, viz. the treasury, office of works, civil service commission, exchequer and audit department, and the stationery office. The number of officers employed and the amount voted to be accounted for by these departments for the year 1892-93, and by some of the other principal departments of the state, is shown in the following table:

Office.	Numbers Employed.	Vote 1892-93.
Treasury (13 votes)	434	£616,875
Office of Works (10 votes)	375	887,553

T. H. E.

DEPARTMENT (FRANCE). A term applied to the principal territorial and administrative areas existing in France. The division of that country into departments was first effected by the decree of the 22nd December 1789, the arrangement being embodied in Art. I. of the Constitution of 1791. There are at the present time eighty-six departments, or eighty-seven if the "territory of Belfort," the remnant of one of the departments ceded to Germany in 1871, be regarded as a separate department. Since 1889, the three departments of Algeria have also been treated, for most purposes, as part of France proper. The area of a department ranges from 184 square miles in the case of the Seine to 3597 square miles in the case of the Landes, the average being about 2300 square miles, or more than one-third the area of Wales. A department is administered by a prefect appointed by and representative of the central authority. He is assisted by a *conseil général*, elected by universal suffrage, and a council of prefecture, nominated by the central authority, for the purpose of deciding legal questions and advising the prefect when asked to do so. Each department is divided into "arrondissements," these again into "cantons," and the "cantons" into "communes."

[See Block's *Dictionnaire de l'administration française*, and *Dictionnaire Général de la Politique*.—"Local Government in France," by M. Waddington, *Nineteenth Century*, July 1888.]

T. H. E.

DEPOPULATION (TERM). The laying waste, destroying, and unpeopling of a place (Co. 12 Rep. p. 30), stated to be "now the apparent effect of enclosing lordships and manors, whereby several good old villages have been reduced from a great number of sufficient farms to a few cottages," by Cowel (*Interpreter*, ed. 1637), in whose time an extensive inquiry into the depopulation of the rural districts was carried out. The same writer states that *Depopulatores agrorum* "were so called because, by prostrating and ruining houses, they seemed to depopulate towns"; and *depopulatio agrorum* was a great offence at common law for which benefit of clergy was denied. The pulling down of farm-houses and conversion of arable into pasture was checked by 4 Henry VII., and other well-known acts throughout the Tudor period (Cunningham, I. 468). Depopulation might also ensue from excessive taxation of purveyance (*Diabolum*, i. 8). The unit of prosperity in the earlier and later inquisitions alike was the plough itself—the extent of depopulation being ascertained by the reduced number of ploughs in each village.

H. H.

DEPOPULATION, IN RELATION TO ECONOMIC HISTORY, has hitherto been chiefly considered as a remarkable but disconnected phenom-

enon. Thus, while it is usual to dilate upon the alarming proportions of this social movement at several distinct periods of our history, it has not always occurred to the general historian to regard it as a visitation, possible under the political environments of every age.

The truth is that the same causes—the visitation of God and the inhumanity of man—have not infrequently operated to produce the same results throughout successive centuries. At uncertain, though constantly recurring intervals, this social scourge has hindered the fairest prospects of industrial progress. Though in recent years less known as a factor in economic life, in earlier days depopulation saddened the reigns of powerful monarchs—causing alike the exultation of foreign enemies or trade rivals and the lament of successive generations of social reformers.

The depopulation of Saxon and Norman England was rather general than local, and of historical rather than economic interest, except for the insight that is afforded by it into the industrial resources of the country. The recurring pestilences and famines, and the partial invasions of the next three centuries left an equally indelible mark upon the page of history; but it is with individual enterprise and the public policy which governed its ceaseless workings from the 14th to the 17th century that we are especially concerned.

The "peace of the plough" is perhaps a fanciful term applied to a very real force in the national polity. It denotes a predominant interest in the pursuit of agriculture, as forming the very basis of the industrial life of the nation. Herein its chief wealth was invested, hereby its entire finances were adjusted, and the ploughshare and the reaping-hook continued to be idealised as the symbols of native industry for centuries after they had been practically replaced by the shepherd's crook and the weaver's shuttle. Therefore, from Saxon times onwards we find the peace of the plough preserved by a succession of remedial measures intended to foster a frequently declining industry.

It is to be remembered that down to the close of the 13th century not only the main resources of the country but the chief part of the royal revenue were derived from this source. This is the period of the great prœdial surveys, and of agricultural treatises; the period of CARTAGE and SCUTAGE (*q.v.*), and of royal commissions of inquiry into the grievances of the rural community. The *Dialogus de Scaccario* alludes to one of these inquisitions in the well-known story of the king on his progress being waylaid by husbandmen bearing their idle ploughshares aloft "as a symbol of agricultural depression." A few original fragments of another inquisition of the 12th century have survived, which almost anticipate the complaints of the English peasant insurgents of the

16th century. The Saxon Chronicle gives ample instances of agricultural distress and depopulation over a wide period, but it is not till we reach the middle of the 14th century that the evil assumes the characteristic type which so long prevailed. Before the reign of Edward III. the interest of the crown in the distribution of wealth had undergone a change. The sheriff's farms no longer enabled the king "to live of his own"; great escheats brought with them greater waste; the last desperate attempt to exact the full feudal liabilities of the military tenants by new-fangled inquisitions, Nevill's taxation—as odious and as fruitless as Noy's ship-money—had failed. The crown, therefore, was compelled to drift with the flowing tide. It spread its nets there and drew in an ample revenue from customs and subsidies and farms of the Lombard and Flemish publicans in place of feudal levies and the plunder of the Jewish mortgagees. The staple articles of the export trade of England became wool and fells, and leather and furs. Corn was henceforth exported only under the sliding scale. Then followed the plague, and in its wake inclosures and convertible husbandry. Then the prædial insurrection, and the industrial revolution had begun.

From the close of the 14th to the beginning of the 17th century we can trace the depopulation of the English rural districts in the complaints and remonstrances of the oppressed, backed by a long string of useless remedial measures, not wholly inspired as might be supposed by the goodwill of visionary churchmen, benevolent despots, and alarmist legislators, but by the far-seeing policy of the great ministers of the crown, the obvious meaning of which is apparent in most of the economic tracts of the 16th century as a preparation for the deadly struggle between the landed and the moneyed interests.

In one aspect the Statute of Labourers itself was devised for the encouragement of tillage. It was so expressed in its later editions, and almost simultaneously the act of depopulating is mentioned as a felony. All through the 15th century the evil grew while the feudal system dwindled. The feudal surveys of Henry VI. are an instructive commentary upon the *Testa de Nevill* on the one hand and the Statute of Fines on the other. It was in the reign of Henry VII. that the suffering consequent on inclosures was first brought prominently forward in a well-known statute. This, however, and the similar measures of the next four reigns seem to have given no real relief to the congested districts. Even the partial migration of labour to the towns was insufficient to cope with this distress. The real solution was the increased employment of labour made possible by the success of convertible husbandry.

There are many valuable materials extant to enable us to estimate both the causes and the extent of this depopulation in the 16th century,

but few perhaps as complete as the curious returns made in the year 1517 (*Lansd. MSS.*, i. 60) and the still more extensive returns made in pursuance of letters-patent dated 20th August 1608, which have hitherto been little known (*Chancery Records, Petty Bag, Depopulations*).

This latter instrument recites that the crown being given to understand that there are in many parts of England, and notably in the county of Bedford, "many houses pulled downe, lett to decay, standinge voide and uninhabited, or the ground that of former tymes belonged to dwellinge-houses dismembered and taken from them and greate quantities of ground heretofore used for arrable converted to pasture, by which and by many other synyster and corrupt practises and devises our Realme is in many partes wasted and depopulated to the grievance of our people the damage of our estate and against the ancient common lawes and statutes of our Realme, and which we are determined to remedie and redresse," the lord-lieutenants and certain knights and esquires of several of the home counties, to which this inquisition seems to have been confined, are hereby empowered to inquire by a sworn jury and examination of witnesses as to the facts alleged in the schedule.

The articles of the inquiry are to the following effect:—(1) How many towns, villages, churches, hamlets, boroughs, parishes, dwelling-houses, farms or farmhouses, families, ploughs, or tenancies in the county of *Bedford* have since the twenty-fourth year of Elizabeth been depopulated, and by whose fault and by what means; and the population maintained before and after such depopulation; (2) what grounds have been converted from tillage into pasture; (3) what lands have been severed from the farm-buildings; (4) what farm buildings have been pulled down; (5) who hold more than one farm; (6) who have evicted their tenants; (7) what inclosures have been made.

The returns to this inquiry, which were ordered to be made into the Chancery before the October following, give us a complete picture of the agrarian revolution during a given period within a given district. They are as complete in their way as the Hundred Rolls of the 13th century, and they may be regarded as the summary of the agrarian question before it disappeared from public view for another two centuries. It was upon the evidence of this commission that the lawyers of the 17th century based their definitions of depopulation, and it is in this connection that it has descended to us as an economic term.

[Cunningham, vol. ii. Appendix.—The *Inquisition of 1517*, edited by I. S. Leadam.—*Transactions of R. Hist. Soc.* (N.S.) vol. vi. pp. 167-314.]
H. HA.

DEPOPULATION (CAUSES). The term depopulation is now used in a sense very different from that originally assigned to it. Such a true

depopulation, or stripping a country of its inhabitants, as has occurred in the past in Mesopotamia, Syria, and parts of central Asia, is scarcely known in these days, but the term depopulation is now applied to the case of any country, or part of a country, in which the population as measured from time to time is found to be diminishing.

The causes of depopulation are numerous; for convenience they may be grouped under three headings, *physical*, *political*, and *economic*, but usually several causes contribute to the result.

A. PHYSICAL CAUSES.—(1) *Volcanic eruptions*, within the usually restricted limits of their action, produce more considerable effects than might be supposed, both in direct destruction of life and in rendering large tracts of country incapable of cultivation. Among the more notable outbursts of volcanic force which have thus caused depopulation may be mentioned the eruptions of Vesuvius in 79 A.D. and again in 1822; of Etna in 1669, which destroyed fourteen villages; of Papandayang in Java in 1772, which is said to have buried 40 villages with 3000 persons; of Galunggung, also in Java, in 1822, which killed 4000 people; of the Volcan de Agua in Guatemala in 1541; of Skaptar Jökull in 1783, which destroyed one-sixth of the inhabitants and one-half of the live stock of Iceland, and rendered great part of the island permanently sterile; of the "king of volcanoes," Mauna Loa, in Hawaii, in the years 1855, 1868, and 1881; of the oil wells at Baku in 1887; and of Tomboro, in the island of Sumbawa in 1815, said to have destroyed 12,000 people. Again in 1883 one of the most remarkable outbursts of which we have records occurred in Krakatoa, causing a loss of life estimated at the time to amount to 75,000; while lastly, Tarawera in 1886 covered a large tract of the north island (New Zealand) with mud and ashes. (See, for volcanic phenomena generally, Humboldt's *Cosmos*).

(2) *Floods*.—The Ho-ang Ho affords the most striking instances,—in 1851-53 it changed its course and buried whole villages in mud; in 1888, breaking down its banks once more, it gave rise to an appalling catastrophe, overwhelming it is said at least one million of people and causing subsequently widespread famine.

(3) *Changes of climate*, more especially drought, due to the neglect of irrigation works, or the destruction of forests, may cause the land to be incapable of sustaining as large a population as formerly. The condition of Mesopotamia since its conquest by the Turks in 1515 is a conspicuous example of the former, North China of the latter, case. Mr. J. A. Baines, census commissioner of India, says (*Times of India*, 18th April 1891) that the census proved that a local malarial fever had caused considerable emigration from Rajshahye and Nuddea in Bengal.

(4) *Pestilence* was formerly in Europe, as it is still in Asia, both a potent and a frequent cause of depopulation (see BLACK DEATH). In modern times the epidemics of cholera in 1849, 1853, 1854, 1857, and 1866, of smallpox in 1871, and of influenza in 1890, 1891, and 1892 decidedly checked the natural increase of the population in several countries of Europe (see *Statistical Chronology of Plagues and Pestilence as affecting Human Life*, etc., by C. Walford, 1884).

(5) *Famines* resulting from failure of crops due to exceptional seasons or plagues of locusts, or to great disasters such as the bursting of their banks by rivers, have often been greatly aggravated by pestilence or war; in fact, these three causes are frequently inseparably bound together. The most notable instance in recent times of famine causing considerable depopulation in Europe occurred in Ireland in 1847, but in India famines still from time to time greatly check the growth of population. Great famines occurred in 1770, 1781-83, 1790-92, and even so recently as 1860-61 half a million of people perished from famine in North-West India, while in 1865-66 it is believed that one and a half million perished in Orissa. However, in 1874 and 1876 the efforts of the Government were so far effectual as to prevent any great loss of life except in a few districts. Mr. Baines (*Times of India*, 18th April 1891) says that the famine tracts of Madras, which showed considerable depletion in 1881, filled up rapidly by 1891 owing to the return of emigrants or to actual immigration from other districts. There was an awful famine in North China in 1877-78 in which millions are reported to have perished (see *Famines of the World*, etc., by C. Walford, *Journal of the Statistical Society*, vol. xli. 433, vol. xlii. 79).

B. POLITICAL CAUSES.—(6) *War*, involving as it once did the massacre of women and children, and the carrying off of whole nations into slavery, has been a most powerful cause of depopulation, especially in Asia and Africa. The extinction of aboriginal races in recent times has often been a result of increasing population, the stronger race displacing the weaker, but the conquests of such nations of warriors as the Matabele have caused great diminution of more civilised races like the Mashonas. Modern wars are comparatively short in duration, while owing to sanitary precautions pestilences do not so often follow in their train. Thus it has been said that the war between Prussia and Austria in 1866 was the first in which more men were killed in action than died of sickness. In France in 1854 and 1855 the deaths exceeded the births by 62,318 and 35,606 respectively, and in Austria in 1866 by 57,831; in both this result was the combined effect of cholera and war. In France again in 1870 and 1871 there was an

excess of deaths over births of 103,394 and 444,889 respectively, a disastrous result of the war, the commune, and an epidemic of small-pox.

(7) *Actual deportation of the people*, as in the familiar instances of the Jews in the Babylonian captivity, the Jews expelled from Spain (1492), and the Moors also from that country (1609). This heading connects itself with the next one to be considered.

(8) *Religious persecution* drove the Huguenots from France, the Pilgrim Fathers from England, and is now driving the Jews from Russia, to the great economic disadvantage of the persecuting country in each case.

(9) *Bad government* is not perhaps directly a great cause of depopulation, but indirectly it assists. Restrictions on trade, oppressive taxation, bad land laws, capricious interference with the liberty of the subject, as well as social and political agitation, all discourage the growth of population; but of all acts of government probably compulsory military service has most effect in stimulating emigration.

C. ECONOMIC CAUSES.—Though the action of these is often not so obvious as in the case of natural and political causes, and is often difficult to unravel satisfactorily, yet they are really far more powerful than all the other causes put together.

(10) *The repeal of the Poor Law*.—The old law of settlement in England was intended to prevent men from leaving their native parishes; it was a protective measure which tended to keep up artificially the number of the rural population; its repeal naturally facilitated migration and to that extent contributed to local depopulation. The same is true of the abolition of out-door relief to able-bodied men. The poor law has, however, in some cases produced the same result in an opposite way: *i.e.* some landlords, to prevent the poor from becoming chargeable upon the land, cleared their estates of cottages and so caused a veritable depopulation within a limited area.

(11) *The formation of deer forests*.—Some Scotch landowners, finding they could obtain better rents by devoting their land to sporting purposes, have followed the classical example of William the Conqueror, and removed all agricultural tenants with a view to making deer forests. Naturally this has taken place only in those parts of the Highlands where the land was poor and ill adapted to agriculture. To some extent the inhabitants have found compensating employment in meeting the personal wants of the sportsmen. The real objection to such afforestation seems rather to be to its selfish character than to the withdrawal of a small quantity of land from cultivation.

A return to the House of Commons dated 4th August 1891 gives certain "particulars of all deer forests and lands exclusively devoted

to sport in Scotland." From this we learn that the total amount of such lands was in 1883 no less than 2,292,153 acres, and that 274,980 acres have been afforested since, the recent additions being in the counties of Argyll, Inverness, Ross and Cromarty, and Sutherland. The number of persons displaced is not given, but there are various indications that at any rate the greater part of the land devoted to sport can be of but slight agricultural value, thus:—(1) Two-thirds of the estates comprised land having an altitude exceeding 2500 feet above the sea, while in only four estates was the highest land under 1000 feet. (2) In about half the estates the rent before and after afforestation is given; in the very great majority of cases the sporting rent is greater than the old rents, often several times as great, in only three cases is the new rent 25 per cent below the old. (3) The rent before afforestation averaged in more than one-fourth of the acreage for which the facts are available from *nil* to under 2½d. an acre; in nearly half the acreage between 3d. and 8d., and in less than one-fourth between 9d. and 1s. 8d., the last being the highest rent recorded. Land commanding such average rents could sustain but a trifling pastoral or agricultural population.

(12) *The repeal of the corn laws*, by bringing down the artificial price of wheat, caused the tillage of land ill adapted for the growth of cereals to be no longer profitable; hence some lands either went out of cultivation altogether or were devoted to pasturage, in either case there was less employment for labour on the farms affected.

(13) *The application of machinery to agriculture* enables the same amount of land to be cultivated by the labour of a smaller number of men. The cause has operated widely in different parts of the world.

(14) *The centralisation of manufactures*, due to the adoption of the factory system, has caused the decay of village industries such as hand-loom weaving, and has lessened the importance of the village craftsmen.

(15) *The direct attraction of large towns*, not merely as offering higher wages to labour, but as affording more interests, more amusements, in short, more "life," is a potent factor in promoting depopulation in rural districts.

(16) *Improved education and a cheap press* make men more ambitious and more restless, while by familiarising them with new ideas they make them less fearful of change. Moreover in rural districts compulsory education tends to prevent children from being early apprenticed to the soil, and learning the manifold duties connected with agricultural labour.

(17) *The rise in the standard of living* is a very potent and widespread cause of migration, and hence of rural depopulation. Men are no

longer content to live under the old conditions which satisfied the few wants of their grandparents; they want better food, better clothes, better houses, and shorter hours of labour; to obtain these things they must earn better wages; hence they are stimulated to leave their homes in search of more remunerative employment than their native villages afford. This cause has no doubt been largely operative in keeping up the great stream of emigration from Ireland, a stream which commenced to flow long before the potato famine brought it into notoriety.

(18) *Improved communications*, railways and steamships, co-operate powerfully with many of the above causes to accelerate the depopulation of the rural districts; they bring corn from distant countries where it can be grown more cheaply, and so bring down prices; conversely they make more fertile soils readily accessible to settlers; they bring manufactured articles to remote country places and so injure village industries; they facilitate the removal of labourers to factories and mines; they even, as in the case of Cornwall, transport miners to richer and more easily worked lodes in distant lands; in a few cases they lead to local depopulation by diverting old lines of traffic.

(19) *Improvements in large towns* lead to the depopulation of their central areas, dwelling houses are turned into places of business or removed to make room for public buildings, while large clearances are made for railways and new streets. This has long been an obvious fact in London, but a like movement is also in progress not only in such towns as Manchester, Liverpool, and Birmingham, but even, as shown by the last census, in Sydney and in Adelaide; no doubt the same is true of most large towns throughout the world.

(20) *An abnormal age and sex constitution of the population*, the result of war or emigration, lowers the marriage rate and consequently the rate of natural increase. In England there is a marked excess of women, in many of her colonies an even more marked deficiency; in Ireland and in many rural districts of England there is a great excess of old people.

(21) *Deferred marriage and the artificial limitation of children* both contribute to depopulation by lowering the rate of natural increase. The first is a powerful cause in the upper and middle classes in England, the second is a still more powerful cause in France, and is said to be in some portions of the United States. To what extent families are thus restricted in England is uncertain, but the practice has many able advocates and the subject is now widely and openly discussed in a manner that would not have been believed to be possible a few years ago. In France the peculiar land system which compels the division of real estate equally among the children makes

small families specially desired. We are not here concerned with ethical considerations.

The economic question arises whether protection, in whatever form applied, can succeed in achieving the result aimed at. In the case of France, which restricts its birth-rate to such a degree that it increases more slowly than any other nation, does France produce as many labourers as she requires? If so, why are there more foreigners in France than in any other country? Does she have to import Belgians, Swiss, and Italians because she has not enough Frenchmen for her needs? The foreign born in France increased from 380,831, or 1.1 per cent of the whole population, in 1851, to 1,126,531, or 2.9 per cent of the whole population, in 1886, numbers and proportions not approached in any other country of Europe. In the interval of fourteen years, between the census of 1872 and that of 1886, the total increase in the population of France was 2,116,082, of which no less than 385,863, or 18 per cent, was due to the increase of the foreign born.

The census of 1891 showed a diminution of the number of foreigners by 13,416, but this is largely attributed to the effect of the alien law of October 1888.

The increase of the population of France in the five years 1886-1891 was only 124,289, by far the smallest increase yet recorded.

Rural depopulation in England and Wales.—

The division of a population into urban and rural is a matter of considerable difficulty, and strict comparisons at successive periods are scarcely practicable. In the *Census of England and Wales 1881* (vol. iv. p. 9) it is shown that whereas "the town population, *i.e.* inhabitants of the districts and sub-districts which include the chief towns" increased in the census intervals since 1851 by 19.41, 18.09, and 19.63 per cent respectively, "the country population, *i.e.* the inhabitants of the remainder of England and Wales, which comprises the smaller towns and the country parishes," increased by 4.12, 7.32, and 7.42 per cent. Again the *Preliminary Report of the Census of England and Wales 1891* (p. viii.) shows that in the ten years 1881-91 the "urban sanitary districts" increased by 15.3 per cent, whereas the "rural sanitary districts" increased by only 3.4 per cent, "and," the report says, "these figures may be taken as representing with sufficiently approximate accuracy the respective increases in the urban and the rural populations." If this be so, our rural population (taken as a whole) is still increasing, but so slowly that we may practically consider it to be stationary. An examination of the (geographical) counties separately shows that Cambridge, between 1851 and 1891, has fluctuated in such a manner that its population has only increased by 3345 in forty years; Dorset lost 4746 in 1871-81, but has regained

3518 in 1881-91; Norfolk lost 7916 in 1851-61, but has much more than made up the loss since; Westmoreland lost 819 in 1871-81, but has gained 1907 in 1881-91; Wilts lost 6969 in 1841-61, but has gained 15,653 since; but on the other hand Cornwall has lost continuously since 1861, in all 46,801, or 12·7 per cent; Hereford since 1871, in all 9384, or 7·5 per cent; Huntingdon since 1861, in all 6478, or 10 per cent; Rutland since 1851 (with a slight exception), in all 2324, or 10·1 per cent; Shropshire since 1871, in all 11,787, or 4·8 per cent. It will thus be noted that the decrease has amounted to about $\frac{1}{3}$ in Cornwall and $\frac{1}{4}$ in Rutland and Huntingdon. In the decade 1881-91, out of twelve Welsh counties no less than nine declined in population; in Carnarvon, Flint, and Merioneth, this is something new, but in Cardigan it dates from 1871, in Brecknock and Pembroke from 1861, in Anglesea from 1851, and in Montgomery and Radnor from 1841. This result may be put in another way; while the population of England and Wales has been steadily growing, the following counties are practically in the same (absolute) position as they were many years ago, viz., Dorset as in 1871, Shropshire as in 1861, Hereford, Huntingdon, Brecknock and Pembroke as in 1851; Cornwall, Rutland, and Anglesea as in 1841, Cardigan as in 1831, Montgomery and Radnor as in 1821. The depopulation of rural Wales began much earlier, and has been much more intense, than in England; Cardigan and Montgomery were literally decimated in the ten years preceding the last census.

The *Preliminary Report* 1891 (p. vi.) says: "The increase of population was by no means equably spread over the country. In 271 of the 632 registration districts into which England and Wales are divided for registration purposes, the returns show an actual falling off in the number of inhabitants, and in 202 out of these 271 districts there had also been a decline of population between 1871 and 1881." A comparison, district by district, of the census of 1891 with that of 1881 shows that the process of depopulation of the more rural registration districts was notably less rapid in the latter period than the former in the following registration counties, Hants, Berks, Bucks, Oxon, Hunts, Beds, Cantab, Essex, Suffolk, Wilts, Dorset, Devon, Cornwall, Somerset, Worcester, Westmoreland, Glamorgan, and Brecknock. It was however notably more rapid than during the preceding decade in Sussex, Northants, Hereford, Salop, Rutland, Lincoln, Nottingham, Yorkshire, Northumberland, Cumberland, and in most of the Welsh counties.

If we look still more closely into the case of Norfolk, Suffolk, and Essex, three typical counties in the corn-growing country, we find

the following interesting facts. In Essex there are four, in Suffolk seven, and in Norfolk nine districts in which every census since 1851 has shown a decrease of population. This amounted in the four Essex districts to 11,185 or 12·9 per cent, in the seven Suffolk districts to 20,809 or 16·4 per cent, and in the nine Norfolk districts to 20,300 or 11·6 per cent. The greatest decline occurred in the Hoxne district (Suffolk) viz. 26·8 per cent; the least in the Smallburgh district (Norfolk), viz. 6·8 per cent. In general terms, in country districts in the eastern counties a decrease of from $\frac{1}{4}$ to $\frac{1}{2}$ of the population was not uncommon—a true *decimation* but scarcely a true *depopulation*.

For a very able and complete analysis of the facts as to depopulation in the county of Huntingdon, a paper by Dr. William Ogle in the *Journal of the Royal Statistical Society* (vol. lii., 1889, p. 205) should be consulted. The chapters by Mr. H. Llewellyn Smith in Mr. Charles Booth's *Life and Labour* are also very instructive.

Rural Depopulation in Scotland.—Although the population of Scotland has increased in every decade of the present century, the phenomenon of so-called depopulation has been exhibited in limited areas. Three counties, Perth, Kinross, and Argyll reached their maximum in 1831; one, Inverness, in 1841; five, Sutherland, Ross and Cromarty, Dumfries, Kirkcudbright, and Wigtown, in 1851; five, Shetland, Orkney, Caithness, Berwick, and Roxburgh, in 1861; three, Nairn, Elgin, and Haddington, in 1881. In contrast to these the increase has been steadily maintained at each census in Banff, Aberdeen, Forfar, Fife, Stirling, Dumbarton, Renfrew, Ayr, Lanark, Linlithgow, Edinburgh, and Selkirk; and these counties contain seven out of the eight large towns of Scotland. In several counties the decrease has been intermittent, but in the case of Shetland, Caithness, Ross and Cromarty, Berwick, and Wigtown it has been steadily maintained. The seventeen declining counties had in 1891 a collective population numbering 91,654 less than the sum of their several maxima. Argyll has lost 25,028, Perth 16,038; the percentage decline varies from 31 in Kinross, 25 in Argyll, 17 in Wigtown, and 15 in Sutherland, to less than 5 per cent in Nairn, Haddington, Elgin, and Roxburgh. It should be observed that although the depopulation is most evident in the Highlands, and more especially in the extreme north and west, yet six of the lowland counties have together diminished by nearly 20,000 persons. The most active causes of this depopulation have been the application of machinery to agriculture, and the attracting force of the labour markets of Glasgow and the north of England. The diminution in the northern and western counties may probably be mainly attributed to a rise in the standard of living and consequent emigra-

tion since the poor soil did not afford employment for more labourers, but no doubt the concurrent extension of sheep farming, and in a few cases the formation of deer forests, have contributed to the result. Where the barrier of the sea has tended to check the beneficial operation of migration, as in Lewis, the population has continued to increase, with the disastrous results that are too familiar.

Depopulation in Ireland.—The case of Ireland is at once so important and so instructive as to merit especial attention. A century ago Ireland was a by-word for poverty; the people had few other resources than tilling the soil, and this they did in a careless manner, demoralised as they were by long dependence almost solely upon the potato, a crop which in fair seasons gives food for forty persons by the labour of one. The Irish lived under almost the lowest standard conceivable, miserably clothed and fed and even more miserably housed, and were almost chronically on the verge of starvation. Famines occurred in 1814, 1816, 1822, and 1831. Under these distressing circumstances the population continued to increase till at the census of 1841 it numbered 8,196,597. Even at that time the pressure of population upon the means of subsistence had begun to seek relief by emigration, and the census of 1841 showed the population to be considerably less than had been anticipated (see *Census of Ireland 1841*, vol. i. p. ix.); in fact no less than 428,471 emigrants are recorded as having left Ireland for the colonies, and 104,814 for Great Britain, during the decade 1831-41. Nevertheless the population continued to increase, and is believed to have reached about 8,295,061 by the middle of the year 1845, which would give a density of 525 to the square mile. It is true that the density of the population of England and Wales in 1891 was 458 to the square mile, in Belgium 535, and in large districts of Bengal ranges from 555 to no less than 706, but the first-named countries have great wealth in minerals and manufactures with which to buy food from other countries, the latter has a very fertile soil and a tropical climate. The potato rot appeared in 1845 and again in 1846, the main food supply of the people failed, and famine was inevitable. It reached its height in 1847 and was, as a direct result, accompanied by severe epidemics of typhus and relapsing fevers. It is believed that starvation and fever between them claimed from 200,000 to 300,000 victims, but when the people were again numbered in 1851 the population had shrunk to 6,074,278, or 1,622,319 less than in 1841, but 1,720,788 less than the supposed maximum of 1845. The population thus diminished by 20 per cent in six years! The greater part of this startling depopulation was of course due to the great exodus in 1847 and the following years, when the Irish poured into

Liverpool and Glasgow and spread themselves over England and Scotland, while every ship sailing for Canada and the United States was filled with Irish emigrants.

The decrease affected every county in Ireland except Dublin (it was least in Leinster, greatest in Connaught), but while this unexampled depletion of the rural districts was taking place, there was an increase in nine town districts amounting in the aggregate to 77,519. Belfast and Dublin each added some 25,000 to their numbers, and the increase amounted to 6 per cent in Cork, 10½ per cent in Limerick, 11 per cent in Dublin, and 33 per cent in Belfast. Meanwhile the census of 1851 showed that the extent of land under tillage had increased by 2091 square miles, and the value of the agricultural stock and crops was greater than any previously recorded. No fewer than 355,689 "fourth-class houses," mostly mud cabins, had disappeared, whereas the houses of the first class had increased by 10,084, and those of the second class by 54,574. In short the depopulation was accompanied by a very notable rise in the standard of living.

Subsequent enumerations have shown the same thing,—a steady, though less rapid, diminution of population accompanied by a rise in the standard of living. The census of 1861 showed a further loss of population amounting to 753,418; that of 1871 a loss of 386,590; that of 1881 a smaller loss, 237,541; but that of 1891 shows a return to larger figures, 468,674. The total diminution of the population of Ireland since 1841 amounts to 3,490,435, or 42·6 per cent, distributed as follows: 786,451 in Leinster, or 39·7 per cent; 1,235,466 in Munster, or 51·4 per cent; 771,386 in Ulster, or 32·3 per cent; 697,132 in Connaught, or 49·1 per cent. Except Dublin and Antrim, and Kerry in 1881, every county has diminished in numbers each decade since 1841. The mud cabins have now nearly disappeared, but on the other hand there is some increase in overcrowding of tenement houses in the large towns.

In the half-century during which this great and real depopulation has been going on, the inhabitants of Cork and Waterford have diminished by 7 per cent; those of Galway, Limerick, and Drogheda by between 20 and 30 per cent; those of Kilkenny by 42 per cent; but on the other hand Newry has increased by 10 per cent, while Londonderry has doubled and Belfast considerably more than trebled its population: the latter city in its rapid progress has indeed rivalled some of the most prosperous English towns. The city of Dublin increased in the same period by 7 per cent, but "greater Dublin," including the suburbs, by 24 per cent.

Rural Depopulation in France.—It is well known that the exceptionally low birth-rate of France involves a correspondingly small rate of

natural increase ; it is perhaps not as well known that depopulation of country districts is a no less striking phenomenon in France than in England ; while it need scarcely be mentioned that the conditions of land tenure are as different as can well be imagined. The population of the whole country continues to increase slowly, a large proportion (about a fifth) of this increase being due to the immigration of foreigners, at the same time in thirty-nine out of the eighty-seven departments the present population (census 1886) is less than that of 1861. The absolute decrease amounts to between 20,000 and 30,000 for the twenty-five years in Gers, Lot, Lot et Garonne, Haute Saône, Somme, and Vaucluse ; it is between 30,000 and 40,000 in Eure, Mayenne, Sarthe, and Var ; it is no less than 43,725 in Calvados, 56,102 in Orne, and 70,556 in Manche. As a rule the densely populated departments have increased in density, while the sparsely populated have lost population. A careful analysis of a table in the report of the census of 1886 shows that of the 361 *arrondissements* into which France is divided 124 appear to be still increasing in population, while 61 attained their maximum by 1841 or before, 56 attained their maximum at the census of 1846, 44 at that of 1851, and 76 in the following thirty years. It would appear therefore that some crisis in rural economy occurred during the years 1846-51, which led to no less than 100 *arrondissements* reaching their maximum at about that time. The decrease in population from the maximum in 21 *arrondissements* reached a degree ranging from 10 to 23 per cent.

The Preliminary Report of the census of 1891 continues the same story. In no less than 55 out of the 87 departments there was a decrease of population, amounting in all to 399,001. The decrease was most marked (exceeding 10,000) in Lot, Aveyron, Aude, Dordogne, Gers, Orne, Lot et Garonne, Tarn, Yonne, Aisne, Ariège, and Haute Saône. The net increase of the whole country was the smallest hitherto recorded, viz. 124,289. At the same time the 57 large towns exhibited a net increase of 340,396, proving conclusively that there had been a migration from country to town of not less than 216,107 in the five years.

Other European countries.—The tendency of people to flock into cities, which has been shown to be closely related to rural depopulation, has been illustrated as regards Germany, Holland, Austria, Hungary, Sweden, France, and Italy, by Mr. E. G. Ravenstein (*Journal of the Royal Statistical Society*, vol. lii. 1889, p. 241), and as regards Germany, by M. le Vicomte Rovrie de Beaucaire (*Bulletin du Ministère de l'Agriculture de France*, Fév. 1886).

Rural Depopulation in the United States.—Perhaps the last place where we should expect to find this phenomenon is the United States,

yet that country is not without examples of it. The census of 1890 showed that the state of Nevada had lost in the decade no less than 16,505 persons, or more than one-fourth of its population ; this is attributed to the failure of the Comstock and other mines. No other state actually diminished in numbers, but if the distribution of the population by counties be analysed it will be found that a considerable total depopulation has occurred, notably in the following states : Maine, Vermont, New York, Maryland, Virginia, North and South Carolina, Ohio, Indiana, Illinois, Iowa, Kentucky, Tennessee, Mississippi, Colorado, Arizona, and California. When a period of thirty years is considered it will be found that the three New England states of Maine, New Hampshire, and Vermont have increased very slowly. Again, if we divide the population in each of these states into urban and rural (a division not without its difficulties), it will be found that the rural population of Maine is now smaller than it was in 1860, that of Vermont smaller than it was in 1870, while those of Massachusetts, Rhode Island, and New York have all decreased considerably during the last decade. In addition to many of the causes that have operated in Europe, the state returns show that large numbers of New England farms have been abandoned, either because the soil was naturally poor, or exhausted by an improvident system of farming, or because the farms were inconveniently situated far away among the hills. Thus it happens that much of the soil of New England has passed out of cultivation, the former cultivators having either gone into the great cities or migrated to the fertile soils of the western prairies. One thing is certain, the movement cannot be attributed to an aristocratic or exclusive land system.

Economic Results.—In considering results, our attention will be confined to such depopulation of rural districts as has occurred in the British Isles.

There is no doubt that the present tendency is for the rural population to be reduced to the lowest point consistent with the due cultivation of the land, and for all subsidiary industries to move, so far as practicable, into larger centres, with the well-known result that the proportion of modern civilised populations living under town conditions is a gradually increasing one. In spite of all our sanitary progress a population reared in a town can scarcely hope to be as hardy and vigorous as one born and bred in the country, so that some amount of racial degeneration appears to be inevitable.

Remedies.—All deplore the diminished numbers of our rural population and many have sought by legislative or other interference to check the evil. Bad government may of course be improved, religious persecution may be made to give way to toleration, bad laws may be

repealed, oppressive taxation may be removed or its burthens equalised, but it is obvious that the causes of the depopulation of rural districts are too deep-seated to admit of eradication. The great fundamental economic law of supply and demand will not admit of denial. The provision of allotments for labourers, if judiciously carried out, might be very beneficial; an amendment of the land laws, especially by making public all mortgages and charges on land by a system of registration, and so facilitating and stimulating the transfer of land, would make our land system healthier. An extension of market gardening would of course *pro tanto* employ more hands; something may possibly be devised to foster the growth of village industries; more businesses may be transferred from London to small country towns, as has already been done in the printing trade; country life may be made less dull,—still the countryman will wend his way to London, Glasgow, or Belfast, to New York or Montreal, to Sydney or Melbourne. The remarkable uniformity of the growth of large towns, not only in every country of Europe, but in America and Australia, proves conclusively that it is no question of land laws that regulates the matter. Do not let us deceive ourselves by expecting that results will in this country follow land-law reforms which have not appeared in other countries where a diametrically opposite system has been established. The modern man prefers to live in a town, improved means of communication enable him to accomplish the object of his desires, and no effort will prevent him from doing so, or will succeed in attaching to the soil a greater number of labourers than is absolutely required to produce sufficient supplies of food under the easiest conditions attainable.

The following extracts from the *History of New South Wales from the Records*, G. B. Barton (1889), vol. i. 1783-1789 show the apprehensions once felt that the establishment of the new colonies would deplete the parent country.

Page 8.—Sir George Young sketched the prospective advantages of the settlement in the following form. . . . 4. The settlement of the country would not tend to “depopulate” the parent state, as the settlers would be principally collected from the Friendly Islands and China; the only men required from England being a few skilled workmen, who might be drawn from the ships sent out on the service.

Page 439.—Sir G. Young’s proposal—

At a time when men are alarmed at every idea of emigration, I wish not to add to their fears by any attempt to depopulate the parent state; the settlers of New South Wales are principally to be collected from the Friendly Islands and China; all the people required from England are only a few that are possessed of the useful arts, and those comprised among the crews of the ships sent out on that service.

G. B. L.

DEPOSIT (SALES OF LAND). It is usual, on the sale of land or houses, for the purchaser to deposit a sum (generally £10 per cent of the purchase-money) as soon as the bargain is concluded, which on completion is considered as a payment on account of the purchase-money, and in case of non-completion through the purchaser’s default is forfeited to the vendor. When the sale takes place by auction the deposit is generally paid to the auctioneer, who holds it as stakeholder for both parties, but in the case of a private contract the deposit is usually paid to the vendor. In cases where the vendor is not entitled to receive the purchase-money, or is only entitled to a part of it (as in the case of a sale by a tenant for life under the Settled Land Act, or by a mortgagor), it is safer for the purchaser to pay the deposit to the vendor’s solicitor as stakeholder, or to pay it into a bank to the joint account of his and the vendor’s respective solicitors [cp. EARNEST MONEY]. E. S.

DEPOSIT (DEPOSITS). The term “deposits” is used in banking in a technical sense. In considering this it must be remembered that banks may be divided into three classes—banks of issue, of discount, and of deposit. In the first the banker trades with the capital of the public, in the second with his own capital, and in the third, by far the most important at the present day, with that of his customers. Although in its present development deposit banking is entirely modern, as an institution it is of ancient origin. The *Trapezitæ* of Athens received deposits at least as early as the sixth century B.C. They held money at interest, and also took deposits specially for the purpose of payment to a third party, but it is not certain that they kept running accounts. In Rome, both the *ARGENTARIII* (*q.v.*) or private money lenders, and the *MENSARII* (*q.v.*), who were appointed by the state, received money on deposit, in addition to money-changing and money-lending. They kept two classes of accounts. On the one interest was paid, the account was then called *creditum*. On the other, called *depositum*, no interest was paid, the lodgment being for safety or for convenience of payment to a third party, upon verbal request, or written authority of the depositor, but it is not certain whether this assignment or cheque (*attributio, perscriptio*) was transferable. In the middle ages the banks of Venice and Genoa, although primarily incorporations of public creditors, also took deposits, although it does not appear whether they paid interest upon them, or lent out the moneys held. The chief function of these banks as well as those of Amsterdam and Hamburg (see *BANKS, EARLY EUROPEAN*) was to remedy the deficiencies of the circulating medium, which consisted of coins of different countries and kinds, all more or less clipped or defaced. Owing to the difficulty of dealing with

such a currency it became the practice to deposit it in the bank, and to make transactions in bank money. These deposits could not generally be withdrawn, but might be transferred to the credit of other persons. Banks of this class did not lend out any part of their deposits, and therefore did not increase the circulating capital of the country. Out of them arose the banks of issue, dating from the 17th century, which have now, among English-speaking races at least, very largely given place to the modern banks of deposit. In these the cheque has taken the place of the bank note, and by the convenience of this instrument banking has reached a degree of development of which it had not previously been supposed capable (see BANKS and CHEQUE, LAW OF).

The term "deposit" is now used both *generally* and *specially*. *Generally*, it denotes the whole amounts lodged in a bank under whatever conditions held. *Specially*, it denotes money lodged at interest, usually in round sums, and not subject to cheque at sight, a *deposit receipt* being given against every sum paid in, which receipt must be given up on repayment. In its special application the use of the term is the reverse of that which obtained among Roman bankers as quoted above. Connected with the special use of the term is the subject of deposits in Savings Banks (see BANKS). Circulating capital deposited in these banks is not available for the daily needs of business, as their funds are invariably employed in fixed investments, but they are more useful than if hoarded. Banking deposits are frequently taken as an index of prosperity. In comparing returns of deposits held in different countries, or at different times, regard should be had to the following considerations among others. (1) The proportion of the whole banking institutions comprised in the returns under discussion. In comparisons as to time, important alterations may have taken place, so that returns at one date may show deposits previously existing but then concealed. This may be due to (a) greater perfection in returns, or (b) change in character of banking institutions, *e.g.* gradual adoption by private banks of practice of publishing accounts, or their absorption by banks already publishing. (2) Character of banking institutions. A number of single banks will show large amounts of deposits with each other, which would not appear at all in the case of a few large banks with many branches, *e.g.* some 300,000,000 of dollars (say £60,000,000 sterling) of such cross deposits are held by the national banks of the United States. (3) Peculiarities in making up balance sheets or returns, *e.g.* in the United States clearing exchanges are always made in the morning, therefore the whole clearing appears among the assets of the previous day, and the deposits are larger by a corresponding amount. Thus in

returns of national banks at different selected dates we find—

	1869. mlns. \$	1880. mlns. \$	1890. mlns. \$
Deposits	678	1280	1925
Clearing Exchanges	154	244	84
Net Deposits	524	1036	1841

In sterling, converting the \$ as 5 = £1.

	1869.	1880.	1890.
Deposits	£135,600,000	£256,000,000	£385,000,000
Clearing Ex.	30,800,000	48,800,000	16,800,000
Net Deposits	£104,800,000	£207,200,000	£368,200,000

Between the first and last dates the increase in gross deposits is 184 per cent, in net deposits 251 per cent. (4) Characteristics of business in different countries, *e.g.* as between France and the United States, where totally different financial methods prevail. (5) Characteristics of banking in different countries, *e.g.* Australasian banking, where probably one-fourth of the deposits shown at the present date are drawn from the United Kingdom, and therefore should be deducted in estimating the wealth of those colonies.

R. W. B.

DEPOSITION. In the wider sense deposition means the act of giving evidence in a judicial proceeding. In its narrower sense it means evidence so given which has been recorded in writing. It is a fundamental principle of the English law of evidence that wherever it is possible a witness must be produced in court to be personally examined and cross-examined; and, if this can be done, no record of evidence formerly given by him will be accepted as a substitute for appearance. If the witness cannot be produced either because he is dead or too ill to travel, or insane, or kept out of the way by the person against whom his evidence is used, then his deposition is admissible. But in this case the person against whom the evidence is used in a criminal case must have had the opportunity by himself or his legal adviser of cross-examining the deponent. When any person has been arrested upon the charge of committing an indictable offence, the magistrate before whom he is brought should cause all the evidence given to be taken down in writing. Magistrates are also empowered to take the depositions of persons who are so ill that they are not likely to be alive at the time of the trial.

[See Stephen, *Digest of the Law of Evidence*, art. 32 and 140-142].

F. C. M.

DEPOSITUM. Expression of Roman law for the contract which arises when goods are left in some person's custody, no reward being given to that person for keeping them. E. S.

DEPÔTS ET CONSIGNATIONS (CAISSE DES). A public establishment in France charged to receive and manage under the responsibility of the state all obligatory deposits of money or securities, comprising the funds of benefit societies and savings banks, guarantee money, judicial consignations pending judg-

ment, unclaimed successions, endowments of public institutions, pension funds, etc. The Caisse was charged with the sinking fund of the public debt until its suppression. It also receives voluntary deposits; but the amount is unimportant since the interest has been reduced to 1 per cent. The total liabilities of the Caisse, on the 31st December 1889, amounted to £163,213,166, nearly three-fourths of which were to the savings banks. The funds are employed in rentes, treasury bills, and advances to public bodies; the revenue being credited to the different classes of deposit accounts at variable rates of interest.

T. L.

DEPRECIATION. Depreciation is a term used by accountants to describe the reduction in value that takes place in the machinery and plant of a factory or other undertaking in which industrial operations are carried on, which reduction in value must be provided for in the account of profit and loss, before arriving at a present value. Manufacturers, shipowners, or others who treat the annual earnings of their property as income, deducting only the actual outgoings for repairs will soon find themselves with a diminished capital. But, while repairs alone will not maintain a full value or balance the inevitable effects of time and use, the necessity for depreciation may be reduced or avoided by an expenditure out of current earnings for renewals and extensions. Depreciation arises from various causes, but among manufacturers it is generally confined to the loss by "wear and tear." Thus in the statutes under which the inland revenue is collected the commissioners who make the assessments for income tax are authorised "to allow such deductions as they may think just and reasonable as representing the diminished value by reason of wear and tear during the year of any machinery or plant used for the purposes of the concern." But a reduction in value may arise from other causes. For in arriving at the present capital value of machinery or plant it must also be considered whether any of it has become obsolete or has, owing to changes in trade, a less earning power than formerly. Alterations in value may be dealt with in various ways. The most usual is, to write off in each annual account a percentage from the capital value of the preceding year, this percentage either differing for the various classes of plant such as buildings, boilers, machinery, and horses, or being an average rate over the whole. This system of dealing with a constantly reducing value spreads the depreciation over a long period. For 5 per cent so applied would, in 20 years, still leave 36 per cent of the original value. The rate of depreciation may have to be varied. Thus if owing to active trade a manufactory has been working longer hours than usual, or the machinery has been forced to meet an exceptional demand, it is proper and prudent

to write off more than usual for wear and tear. On the other hand dull times and short hours may justify a lower rate than usual, though it must be remembered that buildings and plant deteriorate even when idle. Notwithstanding this annual depreciation the tendency of most concerns is to grow in value owing to the expenditure for extensions, which may under such a system be properly added to the capital value. But whatever the methods adopted for estimating and stating the depreciation, it may be said in regard to any of them that the object in view is so to treat the nominal capital in the books of account that it shall always represent as nearly as possible the real value.

Occasional valuations may serve as a useful check in the correctness of a depreciation system, and it is frequently from the inconvenience and cost of making them that they are not made every year. An error may be in either direction. Where there is only one proprietor or few partners, an excess of caution may do no harm, the real value remaining even if too much is written off for depreciation in the books of account. But such an excess is unfair in the case of shareholders who may have only a fleeting interest in the undertaking, and who, not being made acquainted with the details of the annual "profit and loss" accounts, may suffer a diminution of income and a reduced value in their shares for the sake of those who will be shareholders hereafter. Where the nature of the property may render it difficult to estimate correctly the rate of depreciation, the case is sometimes met by establishing a *RESERVE (q.v.)* which, standing separately in the accounts, shows to all concerned a fund available for division in the future. Sometimes depreciation in value is met by the establishment of a *SINKING FUND (q.v.)* Thus the tenure of land or buildings may be shortening; the exclusive patent rights of valuable machines or processes may have only a short time to run; or the minerals in a mine may be consuming. In each of these cases a fund is necessary to give back the capital that has been originally embarked in the undertaking. In some cases the gross earnings are divided each year as income among the shareholders, each of whom is left to provide his own sinking fund. So long as the facts are clearly known to all concerned one system may be as good as the other. In large permanent undertakings like railways there is generally no separate system of depreciation, it being deemed that the value of the property is shown to be maintained by the continual working and by taking care that expenditure for renewals is all defrayed out of current earnings.

But while, in a large undertaking like a railway, the annual expenditure for repairs and renewals may fairly balance the deterioration that is continually going on, smaller concerns

not having so extensive a plant may be subjected to irregular outgoings that will disturb the annual average rate of profit. In some such cases instead of providing beforehand for exceptional renewals by a depreciation rate or reserve fund, the necessary money is borrowed and charged to a *SUSPENSE ACCOUNT* (*q.v.*) which is paid off by instalments in future years. This is obviously unsound where the expenditure has merely maintained or restored the earning power of the concern, and has not increased it.

E. M.

DEPRECIATION OF MONETARY STANDARD may be defined as the lowering of the value of money in relation to goods. The conception of a change in the value of the thing in relation to things in general is not quite clear; and has been pronounced invalid by high authorities. Thus J. S. Mill speaks of the "necessary indefiniteness of the idea of general exchange value—value in relation not to some one commodity, but to commodities at large" (*Political Economy*, bk. iii. ch. xv. § 1). "We cannot even suppose any state of circumstances" in which the idea would be definite. Yet, as Dr. Sidgwick has observed (*Political Economy*, bk. i. ch. ii.), the same Mill, in the chapter next but one preceding, says that "during the last five years of our long struggle with Napoleon . . . the value of the standard itself was considerably raised"; meaning "an enhancement in the value of gold" in relation to commodities. With a like appearance of inconsistency Ricardo has some passages like the following:

"It has indeed been said that we might judge of its value [the value of a currency] by its relation not to one but to the mass of commodities. . . . Such a test would be of no use whatever. . . . To determine the value of a currency by the test proposed . . . is evidently impossible" (*Proposals for an Economical and Secure Currency*, § 2).

"When we speak of the high or low value of gold, silver, or any other commodity in different countries, we should always mention some medium in which we are estimating them. Thus, when gold is said to be dearer in England than in Spain, if no commodity is mentioned, what notion does the assertion convey? . . . Gold appears dearer or cheaper in Spain as the fancy of the observer may fix on the medium by which he estimates its value" (*Political Economy*, ch. xxviii.) But elsewhere Ricardo implies the conception which is in question: "In saying that gold is at a high price we are mistaken; it is not gold, it is paper which has changed its value. Compare an ounce of gold, or £3 : 17 : 10½, to commodities, it bears the same proportion to them which it has before done" (*High Price of Bullion*; Works . . . by M'Culloch, p. 279, ed. 1888). The difficulties urged by Ricardo and

J. S. Mill show that variations in general prices cannot be precisely determined. That it is not wholly indeterminate their admissions show—backed by the reasoning of other theorists, especially MALTHUS and JEVONS (*q.v.*), and the evidence of ordinary language. That there was a depreciation of money in relation to things in general, after the influx of gold from California in this century, few deny; that there was such a depreciation after the influx of silver from America in the 16th century, all admit.

Depreciation as here defined is theoretically ascertainable by observing the variation of the price of each of a number of articles, and taking the average of those variations. For discussion of the different methods of taking such an average see **INDEX-NUMBER**.

A summary method of ascertaining depreciation is afforded by the use of some one typical article as a *measure of value*—"a measure of the power of purchasing generally, or of commanding such important commodities as the necessities and conveniences of life" (Malthus, *Measure of Value*, p. 2). As the article best fitted for this purpose Malthus selects *Labour* (*Pol. Econ.*, 2nd ed. ch. 2.—J. Bonar, *Malthus and his Work*, bk. iii. ch. 2). According to this view the depreciation of money is measured by the diminution in the quantity of labour which can be purchased for the same amount of money. Corn also has been proposed as a measure of value when the comparison is between distant periods (Adam Smith, *Wealth of Nations*, bk. i. ch. v.) An average between corn and labour is proposed by Malthus in the first edition of his *Political Economy*. In this connection should be mentioned Mill's statement: "To obtain an approximate measure by which to estimate value in use, perhaps nothing better could be chosen than one day's subsistence of an average man, reckoned in the ordinary food consumed by the class of unskilled labourers" (*Pol. Econ.*, bk. iii. ch. xv. § 2).

A measure proper for thus determining the depreciation of a debased coinage or an inconvertible paper money is bullion. A means of applying this measure is afforded by the **EXCHANGES** (*q.v.*) As Ricardo says: "While the circulating medium consists . . . of coin undebased, or of paper-money immediately exchangeable for undebased coin, the exchange can never be more above or more below par than the expenses attending the transportation of the precious metals. But when it consists of a depreciated paper-money [or of a clipped coinage] it necessarily will fall according to the degree of depreciation. The exchange will therefore be a tolerably accurate criterion by which we may judge of the debasement of the currency" (*High Price of Bullion*; Works, p. 274). It was thus that the depreciation of the

paper-money in England during the latter part of the Napoleonic war was shown to be from 15 to 20 per cent. The accuracy of such determinations countenances Ricardo's dictum that "it can only be by a comparison to this standard that . . . depreciation may be estimated."

Depreciation proper perhaps the lowering of value thus measured might be called; it is not necessarily coincident with depreciation in the general sense above defined. Thus Mill in a passage above cited (*Pol. Econ.*, iii. 13, 6) states that in the Napoleonic war "paper, though depreciated relatively to the then value of gold, did not sink below the ordinary value at other times either of gold or of a convertible paper." Professor Walker adduces evidence that the premium on gold, the depreciation of the paper currency in Ricardo's sense, "does not measure the advance of general prices," the depreciation in the other sense of the term.

The propriety of the definition here adopted is that from it flow the chief consequences for good or evil which are attributed to depreciation. (1) A first approximation to an estimate of those consequences is that they are insignificant. Money being regarded as consisting of counters, it is indifferent whether there are more or fewer such. "Let us suppose that to every pound or shilling or penny in the possession of any one another pound, shilling, or penny were suddenly added . . . this increased value would do no good to any one; would make no difference, except that of having to reckon in higher numbers" (Mill, *Pol. Econ.*, bk. iii. ch. viii. § 2, and cp. ch. xiii. § 4). (2) A less abstract view takes into account the disturbance of contracts for deferred payments; the gain to debtors and loss to creditors, and persons with fixed incomes. As producers often belong to the former class, it has been held that, when prices are rising, "everything takes a new face; labour and industry gain life" (Hume, *Essay on Money*). On the other hand Adam Smith says of a debased coinage in a passage which, according to Ricardo, is "equally applicable to a depreciated paper currency" (*High Price of Bullion*; Works, p. 289), "it occasions a general and most pernicious subversion of the fortunes of private people; enriching in most cases the idle and profuse debtor at the expense of the industrious and frugal creditor" (*Wealth of Nations*, bk. v. ch. iii. p. 423, ed. M'C.). Different effects doubtless attend different species of depreciation. That which is due to government tampering with the currency is probably the most deleterious. (3) A nearer approximation to an estimate of the disturbance caused by the depreciation of a currency is obtained by taking into account the different degrees in which the prices of different articles are raised. Inconvertible paper-money issued by the government of a country at war is apt to swell first the prices

of war-materials. Again a change in the agio of gold in relation to inconvertible paper may make itself felt in articles of export and import sooner than in the inland trade (see Adolph Wagner, *Russische Papierwährung*, and Krämer, *Papiergeld in Oesterreich*, 1885). The following seems to be the order in which different classes of articles are in general reached by a course of depreciation: first, wholesale commodities; second, retail commodities; third, labour. (4) A peculiar evil of a depreciated paper-currency is that its value is usually fluctuating. The evils of such fluctuation are well stated by Professor Walker (*Wages Question*). There is reason to think that a fluctuating currency favours the large capitalist, who is best able to weather such disturbances. In the case of clipped coinage ill effects are produced by the difference in the value of the coins according as they are more or less worn (Walker).

[For the general principles of the subject see the leading authorities which have been cited. Additional particulars relating to the consequences of depreciation may be found among the following:—W. Y. E.

DEPRESSION, AGRICULTURAL. Industrial enterprises are so inextricably interlaced that agricultural depression cannot be dis severed from commercial depression. A glance over the last twenty-five years reveals one prime factor in existing financial and social disturbances and many concurrent causes. The prime factor is the substitution of machines for men and the consequent increase in the facilities for the production and rapid distribution of produce. One tendency of this development of labour-saving agencies, sea and land carriage, and telegraphic communication, has been to extend uniformity of prices, to increase the stress of foreign competition, to render depression not local but almost universal. Subject to differences produced by commercial policy, the civilised world has now but one market, and suffers or prospers together. Another tendency, which has little direct bearing on agricultural depression, has been to supply the world so completely with manufactured articles that a danger of a glut arises. A third has been to disturb the parts played by capital and labour respectively. First, handicrafts and domestic manufactures were swallowed up by the machinery of individual capitalists; then, the last was in turn

displaced by associated capital, combined in increasing masses till little is left but the largest establishments. Small shops, small factories, small banks, small sailing ships for ocean transport, are replaced by stores, gigantic syndicates, joint-stock companies, huge ocean steamers. A fourth result has been the destruction of great quantities of what once was accounted wealth. To take one illustration only. The opening of the Suez Canal extinguished the sailing tonnage constructed to make the voyage round the Cape, and the new ships that were built to take the place of the old sailing vessels were displaced five years later by steamships. A fifth result has been temporary or permanent diminution of employment. For instance, the application of steam and machinery on farms, wharves and docks, on shipboard, and in factories, has thrown enormous numbers out of work. The saving effected in different departments of industrial effort by this displacement of muscular labour, this substitution of machines for men, varies from 80 per cent in the shoe trade to 40 per cent in the manufacture of machinery (*United States Bureau of Labour Report*, 1886). Agricultural labourers are least affected by this effect of the development of labour-saving agencies, because in many farming operations, and especially in the care of stock, men are needed. On the other hand, agriculturists have felt more severely than manufacturers the pressure of foreign competition which has resulted from the increased facilities of sea and land carriage. The values of agricultural imports rose between 1866 and 1883 from £77,069,431 (average of five years 1866-70) to £157,520,797.

So vast a change necessarily produced distress. Other causes intensified the crisis. Prices were disturbed by appreciation of gold in relation to commodities and depreciation of silver relatively to gold. An exceptional demand for gold and a falling off in the supply (*Report of the Silver Commission*, 1876; evidence of Sir Hector Hay) increased the purchasing power of the metal and lowered prices. At the same time the depreciation of silver, absolutely in relation to commodities in general, owing to the increased yield of silver mines, and relatively to gold, owing to the enhanced value of that metal, disturbed the trade with countries which employ silver or silver and gold as their standards of value. A series of commercial disasters further aggravated the depression. The prosperity of the country reached its height in 1866. Since that date, in spite of temporary inflations, it has never reached its former level. The opening of the Suez Canal (1869) not only brought Indian producers into competition with English, but broke down the system of warehousing and distribution of produce by which England had hitherto benefited. With the year 1870 began an inflation of prices. The

sudden withdrawal of France and Germany from industrial competition enabled England to increase her exports by 10 millions; the requirements of the Suez Canal gave extraordinary stimulus to the shipbuilding trade; the railway development in Germany and America created exceptional demand for coal and iron. In 1874 the reaction began from inflated prices. The decline of the coal and iron trade, the stoppage, partial or absolute, of cotton mills, disputes between masters and men, bad harvests, complications arising out of the Eastern question, the default on the Turkish debt, depressed every industry. But the extent of the weakness existing in some parts of our commercial system was not revealed till the failures of the city of Glasgow, Caledonian, and West of England Banks in 1878. Various causes combined to prolong the reaction against the inflated prices of 1871-73 and the abnormal demand then made for labour and shipping. Of these causes some were foreign, some domestic, some temporary, and some permanent. Fluctuations in the standards of value, hostile tariffs, stagnant trade, keenness of competition, unsettled politics, are the principal causes that come from abroad. At home the prolongation of the depression is attributed to the slow adjustment of supply and demand, owing to the accumulation, between 1870 and 1873, of savings not invested, to over-trading, trades' unions, deterioration in quality of production, commercial failures, mutual distrust, wet or sunless seasons. Of these causes only one, foreign competition, with low prices as its consequence, must necessarily be permanent.

In the first part of the period under review the collapse of agriculture was primarily due to bad seasons; in the second to low prices. An inclement autumn in 1872, and an unfavourable spring, neutralised the fine harvest weather of 1873. 1874 was the last of a cycle of prosperous seasons. Yet rents continued to rise for at least two years longer. From 1875 to 1877 there was a succession of bleak springs and rainy summers, producing short cereal crops of inferior quality, mildew in wheat, mould in hops, blight in other crops, rot in sheep, disease in cattle, deteriorating the finer grasses of pastures, throwing heavy lands into foul condition. Upon British farmers, thus enfeebled by three bad seasons in succession, fell the growing force of foreign competition, which was suddenly quadrupled by the extension of wheat areas in America and India, and the new facilities of sea and land transport, and the low freightage rates of commercial depression. The sunless ungenial 1879 produced the worst harvest of the century. Since 1882 seasons have proved less uniformly inclement, and trade has shown signs of revival. But farmers have lost their capital, and are confronted by the problem of low prices and the difficulty of holding their own against the pro-

duce of rich unexhausted soils. It is probable that for many years to come this competition in corn and provisions will rather increase than decrease.

The results of this collapse of agriculture have been disastrous to the landed interests. The increase in the value of land for the last half century has been lost. The annual income of landlords, tenants, and labourers was less in 1886 (see Sir James Caird's evidence before the commission on the depression of trade) than in 1876 by £42,800,000; of this sum it has been calculated that landlords and tenants lost £20,000,000 each, and labourers £2,800,000. Landlords have reduced their rentals to the point at which they stood in 1836; farmers have lost 30 to 50 per cent of their capital (Sir James Caird's *Victorian Agriculture*); the money wages of labourers have fallen and many have been dismissed from employment. The land has been injured by bad seasons and weak farming; the live stock of the country has been diminished; quantities of crops have been ruined or deteriorated by the weather.

The loss to the agricultural classes is enormous. It is more difficult to estimate the absolute loss to the nation, or the general effect of agricultural depression upon commercial prosperity. The nation suffers by the diminution in the purchasing power of a class, by the destruction of capital through bad harvests, by the restriction in the demand for labour, and by the removal of capital from one industry to another, especially if it be a removal from within to without its boundaries. It does not at once suffer as a nation from the low prices of agricultural produce. Thus in 1851 the supply of meat per head was 91 lbs., and 317 lbs. of wheat were supplied to a population of 27 millions at a cost of £53,500,000. In 1885 115 lbs. of meat were supplied per head at a greatly reduced cost, and 400 lbs. of wheat to 36 millions of people at a cost of £43,700,000. Here then, so long as the money in payment for this food is earned in other industries, the nation profits by the low prices which ruin agriculturists. But it is a question whether there is not a point at which the wider interests of the nation suffer from cheapness of food, if the price becomes so unremunerative as to drive land out of cultivation. As to the general effect upon commercial prosperity, the depression of agriculture destroys a considerable portion of the capital engaged in land, and looks up another in unrealisable investments; tends to congest the labour market by disturbance of the relations of supply and demand for agricultural labour; drives capital from land into other investments, and, by restricting the field, adds to the over-production of manufactured articles.

[The following books and pamphlets treat of the practical side of the subject: Sir James Caird, *The Landed Interest and the Supply of Food*; and

R. E. P.

DEPRESSION OF TRADE. The royal commission appointed in Great Britain in the year 1885, to inquire into this subject, thus defined depression of trade, in the report adopted by the majority of its members:—"A diminution, and in some cases an absence, of profit, with a corresponding diminution of employment for the labouring classes." The particular instance of this depression into which the commission made inquiry was that dating from the year 1875, which was so conspicuously marked in agriculture; but the statement quoted from the report may be taken as a description of what is commonly meant and understood by depression of trade. The phrase, however, is used very freely and very loosely; and it is therefore best to anticipate more particular discussion of the subject by a few considerations which ought to be kept in mind, and which the above definition helps to explain. (1) All classes are not affected by depression of trade. It is to be observed that, in the first instance at least, profit, and profit alone, is by hypothesis curtailed. If wages suffer, they suffer through the lack of employment which results from the withdrawal of capital found to be invested unprofitably. But it is possible that profit might fall simply through the exertions of the labourers to obtain a larger share of the product as wages; and where the labourers are united enough to accomplish this, it follows of necessity that if by Trades Unions they have to maintain the "out of works," they must be able to check competition among themselves. It might be, therefore, that although fewer labourers were employed in a case of depression, those in employment might not suffer but gain. Again,

all persons who are in receipt of fixed salaries or incomes do not suffer from depression of trade; but, inasmuch as one significant phase of depression is a general reduction in prices, they are gainers and not losers. (2) Although the interdependence of industries is such that a diminution of profit in all may be expected to be simultaneous, or nearly so, yet it must be remembered that one industry, or class of industries, may be for a time subject to severe depression while others are flourishing. The retail and carrying trades are in a different position with regard to the earning of profits from the producing trades; for their percentage of profit depends, not on the ratio between cost of production and price, but on the quantity of custom and the number of transactions they engage in. (3) Depression may affect certain traders in one industry, and may not affect others. During the series of bad years, which, like Pharaoh's lean kine, followed and devoured the years of prosperity in which our trade went up by leaps and bounds, there were plenty of people, even in England, who were amassing fortunes in business all the time. Those who are unsuccessful are apt to lament the falling-off of business as the cause of their misfortunes; while the more lucky make no noise about their prosperity. It would be easy, in any trade or profession, to collect a multitude of evidence from people who could truly say their business was depressed, in the sense applied to the word by the commission. (4) We must be careful to discriminate between a genuine depression and that gradual process of thinning down profit which arises from the natural tendencies of our civilisation, and which is not temporary, but permanent. The slow but certain fall in the rate of interest, the larger share demanded and gained by labour, the increased competition, through the spread of education, for the earnings of business management, and the consequent reduction of these earnings, all combine to effect a chronic decline in profit.

The existence of a genuine depression at times, apart from all the above considerations, is undoubted. In Great Britain there have been numerous instances of such depression during this century, the last of which began about the year 1875, and was the subject of the investigations of the royal commission of 1885 mentioned above. But the earlier phases of depression of trade offer in one respect a distinct contrast to the most recent—a contrast which seems to be symbolic of the modern conditions of commerce. While in former times trade was depressed after a period of great inflation followed by a *crisis*, the depression of late years was preceded by no crisis; and while former stages of depression passed away with some rapidity and gave place in turn to a period of inflation, the revival of trade

which ultimately occurred after 1885 took a long time to become apparent, and was very gradual. This fact would seem to bear out the contention that trade is on a sounder footing than it used to be, however hardly depression may bear on traders; and also that the ten-yearly cycle through which British commerce has been wont to pass has given way to a more equable form of progress. (For an account of the earlier cycles in the present century, see art. *CRISES*. Also Leoni Levi, *History of British Commerce*.—Tooke's *History of Prices*.)

The evidence taken by the royal commission was voluminous, and was derived from representatives of all classes of the community; and from it we can gather the leading features of the depression, as it affected the more important industries. (For the effects on agriculture, see *DEPRESSION, AGRICULTURAL*.) As to trade in general, there was a concurrence of opinion that profits had been lowered, while wages as a rule had remained firm; but this latter proposition must be qualified by the fact that to a certain extent the employment of labour, particularly in some industries, had been less regular, and the real wages of labour therefore below the nominal rate. The rate of interest had also fallen. It was found that competition from abroad, both in our own and in foreign markets, had of recent years become keener. It was also shown in the evidence that the volume of foreign trade had increased largely even during the depression, but that in the matter of values the increase was small in comparison with that of earlier periods. It was shown that the income-tax assessments under schedule D (trades and professions) had increased very considerably since the beginning of the depression; but that the actual number of persons with large incomes had decreased by about 5 per cent, and of those with moderately large incomes in much the same proportion, while incomes between £200 and £1000 a year had increased 33 per cent. It was given in evidence by a number of witnesses that there was a great and apparently a permanent tendency in the supply of commodities to outrun the demand, and that this had given rise to a very general feeling that over-production, as it is called, was the chief cause of the depression. And with regard to labour, it was discovered that while the agricultural labouring population had largely diminished in numbers, by reason of their employers' losses and the throwing of land out of cultivation, neither the shipping nor the textile industries showed any sign that the surplus labour-population had found a place in these large fields of employment.

From these data, supplemented by many minor and incidental points disclosed in the course of the evidence, it is possible to arrive at the most diverse conclusions as to the causes

of the depression, and, it follows, as to the remedies which ought to be applied, if any. What may be called the most pessimistic side of the discussion, which was supported by numerous witnesses, was embodied in a separate report signed by a minority of the commissioners. It is curious that in one important matter the view taken by this minority coincides with the most extreme optimistic opinion; for according to both, the so-called depression is not a passing phase of commerce, but a permanent change in the economy of the state. Those who hold the pessimistic view were able to point to the fact that an immense quantity of evidence had been given before the commission which pointed to a diminished employment of productive machinery, especially in the textile industries; also to the increase in the value of imports of textile manufactures and the decrease in the value of exports of the same article. The loss—partial or total—of certain foreign markets for British goods is another point which was urged with much force; the inference being that foreign governments, having found that high tariffs were successful in shutting English goods out of these markets, would increase rather than diminish them:—a view which the so-called McKinley Act, passed in the United States since the commission finally reported, would undoubtedly have been used to strengthen, had it existed at the time. It was pointed out by those who held the opinion referred to that increase even in the value of trade in certain commodities is no proof of the flourishing condition of such industries. It was shown, for example, that in the ten years preceding 1883 the value of the yearly export of coal and iron had increased by more than £17,000,000; while it was notorious that the coal and iron trades had been suffering greatly during that period. The remedies proposed are generally in the direction of import duties of one kind or another. Tariff duties on manufactures coming from abroad are the most extreme form of this proposal; but countervailing duties in order to balance the effect of bounties when they are given, and a fiscal union with India and the colonies, on the basis of a protective tariff levied against goods coming from other countries, are more frequently recommended. The extreme view on the other side was not represented on the commission; but this may possibly have resulted from the fact that a number of the originally-appointed commissioners did not see their way to accept nomination. That view is well expressed in a work entitled *La Crise*, by M. Prouzet. According to this opinion the depression of trade is merely a temporary accentuation of an economic movement which has been slowly going on for years, and which is destined to go on until the relations between capital and labour are completely changed. The fall in profits is admitted, and also the fall

in interest; but it is pointed out that these events happen not in one country alone, but in all countries; and that therefore the fear of the desertion of any country by capital and consequent diminution of wealth and employment is merely illusory. The wages of labour, it is maintained, do not fall, but rise; and it is asserted that the whole tendency of the process of which the depression is a phase is to reduce the interest on capital merely lent or invested, to reduce the profits of capital employed in business, and to reduce the wages or earnings of business management. This means the wider and more equal distribution of wealth, and is therefore regarded as a matter not of apprehension, but of congratulation. It may be observed that one of the proofs largely relied on by those of this opinion,—founded on an analysis of the income-tax returns,—is by no means conclusive. These returns show a gradual decline in the number of people with large revenues, and an increase in the number whose incomes are moderate. This does not in any way prove that wealth is more widely distributed, unless that conclusion is borne out by independent evidence. If at one time twenty men in one trade make £5000 a year, and four hundred under £5000, and if in ten years' time the figures are one above £5000 and 419 below it, it is impossible to say, without more proof, whether that result is due to a more even distribution of profit, or an accumulation of business and capital in a single hand, to the detriment of other traders.

Intermediate between these two extremes a great variety of views prevail. The most general is that the depression of 1874-85 was a genuine misfortune, shared no doubt by England with many other countries, but bearing with particular harshness on England, because of the great strides made by foreign competition in many branches of industry which were contemporaneous with it. Those who hold this opinion do not regard the depression as permanent; and the events of the years which have followed the publication of the commission's report go far to bear out their views. The great demand for goods consequent on the Franco-German war is not unnaturally held to be the original cause of what is called overproduction, but is truly production of the wrong things. So greatly do modern modes of manufacture stereotype industry, and so curiously do the laws relating to joint-stock companies tempt to enterprise which offers a great temporary advantage but no permanent benefit, that we constantly see capital invested so that it cannot be withdrawn without ruin in some industry where it is equally unable to produce a fair return. The demonetisation of silver by Germany at the time of the suspension of the Latin league also contributed, by disturbance in prices to the difficulties of traders. Those

who hold the moderate view do not believe that what is injurious to capital is necessarily of advantage to the labourers, and they believe that some kinds of labour suffered severely during the recent depression. They do not believe that any violent remedies, such as import duties, would be serviceable, but rather look for such measures as amendment of the Limited Liability Companies' Acts for safety in the future, coupled with improved technical education and the spread of knowledge of the world's markets. In regard to the matter of countervailing duties a considerable difference of opinion prevails, many who are adverse to any form of protection being favourable to such an impost where an important industry is threatened with grievous loss or extinction.

[The report of the above-named commission contains an immense amount of information, both from English and foreign sources, bearing on this subject, and is by far the best compendium from which the question may be studied. Mr. Giffen's *Growth of Capital*, published since the report, forms an excellent statistical commentary.] M. G. D.

DEPUTY. In law, one who exercises an office or other function in another's right, whose forfeiture or misdemeanour shall cause him whose deputy he is to lose his office. A man cannot appoint his deputy in all cases, but only when his own grant of the office justifies him in so doing (Cowel ed. 1727). In another sense the term is used of offices of state, and most anciently of the exchequer and mint. Thus in the absence of the king's treasurer on foreign service a deputy was appointed by commission, and in later times this practice was extended to many other fiscal offices. In certain cases, such as the hereditary offices of the king's court and exchequer, the holder in fee could appoint a deputy (*Dialogues de Scaccario*, i. 3; Madox, *Hist. of the Exchequer*, ch. xxiii.) H. HA.

DE QUINCEY, THOMAS, the son of a prosperous merchant, was born 1785, and, after a brilliant literary career, died 1859. That a genius of so high an order of imagination found the abstract reasoning of political economy "Not harsh and crabbed as dull fools suppose" is instructive. The fascination which the severer aspect of the science had for De Quincey is expressed in that passage of the *Confessions of an Opium Eater* where the writer describes how he was aroused from lethargy by the study of Ricardo's *Political Economy* (1818). The fruit of that study appeared in the *Dialogues of three Templars* (1824), a brilliant exposition and defence of the Ricardian theory of value. The paradox, for so De Quincey admits it to be in a good sense, that real value is measured by quantity of labour, that "a million men may produce double or treble the amount of riches, of 'necessaries, conveniences, and amusements,' in one state of society that they could in

another, but will not on that account add anything to value" (Ricardo, *Political Economy*; chapter on "Value and Riches"), is expounded by the disciple even more fearlessly than by the master. "My thesis," says X, the Socrates of the dialogues, who represents the author's views, "is that no such connection subsists between the two [the quantity obtained and the value obtaining] as warrants any inference that the real value is great because the quantity it buys is great, or small because the quantity it buys is small." "I have a barouche," says the objector, "which is worth about 600 guineas at this moment. Now, if I should keep this barouche unused in my coach-house for five years, and at the end of this term it should happen from any cause that carriages had doubled in value, my understanding would lead me to expect double the quantity of any commodity for which I might then exchange it, whether that were money, sugar, besoms, or anything whatsoever. But you tell me no." . . . "You are in the right," replies X, "I do tell you so . . . If A double its value, it will not therefore command double the former quantity of B" [B representing any assignable thing] (Fourth Dialogue). The intelligent BAILEY (*g.v.*) might well be stirred by these startling deductions to attempt a reply (preface to *Critical Dissertation*). In the later dialogues Ricardo's theory of value is defended against Malthus. This controversy had been commenced in the "Measure of Value," published in the *London Magazine* for December 1823. An article on "Malthus" in an earlier number of the same journal contains a mild attack on the theory of population. Some of the points are elucidated in a letter to Hazlitt which appeared in the *London Magazine*, December 1823. To the same period belongs a sort of *éloge* of Ricardo, which De Quincey, shortly after the death of his revered master, contributed to the *London Magazine*, March 1824.

De Quincey's latest and greatest economical work is the *Logic of Political Economy* (1844). The more original portion of this book may be described as a vindication of the part played by utility in the determination of value. The cause is just and the reasoning ingenious; yet the censure with which J. S. Mill tempers his copious citation from this discourse seems deserved (*Pol. Econ.*, bk. iii. ch. ii. § 1, and § 3 *end*). Certainly De Quincey's illustrations are perfect. The rhinoceros which in the reign of Charles II. was sold for a figure far above the cost of importation, the *Valdarfer* copy of Boccaccio which Lord Blandford bought for £2240 and afterwards, when in pecuniary embarrassments, was sold by auction and purchased for £750 by Lord Spencer, whom he outbid at the first sale; Popish reliques which had a high value, but no cost of production (p. 60 *et seq.*, ed. 1844);—these and other "shining

instances" throw light upon an obscure subject. The "dry light" of logic is intensified by a coruscation of wit. Sometimes, however, the doubt occurs whether the writer was as competent to point a moral as to adorn a tale. Thus, in the case of the pearl-market, and the vividly-pictured slave-market (*ibid.* p. 77 *et seq.*) is it correctly stated that for "the *plebs* amongst the slaves," and the "ordinary pearls," value is determined by cost of production, while "the natural aristocracy amongst the slaves, like the rarer pearls, will be valued on other principles" ? (see DIFFICULTY OF ATTAINMENT). Even the famous parable of the musical snuff-box (cited by Mill, *Pol. Econ.*, bk. iii. ch. ii. § 1) is not rightly interpreted by its author. It is not in general true of a bargain between two isolated individuals (see COMPETITION) that the price will be "racked up to U" (*ibid.* pp. 25-27)—the measure of the "intrinsic worth of the article in your individual estimate for your individual purposes"; in other words its TOTAL UTILITY (*q.v.*) to the purchaser (cp. Mill, *loc. cit.* § 1 *end.*). The following passage seems more correct. "The purpose which any article answers and the cost which it imposes must eternally form the two limits within which the tennis-ball of price flies backwards and forwards. Five guineas being, upon the particular article X, the *maximum* of teleologic price, the utmost sacrifice to which you would ever submit, under the fullest appreciation of the natural purposes which X can fulfil, and then only under the known alternative of losing it if you refuse the five guineas, this constitutes the one pole, the aphelion, or remotest point to which the price for you could ever ascend." The other limit is fixed by the cost of reproduction. These are "the two limits between which the price must always be held potentially to oscillate" (*ibid.* pp. 105, 106). But even here it is not quite clearly stated that, in the absence of competition, the terms are indeterminate; the "tennis-ball" may fall anywhere between the extreme limits. It is nowhere stated that in the presence of competition the upper limit is formed, not by *total*, but *Final Utility* (*q.v.*) De Quincey is far removed from the recent theorists to whom he bears a superficial resemblance by his not having attended to final utility and cognate conceptions. The connection between demand and value is denied by him on the strength of exceptional though striking instances (*ibid.* p. 231, quoted by Mill, *bk. iii. ch. iii. § 2*). "A crazy maxim," he says, "has got possession of the whole world: viz. that price is, or can be, determined by the relation between supply and demand." This imperfect conception of supply and demand is the special object of Mill's severe remarks on De Quincey. Mill's censure is endorsed by Mr. Leslie Stephen in his article on De Quincey in the *Fortnightly Review*

(1871). Mr. Shadworth Hodgson in one of his *Outcast Essays* has traversed this unfavourable verdict.

Whatever be the fate of De Quincey's cardinal tenets, it is certain that his occasional suggestions, the minor pearls of his discourse, enhanced as they are by a setting of consummate literary perfection, will preserve a lasting worth. Some important corrections of Ricardo's expressions deserve particular notice. De Quincey perceived, just as clearly as more recent critics, that "the current rate of profits, as a thing settled and defined, must be a chimera." He exposes "the puerility of that little receipt current among economists, viz. unlimited competition for keeping down profits to one uniform level. . . . Everybody must see that it is a very elaborate problem to ascertain even for one year, still more for a fair average of years, *what* has been the rate of profits upon the capital employed in any one trade" (*ibid.* p. 237 *et seq.*) What more could Cliffe Leslie say? De Quincey complains much that Ricardo, while insisting on the tendency towards the degradation of soils (the LAW OF DIMINISHING RETURNS, *q.v.*), has not sufficiently emphasised the counter-tendency towards improvement in the arts of cultivation. "The land is travelling downwards, but always the productive management of land is travelling upwards" (*ibid.* p. 239). De Quincey discerns what a handle is afforded by Ricardo's partial statement to "the systematic enemies of property" . . . "the policy of gloomy disorganising Jacobinism." Rent is referred by De Quincey not to the "indestructible," but the *differential* powers of the soil. Rent is defined as "*that portion of the produce from the soil (or from any agency of production) which is paid to the landlord for the use of its differential powers as measured by comparison with those of similar agencies operating on the same market.*" The parenthesis exemplifies the pregnancy of De Quincey's occasional suggestions. In presenting the theory of rent, De Quincey employs an admirable geometrical construction. As in the construction which Prof. A. Marshall has made familiar (*Economics of Industry*, bk. ii. ch. iii.), the *ordinate* in De Quincey's diagram represents produce. But the *abscissa* represents not doses of capital but qualities of soil. The two constructions have been combined by the present writer in an illustration of the *abstract theory of rent*, contributed to the British Association (Report, 1886). Referring to the use of diagrams, De Quincey well says:—"A construction (*i.e.* a geometrical exhibition) of any elaborate truth is not often practicable; but, wherever it is so, prudence will not allow it to be neglected. What is called *evidentia*, that sort of demonstration which shows out . . . is by a natural necessity more convincing to the learner. And, had Ricardo relied on this constructive mode of illustrating his chapters upon

rent and upon wages, they would not have tried the patience of his students in the way they have done." Had De Quincey pursued his mathematical studies further, and applied the conceptions of the infinitesimal calculus to the theory of value, he would have escaped his capital error of having confused integral (or TOTAL, *q.v.*), with differential (or final) utility. If he had worked with dU , instead of U , he might have anticipated Jevons.

All the works which have been referred to will presumably be included in *The Collected Writings of De Quincey*, by Professor Masson, 1890. In the American edition of 1877, called the Riverside edition, all are to be found except the letter in reply to Hazlitt (*London Magazine*, December 1823), and the *éloge* of Ricardo (*ibid.*, March 1824). These are reprinted in *De Quincey's Uncollected Writings* by J. Hogg, 1890. The Edinburgh edition of De Quincey's works in sixteen vols., completed 1871, omits also the *Logic of Political Economy*. Earlier collections are still more incomplete.

F. Y. E.

DERELICT. The legal quality of derelict was recognised by the Roman Law (Dig. i. xlvij. Tit. ij. De Furtis). Anything wilfully cast away either on sea or land. Goods thrown out of a ship, to lighten the same in case of distress, are not derelict for want of intention (Just. Inst. II. 1. 48). If a ship made jettison without hope of recovering the goods they were derelict to the finder (Rolle of Olayron, 32, 34). Derelict lands suddenly left by the sea belong to the crown, except in case of an arm of the sea belonging to a subject, but if the sea recede slowly, by imperceptible degrees, the land thus gained goes to the owner of the adjacent soil. This was ascertained by commission, and is a subject for a jury. Boats or other vessels forsaken or found on the seas without any person in them are called derelict. Of these the admiralty has the custody and the owner can recover within a year and a day.

[Moore on *Foreshore*.—*Black Book of Admiralty* (Rolls), III. 2.—Hale, *De jure Maris*.]

H. HA.

DERELICTIO. Expression of Roman law for the abandonment of any object of property with the intention of renouncing all rights of ownership over it.

E. S.

DE SANCTIS, MARCO ANTONIO, lived in the 16th century and the beginning of the 17th. Toppi (*Biblioteca napoletana*, Napoli, 1678, p. 204) says he was born at Nocera dei Pagani, but gives no other biographical indications. Two dissertations of De Sanctis are extant; their scientific value is less than their historical importance, because Antonio Serra would probably never have written his famous *Breve trattato delle cause che possono fare abbondare i regni d'oro e d'argento* (1613), if it had not been for the writings of De Sanctis, which he undertook to refute. The two pamphlets of De Sanctis bear the titles: *Discorso di Marc' Antonio*

De Sanctis intorno alli effetti che fa il cambio in Regno, in Napoli, appresso Costantino Vitale, 1605; and *Secondo discorso di Marc' Antonio De Sanctis, intorno alli effetti che fa il cambio in Regno sopra una risposta che è stata fatta adverso del primo*; in Napoli, nella stamperia di Felice Stigliola, a Porta Reale, 1605. De Sanctis endeavours to prove, in the first *Discorso*, that the only remedy against the scarcity of money which was felt in his days in the realm of Naples, would be an act of the government called *Prammatica*, by which the value of foreign coin should be fixed in the money of the country, and heavy penalties prescribed to enforce the established ratio in the payment of all bills of exchange and to prevent any other attempt to give money a value different from that which the *prammatica* prescribed. His advice was followed, but given up two years later, when the effects of the *prammatica* had made people wiser. The first pamphlet of De Sanctis was answered by an anonymous Genoese author to whom he replies in the second one.

[Sir T. Twiss, *View of the Progress of Pol. Econ. in Europe*, 1847, Lect. I.] M. P.

DESCENT OF PROPERTY. Sir Henry Maine (*Early Law and Custom*, London, 1883) points out the connection between ancestor worship and the descent of property in the Eastern and the Roman Empires. "Almost all the English law on the subject of the descent of personalty, a great deal of continental law on the same subject, and some part of our law of realty has for its foundation the 118th Novella Constitutio of Justinian. This novella is the last revision of the older Roman law of succession after death, which was formed by the fusion of the rules of inheritance contained in the venerable Twelve Tables with the equity of the Prætor's Edict: two streams of law profoundly influenced at their source as no reader of M. Fustel de Coulanges can doubt by the worship of ancestors" (Maine). In the *Principles of the Law of Succession to Deceased Persons*, by T. R. Potts, London, 1888, will be found a brief sketch of the history of the law of descent in England. Kenny and Laurence, in their *Essays on the Law of Primogeniture*, Cambridge, 1878, trace the history of primogeniture in England. *The Succession Laws of Christian Countries*, by Eyre Lloyd, London, 1877, contains a summary of the law of descent in the principal European countries. In France, Belgium, Prussia, Austria, and other continental states, on an intestacy all children take equally, no distinction being drawn between males and females or between real and personal property. In England, and in countries that have adopted English common law as the basis of their legislation, the eldest son as a rule succeeds to real property to the exclusion of all other children, whilst the personalty is divided between the widow and the children. Two

important changes have been recently introduced in England and in Ireland. By the 53 & 54 Viet. c. 29, if there are no issue, and the net value of the realty and the personalty does not exceed £500, then the whole estate goes to the widow; if the net value exceeds £500 then the widow is to have £500, whilst by the 54 & 55 Viet. c. 66, § 84, any real estate registered under the act is on the death of the owner intestate to devolve on the personal representatives as if it were personal property.

[As to the economic effects of the English as compared with the continental law, see G. C. Brodrick, *English Land and English Landlords*, London, 1881.—*Systems of Land Tenure in Foreign Countries*, Cobden Club Essays, London, 1870 (see REQUEST, POWER OF; LAND LAWS).]

J. E. C. M.

DESIGNS, COPYRIGHT IN. By laws passed in 1737 and 1744 France recognised a right of property in designs applied to silks. In 1787 England by the 29 Geo. III. c. 38 gave protection to the first inventor of a design for linen or cotton cloth. Subsequent acts extended protection to mixtures of flax and cotton, and to animal substances. By the 46 & 47 Viet. c. 57 a new or original design may be registered by its proprietor for a particular class or classes of goods, and by such registration the proprietor obtains copyright in the design, *i.e.* the exclusive right to apply the design to any article of manufacture or substance for five years.

[W. N. Lawson, *Patents, Designs, and Trade Marks*, London, 1889 (see COPYRIGHT).]

J. E. C. M.

DESMARETS, NICOLAS (1648-1721), controller-general of finance under Louis XIV. between 1708 and 1715, was a nephew of Colbert, who gave him a post in his bureau. He rose to be *maître des requêtes*, and on the death of his uncle in 1683 was made *intendant des finances*, an office he held but a short time. Lepelletier, who hated his predecessor Colbert and all connected with him, brought a charge against Desmarets of making illicit profit from the coinage, and he was forced to retire to an estate at Maillebois. In 1702 Chamillart spoke in favour of the disgraced man to the king, who nominated him one of the two recently appointed directors of finance (Saint Simon, *Mémoires*, iv. 183). His financial and administrative abilities were of great service to Chamillart, on whose resignation the king gave the controllership of his finances to Desmarets, 29th February 1708. "Il était tout à fait l'homme de la situation," says Vuhner, who describes him as possessing "une remarquable sagacité, une intelligence vive et profonde à la fois, beaucoup de justice et de rectitude dans les idées . . . une fécondité, une abondance d'imagination impuisable" (*Le Dette Publique*, i. 128). The condition of affairs was most alarming, with an increased expendi-

ture and a diminished revenue. The income from taxation had fallen from 112 to 75 millions of livres, and the total yearly expenses had risen from 119 millions to 220 millions. The debt was 2 milliards. Arrears to the amount of 36 millions were due to the army, and the revenue of five years had been spent in anticipation. Desmarets commenced by repealing the decree of Chamillart which permitted payments in specie or paper. He allowed the capitation tax to be commuted by a payment of six years in advance. He doubled toll-duties and contracted with Samuel Bernard and others loans extending to 230 millions. These expedients enabled him to get through 1708, but the troubles of the next year began with a winter of unusual severity. To meet the famine which followed he brought wheat from all parts of Europe, enforced a special tax on the rich, sold the undergrowth of the state forests, and effected a recoinage. He received the dignity of minister from Louis.

The king did not accept the onerous conditions offered by the allies in 1709. To meet the enormous charges of the campaign Desmarets proposed a war tax of a *dixième* on all property and incomes. Even the clergy and nobility were not exempted. The new tax produced 25 millions. He also borrowed 15 millions from some merchants. In 1711 he commenced a more regular system and converted into 5 per cent *rentes* all the various state loans. The energy and ability of Desmarets in putting in order the financial embarrassments of the kingdom were of great help to Louis XIV. "Si nos gens de guerre avaient le courage et le génie de Desmarets nous gagnerions toutes les batailles," said Madame de Maintenon. In the seven years of his administration the net produce of the ordinary revenues did not exceed 269 millions, and during this time he was obliged to find 1300 millions of extraordinary resources, and even then he left over 300 millions unpaid (A. Vuitry, *Le désordre des Finances*, p. 25). He hoped in 1715 to produce a properly-balanced budget if the king lived to bestow his favour for two years. Louis died, however, 1st September 1715, and Desmarets was dismissed by the regent. He retired to Maillebois, where he died 4th May 1721. Saint Simon, who was ill-disposed towards Desmarets, draws his character as that of a man "qui avoit plus de sens que d'esprit, et qui montrait plus de sens qu'il n'en avoit en effet; quelque chose de lourd et de lent, parlant bien et avec agrément, dur, emporté" (*Mémoires*, xviii. 157). His son, the Marquis Desmarets de Maillebois, marshal of France, is famous for his Italian campaigns.

Desmarets presented to the Regent *Mémoire sur l'administration des finances depuis le 20 Février 1708 jusqu'au 1er Septembre 1715* (Paris, 1716) 8vo, (also reprinted about 1789, and in the *An-*

nales Politiques (1757) of the Abbé Castel de St. Pierre) "Très-curieux," says Lenglet du Fresnoy, "il vient de main de maître, mais il n'a pas tout dit" (*Méthode pour étudier l'Histoire*, xii. 337). In the opinion of Voltaire "ce mémoire prouve qu'il avait des talens, une grande modestie et des intentions droites" (*Siècle de Louis XIV.*, 1819, i. 38; see also ii. 31).

[Saint Simon, *Mémoires*, 1856, etc., tomes ii., iv., vi., vii., ix., xi., xiii., xviii.—*Nouveau Dictionnaire d'Économie Politique*, 1890, i. 669-701.—F. DESTUTT DE TRACY, ANTOINE LOUIS CLAUDE, Comte (1754-1836), born in the Bourbonnais, died at Paris. He was a member of the constituent assembly, and was arrested and imprisoned during the Reign of Terror. He was set at liberty after the 9th Thermidor, 27th July 1794. Although he became a senator under the empire, and subsequently a peer of France under the Bourbon restoration, he retained throughout his early sympathies with liberty. From the year 1808 he had been a member of the French Academy. When, in 1832, the Academy of Moral and Political Science was re-established, he was invited to join the section of moral science. As a philosopher he was one of the last survivors of the *école sensualiste*, a school whose method of thought may best be defined in the words of one of their members, "Penser c'est sentir, rien que cela," and he was also an economist of great distinction. As early as 1793 he wrote, at the request of the well-known Jefferson, his *Commentaires sur l'Esprit des Lois de Montesquieu* (1 vol. 8vo, 1819). In this work he corrected some of the economic errors into which that able thinker had fallen. In 1804 he published his *Traité de la volonté*, part of his *Éléments d'Idéologie*, the larger part of which formed a treatise on political economy. This work was reprinted, without any modification, under the title of a *Traité d'économie politique*, in 1823 (1 vol. in 18mo). In these two works, the commentary and the treatise, Destutt de Tracy shows that he had attained a higher level than the majority of his contemporaries. He has obtained a popularity equal to his deserts, notwithstanding the somewhat metaphysical form with which he had invested his subjects. Bonaparte had him in view when he inveighed against the "Idéologues."

A. C. F.

DESTUTT DE TRACY and RICARDO. A reference to M. de Tracy will be found in Ricardo's *Principles of Political Economy and Taxation*

ed. 1852, note p. 171. He says with respect to the *Éléments d'Idéologie*, "In this work M. de Tracy has given a useful and an able treatise on the general principles of political economy, and I am sorry to be obliged to add, that he supports, by his authority the definitions which M. Say has given of the words 'value,' 'riches,' and 'utility.'" In the text Ricardo observes, "I cannot agree with M. Say in estimating the value of a commodity by the abundance of other commodities for which it will exchange; I am of the opinion of a very distinguished writer, M. Destutt de Tracy, who says, that 'To measure any other thing is to compare it with a determinate quantity of that same thing which we take for a standard of comparison for unity. To measure, then, to ascertain a length, a weight, a value, is to find how many times they contain metres, grammes, francs, in a word, unities of the same description.'" An interesting account of Ricardo's meeting with De Tracy is given in the *Letters of Ricardo to Malthus*, No. lxxiii., edited by J. Bonar, p. 211, ed. 1887.

DETRACTION, DROIT DE. In France, before the Revolution, the right of aliens to inherit property was limited by the *droit de détraction*, which enabled the state to confiscate part of any bequest or inheritance falling to an alien. For the history of its abolition see AUBAINE, DROIT D'. It need only be remarked here that at the present time, should the laws of another country impose any tax of this kind on a share of an inheritance left to a Frenchman, the French law will, where possible, compensate the person so damned out of any share of the inheritance falling to an alien resident in France. In England and other countries, especially Russia, the right of aliens to inherit land is either entirely denied or severely restricted; but these rules, though analogous to the *droit de détraction*, have a political not a financial aim.

[*Les Codes annotées de Sirey, édition entièrement refondue*, par P. Gilbert, 1847.—*Littre's French Dictionary*, s.v.—*Dictionnaire général de la Politique*, par Maurice Block, 1873, s.v. "Étranger."] C. G. C.

DEVELOPMENT, or evolution, as distinguished from mere change, means a *growth*, or the unfolding of qualities present, but at first latent, in the subject concerned. DARWINISM (*q.v.*) is therefore not a doctrine of development or evolution unless we regard animated nature collectively as one subject which remains the same throughout its changes. The idea of development applies to man and human societies, and especially to their science and culture, for there is present an identity of the subject (humanity) with continuity through the changes—*e.g.* from Greece, through Rome and the middle ages to modern civilisation—and preservation of the results of the past.

Economic evolution has been used in two senses (a) the growth of new forms of industrial organisation, keeping pace with new wants, new powers of science over nature, and new political relations, and (b) the growth of economic theories, which may or may not be in correspondence with (a). The name is best kept for the first of the two phenomena; and the latter may be called the evolution of economics. In both cases the use of the name evolution instead of change seems to imply that both the outward changes, say in European industry during the last hundred years, and the changes in theory, say from Adam Smith to J. S. Mill, have followed a course for which it is possible to discover some logical necessity.

The term evolution was not unknown in the last century, and the idea became the ruling thought of Fichte and especially of Hegel and his followers. In England, the idea has gained currency through the writings of Spencer and Darwin; and evolution in the sense conceived by biology appears to be the essence of the popular philosophy of our day. Marx has applied the notion to economics, and the relation of the two is already a topic of controversy. The extreme left of the school of historical economists hold that there are as many forms of economics, all relatively true, as there are separate peoples and separate epochs; and they would not distinguish the development of economics from the general progress of historical change. The conception of economics as a body of doctrines of universal validity or absolute truth is no doubt discredited; but the conception of "economic categories" as a permanent basis of further development has gained ground; and seems indeed to be required by the very notion of development.

[For distinction of historical and economic categories, see A. Wagner, *Lehrbuch der politischen Ökonomie, Grundlage*, pp. 352 seq. and the references there given to Rodbertus and Schäffle.—For distinction of development from Darwinism see E. Caird, *Philosophy of Kant*, (2nd ed. 1889) vol. ii. pp. 539 seq. and S. Alexander, *Moral Order and Progress* (1889), pp. 139, 309, 382, etc.] J. B.

DE VIO, F. TOMMASO (1470-1534), born at Gasta, and sometimes called Thomas de Vio Cajetan, was famous for his learning; at Ferrara, where he held disputations with Pico della Mirandola, he was made a Doctor *honoris causæ*; he taught philosophy in the *Ginnasio Romano*, and was made Cardinal of S. Sisto by Leo X. He was consulted in all the weighty theological questions of his time. Amongst these was the question of Henry VIII.'s first marriage, which he declared valid. He was sent to Germany to controvert the opinions of Luther. He wrote a great many works of which a list can be found in A. Ciaconii: *Vite et res gestæ Pontificum romanorum et Cardinalium*. Romæ. 1677, vol. iii. p. 390-394. Here only

the more important concerning economical topics are mentioned:

De Usura, written in Milan, 1500; *De Cambiis*, written also in Milan, 1499; and *De Monte Pietatis*, written at Pavia, 1498, all published 1596 in Venice; F. Thomæ de Vio Caietani, ordinis Prædicatorum, *Opuscula omnia*. Venetiis, 1596, p. 168 et seq. In his pamphlet *De Usura*, De Vio does not discuss the argument *ab ovo* and exhaustively, intending rather to solve some special cases in which he thinks the current opinions of canonists wrong or exaggerated. In his pamphlet *De Cambiis*, he declares himself opposed to the profession of what then was called a *cambist*, recognising only the legitimacy and utility of the change of money against money. In his pamphlet *De Monte Pietatis*, he proves that these establishments for pawnbroking served simply to cover a species of usury. De Vio's pamphlets must, therefore, be considered as one single tract in which he discusses the same subject, viz. usury, under three different aspects, and in which he follows the opinions current in his time, although sometimes showing views somewhat broader than those of the canonists. M. P.

DEVISE. A gift of land or other real property by will. The person to whom the gift is made is called the devisee. E. S.

DEW, THOMAS RODERICK (1802-1846), was born in Virginia and was educated at the College of William and Mary; in 1827 he was appointed professor of history, metaphysics, and political economy in the same institution, and in 1836 president; he died at Paris while travelling. Dew was a most thorough and earnest teacher of history, and exercised great influence throughout the south in upholding public opinion in the support of free trade and negro slavery. On strictly economic subjects he wrote: *Lectures on the Restrictive System*, Richmond, 1829 (pp. 195). In this Dew questioned the general advantage to be gained from manufactures, since they are liable to great fluctuations; and a factory population is not only unfavourable to liberty, but turbulent and of necessity dependent. He wrote an *Essay on the Interest of Money and the Policy of Law against Usury*, Shellbank, Va., 1834 (pp. 24); in which usury laws are regarded as influencing unfavourably the distribution and circulation of capital, and checking the natural division of employments and treating the question with special reference to the farming interest. He also wrote a *Letter on the Financial Policy of the Administration and the Laws of Credit and Trade*, Washington, 1840 (pp. 16), attributing the crisis of 1837 not to banks but to the course of trade; banks are the effect and not the cause of speculation. Dew opposed the sub-treasury system inasmuch as it tended to unsound banking operations. For an interesting statement of his educational work and for

bibliographical references, see *Circ. of Information of U.S. Bureau of Educ.*, No. 1, 1887. *College of William and Mary*, by Professor H. B. Adams, pp. 54-56. D. R. D.

DIAGRAMS. For the purpose of conveying readily to the mind the general facts contained in a table of figures, nothing seems better suited than some form of diagrammatic representation.

When the relative magnitudes of a number of disconnected quantities are simply concerned, a series of geometrical figures, circles, squares, or oblongs whose areas are proportional to those magnitudes, is commonly employed.

The delineation of the varying circumstances of the different parts of a country in respect to such matters as density of population, degree of poverty, etc., by colouring a map in different tints, which has been frequently employed (recently by Mr. Chas. Booth in *Labour and Life of the People*), is a method which is very readily understood.

The curves which record the readings of a barometer or thermometer are illustrations of another class of diagrams which are very largely used for economic purposes.

It requires a very special training to be prepared to grasp readily the salient points of complicated schedules of figures, which can, however, be exhibited very readily even to the untrained by means of such diagrams. This renders them of great service to the teacher of economics. But curves of similar construction are invaluable adjuncts in the study of economic theory, possessing all the general advantages of arithmetical illustrations, while they are less liable than these to admit the unwary assumption, in the data of illustrations, of the result which it is desired to establish by their help.

If we wish to draw a curve showing the variations in the price of some commodity (say iron) in the course of a number of years we proceed as follows. Along a line Ox (Fig. 1)

Fig. 1.

a number of equal distances On_1, n_1n_2 , etc., are measured. We may take each of these distances

to represent some convenient interval of time, an hour, day, year, or any other suitable interval. From the points O, n_1, n_2 , etc. lines Op, n_1p_1, n_2p_2 etc., are drawn perpendicular to Ox and of such lengths as to be proportional to the price of iron at the epoch represented by the point from which the line is drawn. We might for example draw them on the scale of one-twentieth of an inch for each shilling of the price of a ton of iron, or on any other convenient scale. The points Pp_1p_2 ...being connected by a broken or curved line, such a line will exhibit the variations of the price of iron with the progress of time, in a manner which is quite as accurate as the table of figures from which the curve is derived, and which is far more striking to the eye of even the most skilled statistician.

The manner in which the connection between time and price is thus shown may be employed to show the concurrent variations of any two connected quantities in economics.

If the abscissæ (the distances along Ox) represent the amounts produced in a given time, such as a month or year, the ordinates (n_1p_1 etc.) denoting the corresponding prices at which the goods could be profitably produced, the curve becomes the ordinary supply curve.

If the abscissæ denote the quantities which could find purchasers at the prices denoted by the ordinates, we obtained the demand curve (cp. DEMAND CURVE).

These curves cannot be drawn completely from records of experience, because actual experience covers in general but a small range of prices for any one commodity. No uncertainty is, however, owing to this cause, introduced into the arguments based on them, since the really important parts of them are those of which we have experience, and, in addition to this, the arguments commonly depend not so much on actual lengths of lines as on the general direction of the curve, whether upwards or downwards, and whether the slope of the curve be gradual or rapid.

It is the result of experience that—except in such a case as that of a collector of rare specimens of some kind, when his collection may be doubled in value by the addition of a single specimen which renders it complete—people are not willing to pay so much for a given small addition to their store of any commodity when they already have a large amount of it, as when they have but little; this enables us to say at once that the demand curve must slope downwards throughout, whatever be its shape in other respects.

With regard to the supply curve, it is quite possible that its slope should be sometimes upwards, sometimes downwards, or that it may be horizontal throughout or for a portion of its length. If, however, we are considering only small changes in production, not involving a reorganisation of the industry concerned, an

increase of product means, in general, an increase in the total cost out of proportion to the addition to the amount of produce, i.e. in the neighbourhood of the actual price the curve slopes upward as we proceed outwards along it, though there are, doubtless, cases in which the contrary is true, and it is drawn sloping downwards in Fig. 5.

For the problem of the equilibrium of supply and demand, the use of diagrams enables us to grasp more clearly than any other method the relations between the quantities involved.

If Dd and sS (Fig. 2) be portions of the curves of demand and supply intersecting at P and

Fig. 2.

PN be perpendicular to Ox , then PN denotes a price which will equate demand and supply. At a price less than PN it would not be profitable to produce so much, at a greater price there would be more than the ordinary profit, which would lead producers to endeavour to increase their businesses. At a price greater than PN consumers would not be found for the whole amount ON , at a less price consumers would be tempted to increase their consumption, and would be desirous of using more than the amount ON .

Small variations from the conditions indicated will upset the balance struck at the price PN . We see that the price, which may be taken to measure the exchange-value of the commodity, is equal on the one hand to the expenses of production at the margin, and also to the marginal demand price, i.e. to the estimate in money equivalent made by purchasers, of the utility to them of those portions which they consider only just worth their outlay.

If the curves be supposed traced back to meet Oy (see Fig. 3) we have a representation of the total utility to consumers of the quantity of commodity ON in the area between the curve Dd and the lines OD , ON and NP .

The actual outlay being measured by OMP (if PM be parallel to Oy), the area DMP is what is called by Prof. Marshall the *Consumer's Rent*, being the excess of the money measure of the total utility over the money cost.

Under certain conditions the area MsP denotes the *Producer's Rent* measured in money.

Fig. 3.

The relations expressed by these curves are represented in a different manner by Auspitz and Lieben in their work on the *Theorie des Preises*. The curves they draw have for ordinates the prices, not of a unit, or given quantity, but of the total quantities represented by the corresponding abscissæ.

The price, in the ordinary sense of the term, is represented by the trigonometrical tangent of the angle between the line touching the curve at any point and the line Ox , for it is the rate at which the total price increases as the amount increases.

Lines being drawn from O parallel to the tangents at every point to the total cost curve OS to intersect the corresponding ordinates, a second curve is deduced (the dotted curves in Fig. 4). A similar construction applied to the

Fig. 4.

total demand curve gives a second derived (dotted) curve, whose intersection with the former at p gives the position of equilibrium of supply and demand and the normal exchange value. ON is the amount produced and consumed, and the price at which a unit of it is saleable is represented by the ratio of PN to ON .

Among the many diagrams expressing the

very wide circulation. Dickinson was an intellectual factor of the first importance in founding the Independence of the United States, and drafted some of the principal state papers of the time. He was elected president of Delaware in 1781, and of Pennsylvania in 1782.

*The Historical Society of Pennsylvania proposes to print a more complete edition of his political writings than that which was published under his own supervision at Wilmington in 1801." *The Life and Times of John Dickinson*, by Charles J. Stillé, LL.D., Philadelphia, 1891.

H. H.

DICKSON, Rev. ADAM (1721-1776), was born at Aberlady, East Lothian. He graduated at Edinburgh University and was appointed minister at Dunse, Berwickshire, in 1759. He was transferred to Whittinghame in East Lothian in 1769, and died in consequence of a fall while riding.

Dickson gave much attention to agriculture, and published in 1762 a *Treatise on Agriculture* (new ed. 1770, 2 vols. 8vo), with special reference to the soil and climate of Scotland. One section, *On Manures*, directed against Tull, was reprinted in A. Hunter's *Georgical Essays* (vol. iii., 1770). He also wrote *Small Farms destructive to the Country in its Present Situation*, 1764, and *An Essay on the Causes of the Present High Price of Provisions*, etc., 1773, 4to. In this pamphlet he contended that high prices were not due to bad crops but that they were connected with luxury, currency, taxes, and the national debt. Among other remedies he proposed road-making, ox-labour, a tax on stockholders, and an export duty on corn. Dickson is best known for his *Husbandry of the Ancients* (1788, 2 vols. 8vo, French translation by Paris, 1802), derived from the "Scriptores rei rustice" and other writers, and compared with the modern system. His practical knowledge enabled him to clear up many difficulties, but his scholarship was imperfect (Smith, *Dict. of Antiquities*, 1890, i. 83).

[Biography prefixed to *Husbandry of Ancients*, 1788, vol. I.—*Dictionary of Nat. Biography*, xv. 28.]

H. H. T.

DIDEROT, DENIS (1713-1784), IN HIS RELATION TO ECONOMICS. There is hardly a single branch of science which does not owe some kind of gratitude to the universal genius of this very able and characteristic French writer. His suggestive mind, his common sense, and his power of concentrating the best thoughts of his contemporaries into one focus, naturally extended themselves to the narrow ground, as it was in his day, of political and economic science. It is almost impossible to state how far in this respect Diderot could lay claim to originality. He is known to have written many passages in the most celebrated works of his time. Rousseau confessedly studied his style, and some striking pages in his

Discours sur l'Inégalité and in Holbach's *Système de la Nature* are written by Diderot; his keen wit in conjunction with that of Galiani produced the *Dialogues sur le commerce des bleds*. It was, however, his connection with the great *Encyclopédie* (1751-1771) which brought him into closer contact with students of economic phenomena, and which also led him to promote and animate their work. The principles of mercantilism, like Forbonnais' *Éléments du Commerce*, as well as the first drafts of the economic system of the physiocrats, Quesnay, Morellet, St. Lambert, Leroy, and in part those of Turgot, are embodied in this vast enterprise. Diderot, who perhaps became acquainted with Quesnay's studies through a mutual friend, Leroy, and had publicly, in 1748, paid homage to Quesnay as a first-rate surgeon (*Œuvres*, t. ix. p. 214), did not blindly follow the track of his school. Perhaps on account of the withdrawal of Quesnay's co-operation in 1757, when the *Encyclopédie* was suppressed, their relations grew colder. Diderot preserved an independent attitude, declaring for instance in 1769 that he "did not approve the opinions of the *Quesnelistes*, but on account of their sincerity held them to be good fellows who did their best" (*Œuvres*, t. iv. pp. 80-85). Similar opinions may be found in the *Réfutation suivie de l'ouvrage d'Helvétius intitulé L'Homme*, (*Œuvres*, t. ii. p. 352), and in Diderot's recommendation of economic instruction in the Russian universities, made to Catherine II. in 1775-1776 (*Œuvres*, t. iii. p. 491). We even owe to him the knowledge of a humble outsider of the physiocratic school—Boesnier de l'Orme, whose anonymous book *Du Rétablissement de l'Impôt dans son Ordre Naturel* (Yverdon, 1769) has been ably criticised by Diderot (*Œuvres*, t. iv. p. 39); see on this book also *Éphémérides du Citoyen*, 1769, t. vi. pp. 255-256, t. viii. pp. 136-163.

Diderot's own contributions towards the *Encyclopédie* bear the features of the different influences of his time, and sometimes of a slight trace of mercantilist views; he often, with a keen instinct, adopts the attitude of his physiocratic friends, without participating in their extravagances; not seldom one might be inclined to ascribe him an anticipation of modern social thought. His articles, moreover, are interesting as exhibiting the vast difference between economic ideas and even terms used nowadays and at the time of their formation. This may be illustrated by the following extracts:

Agriculture (*Œuvres*, t. xiii. pp. 243-265) contains a history of ancient and mediæval agriculture, instructions for husbandmen for each month in the year, and describes the new English agricultural system of Jethro Tull, as interpreted by DUHAMEL DU MONCEAU (p. 373). *Artisan* (p. 373), a man who is engaged in the mechanical work that needs the least intelligence. *Balances* (p. 408), gives a description of the rules of the corporation of makers of weights and scales, and their supervision by the

Cour des monnaies. The different meanings of the terms, *Bénéfice, Gain, Profit, Lucre, Emolument* (p. 425), of *Besoin, Nécessité, Indigence, Pauvreté, Disette* (p. 478) are explained. *Besoin* (p. 427) is described as comprising the appetites of the body and the desires of the mind; its tendency is to lead primitive man on the one hand to a system of associated life, on the other by the development of artificial wants to bring about the dissolution of society. The articles *Boucher* (p. 489) and *Boulangier* (p. 498) contain an account of the regulations, apprenticeships, etc. of the butchers' and bakers' corporations. In *Brut* (p. 513) raw-produce is distinguished from the finished article. *Change* (t. xiv. p. 85) is said to relate to the barter of movables, *échange* to an estate, etc., *permutation* to ecclesiastical dignities. "There are few exchanges, in which absolutely good faith is preserved; generally the two parties seek to deceive each other." *Chemins* (p. 116) is a history of highway administration in Europe. *Co-opérateur* (p. 225): "this term is much more frequently used in theological matters than in any other." Almost the same moral significance is attached to the word *Crédit* (p. 240), in which reference is only made to the work of Duclos, *Considérations sur les Mœurs*. A vindication of the natural rights of mankind is contained in *Droit Naturel* (p. 296). The study of the rules of husbandry is recommended in an article on *Économie Rustique* (p. 378). (*Fondation*, although inserted in *Œuvres*, t. xv. p. 12, is by Turgot, see the *Encyclopédie*, 1757, t. vii. p. 14). *Homme* (*Politique*, t. xv. p. 139) the pith of this article is derived from an article by Quesnay, which the latter had suppressed. The existence of this was recently discovered by Dr. S. Bauer. "The wealth of a nation is the produce of the sum total of its labours, after the cost of labour has been deducted. The greater the net produce and the more equal its distribution, the better the administration. As long as there is land lying waste, a man is employed to disadvantage in manufacture. The number of domestic servants, and of producers of luxuries, should be diminished. The maxim that an increase of comfort among the agricultural classes would remove a spur to industry is the saying of an ignorant and malignant man. The hope of living the life that a man longs for, urges him to his particular occupation," etc. *Honoraire* (p. 140) a term used for the remuneration of liberal professions, *appointements* for all posts, *gage* for servants, *gage* for soldiers, *salaire* for working men. *Hôpital* (*ibid.*), deals with the administration of almshouses and hospitals. In this article, to quote Mr. Morley, "Diderot struck a keynote of difference between the old Catholic spirit and the new social spirit." "It would be far more important to work at the prevention of misery than to multiply places of refuge for the miserable." The spirit of Rousseau seems to have inspired the following article: *Indigent* (p. 204), "a man who, wanting the necessities of life, exists in the midst of his fellow-citizens, who exult over him with insolent luxury, rioting in the enjoyment of all possible superfluities. Indigence is not a vice, it is worse than that. There are none indigent among savages." A modern line of

thought pervades the notice of *Journalier* (p. 314), "This class of man forms the greater part of a nation; a good government ought to keep his lot principally in view. Whenever the day labourer is miserable, the nation is miserable." The eulogy of competition is contained in *Laborieux* (p. 406), "Name a price, and competition will ensue; taxes and despotic government annihilate industry by rendering their fruits uncertain." *Laboureur* (*Économie Rustique*, p. 407) again brings back reminiscences of Quesnay: "Unhappy the nation in which the farmers are poor, for agriculture greatly needs improvement. Wherever the corn trade is restricted, the reduction of price falls heavily upon the cultivators of the soil; arbitrary taxes, moreover, reduce their earnings and obstruct the flow of national revenue." Like Rousseau, in the article *Législateur* (p. 427) he admonishes princes to visit the houses of the labouring poor, and pleads in *Législation* (p. 436), for the simplest legislation and the system the most consonant to nature, by which the passions of men should not only be curbed, but directed to advancing both private and public interest. The legislator must take care that the expenses of associated life shall fall upon the rich, who enjoy the corresponding advantages (see Mr. Morley's *Diderot*, vol. i. p. 243-246). In the article, *Luxe* (*Morale et Philosophie*, vol. xvi. p. 5), Diderot displays his utmost ingenuity. After having refuted by historical examples all sweeping propositions for and against luxury, he explains it to be a natural outcome of civilisation and not a necessary cause of the decline of empires. Luxury must be in proportion to the general production. "There was more luxury in the years of magnificence of Louis XIV.'s reign than in 1720, and in 1720 this luxury was more excessive." Luxury turns away attention from agriculture, and the privileges granted to the producers of luxuries create an artificial irregularity of distribution; luxury easily escapes taxation, and the "nouveaux riches," indulging in it, demoralise society. The remedies against luxury consist in its gradual diffusion, and in the abolition of its privileges. The article closes with the admirable sentence: "Je prie les lecteurs de se dépourvoir également des préjugés de Sparte et de Sybaris; et dans l'application qu'ils pourraient faire, à leur siècle ou à leur nation, de quelques traits répandus dans cet ouvrage, je les prie de vouloir bien, ainsi que moi, voir leur nation et leur siècle sans des préventions trop ou trop peu favorables, et sans enthousiasme, comme sans humeur" (p. 30). Modern ideas and Rousseauism are intermingled in *Misère* (p. 119), "The poor common people are incredibly stupid. I know not what false prepossession closes their eyes to their present wretchedness, and to the still deeper wretchedness that awaits their years of old age. Misery is the mother of crime. It is rulers who make men miserable, and it is they who shall answer in this world and the next for the crimes that misery has caused." He remarks in the same spirit on *Opulence* (p. 171), "It is but seldom that this does not augment the natural malignity of mankind, and that it increases happiness." *Propriété* (p. 439) is shown to be a condition of security—security

was the aim of men in forming societies; taxes the means to uphold them. Where a king pretends to be the sole proprietor of the goods of his subjects, anybody may become king by force. *Prostitution* (p. 440) is explained almost only in the figurative sense as applied to mercenary writers. In *Representations* the usefulness of representatives of the "nation" in the way of advising the king are explained. All "citoyens" ought to choose more as representatives, who are qualified to be so by reason of their property or their knowledge of the interests of the people. Members from the ranks of the clergy, the nobility, the magistracy, merchants and cultivators of the soil, should be chosen for these assemblies. Diderot's opinions, one sees, are on this point more akin to the doctrines of the physiocrats, and to those of continental liberalism, than to those of modern democracy. The article on *Souverains* (p. 166) does not go beyond the current theory of social contract and renunciation of natural rights. In *Scritti* (p. 130) Diderot proclaims the principle of seeking the common good of all, not only as the supreme, but as the universal rule of conduct.

After the completion of the *Encyclopédie*, Diderot wrote some pamphlets which evince his unceasing interest in free enterprise. In the *Lettre historique et politique adressée à un Magistrat sur le Commerce de la Librairie*, 1767 (*Œuvres*, t. xviii. p. 7) he admits that "he would consider the entire and absolute abolition of corporations as a step towards a wiser government." Three are many strikingly characteristic remarks on commercial and economic life in his *Voyage de Hollande*, 1774 (*Œuvres*, t. xvii. pp. 406-408). There are besides in his *Fragments politiques* scattered ideas about the dangers of a sudden influx of the precious metals (*ibid.* t. iv. pp. 41-50). His work *Mon père et moi* concludes with an idea of statistics of the distribution of income, and the postulate of exempting the physical necessary from taxation (pp. 481-482). A highly curious anticipation of the modern labour question, as exemplified by the condition of the miners of Saxony, is contained in the *Réputation suivie de l'écrit d'Helvétius intitulé L'Homme*, 1774-1775 (*Œuvres*, t. ii. pp. 430-431).

[The passages above referred to are quoted from the *Œuvres complètes de Diderot*, edited by J. Aulzet at M. Tournoux, 1875-77, 20 vols.; also Rosokruiz, *Diderot* (1896)—Morley, *Diderot and the Encyclopédists*, 2 vols., 1878, 1891, especially vol. i. pp. 177-247.—Du Bois-Reymond, *Die Diderot's Gedächtniss*, 1884.] S. R.

DIETERICI, KARL FRIEDRICH WILHELM (1790-1859), a great name in statistics, was born in Berlin, served under Blücher in the Napoleonic war, held several public appointments—the post of professor of political economy (für Staatswissenschaft) from 1834, that of director of the statistical bureau in Berlin from 1844, and died in his native city. His virtues and amiable character are attested by his successor Engel (*Report of the International Statistical Congress at London*, 1869, p. 43) and others who speak from personal knowledge.

Both in the spheres of political economy and

statistics, especially the latter, Dieterici was eminent. In his inaugural professorial letter *De viâ et ratione œconomiam politicam docendi* he distinguishes the different methods of cultivating the science—the philosophical, the juristical, the historical ("Est *historica via œconomiam politicam docendi*," written in 1835); the political or statistical method, of which Humboldt is given as an instance *qui quantum auri et argenti ex America in Europam allatum sit, quantum theœ consumatur, aliaque similia accurate . . . explicavit*; the technological method, which J. G. Büsch and Ricardo have followed, both praised for their attention to facts and experience. The true method is compound: *et mere philosophando et mere experiendo erratur*. Dieterici promises to unite theory and experience. The facts are perhaps more interesting than the theory in his most ambitious contribution to economics, *On Overpopulation* (*Über den Begriff der Übervölkerung*, Akademie der Wissenschaften in Berlin; März, 1849). True to facts, *experientia maxime fretus* as he promised, Dieterici enriched many departments of statistics. His memoir on the *Mean Duration of Life* (*Über den Begriff der mittleren Lebensdauer und deren Berechnung für den preussischen Staat*, Akademie der Wissenschaften in Berlin, December 1858) may be noticed among many other valuable contributions to vital statistics, which will be found among the following references.

Die Waldenser und ihre Verhältnisse zum Brandenburgisch-preussischen Staat (1831).—*Geschichtliche und statistische Uebersicht der Universitäten im preussischen Staat* (1836).—*Statistische Uebersicht der Wichtigsten Gegenstände des Verkehrs und Verbrauchs im preussischen Staat und im deutschen Zollverbande . . .* (1838-1857).—*Statistischen Tabellen des preussischen Staats nach der amtlichen Aufnahme des Jahres 1843*.—*Uebersicht der Bodenfläche der Bevölkerung und des Viehstandes der einzelnen Kreise des preussischen Staats* (1845).—*Die Bevölkerung des preussischen Staats nach der amtlichen Aufnahme des Jahres 1846* (1848).—*Der Volkswohlstand im preussischen Staat . . .* (1846).—*Über Auswanderungen und Einwanderungen* (1847).—*Über preussische Zustände über Arbeit und Kapital* (1848).—*Gedächtnissrede* (in honour of Fred. William III.), 1852.—*Handbuch der Statistik des preussischen Staats* (1858-61).—Much of Dieterici's work is contained in the periodical which he edited from 1845 till his death—*Mathematischen des Statistischen Bureau's in Berlin*. The fourth volume for 1851 contains the valuable essay *Ueber den Begriff der Statistik*. [*Allgemeine Deutsche Biographie*.—Reports of the first four international statistical congresses, *passim*.]

F. Y. E.

DIFFERENTIAL DUTIES. (See DISCRIMINATING DUTIES.)

DIFFICULTY OF ATTAINMENT is a phrase used by De Quincey, Mill, and others, to denote a condition which must be superadded

to utility in order that there should exist value in exchange. "Any article whatever, to obtain that artificial sort of value which is meant by exchange value, must begin by offering itself as a means to some desirable purpose; and secondly, even though possessing incontestably this preliminary advantage, it will never ascend to an exchange value in cases where it can be obtained gratuitously and without effort" (De Quincey, *Logic of Political Economy*, p. 13; quoted by Mill, *Pol. Econ.*, bk. iii. ch. ii. § 1). The difficulty of attainment here indicated is primarily that which is experienced by the purchaser. But it is usual to extend the term to the difficulty experienced by the producer. Thus De Quincey continues: "Walk into almost any possible shop, buy the first article you see; what will determine its price? In the ninety-nine cases out of a hundred simply . . . difficulty of attainment. . . . If the difficulty of producing it be only worth one guinea, one guinea is the price which it will bear." So Mill, of what he considers the general case, "the obstacle to attainment consists only in the labour and expense necessary to produce the commodity" (*loc. cit.*, § 2). And by others difficulty of attainment is used as equivalent to cost of production. Thus Walker (*First Lesson in Political Economy*, Art. 67), "Cost of production is only another name for difficulty of attainment." This transition from the sense in which the difficulty, like the other factor utility, is experienced by the individual purchaser is legitimate, where there exists such perfect "industrial" Competition that it is free to any one to enter any occupation. In that case the sacrifice made to attain a commodity by purchase tends to be equivalent to the efforts and sacrifices made in attaining it by production. If the value in exchange were higher, the commodity would not be purchased; if lower, it would not be produced.

The wider conception is particularly appropriate to the case which Mill, dividing the different kinds of difficulty, places second; where, "without a certain labour and expense it [the commodity] cannot be had; but, when any one is willing to incur this, there needs be no limit to the multiplication of the product" . . . up to a point which there is no need, for practical purposes, to contemplate (*Pol. Econ.*, bk. iii. ch. ii. § 1). In this case difficulty of production has a certain pre-eminence over the co-factor utility, both as (a) a cause, and (b) a measure of value. (a) The cause of a phenomenon being usually a somewhat arbitrarily selected portion of its total antecedent (Mill, *Logic*, bk. iii. ch. v. § 3; Venn, *Empirical Logic*, p. 57 *et seq.*), it is not paradoxical that sometimes utility, sometimes cost, should be regarded as the cause of value. Utility indeed is invariably an antecedent. But the scale of

utility (see DEMAND CURVES), may, in the case supposed, be varied without any variation of value. "If the demand for hats should be doubled, the price would immediately rise; but that rise would be only temporary, unless the cost of production of hats . . . were raised" (Ricardo, *Pol. Econ.*, ch. xxx.) Whereas, if the cost of production of an article is varied, its value varies concomitantly. "Diminish the cost of production of hats, and their price will ultimately fall to their new natural price, although the demand should be doubled, trebled, or quadrupled" (Ricardo, *ibid.*) Prediction, the prerogative of causation, is attached to cost rather than utility. (b) Accordingly, in the case supposed, the comparative difficulty of producing two commodities affords a simple measure of their relative value. It is true also that value is proportioned to final utility. But this measure cannot be read until the measurement is already given. We cannot tell what the final utilities will be till we know the values. In some cases indeed (see below (4) and (5)) it is conceivable that, given the dispositions, the Demand-Curves of all the dealers in a market, we could deduce the rate of exchange which will be set up. The calculation is indicated by Professor Walras in his *Éléments d'Économie Politique Pure*, Art. 50. Still difficulty of production, in the case most favourable to its operation, measures value directly, as a clock measures time; whereas utility at best is a measure like the shadow cast by the sun, which can only be interpreted by a difficult calculation.

This theory is subject to several reservations and exceptions. (1) The pre-eminence of difficulty of production as a regulator of value depends largely on the assumption that labour is perfectly homogeneous. If all labour consisted of raising weights in precisely similar circumstances, the theory might be literally true. "If . . . it usually cost twice the labour to kill a beaver which it does to kill a deer, one beaver should naturally exchange for or be worth two deer" (Adam Smith, quoted by Ricardo), there being only one mode of labour, work being as homogeneous as, say, gold. But suppose, besides effort of exertion, the sacrifice of waiting is required. Then, as between commodities involving these elements in different proportions (cp. Ricardo, ch. i. § 4), it would no longer be possible to assign the rate of exchange between the commodities without being given the comparative remuneration for the two kinds of sacrifice. But this datum could not in general be obtained *a priori*, but only as a result of the higgling of the market.¹ Now, in fact, there

¹ This reservation holds even upon the imaginary supposition that there existed a competition so perfect that it is free to any one to choose whether he will labour or abstain, *a fortiori*, when, as in reality the abstainers form a "non-competing group"; and so fall under head (3).

are not only two, but many, kinds of sacrifice. The general principle is that the "net advantages" (Marshall, *Principles of Economics*, vol. i. 2nd ed. p. 136) in occupations between which there is "industrial competition" (Cairnes), tend to be equal. Accordingly the statement that the "quantity of labour realised in commodities" (Ricardo) regulates their exchangeable value, can be true only on an average with wide deviations. Take the case put by De Quincey of a pearl-diver who sometimes obtains, along with "ordinary," superior pearls. The true principle is that the net advantages of pearl-diving are the same as those of any other occupations between which there is industrial competition. How much truth is there in the proposition that the value of any pearl is proportioned to the "quantity of labour realised" in it? The instance taken is a mild case of plural occupations, or joint production (see BY-PRODUCT). The application of the general principle of net advantages here affords little light as to the value of particular articles (cp. Sidgwick, *Pol. Econ.*, bk. ii. ch. ii. § 10).

(2) The pre-eminence of difficulty over utility, as a regulator of value, disappears altogether when we pass from Mill's second case to a category comprising both Mill's third case (*Pol. Econ.*, bk. iii. ch. ii. § 2), in which the cost of production increases with the quantity produced, according to the law of DIMINISHING RETURNS (*q.v.*), and the converse case, in which the cost of production diminishes with the quantity produced according to the law of INCREASING RETURNS (*q.v.*). In this case the two factors, utility and value, become co-ordinate. As Professor Marshall says (*Economics of Industry*, 1st ed. p. 148), "the amount produced and its normal value are to be regarded as determined simultaneously under the action of economic laws. It is then incorrect to say, as Ricardo did, that cost of production alone determines values; but it is no less incorrect to make utility alone, as others have done, the basis of value." With reference to what Jevons calls the "mechanics of industry" it seems trifling to inquire whether the force or the resistance contributes more to the determination of equilibrium. The *simultaneity* of the two conditions is indicated by Jevons in his discussion of cost of production (*Theory*, ch. v.) Jevons there entertains the unreal conception that it is free to the producer to apply his efforts in "doses" to different kinds of production. This at most is true of the mere inventor as distinguished from the *entrepreneur* and operative. Still the conception may be usefully employed as symbolical of the actual working of competition in a regime of division of labour (Pantalone, *Principii. Theorema di Ricardo ad Marshall*). The simultaneity of the two conditions may best be shown by imagining the disutility, as well as the utility,

to be of the sort called "final" (see MATHEMATICAL METHOD).

(3) The co-ordinateness of difficulty of production with utility disappears when industrial competition is no longer supposed. In this case the assumed equation between the purchaser's and the producer's difficulty of attainment fails. The typical instance is international trade. There is no correspondence between the efforts of the Chinese producer of tea and the sacrifices which the English purchaser incurs to obtain it. It is pointed out by Cairnes that the principle of international trade governs domestic industry where "non-competing groups" exist. With reference to this case, as well as the preceding, Dr. Sidgwick justly says: "It is not merely inconsistent with facts but with other parts of Mill's teaching, to say broadly that 'the value of things which can be increased at pleasure does not depend . . . upon demand'" (*Pol. Econ.*, bk. ii. ch. ii. § 9). In this case the value of an article is proportioned to its final utility for the purchaser in the same sense as in the preceding cases. But it is not proportioned to the difficulty of attainment in the same sense.

(4) The co-ordinateness of difficulty of production with utility is not even supposable, when we pass to another category, Mill's first: "things of which it is physically impossible to increase the quantity beyond certain narrow limits;" such as "ancient sculptures" . . . "rare books or coins" . . . "houses and building-ground in a town of definite extent," and "potentially all land whatever" (*Pol. Econ.*, bk. iii. ch. ii. § 2).

(5) With Mill's first class go those commodities which are temporarily "unsusceptible of increase of supply" (*ibid.* § 5); in short all cases of MARKET as distinguished from NORMAL VALUE (*q.v.*)

(6) Lastly, all cases of monopoly must be excepted from the sphere within which the difficulty of attainment experienced by the purchaser is equateable with the difficulty of production. Outside this sphere the difficulty experienced by the purchaser is due to the niggardliness of his fellow-man, rather than the stubbornness of nature; and is measured only by his own reluctance to part with some useful commodity, and not also by his (potential) effort in producing the article purchased.

It is easier to refine upon these logical distinctions than to prove what is the relative extent and importance of the categories defined; which conception, if any, may be taken as typical of the facts. This is a matter of judgment rather than demonstration; about which there is much disagreement between economists of the last and the present generation. The case which one treats as the general rule, another treats as exceptional or non-existent. Mill speaks of his second category as "embrac-

ing the majority of all things that are bought and sold" (*P. E.*, bk. iii. ch. ii. § 2). To the same effect Ricardo on the very first page of his *Principles*. The reservations which are here indicated under heading (1) are waived by Ricardo. Of the effect of the rate of profits on value he says, "the reader" however should remark that this cause of the variation of commodities is comparatively slight in its effects" (*ibid.* ch. i. § iv.) The difficulties caused by the difference in the qualities of labour he dismisses in a few sentences (ch. i.) The extreme recoil from Ricardo's position is marked by the AUSTRIAN SCHOOL (*q.v.*), who emphasise utility as the determining principle of value, and assign quite a secondary place to Cost. See especially Professor Wieser, *Ueber den Ursprung . . . des wirthschaftlichen Werths*; and Dr. Böhm-Bawerk, *Kapital und Kapitalzins*, interpreted by Mr. James Bonar in the *Quarterly Journal of Economics*, October 1888, January 1889. In this attitude they had been anticipated by Jevons. But Jevons, as has been shown, admitted cost of production as a simultaneous factor. The simultaneousness of the two conditions in a regime of industrial competition has been defended by the present writer in the *Revue d'Économie Politique* for October 1890. In fine there are those who regard all abstract theory as futile (see the HISTORICAL SCHOOL). CLIFFE LESLIE and HELD (*q.v.*), Brentano and others, harp on the unreality of the Ricardian assumptions. Neumann's article on prices in Schönberg's *Handbuch* teems with cases which it is difficult to reconcile with any theory of the relation between value and difficulty of attainment. F. Y. E.

DIFFUSION THEORY OF TAXATION.

This is the name given (*e.g.* by Mr. F. A. Walker, *Pol. Econ.*, § 485) to the theory that the individuals from whom a tax on a particular kind of commodity, exchange, or occupation, is actually levied do not ultimately bear the burden, but shift it on to other classes, so that the tax is "diffused" or spread over a large area (see TAXATION). E. C.

DIGGES, SIR DUDLEY (1582-1639), director of the East India Company, was one of the ablest defenders of that society. The loss, near Bantam, in 1613, of the *Trades Increase*, gave rise to an anonymous pamphlet (the *Trades Increase*, by J. R., Lond., 1615) in which the author, while strongly objecting to all the then existing trading companies (see FOREIGN TRADE, REGULATION OF), made an especially violent attack on the East India Company, to whom that vessel belonged. He accused them of restricting the supply of East India commodities and of other objectionable practices, and maintained that their trade led to the diminution of the naval strength of the kingdom. The Company wished to prosecute the author in the Star Chamber, as some parts of the book were held to be "very near to

treason and all the rest very dangerous." (*Court Minutes*, 22nd Feb. 1615). Sir Dudley Digges, however, was of opinion that a book should be put forth refuting the charges brought against the Company. He accordingly published *The Defence of Trade: in a letter to Sir Thomas Smith, Knight, Governor of the East India Company*, From one of that Society, Lond., 1615. In this pamphlet he replied to the objections to the Company which were based upon the risks of the trade, the frequent loss of ships and men, and the consequent decrease of the naval strength of the country. He also maintained that the East India trade "increased the stock of the kingdom" (p. 43), and pointed out the fall in the prices of East India goods since the formation of the Company.

[State Papers Colonial (East Indies) 1610-15 *passim*. For full details of the life of Sir Dudley Digges, vide *Dict. Nat. Biog.*] W. A. S. H.

DILIGENCE (Scot.) (1) Care in regard to the subject-matter of a contract; (2) the procedure of the court whereby witnesses are made to attend or documents caused to be produced; (3) attachment of person or property at the instance of creditors to enforce satisfaction of a debt or obligation. A. D.

In English business phraseology *due diligence* is an expression denoting the care which persons who have undertaken certain duties with reference to the performance of work or the custody of goods must bestow on such work or such custody. The amount of care to be given depends on the nature of the contract. When a reward is given or promised, such "care and diligence are expected as are exercised in the ordinary and proper course of similar business, and such skill" as the person who undertook the work or the custody "ought to have, namely, the skill usual and requisite in the business for which he receives payment." When no reward is given or promised, the care usually given to one's own affairs is sufficient. E. S.

DILIGENTIA. Expression of Roman law for the care which was required in certain relations created by contract or otherwise. The degree of diligence required varied according to the circumstances of the case. Sometimes it was sufficient to give the care which the person concerned gives to his own affairs ("dil. quam suis rebus adhibere solet"); sometimes the diligence of a careful householder ("dil. boni patrisfamilias") was necessary. E. S.

DIME. United States silver token coin; nominal value ten cents. First struck in 1796, weight 41.6 grains, fineness 892.4. Altered in 1837 to weight 41.25 grains, fineness 900. Weight again reduced in 1853 to 38.4 grains, and fixed in 1873 at 38.58 grains. English standard value (silver 925 fine at 5s. 6d. an ounce) 5.16d. Value in silver francs, 900 fine, .5 franc. F. E. A.

DÎME ROYALE. In 1707, at the most disastrous period of the war of the Spanish Succession, the famous Marshal Vauban published his *Projet d'une dîme royale*, which remains the most memorable contemporary impeachment of the French financial system under the monarchy. In his engineering tours about France, Vauban had carefully studied the condition of the agricultural classes, and had arrived at the most gloomy conclusions. "One-tenth of the people has fallen in recent years into beggary; five other tenths cannot afford an alms to the paupers, because they are on the verge of beggary themselves; of the remaining four-tenths, three are in a bad condition, overwhelmed with debts and litigation; while of the remaining tenth barely 10,000 families can be called really rich." For this deplorable state of things the financial system is mainly responsible, and of this system the most glaring defects are the innumerable exemptions from payment and the practice of farming out the taxes, by which the great capitalists make a fortune at the expense of the people. Vauban reckoned no less than eighteen classes of persons who were exempt from the *taille* and other taxes. The exemptions were due in great measure to the practice of selling offices, which had grown up in the 15th century. To make them valuable, the monarchy had parted with the right of removal, thus losing control over its own servants. When they could no longer be trusted, their functions were given to a new set of officials: these in their turn bought their places, became useless, and were superseded by new agents. The result was the existence in France of an enormous number of useless officials, while the real work was done by the intendants and their agents. An office without functions was worth buying, because it freed its holder from direct taxation. Thus the sale of offices created a vast disguised public debt, the amount of which was as difficult to estimate as were the ruinous terms on which it was contracted. It resulted that the contributors to direct taxation were those who could not afford to purchase exemption. The indirect taxes, the *adels* (see ADLDS, COFFRÉS), and the *gabelle*, were as ruinous to industry, if not so glaringly unfair in their incidence, as the *taille*.

Vauban's remedy for the evils which he depicts was to abolish the existing taxes, and to substitute one single impost, levied directly upon real and personal property, from which no class was to be exempt. This *dîme royale*, etc., was to be graduated, varying from a twentieth to a tenth of income, and was to be collected directly by agents of the government. The suggestion of a reform which attacked so many vested interests, and the masterly exposure of profitable abuses, were enough to obliterate in the minds of Louis XIV. and his

ministers the services of the veteran marshal, now in his seventy-fourth year. The council issued a decree ordering the book to be confiscated, and prohibiting its sale under a fine of 1000 francs. On 24th March 1707, Vauban received the news of the confiscation of his book; on the 30th he died, broken-hearted at the ingratitude of a sovereign whom he had served only too well.

The *Projet d'une dîme royale* which has frequently been published separately, may also be found in *Daire, Économistes financiers du XVIII^{me} Siècle*, vol. i. p. 33. R. L.

DIMENSIONS OF ECONOMIC QUANTITIES. A unit is a concrete magnitude selected as a standard by reference to which other magnitudes of the same kind may be compared. A derived unit is a unit determined with reference to some other unit. Thus the unit of area may be derived from the unit of length by being defined as the area of the square, erected on the unit of length. The unit of speed may be derived from the unit of length and the unit of time, by being defined as that speed at which the unit of length is traversed in the unit of time. In relation to the derived units of area and speed, the units of length and time would then be fundamental,—“fundamental” being a term correlative to “derived.”

The theory of dimensions is concerned with “the laws according to which derived units vary when fundamental units are changed” (Everett). A fundamental unit, together with the magnitudes of like kind referred to it, is regarded as having one dimension. Thus a length has the dimension L. The unit of length enters twice into the unit of area, first determining the base and then the altitude of the unit rectangle, and therefore the dimensions of an area are LL, usually written L^2 . If we alter the unit of length, say from a foot to an inch (1:12) the unit of area will be reduced in the same ratio twice successively (1:144 in all). The variations of the unit of area, therefore, are directly as the squares of the variations in the unit of length. The units of length and of time enter once each into the unit of speed, but they do not enter on the same footing. If the unit of time be the minute, and the unit of length the foot, the unit of speed will be a foot per minute. This unit will become smaller if we make the unit of length smaller, since an inch per minute is a smaller speed than a foot per minute; but it will become larger if we make the unit of time smaller, a foot a second being a greater speed than a foot a minute. This is expressed by saying that the dimension of time T enters *negatively* into speed. The dimensions of speed, then, are expressed as LT^{-1} . A unit into which a dimension enters negatively is always a unit of rate, and measures amount of *x per unit of y*, $-y$ being the quantity the dimension of which enters negatively.

We have now examined simple cases of the variations of derived units, but it is obvious that the *numerical values* of concrete magnitudes vary inversely as the units by reference to which they are estimated. The smaller the unit the greater the numerical value of any given magnitude. The numerical value of a magnitude, therefore, will vary inversely as the unit whose dimension enters into it positively, and directly as the unit whose dimension enters into it negatively. Thus, let the unit of speed (dimensions LT^{-1}) be a foot per minute, and let the numerical value of a certain concrete speed be 10, *i.e.* let the speed be *ten* feet per minute. Then change the unit of length to an inch (1:12) and the unit of time to a second (1:60); the derived unit will now be an inch per second, and its relation to the former derived unit is obtained by altering directly in the ratio of 1:12 (dividing by 12) and inversely in the ratio of 1:60 (multiplying by 60), so that the new unit is five times as great as the old one, an inch per second being five times as great a speed as a foot per minute; but the numerical value of the concrete speed we had to express must be altered inversely as 1:12 and directly as 1:60, and is now only 2—*i.e.* the speed is *two* inches per second—or one-fifth of what it was before.

If we are measuring such a magnitude as feet of vertical motion per foot of horizontal motion in the path of a projectile, the dimensions will be LL^{-1} and will cancel each other. No change in the unit of length, then, will in any way affect the numerical value of this magnitude, and as no other dimension enters into it at all, it may be said to have no dimensions. Angular magnitudes, defined as ratios between arcs and radii, trigonometrical functions, and ratios generally are of this nature. They have no selected units, and their numerical values are absolute.

When the elements of the theory of dimensions have been thoroughly grasped it will be easy to apply it to economic questions; and it will be found an invaluable check in the more intricate problems of co-ordination and analysis. Thus, if the unit of value-in-use or utility be taken as fundamental, and regarded as having the dimension U, and if the commodity we are considering be taken as having the dimension Q, then DEGREE OF UTILITY (*q.v.*) of the commodity, being the rate at which satisfaction is secured per unit of *commodity* consumed, will have dimensions UQ^{-1} , and, will be readily distinguished from rate of enjoyment, accruing to the consumer, per unit of *time*, with dimensions UT^{-1} . *Price*, determined by *marginal*, or final, DEGREE OF UTILITY (*q.v.*), will have dimensions UQ^{-1} or P; and *hire*, being price per unit of time, will obviously have dimensions PT^{-1} or $UQ^{-1}T^{-1}$. When the thing hired is money and is used commercially, the utility derived from it is a commodity of like nature with itself.

The dimension U then becomes Q, and the dimensions of interest (as a rate) are $QQ^{-1}T^{-1}$ or T^{-1} , which will be found on reflection and experiment to be correct.

The theory of dimensions should be applied to economics in close connection with the diagrammatic method. But of course the connection between dimensions, as now explained, and the geometrical dimensions of the diagrams is purely arbitrary. The physicist may, according to his convenience, represent the height of a projectile—a magnitude of one dimension—by a line, or by an area, and speed by a line or an inclination. So the economist may represent a magnitude measured by a complicated derived unit by a line, or a magnitude measured by a fundamental unit by an area or a solid; and if he keeps the theory of dimensions well before him he may vary his methods indefinitely without any danger of confusion. In all cases, however, the dimensions of those quantities represented by areas or solids will be compounded of the dimensions of those represented by the lines which determine them. Again, those who have any acquaintance with the elements of the calculus will see that if the equation of a curve be differentiated to x then the area of the derived curve will have the same dimensions as the ordinate of the fundamental curve; the ordinate of the derived curve will have the dimensions of the ordinates of the fundamental curve positively, and those of its abscissæ negatively; and the abscissæ of the two curves will have the same dimensions. In other words, differentiation introduces the dimensions of the variable to which we differentiate negatively, and integration introduces the dimensions of the variable to which we integrate positively.

By way of illustration take a figure, on the ordinate of which intensity of desire, or degree of utility, is represented, while supply of commodity per unit of time is measured on the abscissæ. Now imagine a third axis (of Z) perpendicular to the page, along which time is measured. Such a figure will enable us to represent all the quantities we have to deal with in an ordinary problem of consumption. Rate of supply is represented on axis of X,

dimensions QT^{-1} ; degree of utility on axis of Y, dimensions UQ^{-1} ; time on axis of Z, dimension T; rate of enjoyment on areas parallel to plane of axes of X and Y, dimensions $UQ^{-1}QT^{-1}$

or UT^{-1} ; total enjoyment on solid figure, dimensions $UQ^{-1}QT^{-1}T$, or U ; total supply on areas parallel to plane of axes of X and Z , dimensions $QT^{-1}T$, or Q , and in like manner price, hire, total sum paid, etc., may be read, and their dimensional relations seen at a glance.

[The theory of dimension was (according to Jevons, *Principles of Science*, 1887, pp. 325) first clearly stated by Joseph Fourier. He expounded it with great lucidity in his *Théorie Analytique de la Chaleur*, 1822, §§ 159-162. An excellent popular statement of the theory, as it has since been elaborated, will be found in the beginning of Prof. J. D. Everett's *U.S. System of Units*, 1891. Jevons was the first to suggest the application of the theory to economics (*Theory of Political Economy*, 1888, pp. 232-252), but he unfortunately fell into some apparent errors and confusions which made the suggestion barren in his hands. A criticism of his treatment of the subject and an independent working-out of his suggestion, by the writer of the present article will be found in the *American Quarterly Journal of Economics* for April 1889, pp. 297-314.]

DIMINISHING RETURNS. The law of diminishing returns is the name given to the proposition that increase of the population of a country, or, more strictly speaking, increase of the labour expended on a given area, tends to be accompanied by a diminution of the returns to a given amount of agricultural industry. The law, it is added, is only true after population has reached a certain degree of density, and even then improvements in the methods of production have a counteracting tendency. Its origin is to be found in the corn-law discussions of 1814 and 1815. During the great war cultivation had been extended over lands of a worse quality than those previously occupied, and the conclusion of peace threatened, unless more stringent restrictions on importation were enacted, to throw these lands out of cultivation. It was generally assumed that this would be an evil to the whole nation, and not only to the owners and cultivators of the lands in question, as it was supposed that every increase of cultivation must ultimately lower the price of corn by making it more abundant. But Malthus, in his *Observations on the Corn Laws* (1814), attributed "no inconsiderable part" of the difference between the English and the foreign price of corn to the "necessity" of cultivating the poorer lands, from which a given amount of produce is obtained by the expenditure of a larger quantity of labour than is required in raising an equal amount of produce on the better lands (p. 40). In the *Nature and Progress of Rent* (January 1815) he worked out this idea, and mentioned the opposing force of agricultural improvements, which he considered to be nearly sufficient to balance the necessity of applying to poorer land, so that "the quantity

of labour and capital necessary to procure the last addition that has been made to the raw produce of a rich and advancing country is almost constantly increasing" (p. 45). Sir Edward West, in his *Essay on the Application of Capital to Land* (January or February 1815), put forward the same idea of an actual diminution of the returns to agricultural industry in order to show that the price of corn would not be lower than the price at which importation was allowed (see CORN LAWS). Ricardo, in his *Essay on the Influence of a Low Price of Corn on the Profits of Stock* (February 1815), used the theory that with the increase of population the returns to agriculture diminish "independently of all improvements,"—i.e. supposing improvements not to take place,—as an argument against any restriction on the importation of corn. For this purpose it was not necessary to follow West and Malthus in holding that returns have generally diminished in spite of all improvements, but there can be no doubt that Ricardo did believe that improvements have only a temporary effect in retarding the diminution of returns (*Low Price*, Works, p. 377 n.; *Principles*, Works, p. 66). James Mill, in *Elements of Political Economy* (1821), insisted on an actual diminution of returns, and paid no attention to the effect of improvements in production. McCulloch, in *Principles of Political Economy* (1825), expressed unhesitating belief in the actual diminution of returns with only temporary interruptions due to improvements (pp. 205, 277, 278, 383). This became for the time the received doctrine (see Longfield, *Lectures*, 1834-35, p. 181). But Dr. T. Chalmers in 1832 denied it, and showed, what was not then generally understood, that the bringing of new land into cultivation does not prove that an actual diminution of returns has taken place, as, owing to "improvements" or changes in human knowledge, the labour on the new land may be now as productive as the labour on the old land was before the change (*Political Economy*, in Works, vol. xix. pp. 17-24). H. C. Carey, in his *Political Economy* (1837-40), brought forward facts to show that the returns to agricultural industry, so far from diminishing, have actually increased enormously (vol. i. p. 58, iii. pp. 69, 70). J. S. Mill's teaching on the subject is not altogether consistent; sometimes he speaks as if there were no doubt that returns had increased (e.g. in the "Introduction" to *Pol. Econ.*) at other times as if they had with occasional interruptions steadily decreased (*Pol. Econ.*, bk. i. ch. xii. §§ 2 and 3, esp. in 1st ed. ch. xiii. § 2, bk. iv. ch. ii. § 3, ch. iii. § 5). To meet Carey's objection, advanced in *Past, Present, and Future* (1848), and in *Principles of Social Science* (1858), that, as a matter of fact, the best fertile lands are cultivated first, Mill confined the operation of the "law" to

old countries. Cairnes is probably the last writer of importance who expressed a strong belief in an actual diminution of returns (*Leading Principles*, 2nd ed. p. 119).

By the law as it is now taught (Sidgwick, *Principles*, bk. i. ch. vi.; Marshall, *Principles of Economics*, bk. iv. ch. iii.) no suggestion of any actual diminution of the returns to agricultural industry is intended. It is merely equivalent to the proposition that in each stage of progress there is a limit beyond which the labour expended upon a given area cannot be increased without causing a diminution of returns. The position of the limit is constantly being changed by the progress of knowledge, and to say whether it has been passed in any particular case is a very difficult practical question. And even in a case where the productiveness of agricultural industry had actually diminished, it would not necessarily follow that the productiveness of all industry taken together had diminished. Diminishing returns in agriculture might be counterbalanced by increasing returns in other industries. On this point see INCREASING RETURNS.

In the older statements of the law the "diminishing return" was the return to "a given amount of labour and capital." But a given amount of labour is not always aided by the same amount of capital, and when a given amount of labour is assisted by a greater amount of capital the returns to capital may diminish without any diminution of the produce of a given amount of labour. (See J. B. Clark, "Law of Wages and Interest" in *Annals of the American Academy of Political and Social Science*, July 1890.) E. C.

[For a fuller account of the discussions of 1813 to 1815, see E. Cannan, "The Origin of the Law of Diminishing Returns" in the *Economic Journal*, March 1892.]

DIMINISHING UTILITY. (See UTILITY.)

DINAR (*ancient*). An Arabian gold coin weighing about sixty-six grains. It formed the circulating medium of a great part of both Asia and Africa for about twelve hundred years.

DINAR (*modern*). The equivalent of the franc in Servia (see FRANC). F. E. A.

DIODATI, DOMENICO, a Neapolitan, lived in the second half of the 18th century. He was the author of *Illustrazione delle monete che si nominano nelle Costituzioni delle Due Sicilie*, Napoli, presso Donato Campo, 1788 a book which describes the coins of Frederick II., Emperor of Germany and King of the Two Sicilies, and expresses their value in terms of money current at the author's date. It does not deal with theory, except by discussing the "three different values of money, extrinsic value, intrinsic value, and commercial value." According to Diodati the extrinsic value of a coin is the one declared by the state; the intrinsic value, the value of the metal in it; the commercial value,

the purchasing power of a coin in terms of commercial commodities. M. P.

DIODATI, LUIGI, the younger brother of Domenico Diodati, also wrote on coins, from a wish to continue his brother's work. His competence in questions concerning coins was recognised by the government, which made him director of the Neapolitan mint. He was a great admirer of Broggia, and sent Broggia's works to the Russian court to be translated into Russian.

In his book *Dello stato presente della moneta nel Regno di Napoli e della necessità di un alzamento, con Prefazione*; Napoli, stamperia Migliaccio, 1790, and in a sequel to it: *Risposta ad alcune critiche fatte all' opera intitolata . . . ut supra*; Napoli, 1794, Diodati discusses an abstruse point in the history of money, which he says neither De Sanctis, Serra, Turbolo, Locke, Melon, Spinelli, Galiani, nor Beccaria had explained completely, viz. the true cause why gold had disappeared in 1587 from the kingdom of Naples. The usual explanation of this fact was an excess of imports over exports, whilst it was due, according to Diodati, to the monetary reform undertaken by the other states of Italy, each of which had raised the nominal value of their coins. In conformity with this central idea of his, Diodati advises his government to raise the nominal value of money in the kingdom of Naples, so as to make it equal to that of other Italian states, and explains at great length how this alteration should be carried out—changing the money into a species of token money. The reason which Diodati gives for the elevation of the nominal value of coins in other states, and therefore for doing the same in the kingdom of Naples, consists in the rise of prices and the fall in the value of money, consequent on the discoveries of silver in America, and the impulse these supplies of metal gave to enterprise and business, whilst reducing all fixed incomes. M. P.

DIRECT TAXATION. As defined by Mill (*Principles*, bk. v. ch. ii. § 1), taxation "which is demanded from the very persons who it is intended or desired should pay it."

Mill's definition has been generally adopted (see Prof. J. S. Nicholson's Art. "Taxation," *Encyclopædia Britannica*, 9th ed.), e.g. by Wagner (*Handbuch*, vol. ii. p. 152), and by Fawcett (*Manual*, 5th ed., bk. iv. ch. iii.) The latter writer abbreviates the definition by the statement that "a direct tax is really paid by the person from whom it is levied."

Practical financiers, as Prof. Bastable states (*Public Finance*, bk. iii. ch. i.), "regard those taxes as direct which are levied on permanent and recurrent occasions."

M'Culloch defined a direct tax as one which is taken directly from income or capital, and Dr. Ely (*Taxation in American States and Cities*, New York, 1888, p. 69) observes that

"direct taxes are taxes on trades, including any branch of business, on permits, on property consisting of other economic goods than articles of consumption, and on income." Both these definitions would include taxes on articles of luxury such as dogs, horses, carriages, and also on successions and gifts.

In this connection Prof. Sidgwick's remark may be noted, "The common classification of taxes as direct and indirect appears . . . liable to mislead the student, by ignoring the complexity and difficulty of the problem of determining the incidence of taxation." See also *TAXATION*.

T. H. E.

DIRECTORS, LEGAL DUTY OF. The duties and responsibilities of directors of joint-stock companies and other associations have frequently been discussed in the courts, and their position is now well defined. In the first place, a director must act strictly within the powers of the company as defined by the memorandum of association, and also within the powers entrusted to the directors by the articles, and if he expends any money or incurs any loss in consequence of transgressing such powers, he is liable to refund the amount. As regards transactions *within* such powers it has sometimes been said that directors are in the position of trustees, and attempts have been made to make their duties as stringent as those of the trustees of wills and settlements, but the courts have consistently opposed that view, and it is now well established that "if the directors apply the money of the company or exercise any of its powers in a manner which is not *ultra vires*, then a strong and clear case of misfeasance must be made out to render them liable" (see the present Lord-Justice Kay's judgment *In re Faure Electric Accumulator Company*, 40 Ch. D. 141, 152); in other words, unless it can be proved that the directors have been guilty of fraud or reckless negligence, they cannot be made responsible for losses arising through any of their acts or omissions as long as they have not transgressed the boundary lines laid down by the memorandum and articles.

A special liability is imposed upon directors with regard to prospectuses. In the first place, it is provided by Companies Act 1867, § 38, that every prospectus issued by a company must contain certain particulars respecting contracts entered into by the company or its promoters, and that the absence of such particulars renders the directors liable in the same way as if the prospectus in question had contained a fraudulent statement. In the second place, directors are liable in respect of fraudulent statements in prospectuses, and to a certain extent also for untrue statements made negligently, but in good faith. Before the Directors' Liability Act of 1890 proof of fraud was always necessary, but fraud was held to be proved if a false representation had been made—(1) knowingly,

(2) without belief in its truth, (3) recklessly (see Lord Herschell's judgment in *Derry v. Peck*, 14 Appeal Cases, 337, 359). The new act imposes a more stringent liability, inasmuch as it entitles persons who take shares or debentures on the strength of an untrue statement made in a prospectus to claim compensation, notwithstanding the absence of fraud, unless it can be shown that the person from whom compensation is claimed had reasonable cause to believe, and did in fact believe, that the statement was true. Before the act of 1890 a director who had not authorised or connived at the issue of a prospectus containing a false statement was not liable; but now a director is not absolved from his liability by showing that the prospectus was issued without his knowledge or consent; he must further show that "on becoming aware of its issue he forthwith gave reasonable public notice that it was so issued without his knowledge or consent." E. S.

DIROM, MAJOR ALEXANDER, of Muireisk (end of 18th century), wrote *Inquiry into the Corn Trade and Corn Laws of Great Britain, and their Influence on the Prosperity of the Kingdom*, 1796, with appendix by W. Mackie of Ormiston. The increase of foreign imports of corn is due to alteration of the old corn laws. In consequence of these alterations, Dirom says, "Our agriculture, which had reached its highest prosperity between 1730 and 1750, has ever since been rapidly declining, as is shown by the fact that 137,000 more people were employed in the cultivation of land between 1741 and 1750 than between 1773 and 1784." This pamphlet was answered in 1798 by Rev. J. HOWLETT (*q.v.*), *Dispersion of the Gloomy Apprehensions of late repeatedly suggested from the Decline of our Corn Trade*. Mr. Howlett thinks that the increased consumption of a greater general population, the demand for finer grain than formerly, and the greater numbers of live stock, especially horses—sufficiently account for the phenomenon of increased foreign importation (see Dugald Stewart, *Political Economy*, vol. i. 247 *seq.*) J. B.

DISABILITIES OF ALIENS. The only disability to which aliens now remain subject is that they cannot hold any shares in British ships (see *ALIENS*).

E. S.

DISABILITIES OF INFANTS. An infant (*i.e.* a person not having attained the age of 21 years) cannot, as a general rule, enter into any binding contracts or make any valid dispositions of property. To this rule there are several exceptions. An infant may (1) if a male, marry after having attained the age of 14; if a female, after having attained the age of 12; (2) with the consent of the court (*a*) make a valid marriage settlement (18 & 19 Vict. c. 43) (*b*) make leases and grant renewals of leases (11 Geo. IV. and 1 Will. IV. c. 65, §§ 16 and 17); (3) enter into binding contracts

relating to the supply of necessities—the term necessities not being confined to the bare means of sustaining life, but including all such things as are considered appropriate to the station of life of the person concerned; (4) an infant after attaining the age of 21 cannot retain property subject to liabilities acquired during his infancy without satisfying the liabilities incurred during that time, *e.g.* arrears of rent, calls on shares. On the same principle an infant partner who on attaining 21 retains his share of the profits, must allow himself to be debited with his share of the losses incurred during his minority. (5) Infant holders of gavelkind land may alienate such land subject to the performance of certain formalities, and there are other local customs giving infants an exceptional capacity to contract. (6) Infants holding themselves out to be of full age are liable to restore any advantage they have obtained by their misrepresentation to a person who acted on the faith of it. E. S.

DISABILITIES OF LUNATICS AND DRUNKARDS. In this case it is not quite correct to speak of a disability. Infants and married women are under permanent restrictions imposed on them as a general consequence of their status. Mental derangement, on the other hand, does not in itself create a new status. No transaction could be invalidated by the simple fact that a party to the transaction is a lunatic or a drunkard; on the other hand, a person generally sane or sober may under certain circumstances avail himself of the plea of mental incapacity. The rule is, that a contract or a disposition of property—which term includes testamentary dispositions—is generally not binding on a person who at the time of making the contract or disposition is not of sufficient mental capacity to understand the nature of the transaction. Whether the incapacity is due to insanity in the proper sense of the word, to mere temporary derangement or illness, or to drunkenness, is quite immaterial. As a general rule the party, or representative of the party, who wishes to escape an obligation on the ground of mental incapacity must bring evidence to show that at the essential moment such incapacity existed, but where a person has, after a judicial investigation (inquisition), been formally declared a lunatic, the presumption is reversed, and the party wishing to uphold a transaction to which the lunatic was a party must prove that the contract or disposition was made during a lucid interval. There is one exception to the above-mentioned rule. When a party to a contract, otherwise voidable on the ground of the mental incapacity of the other party, did not, as a matter of fact, know of such incapacity and had no reasonable ground for knowing it, and where it is impossible to restore the parties to their former position, the incapable party or his representa-

tive must abide by the consequences of the contract. Thus the personal representative of a deceased lunatic who, while in a state of mental incapacity not known to the other side, had purchased an annuity from an insurance office, cannot recover the purchase money. (See **DRUNKARDS.**) E. S.

DISABILITIES OF MARRIED WOMEN. It is generally believed that the Married Women's Property Act of 1882 has removed all the disabilities of married women, but this is not the case. A married woman having separate property, not subject to a restraint on anticipation, may now make contracts binding not only the property of which she is possessed at the time, but also property acquired subsequently, during the continuation of the marriage, and she may by will dispose of her separate property; but great anomalies remain, of which the following may be quoted as instances. A married woman, not being possessed of separate property, who purchases goods on credit and disposes of the goods, cannot be compelled to pay for the same although she subsequently acquires separate property of great value. A married woman not having any separate property, but knowing that her husband has made a will under which she will be entitled to a considerable legacy, makes a will, with the intention of securing the benefit of the legacy to some friend or relative, and dies after her husband. The legacy, will go to her next-of-kin, as her will can only dispose of "separate property," and property acquired after her husband's death is not separate property. A married woman entitled to a life interest in property subject to the usual restraint on anticipation, but not possessed of other separate property, incurs large debts. Her creditors are absolutely without any remedy. This state of things is most unsatisfactory. The old common law rule was based on the assumption that husband and wife were one person; the wife's proprietary existence ceased on the day of her marriage, and became absorbed into that of her husband, who took all her personal property, and possessed extensive rights of control and enjoyment with respect to her real property. This view, which at any rate had the advantage of clearness and consistency, has now been definitely abandoned; a wife now retains all her property and has extensive rights of disposition; the remaining restrictions have no social or economical reason, and their practical inconvenience is obvious. (See **MARRIAGE SETTLEMENT.**) E. S.

DISCHARGE (Scotland). Extinction of a debt or obligation, which may be by—(1) payment or performance; (2) abandonment of claim by creditor; (3) compensation or set-off; (4) novation or replacement of the original obligation by another obligation; (5) delegation, or replacement of the original debtor by another

debtor; (6) confusion, the debt and the credit, in a condition immediately and finally to extinguish one another, coming to coincide in the same person. Also (Scotland) the document whereby the creditor discharges the debtor.

A. D.

DISCHARGE IN BANKRUPTCY. The effect of a discharge in bankruptcy under the Bankruptcy Act 1883, is to free the debtor from all debts and liabilities provable in the bankruptcy, except crown debts, and debts incurred by fraud or through a fraudulent breach of trust. Crown debts can be released by a certificate from the treasury. By the amending act of 1890, it is further provided that, unless the court otherwise orders, the discharge shall not release the debtor from any liability under a judgment in an action for seduction, or under an affiliation order, or under a judgment against him as a co-respondent.

Under the act of 1869, the discharge of a bankrupt was a matter practically in the hands of his creditors unless he had paid a dividend of 10s. in the pound. Under the acts of 1883 and 1890, it is in all cases a matter for the judicial discretion of the court.

At any time after being adjudged bankrupt, the bankrupt may apply to the court for an order of discharge, but the application cannot be heard until after his public examination is concluded. Notice of the day fixed for the hearing must be gazetted, and sent to the creditors. On the hearing, any creditors who desire it, must be heard, and the court must take into consideration a report of the official receiver as to the bankrupt's conduct and affairs. If it is shown that the debtor has been convicted of a misdemeanour under the Debtors' Act 1869, the court is directed to refuse the discharge. If, on the other hand, the debtor is shown to have been guilty of certain minor acts of misconduct specified by the act, such as the assets, without reasonable excuse, not amounting to 10s. in the pound, or not keeping proper trade books, or trading with knowledge of insolvency, or having been guilty of fraudulent conduct, the court must either refuse or qualify the discharge. A discharge may be qualified either by suspending it for a specified time, usually not less than two years, or by imposing conditions as to after-acquired property, as, for instance, by directing judgment to be entered up against the debtor for a certain sum. If the debtor's conduct has been blameless he is entitled to an unconditional discharge, and he may also obtain a certificate from the court removing any civil disabilities consequent on bankruptcy (§ 8 of the Act of 1890).

An undischarged bankrupt who obtains credit from any person to the extent of £20 or upwards without informing such person of his status is guilty of a misdemeanour.

M. D. C.

DISCLAIMER. A person appointed as trustee

of a will or settlement who does not wish to accept the trust will find it safer as a general rule to execute a deed by which his non-acceptance is stated. A deed of this nature is called a deed of disclaimer. The word disclaimer is also generally used for any act of renunciation.

E. S.

DISCOMMODITY. The terms *disutility* and *discommodity* have been introduced into the nomenclature of political economy by Jevons (*Theory of Political Economy*, 1879, pp. 62, 63) as the opposites or contraries of the terms utility and commodity. Thus, by *disutility* he means, not the mere absence of utility, but the quality of causing positive inconvenience or discomfort. Similarly, by *discommodity* he means any action or material thing which possesses disutility. The term *discommodity* is used in much the same sense by Professor Marshall. "While demand is based on the desire to obtain commodities, supply depends on the overcoming of the unwillingness to undergo 'discommodities.' These fall generally under one of two classes, labour and the abstinence involved in putting off consumption" (*Principles of Economics*, vol. i. ed. 2, 1891, p. 193).

J. N. K.

DISCOUNT. The term "discount" signifies an abatement, or deduction, and is in practice applied in several ways: (1) stocks or shares are said to be at a discount when their market value shows an abatement from par value; (2) the stock of a trader is sometimes, from bankruptcy or other cause, sold at a discount from cost price; (3) a quoted or published price may be by custom subject to an abatement or discount, to purchasers for the trade, or for export; (4) an account for goods delivered may be paid at a date earlier than is usual upon receiving a discount therefrom; or (5) a bill of exchange, due at a future date, may be discounted, i.e. sold for cash at an agreed abatement.

Excepting in the first case, the discount is usually expressed at a rate per cent, and in cases 2, 3, 4, the formula for calculation is simply $D = \frac{P \times R}{100}$. In the discount of a bill of exchange, the time it has to run is taken into account, and the formula is $D = \frac{P \times R \times T}{100}$; T representing, in theory, fractions or multiples of a year, but, in the practice of a banker, a fraction only.

In law, and in fact, the operation of discounting a bill is a purchase, and the property therein passes to the purchaser, who acquires all the usual rights of a holder (see *BILL OF EXCHANGE*, *ENDORSER*, etc.) In practice, a banker always places the amount of the bill to the credit of his customer, debiting him at the same time with the discount. In most discount operations the effective rate of interest

upon the capital employed is greater than the nominal rate of discount. In the first three cases referred to above, time is an uncertain factor, and the effective rate will be increased according to the shortness of the time that elapses before the investment is realised; or will be diminished if that time should exceed one year. In obtaining discount upon the prepayment of an account the effective rate is dependent upon the time when payment would otherwise become obligatory. In discounting a bill of exchange, the time it has to run is taken into account in deciding the *amount* of discount, and the only advantage in the effective rate over the nominal rate is that—common also to all the other cases—arising from the fact that the discount is received at once.

Having regard to this fact, it is taught in the schools that *true discount* is the difference between the whole sum and its "present value," this latter being defined as the sum which, if put out at interest at the rate named, would amount, at the end of the given term, to the sum due. It is also further laid down that the current method of charging discount produces less to the holder than he should equitably receive, and examples are usually given only in what is termed the "more correct rule" of "*true discount*." But this teaching is altogether wrong, and appears to be based upon the erroneous notion that the operation of discounting is an *advance*, whereas it is a purchase. Moreover, as the word signifies an abatement, or "reckoning from," it is clear that such abatement must be calculated upon the gross sum, and not upon the net result of its own deduction. The theory of "*true discount*," also connotes the idea, which is equally unsound, that there is an "equity" in rates other than that obtained by free sale in a free market. As a matter of fact it is always found that the discount rate on bills is lower than the rate of interest on advances, which though chiefly due to the more liquid character of an investment in bills, is also, no doubt, in part due to the advantage under discussion.

The extent of this advantage varies directly with the nominal rate, but in greater degree. Thus:

With discount at 1% the effective rate is 1·01	% p. ann.
" " " 3% " " " 3·0927	+
" " " 5% " " " 5·2631	+
" " " 10% " " " 11·1	%

From these instances it appears that the extra profit increases almost as the square of the rate.

But this advantage is derived in the way of compound interest, and is therefore dependent upon the frequency with which the profit is received. The operation of the rule is, however reversed, and the shorter the term the less is the profit. The rates quoted above are based upon a supposed discount of twelve months' bills, and as bankers very rarely dis-

count bills with more than six months to run, and in by far the greater number of cases take bills of three months, or less, the advantage they obtain is very much less than is generally supposed. The effective rate derived from a year's full employment of capital in discounting at 5 per cent is as follows:

In 6 months' bills	5·19375%
" 3 " "	5·16
" 2 " "	5·14875%

As this presupposes an immediate re-employment of the full amount obtained by the payment of each bill as it falls due, and a constant rate of 5 per cent, it is considerably above the probable experience.

R. W. B.

DISCOUNT, FRENCH STOCK EXCHANGE (*Fr. Escompte*). The privilege accorded to buyers for the account on French bourses, to demand immediate delivery. The right is based on the fiction that sellers always possess the stock or shares they have sold, and is reaffirmed in Art. 63 of the decree of the 7th October 1890, relative to the office of *agent de change*:—"The purchaser may at all times call for the delivery, by anticipation, of the securities negotiated, whether firm or at option." Sellers may, however, stipulate that the operation is not discountable. The privilege is not frequently exercised, and, unless the market has been prepared by a corner, the *manceuvre* may turn against those who employ it, for if the seller has no difficulty in procuring the stock, the effect produced may be the reverse of that intended. Notice of "discount" must be given before business hours by the buying *agent de change* to the selling one with particulars which are posted in the private room of the corporation in the bourse building, and the purchase money must be deposited. The seller is allowed five days to pass the stock or shares, and two additional if the transfer requires the acceptance of the buyer, after which the usual measures against defaulters may be applied.

T. L.

DISCOUNT, LONDON STOCK EXCHANGE. The word is used in two senses, the one legitimate, the other being a piece of slang. First the scrip of a new issue is usually quoted at a discount, or at a premium, as the market price falls below or exceeds the amount of the instalment so far paid up. Thus, were a new government bond to be on the market, on which only £25 per cent had been paid up, the price—supposing it to be £26, would be quoted £1 premium. If, for another example, the shares in the Manchester Canal, on which £10 had been paid, were purchasable at £8, the market price would be £2 discount. When new scrip has been fully paid up, the necessity of quoting at a premium or discount ceases, and the plain price is then customarily quoted. The second sense in which the word discount is used on the stock exchange is to imply a preliminary effect on the market of news, or some other influence

which tends to raise or depress prices. There have, again and again, been rumours of coming war between Russia and England, and a fall in prices of government stocks was produced merely by the "discount" of the effect which an actual outbreak of hostilities would have upon the market. Similarly, the shares of this or that joint-stock company sometimes fall in the market, or rise, as the case may be, dealers and speculators being anxious to discount the effect of a good or bad dividend. Occasionally the effect of this discounting process is excessive, and the actual occurrence of what is anticipated or discounted, and the confirmation of rumours, is often followed by reaction.

On the stock exchange the word is used rather as a piece of slang to convey the impression that an expected event—say the death of the late Emperor Frederick of Germany—has been acted upon in advance by dealers and others, who by putting down or raising the quotations of the stocks in which they deal, "discount" the probable effect of that event on the market. Thus we hear of news being discounted, *i.e.* anticipated in a similar way as the value of a bill is anticipated under Discount.

A. E.

DISCOUNT HOUSES. See BILL BROKING.

DISCOVERIES, GEOGRAPHICAL (INFLUENCE ON TRADE OF). The effect of discovery is to modify or recast the conditions under which trade and industry are carried on. But such effect almost invariably though it be, may and does manifest itself in certain different directions, and thus, though it would be hard to describe within reasonable limits the results produced in the economic world by the discoveries which have been made, it is possible to suggest the directions in which these may be sought. Geographical discoveries may affect trade in the following ways—

a. By providing new sources for the supply of raw material.

b. By opening up new markets.

c. By the ultimate evolution of new trade rivals or competitors.

It is hardly necessary to point out that newly-discovered countries may pass through all the phases described above with regard to other and older-established countries. North America, for example, is the great source of cotton supply, it is a trade rival, and for some time it offered a large opening for the import of goods of European manufacture. As a rule, however, discovery tends to promote the greater differentiation of trade and industry. Each country attains to a distinct and separate position in regard to either supply or manufacture.

There is, however, another mode in which trade is affected by discovery.

d. By opening up new sources for the supply of the precious metals. These may be discovered in an old country; or a new country

possessing gold or silver mines may be suddenly discovered. The discovery of the Americas in the 15th century was of this latter character (see GEOGRAPHY, COMMERCIAL; GOLD—SILVER, DISCOVERIES OF).

E. C. K. G.

DISCOVERIES OF PRECIOUS METALS.

See GOLD—SILVER, DISCOVERIES OF.

DISCOVERY IN ACTIONS. Discovery in its widest sense means the procedure by which a party in an action may obtain sworn information from his opponent with reference to matters affecting the questions in dispute. Such information may be obtained (1) by administering interrogatories (written questions relating to relevant matters which must be answered by affidavit); (2) by requiring an affidavit of documents (a list of documents, verified by affidavit, relating to the matters in question in the action, being in the possession or power of the party from whom discovery is sought); (3) by giving notice to produce for inspection any documents referred to in the pleadings or in the affidavit of documents. A party may refuse to answer interrogatories or to produce documents for inspection on certain grounds, as for instance because the answer or the production of the document would subject him to criminal proceedings, or that the required disclosure would violate professional confidence or be detrimental to the public interest. Non-obedience to an order of the court directing discovery may subject the disobedient party to imprisonment.

E. S.

DISCRIMINATING OR DIFFERENTIAL DUTIES. Duties imposed upon commodities, and differing in amount according to the particular source from or mode in which those commodities are obtained.

When discriminating or differential duties have been imposed, the circumstances most frequently taken into account have been (*a*) the process of production employed, as in the case of a manufactured article produced either by hand or by steam power; (*b*) the material used, as in the case of sugar made from cane or from beetroot; and (*c*) the country or place of origin, as in the case of what are termed CORN LAWS (*q.v.*)

In cases in which regard has been had to the country or place of origin, the object has been either to protect the home product, or to favour importation from one particular place or in one particular manner, as, for example, where lower duties have been charged on the produce of a colony or of a country with which special treaty obligations are in force, or where higher duties are imposed on goods imported in shipping carrying a particular flag.

In an interesting note to his edition of the *Health of Nations* (new edition, 1863, p. 599) M'ulloch discusses the effects of the differential duties imposed on foreign timber to favour our North American colonies, and Sir Thomas Farrer,

in his *Free Trade versus Fair Trade*, refers somewhat fully to the proposals of the fair traders for differential duties in favour of the colonies. The latter writer remarks that such duties are "open to the fatal objection which makes all protection odious to free traders—viz. that they hinder people from buying and selling where they find it to their interest to buy and sell; that they limit production by preventing people from using their natural capacity to the utmost in making and selling the things which they can make better than others."

J. S. Mill arrives at somewhat similar conclusions. "Whatever else may be alleged in favour of such distinctions, whenever they are not nugatory they are economically wasteful. They induce a resort to a more costly method of obtaining a commodity, in lieu of one less costly, and thus cause a portion of the labour which the country employs in providing itself with foreign commodities, to be sacrificed without return" (*Principles*, bk. v. chap. iv. § 5).

The considerations affecting discriminating or differential duties are very closely connected with those relating to the general subject of free trade and protection (see also MOST FAVOURED NATION CLAUSE).

T. H. E.

DISCUSSION (Scotland). (1) A cautioner or surety, if not bound jointly and severally with the principal debtor, was formerly entitled to demand that the principal debtor should be "discussed"—i.e. that the creditor should employ his means of recourse against him, before he himself was interfered with. This privilege is, since 19 & 20 Vict., c. 60, § 8, now only possessed by cautioners who have expressly stipulated for it. (2) Heirs who represent the ancestor are liable for all his debts; but only in a certain order, which depends on the character in which they succeed; and those who come later in this order are entitled to insist that before they themselves are called upon, those who come earlier should be "discussed," i.e. made to choose between paying the debts and renouncing the succession. In English law choice is described as being "put to Election" (see ELECTION).

[Lord McLaren on *Wills*, § 2269.] A. D.

DISHONOUR OF A BILL. Refusal to accept; or non-payment when due (see BILLS OF EXCHANGE; DILIGENCE; NOTING OF BILLS; PROTEST OF BILLS).

A. D.

DISPOSITION (Scotland). Generally a unilateral deed of conveyance. The "disponer" "sells and disposes" or "gives, grants, and disposes" to the "disponee," the thing conveyed. A "disposition and settlement," or "trust disposition and settlement," a disposition, reserving liferent and dispensing with the necessity of actual delivery of the deed, to trustees with powers and under directions specified, is a common form of making one's will.

"Dispositions in security," or "bond and disposition in security," are forms of mortgage.

A. D.

DISTANCE IN TIME AS AN ELEMENT OF VALUE. Distance does not "lend enchantment to the view" of a future pleasure compared with the same pleasure regarded as present. "There is no man perhaps to whom a good to be enjoyed to-day would not seem of very different importance from one exactly similar to be enjoyed twelve years hence, even though the arrival of both were equally certain" (John Rae, *Statement of some new Principles of Political Economy*, Boston, 1834, a work referred to by Mill in terms of high encomium, *Pol. Econ.*, bk. i. ch. xi.) This incident of our moral nature has often engaged the attention of philosophers. Thus Locke (*Essay concerning Human Understanding*, bk. ii. ch. xxi. § 63): "When we compare present pleasure or pain with future, we often make wrong judgments of them, taking our measures of them in different positions of distance. Objects near our view are apt to be thought greater than those of a larger size that are more remote; and so it is with pleasures and pains, the present is apt to carry it, and those at a distance have a disadvantage in the comparison." Hume gives a more refined explanation of the influence of distance on the will (*Treatise on Human Nature*, bk. ii. pt. iii. § 7; compare the remarks, bk. i. pt. iii. § 9, with respect to a future state). Jevons expresses the depreciation of future pleasures by a fractional factor (a function of the distance in time). Multiplying the future pleasure by this factor we have its value relatively to present pleasure¹ (*Theory of Political Economy*, 3rd ed. p. 72, cp. p. 34). The factor expressing the effect of remoteness should be unity, if human nature were perfect. As Professor Sidgwick says (*Methods of Ethics*, bk. ii. ch. ii. p. 1, note), the "equal and impartial concern for all parts of one conscious life is perhaps the most prominent element in the common notion of the rational—as opposed to the merely impulsive—pursuit of pleasure." But in fact human nature always falls short of this ideal; and according to the degree of such imperfection nations and classes differ in the desire of accumulating the means of future pleasure (see examples quoted from Rae by Mill, *Pol. Econ.*, bk. i. ch. xi.) The "extent of the intellectual powers" is assigned by Rae as one of

¹ Jevons's equations between pleasures (*loc. cit.*) at different distances of time relate primarily to final utilities. But it deserves attention that the equations hold for utilities not qualified as final, upon certain not violent assumptions, which are stated by Professor Marshall in his *Principles of Economics*, p. 179. It is impossible to resist the conclusion, however paradoxical at first sight, that the depreciation of future pleasures, the rate at which they are "discounted," is measured by the rate of discount in the loan market (*Principles, loc. cit.*, and Mathematical Appendix, note 5).

the circumstances which determine the "effective desire of accumulation."

A wiser ground for preferring present goods is their comparative certainty.¹ The "bird in the bush" may never come to hand. The uncertainty of the future is greater, the lower the state of civilisation. "Stability, . . . the reign of law and order," is assigned by Rae as another condition of the effective desire of accumulation.

Again some pleasures are more "urgent" than others. Tastes may change, the sense of pleasure will be dulled in some cases and intensified in others by advancing age. The young man who looks forward to indulging himself in Alpine tours when he has made his fortune "would much rather have them now, partly because they would give him much greater pleasure now" (Marshall, *Principles of Economics*, bk. iii. ch. v.) On the other hand it may be foreseen that certain wants will be more pressing at a future time than at present. Ice will be wanted more next summer than now in winter (Bohm-Bawerk). Age will require more comforts than youth. Prudence dictates spreading out the consumption of a given store of wealth according to the law indicated by Jevons (*loc. cit.*)

The distance in time over which consumption is thus distributed is extended beyond the lifetime of the individual by his interest in posterity. As Mill says (*loc. cit.*): "If mankind were generally in the state of mind to which some approach was seen in the declining [Roman] empire—caring nothing for their heirs as well as nothing for friends, the public, or any object which survived them—they would seldom deny themselves any indulgence for the sake of saving beyond what was necessary for their own future years." Rae places the prevalence of the "social and benevolent affections" first among the conditions of the effective desire of accumulation.

The play of the various motives which have been indicated determines the value of future with respect to present wealth on the loan market, in other words the rate of interest. The spendthrift, however, prefers present to future satisfactions. The borrower of capital to be employed in business is moved by the prospect of future profits. The lender is deterred by providence from grasping all the immediate pleasure which is in his power. Also investment in the "personal capital" of skill and knowledge is governed by motives acting at a great distance in time. The remuneration of the skilled artisan and *entrepreneur* may be expected to compensate the sacrifices made by parents for the education of their children

¹ It is not easy to distinguish the influence in the will of more *certainty* from that of the uncertainty which attends future events. Is it possible to evaluate separately the Jevonian factors *p* and *q*? (See *Theory*, *loc. cit.* ; And cp. Pantaleoni, *Principi*.)

(Cp. Adam Smith, *Wealth of Nations*, bk. i. ch. x., and Marshall, *Principles of Economics*, bk. vi. ch. v., 2nd edition).

Thus distance in time is an element in the value of two important agents of production, borrowed capital and trained labour. It is accordingly also an element in the value of products (so far at least as the agents of production enter in different proportions into the products—Ricardo, *Pol. Econ.*, ch. i. §§ 4 and 5, cp. Mill, *Pol. Econ.*, bk. iii. ch. iv. §§ 3-5).

Also the demand for commodities, as well as the supply of them, is affected by the distance in time over which motives range. Where providence prevails, there will be a demand for durable clothing and articles of furniture rather than drinks and other objects of immediate gratification (Rae, *op. cit.* ch. vii.) Now in the case of articles of which the cost of production varies with the quantity produced—that is in the case of most articles—the extent of demand is apt to affect value (Sidgwick, *Pol. Econ.*, bk. ii. ch. ii. and Marshall, *passim*). In this way then, also distance in time is an element of value.

[Leading authorities on this subject are John Rae, M.D., *Statement of some new Principles of Political Economy*, especially ch. vi. and vii. Böhm-Bawerk, *Positive Theory of Capital* (translated by Wm. Smart); especially bk. v. and parts of bk. i.—Marshall, *Principles of Economics*, 2nd edition, bk. iii. ch. v., and other passages relating to discounted pleasures. Other authorities are cited in Pantaleoni's *Principi*. The subject is referred to in most recent treatises on political economy under the head of Capital. Among the earliest of such references are Senior's Observations on Abstinence in his *Political Economy*, pp. 58-59; and the following remarkable passage which occurs in S. Bailey's *Critical Dissertation on Value*, p. 218.

"The time necessary to produce a commodity may, equally with the requisite quantity of labour be a consideration which influences the mind in the interchange of useful or agreeable articles. We generally prefer a present pleasure or enjoyment to a distant one, not superior to it in other respects. We are willing, even at some sacrifice of property, to possess ourselves of what would otherwise require time to procure it, without waiting during the operation, of what would require labour without personally bestowing the labour. If any article were offered to us, not otherwise attainable except after the expiration of a year, we should be willing to give something to enter upon present enjoyment. On the part of the capitalist who produces and prepares these articles, the time required for the purpose is evidently a consideration which acts upon his mind. If the article is wine, he knows that the quality is improved by keeping; he is aware that the same excellence cannot be imparted to any wine without the employment of capital for an equal period; and that people will be found to give him the usual compensation rather than employ their own capital in producing a similar article."] F. F. E.

DISTRESS. The different kinds of distress may be distinguished according to (a) duration or (b) cause. (a) may be temporary or chronic. The cotton famine, as it is called, during the years of the American civil war, produced temporary distress in Lancashire, which came to an end with the resumption of business at the close of the war; change of fashion often does the same in towns which depend upon a single industry, as Nottingham. On the other hand we speak of the distress in certain parts of London as chronic, meaning that the standard of living is habitually low. So too (b) the cause may vary. Distress may be due to disturbances of the market, a collapse of credit, a falling off in demand, or a change in its direction. Again, it may be due to the failure of a crop, as of the potato in the west of Ireland, or the famines in various parts of India. The treatment of distress will vary with the kind of distress, and will aim either at the alleviation of it, when actually existing, or the removal of its causes, and so the prevention of its recurrence. In the case of widespread temporary distress, temporary measures of relief are often tried. The poor-law is often stretched to allow of relief to able-bodied labourers after a labour-test, instead of limiting it to the workhouse, and in the same spirit charity is often in such cases administered with the help of a labour-test, works of public improvement being set on foot, and wages paid out of charitable funds. If carefully managed, with strict inquiry and personal supervision, these remedies are sometimes effective, but they are attended with great dangers. They are often demoralising to the employed, for the work done is quite disproportionate to the wages paid; they are largely resorted to by persons whose distress is chronic and due to causes within their own control; they attract applicants from other districts, and so swell the evil; they divert employment rather than increase it; they come to be regarded as a permanent source of relief. All these evils are intensified when temporary distress is met by indiscriminate almsgiving. The object of remedies should be to remove the causes from which distress comes, but this is no easy task. When it arises from speculation, or change of fashion, the cure can be found only in a higher sense of responsibility on the part of both producers and consumers. When it is due to overcrowding of a locality or an industry, the cure must be sought in organised effort directed towards an increased mobility of labour from place to place and employment to employment, an increased efficiency, a higher standard of living, a truer knowledge of self-interest. The state can do much, by insisting upon the minimum at least of sanitary progress, the provision of an elementary and perhaps a technical education; but the individual, by example and by influence, can do far more.

The mistakes so commonly made, with the best intentions, in attempts to relieve distress, arise from the scale on which such attempts are made more than from any other single cause. Before relief can be undertaken the mass must be broken up into its constituent units, for every individual differs in history, in circumstances, and in prospects from every other, and to attempt to apply the same remedy to all cases is as dangerous as it would be in medicine. But the power of discriminating between different kinds of need is itself the result of long experience, and even when a judgment has been formed on this point, the remedy is often far to seek. It would be impossible to lay down any rule which would cover all cases of distress, but perhaps the following principles apply to a large majority of them. 1. The help given should be determined far more by the future than the past or even the present, the two latter being valuable chiefly as a guide to the former. Many a remedy which is effective for the moment is disastrous in its after effects, and it will be so in proportion as it fails to make the recipient independent of further help. 2. All relief should be adequate to effect its purpose. 3. Help in money and kind, though often inevitable, should be sparingly given, for it tempts the recipient to have recourse to it on every emergency. 4. The results of the help given should be felt after the need for it is past, a man, *e.g.* who has been assisted by a loan should be taught, when the loan is repaid, to continue the economies required to pay the instalments, and put an equivalent amount weekly in the savings-bank. 5. The responsibility of the members of a family, one to another, should be enforced and developed. 6. Lastly, the knowledge and the judgment necessary to put these principles in practice can rarely be attained unless men act in some sort of combination.

[The relief of distress is the subject of the publications of the *Charity Organisation Society*, 15 Buckingham Street, W.C., especially the *Charity Organisation Review*, and the preface to the *Charities Register*.—Moggridge, *Method in Almsgiving*.—Booth, *Life and Labour*.—Pretymann, *Dispauperisation*.—Mackay, *The English Poor*.] L. R. P.

DISTRESS (Legal Term). The legal remedy known as distress consists in the taking of a chattel of the wrongdoer by the injured party as a means either of compelling the wrongdoer to give redress or of obtaining satisfaction out of the thing seized. Generally speaking, the party who has suffered by a breach of contract, or by a tort, must bring his action for damages, and, if the wrongdoer fails to pay the damages awarded, must have the goods of the wrongdoer taken in execution by legal process. He cannot of his own motion seize chattels of the wrongdoer. The remedy by distress is available prin-

cipally in the following cases: (a) where a tenant has made default in paying his rent; (b) where a person liable to tithe rent charge has made default in paying; (c) where a person liable to pay certain rates and taxes, e.g. poor rate or highway rate, has made default in paying. Also when cattle stray and do damage they may be distrained upon by the party injured.

Of the above cases the first is the most important. Subject to certain exceptions, the landlord may distrain upon the tenant as soon as the tenant has made default. A distress may not be made by night. In making a distress it is not lawful to break open the outer door of a house, but when the house has once been entered, any inner door may be forced in search of goods. All goods found on the premises, whether belonging to the tenant or to a third party, may be taken subject to certain exceptions, of which the chief are as follows: (a) in favour of the goods of a guest at an inn; (b) in favour of goods received by the debtor to be worked up in the way of his trade; (c) in favour of the bedding, the apparel, and the tools of the debtor and his family. The goods distrained must be kept five days,—or fifteen days if the owner so request in writing and give security for any additional cost incurred,—after which they may be sold. The surplus left, after satisfying the debt and costs, must be paid to the debtor. If the proceeds of sale do not satisfy the debt and costs, a second distress can be levied. The person distrained upon has legal remedies for irregular, excessive, or wrongful distress.

Historically the remedy of distress appears to be a relic of the period when legislators sought rather to regulate than to suppress the use of self-help by injured parties. It occupies a far more important place in the early Celtic and German codes than in modern law. It has been retained only in cases where the claim of the creditor was regarded as particularly strong. It has been criticised as exceptional, as harsh, and as unnecessary; but whether it should be altogether abolished is an open question.

[For the outline of the law of distress, consult Stephen's *Commentaries*, vol. iii. pp. 261-274.—For its details see Oldham and Parker, *Law of Distress*.—For an historical investigation of the remedy see Maine *On the Early History of Institutions*, lectures 9 and 10.] F. C. M.

DISTRIBUTION (or in full **THE DISTRIBUTION OF WEALTH**), serves in most economic text books as the heading of that part of political economy which deals with different classes of income such as rent, profit, interest, wages, and their subdivisions. The use of the phrase in this way is of modern origin.

The system of the **PHYSIOCRATS** (*q.v.*) involved the conception of the annual produce of a country being divided between the productive

class, the sterile class, and the landlord class. The process of payments and exchanges, intermediate between production and consumption, by which the division ("*partage*," *Œuvres de Quesnay*, ed. Oncken, 1888, p. 315) was effected, was called "the distribution of the expenses of a nation" ("*la distribution des dépenses d'une nation*," *ibid.* p. 320). The *Tableau Économique* (see **PHYSIOCRATS**) was an arithmetical representation of "the regular order" ("*l'ordre régulier*," *ibid.* p. 319) of this distribution. If Adam Smith's account of the economical table (*W. of N.*, bk. iv. ch. ix.) be compared with Quesnay's *Analyse du Tableau* (*Œuvres*, ed. Oncken, pp. 305-328), no doubt can be felt that the latter part of the title of book i. of the *Wealth of Nations*, "of the order according to which its [labour's] produce is naturally distributed among the different ranks of the people," was like the title of Turgot's *Réflexions sur la formation et la distribution des richesses*, suggested by the physiocratic system. But in adopting the physiocratic phrase, Adam Smith slightly altered its meaning. Though he followed the physiocrats in attaching great importance to the division of the produce between the productive and the unproductive class (*W. of N.*, bk. i. ch. vi. *ad fin.*, and bk. ii. *passim*), what he understood by the distribution of the produce seems to have been, chiefly at any rate, its division into wages, profits, and rent; "The price . . . of all the commodities which compose the whole annual produce of the labour of every country, taken complexly, must . . . be parcelled out among different inhabitants of the country, either as the wages of their labour, the profits of their stock, or the rent of their land; the whole of what is annually either collected or produced by the labour of every society, or, what comes to the same thing, the whole price of it, is in this manner originally distributed among some of its different members" (*ibid.* bk. i. ch. vi.)

Having thus stated that the produce is divided or distributed into the three great portions of wages, profit, and rent, Adam Smith might have been expected to proceed to discuss the circumstances which determine the proportions in which it is divided between the three, to explain what determines the relative magnitude of the whole of wages, the whole of profit, and the whole of rent. He does not do so, however, but "endeavours to explain what are the circumstances which determine" (see ch. vii. *ad fin.*), the absolute magnitude of *per capita* wages, the rate of profit or ratio between profit and capital, and the absolute magnitude of rent *per acre*. There is therefore considerable justice in J. B. Say's remark that the *Wealth of Nations* contains "no complete and well-connected account of the manner in which riches are distributed among the community" (*Traité*, 8vo, ed. 1876, p. 37). Say did not supply

much of the deficiency himself, but his plan of making "production" and "distribution" the headings of separate parts of political economy has been generally followed by later economists. It was introduced into England by James Mill in his *Elements* (1821). Ricardo was led by the course of his argument against the corn laws (see his *Essay on the Influence of a Low Price of Corn*, 1815) to attach great importance to the proportions in which the whole produce of the earth is divided between rent, profit, and wages. "To determine the laws which regulate this distribution is," he declares, "the principal problem in political economy" (*Principles of Pol. Econ.*, pref.) But this problem did not supersede the older question as to the circumstances which determine the ratio between interest and capital, and the absolute magnitude of rent and *per capita* wages.

As regards the distribution of profits and rent among individual capitalists and landlords, economists have usually been silent, taking it for granted that every one knows why some individuals possess much property and others little or none. As regards the distribution of wages among individual labourers, it has in a similar manner been assumed that the reasons why some individuals earn more than others working in the same occupation are too obvious to require explanation, but it has been usual to follow Adam Smith (*W. of N.*, bk. i. ch. x.), in an endeavour to explain why the earnings of the average workman in some trades are greater than those of the average workman in other trades.

The distribution of wealth or income into rent, profit, and wages, and the distribution of these three shares among individuals, under present conditions, is the result of EXCHANGE (*q.v.*) Without exchange there could not, private property being understood to be established, be any conception of a joint income to be distributed. The value of the joint income reckoned in pounds sterling is merely the sum of the values of all the separate incomes, and without exchange these separate incomes could have no values to add together (see VALUE). The proportion of the whole income which falls to any man's share is determined by the value of his contribution to the production of that income, whether his contribution be work performed or the use of land and capital. This fact was so little recognised until recently, that James Mill and his son both thought it desirable to put distribution before exchange in their treatises (see Sidgwick, *Pol. Econ.*, bk. ii. ch. i. § 1).

For an account of the various theories which have been held respecting PROFITS, RENT, and WAGES, see these headings. For an explanation of the "wealth" the distribution of which is discussed in political economy, see WEALTH.

The word distribution is sometimes used by

economists not in the technical sense dealt with above, but as equivalent to the process of conveying commodities from the producers to the consumers, and of dividing large quantities of a commodity into small quantities. See for example the long discussion on distribution in Malthus (*Pol. Econ.*, 1820, ch. vii. §§ 6, 7, 8, 9). This use of the word and kindred expressions is older than the technical usage. Lewis Roberts, in his *Treasure of Traffike*, 1641, speaks of "Commerce or Traffike which distributeth" the produce of a country "into forraigne parts." Adam Smith says that money "circulates and distributes" produce "to its proper consumers" (*W. of N.*, bk. ii. ch. ii.), and we still sometimes speak of merchants and retailers as "distributors," and of co-operative shopkeeping as "distributive co-operation." The kind of distribution contemplated in these modes of expression is a part of the process of PRODUCTION (*q.v.*) E. C.

DISTRIBUTION, ETHICS OF. The primary fact of economics is the production of wealth. The division of the product among those who create it is secondary in logical order and, in a sense, in importance. Yet the most important subject of thought connected with social economy is distribution. If the term be used broadly enough it designates all of the economic process that presents moral problems for solution. On the settlement of the ethical questions concerning the division of the social income depends not only the peace of society but the fruitfulness of industry. It is a striking fact that Ricardo, whose studies carried economic science forward in the direction of the truth concerning distribution, but stopped short of that goal, and so strengthened the hands of social agitators, realised the paramount importance of the subject on which his thought was chiefly concentrated: "To determine the laws which regulate this distribution," he says in his preface, "is the principal problem in political economy."

Scientific errors concerning the law of distribution react more harmfully on production than do errors of doctrine concerning production itself. Among self-asserting people, industry loses fruitfulness whenever the belief is widely diffused that products are shared according to an unjust principle. If it were a general conviction that social evolution is in the direction of iniquity,—that distribution already robs the workers and will rob them more hereafter,—no force could prevent a violent overturning of the social order.

Industry has its fruits and its sacrifices; it creates useful things at the cost of working and waiting. Where production is carried on in a collective way, both the products and the burdens of the process have to be shared by different classes of men according to some principle. The apportionment that has to be

made is not only of products, which represent positive values, but of sacrifices, which may be treated as negative values of a "subjective" kind. While the term distribution, as currently used, designates only the apportionment of the positive values, or products, it is capable of being used in a more complete sense, and made to include the apportionment of the negative ones also. It would then include all of economic science that involves moral problems.

Both parts of this twofold distributive process must in any case be studied if the ethical questions connected with industry are to be solved. There is no independent standard of justice in the distribution of products only. What a man ought to get out of the collective income of mankind depends on how much he or some one who represents him has sacrificed in helping to create it. The apportionment of the positive values referred to is inseparably connected with that of the negative values. Political economy must tell us how both products and burdens are actually shared, and ethics must tell us how both of them ought to be shared, if the existing plan of social industry is to be morally tested.

Political economy has not as yet furnished a theory of the actual distribution of positive values, or products of industry, that has met with general acceptance. It has scarcely attempted to furnish a theory of the distribution of the negative values. Ethical science has not furnished a clear standard of justice in the double apportionment.

Every producer experiences in his own person the double effect of industry; he is first burdened and then rewarded. The net effect of the two influences on the man's well-being may be termed the subjective resultant of production. A complete science of distribution must study the economic resultants in the case of different classes of men. How is a labourer on the whole affected by industry? What is the measure of the net benefit that comes to him from this source? How is a capitalist affected? How do the net effects compare with each other? What tendencies are at work to change the two, both absolutely and relatively? These are economic questions; while the ethical question is what the resultants in the two cases ought to be.

The personal resultant of industry is always a positive quantity. Work yields a net gain; the fruits of it are worth more than they cost. For the most hardly-used classes an industrial life is, by economic tests, more than worth living. The hours of labour in a day are increasingly burdensome as the period of work is prolonged. A man might labour three hours a day with little weariness and no injury. The eighth hour is wearying, and the tenth is more so. There comes a time at which work naturally stops, if the man is free, because

working longer would cost more in the way of pain than it would secure in the way of pleasure. Final or marginal labour is that which just pays for the weariness that it costs. The gain that comes through labour offsets the burden that it entails at the point in the working day at which the burden is greatest. The less onerous labour of the earlier hours affords a net personal gain. If the man is paid by the hour he earns a part of his wages very easily. Intra-marginal labour, as we may term it, affords a net subjective gain, what some would call *PRODUCER'S RENT* (*q.v.*)

Though the wages of all hours may be equal by money standards, they are of unequal utility to the man who gets them. His first earnings are spent on necessities, later ones on comforts, and final or marginal ones on things that figure in his estimate as luxuries. The last hour of his labour may ensure to him only the least important thing that he gets at all. It is the minimum benefit secured by an hour's labour that offsets the maximum sacrifice caused by it. There is therefore a second net gain coming to the worker in the spending of his money. As the sixpence or dime that is spent for a luxury benefits the man enough to offset the weariness of final or most fatiguing labour, those that are spent for food, clothing, etc., afford an additional benefit. The man enriches himself whenever he buys a loaf of bread. In general the sacrifices and the benefits of production just offset each other at the point at which the sacrifices are the greatest and the gains are the least. Everywhere except at the margin the gains are greater and the sacrifices are less.

Again the positive resultant of industry is increased by social organisation. Anarchy, even if it were peaceful, would increase sacrifices and diminish rewards. Whatever might be true of a sparsely settled world, a crowded world is dependent on the multiplying of productive power that combination brings. All classes are debtors to society. No serious case can be made against the existing social order on the ground that it lessens the gain that labour naturally brings.

The indictments brought against the social order are based on the comparative treatment that society accords to men of different classes. Are the benefits conferred on different ones what they ought to be relatively? Does society proceed capriciously in the allotment of rewards and sacrifices? Do some classes fail to get the proportionate benefit that is properly theirs? Are social tendencies in the direction of equity or away from it? These are the ethical questions to be solved by a comparison of the ideally just distribution with the actual one.

Of the ideals of distribution that have been advanced none has been crude enough to provide for the apportionment of the products of

industry and take no account of the burdens. A rule of equal rewards for unequal sacrifices would have no moral support. Ethical studies in this field really have as their object the attainment of a rule for adjusting what we have termed the personal resultants of industry, or a rule that, if followed in practice, would make the net effect of industry on the welfare of different classes equitable. Communist theories make equality nearly synonymous with equity; but the thing that is to be equalised is seldom mere property or income. If the principle of equality be carried into refinements, so as to bring to one level the net benefits that society confers on all its members, the rule approaches, though it is still far from reaching, the ultimate moral ideal of distribution.

The better socialistic ideals are refinements of the rule of equality. In applying the rule to individuals, inheritance is the first disturbing influence encountered. The law of inheritance is based on a certain solidarity of families. Where it is in force the sacrifices of a parent may accrue to the benefit of a child. What we have termed the resultant of industry in the case of the heir to an estate is not to be measured by adding together positive values, represented by the enjoyments that the property brings, with negative values, represented by the inheritor's own sacrifices. If he be considered apart from his family the values in the case are nearly all positive. A crude levelling of individuals' net gains accruing from industry demands the abolition not only of inheritance, but of gifts from parents to children. Where it is advocated it is in the interest of purely individualistic equality.

The handing over of all capital to the state sweeps away even more completely inequalities of wealth in permanent possession. In theory it might avoid the evil connected with the abolition of inheritance, that, namely of reducing the capital that is necessary if wages are to be sustained at a high rate; since it is conceivable that the state itself might accumulate capital with needed rapidity. This measure also would, in effect, disregard the solidarity of families and tend to put men on a footing of individualistic equality.

Economic difficulties do not need to be considered in the shaping of a moral ideal. The vesting of all capital in the state would save the student of applied ethics one serious difficulty, that, namely, of determining whether the sacrifice of abstinence is unduly rewarded as compared with that of labour, or, in other words, whether interest is too high as compared with wages. A socialistic state has its moral duty simplified, since it has only to reward different kinds of labour equitably.

A scheme that is too crude to have much support makes the wages and the working hours equal for all. Estimate the wages in money or

its equivalent, gauge labour by time only, and bring both to an equality in the case of the whole adult population. Even the rewards are not thus in reality equalised, and the sacrifices are very unequal. In real rewards unmarried men would be favoured and large families would suffer. The real sacrifices incurred would vary according to the nature of the work performed.

An improvement on this scheme provides a stipend for each dependent member of a family, and tries to equalise sacrifices by so reducing the number of hours of labour per day in occupations that are disagreeable or hurtful, as to bring all employments to a certain uniformity of burdensomeness. In the case of very disagreeable work the hours would be reduced to a minimum, while in occupations that are less and less repellent they would be shortened proportionately; less. Production would of course suffer by this arrangement, and the ideal that the plan of division presents is that of small but equal pay, with easy work, for all.

Another scheme does not content itself with equalising what we have termed the personal resultants of industry, but aims to level inequalities of condition that lie at the back of industry itself. Society should do more for the lame and the blind than for those who have all faculties in possession, in order that the ultimate condition of all may be made as nearly equal as is possible. Here is the levelling policy in perhaps its most ambitious mood. It is not the treatment of men by society that is to be equalised, but the treatment of them both by nature and society. The industrial organism is to deal with its members unequally in order that it may somewhat neutralise the partiality of nature.

A rule of division that is often regarded as ethically lower than either of those above specified is that of compensation according to actual production. Give to a man the wealth that he creates, neither more nor less. Every one owns what he brings into existence; let not society wrest or filch from him any part of it. Let it keep itself clear from robbery and fraud.

If workers lived side by side in peaceful anarchy, with no division of labour and no exchanges, each man would get what he created. He would get little, but he would get all that would be his own. Introduce now a social union that multiplies products ten-fold but increases some men's returns only five-fold, and you seem to benefit these men and to rob them at the same time. If in organised industry some of the product that is distinctly attributable to labour itself finds its way into the hands of men who do not create it, the labourer suffers a wrong, even though the share that he still keeps may be larger by reason of the fact of his connection with the men who rob him. Such is the conception of industrial society that exists in many minds. The socialistic indictment

against society is that it filches from workers a part of their share of the *extra* product of industry due to organisation. Does society, under natural law, take from labour a product that is distinctly attributable to it? This is one of the most important questions in economics. A successful analysis of social production answers it. What needs to be known is what part of the composite result of industry is distinctly due to labour itself. In a land peopled by isolated producers and managing to live in peace, each man would get his own; does exchange vitiate this result? If so, organisation proceeds here on an unusual principle; since the complications of society as a rule disguise essential facts of primitive industry, but do not annul them. The presumption is that the man who got his own when he worked alone gets it when he trades with his neighbour on terms of genuine freedom, and that a true analysis of social relations will show the fact. If so, society tends actually to conform to the rule "to every man the product that is distinctly attributable to the sacrifices that he or others in his interest have made." There is common honesty in the distribution that takes place under natural law.

[The literature of the subject of economic ethics is not so scanty as it is one-sided. The basis of the socialistic movement is ethical, and much of its literature is designed to prove that society is organised on a plan that systematically wrongs workers in the apportionment of the social income. A defence would naturally aim to show that the law of distribution is not itself iniquitous, however many particular cases of injustice might arise under it. A weak point in the defence is the lack of a clear demonstration of the complete nature of the actual law of distribution, a lack that, as is hoped, may soon be supplied. In the meanwhile statistics are appealed to on both sides to prove, on the one hand, that the actual apportionment of wealth is departing more and more from the ideal standard, and, on the other, that it is tending towards it. For important socialistic arguments see Rodbertus's *Zur Erkenntniss unserer Staats-
wirtschaftlichen Zustände*; Marx's *Kapital*; and Louis Blanc's *Organisation du Travail*. For an argument aiming to prove that the private ownership of land involves progressive injustice in distribution see Henry George's *Progress and Poverty*. Of the numerous replies to this work, that contained in F. A. Walker's *Land and its Rent* may be especially mentioned. An historical treatment of this subject is found in Thorold Rogers's *Six Centuries of Work and Wages*. A theory of a law of utilitarian morality in economic evolution is presented in G. de Molinari's *La Morale Économique*. See also M. Minghetti, *Des Rapports de l'Économie Publique avec la Morale et le Droit* (Guillaumin et Cie). Many of the best studies of the favourable features of the existing mode of apportioning the social income are to be sought in the standard treatises on political economy mentioned in connection with article DISTRIBUTION, LAW OF (q.v.).] J. B. C.

DISTRIBUTION, LAW OF. The most important share of the income of society is the one falling to labour. The so-called "wage fund" theory accounted for the rate at which labourers are paid on the ground that wages come from a fund of capital devoted to this purpose, and that the rate per man depends on the size of the fund and the number of the claimants. The discovery of the fact that wages come from the product of industry, and not from capital, has made a new theory necessary, and has opened the way to the discovery of a general law of distribution.

The parties in the division of the general product of industry are—(1) those who contribute to production the element labour; (2) those who contribute instruments, or wealth in productive forms; and (3) those who bring labour and productive wealth into co-ordination by hiring both of these agents, and receiving and selling their products. The labour furnished includes the work of management, as well as other kinds of industrial effort; and the productive wealth, as the term is here used, includes land as well as other instruments. The co-ordinating function is, in this enumeration, kept distinct from the other two; the man who performs it is not to be treated in this connection as a labourer or as a capitalist, but as the employer of both labour and capital.

The shares to be accounted for are thus wages, interest, and pure profit, and these shares will include the rent of land and the wages of superintendence. The generic varieties of gain come from putting forth productive effort of some kind, from furnishing productive wealth in some form, and from bringing the effort and the wealth into co-ordination.

The scientific law of distribution determines what reward shall attach to the performing of one of these functions. It does not gauge the income of a particular man, since a man nearly always performs more than one function. A capitalist usually works, a labourer usually has capital, and an *entrepreneur*, or co-ordinator of labour and capital, almost invariably owns some productive wealth, and does some directive work. A scientific study aims to discover what determines the gain that attaches to the working, to the saving, and to the co-ordinating. As a man is a composite functionary, it tells us how much he naturally gets in each of his various capacities.

The Nature of the Distributive Process.—Social production is a synthesis of distinguishable elements. Distribution is an analysis; and it reverses the synthetic operation step by step. In organised production one worker does not complete a product from the beginning; if he applies his energy to crude nature and begins the making of something that the wants of society require, he passes the product in an incomplete state to a successor. This man

in turn advances the article nearer to completion and hands it over to a third man. The product, when ready for final use, has passed through the hands of a series of workers each of whom has put his touch on it and passed it to his successor.

The process may be represented by the following diagram :—

Synthesis resulting in the completed product, clothing.

1st Sub-Product. Elementary Utility. Wool.	2nd Sub-P. Place U. Transport- ing.	3rd Sub-P. Form U. Manufac- turing.	4th Sub-P. Form U. Tailoring.
Resulting from the joint action of Ca- pital and Labour.	Joint re- sult of C'. and L'.	Joint re- sult of C''. and L''.	Joint re- sult of C'''. and L'''.

The garment, when completed, is an aggregate of distinct utilities, and we use the term sub-product to denote the quality imparted to it by each specific group of producers. The sharing of the value that a coat represents among the groups that have performed the specific operations of production is an analytical operation, that follows, in a reverse direction, the steps of the productive synthesis.

The first sub-product in the series is wool. It embodies an "elementary utility," or one that results from calling a raw material into existence. The merchant's sub-product is only the special utility imparted to the wool by conveying it to his warehouse, assorting it, and dividing it into quantities convenient for purchasers. It is mainly a "place utility," which is the service-rendering quality that a thing acquires by being taken to the place where it can be used ; though in a complete statement it would be necessary to recognise a "form-utility" due to assorting and dividing. The manufacturer's sub-product is not the cloth, but the "form-utility" imparted to the wool by transmuting it into cloth. The tailor's sub-product is the further "form-utility" imparted to the cloth by making a coat of it. Each specific utility is created by the joint action of labour and capital ; and each of these agents must have its share of the value embodied in its sub-product.

In order that the action of labour and capital within the sub-groups may be a joint-action at all, it is necessary that a certain co-ordinating act be done. Some one must hire labour of the right kind, borrow capital and invest it in the proper forms, and cause the two to co-operate. This is the work of the entrepreneur, in an unusually limited sense of the term. This functionary, in his capacity as entrepreneur, is not a capitalist and not a labourer, however frequently it may happen that the man who performs the co-ordinating function may perform others as well. The co-ordinator, as such, is not a business manager

or superintendent. The performing of this function does not require salaried labour ; indeed, after the process is begun, it scarcely requires effort at all.

Bargaining operations first divide the total product of industry among the general groups of which society as a whole is composed. How much wealth shall come to the entire group of workers, capitalists, and entrepreneurs who are engaged in the creating of the finished products, woollen garments ? That depends on the price for which the garments sell. A myriad of finished products from other groups in the world at large must come, by way of exchange, to minister to the wants of the men in this one group ; and the quantity and quality of those products is fixed by the sale of the clothing. This sale, and others like it, perform the first and most generic dividing act that takes place in the process of distribution. It determines the total income of those who contribute to the production of clothing.

What fixes the part of the income of this general group that goes to each of the sub-groups that compose it ? Bargains again. Each group must buy the utilities made by those that come earlier in the series, and sell them, with the addition of its own utility, to the group that succeeds it. The manufacturing group buys wool and sells cloth ; and what it receives, less what it pays, constitutes the reward of the manufacturing operation. As the first division of the income of society resolves it into rewards of general producing groups, the first sub-division resolves the portion falling to one general group into shares for the sub-groups that constitute it.

A further division is to be effected : it is that of the shares falling to labourers, to capitalists, and to entrepreneurs in each sub-group. Here is the test operation of distribution ; in this smallest of fields is created and divided the wealth that rewards each class in industrial society.

The productive operation from the fruit of which labour and capital get their pay is *intra-groupal* ; it goes on within the specific industry in which a particular force of men and their quota of capital are engaged. The value that rewards woollen weavers and spinners and the men who furnish them capital is created wholly within the mill, and the sum that is divided between these classes is a sum on which no others have any claim. Yet the fact that labour and capital both migrate freely from group to group, so that workers from any group are able to share in the special gains that may come to the earners in any other, creates a certain solidarity of labour on the one hand, and capital on the other. Give to the wool spinners an advance of wages, and movements of labour will in the end distribute the gain among the whole working class. On the

other hand, change the cardinal relations of labour and capital as a whole, and you change them in the end within every sub-group. Labour is in reality *trans-groupal*, and capital is the same. Each is a productive agent, the field of which extends directly across the sub-groups of the diagram. It is the relation of all capital to all labour that determines wages and interest. The law of wages is nothing if not general, and the same is true of the correlative law of interest.

It is a familiar fact that interest and wages tend toward uniformity in different occupations. Men of different productive powers may earn different rewards, even within a single trade; and the labour of management regularly receives more than work of the ordinary kinds. Men differ in the amount of working force that they possess, but men of like power tend to receive uniform wages throughout the series of industrial groups. If wages are high in the woollen mill the young men and women who are about entering the field seek out this part of it, and by their competition reduce the wages there prevalent to the rate that prevails elsewhere. Interest tends to a similar uniformity; under free competition it tends to keep the same rate in all industries.

With interest has often been vaguely grouped what we have termed pure profit itself; the gross gains loosely attributed to capital tend toward equality. It is, however, in a special way that the element that we have distinguished as pure profit tends toward equality in different industries. Wherever it comes into existence it sets at work forces that tend to sweep it again out of existence. In a way this gain is self-annihilating. The uniform rate toward which pure profit tends,—though it never reaches it in all groups at once,—is a zero rate. Here, indeed, we reach controverted ground, and can claim only to present one theory, not a view that has universal support; but the evidence in favour of the correctness of the view is simple and conclusive. Competition tends to annihilate pure profit. The existence in one sub-group of a gain that is in excess both of interest on all the productive wealth that is there used, and of pay for all labour, is an inducement to the entrepreneurs of the group to hire in the market both capital and labour, and secure the pure profit that their joint industry creates. Let woollen mills pay wages, including salaries, and a double interest on the capital that they use, and the mills will speedily enlarge their capacity. The increase in the product will then reduce the price of it, and ultimately bring the enlargement to an end. Under natural law the sub-groups are in stable equilibrium when, aside from insurance and taxes, each earns wages on all labour, including the labour of management, interest on all capital employed, and nothing more.

On this point the testimony of experience confirms the conclusions of theory.

The equilibrium is never in practice perfect. Causes that cannot here be analysed in any fulness cause the element pure profit to continually reappear. Inventions, as applied in particular industries, give to one and another of the sub-groups a gain that is in excess of that which perfectly stable conditions would afford. The occupation of new land creates, in a local way, a pure profit for the earlier comers. Continually appearing in particular parts of the field, and slowly disappearing by reason of competition,—such is this element of the social income. If we watch a single sub-group we find the profit at intervals appearing and disappearing; if we watch the industrial field as a whole we find it everywhere present, though not long at the same points.

Pure profit depends on a relation between industrial groups. What the manufacturer pays to the earlier groups in the series above represented, and what he receives from the tailoring group, determine this part of his gain. The actual position of the entrepreneur himself, in the diagram that describes the sub-groups, is on the line that separates his own industry from the following one. He is a purchaser of everything that is produced on the left of that line. In the buying of materials he purchases the products of the earlier sub-groups, and in the paying of wages and interest he virtually buys the sub-product created in the group to which he himself belongs. The entrepreneur of the woollen mill buys wool, and so pays for the sub-products created by wool growers and merchants; and he buys the form-utility created in the woollen mill itself by making bargains with workmen and capitalists, giving them fixed sums, and inducing them to relinquish their claims on the cloth. As the place of a particular workman and of a particular amount of capital is, in the diagram, *intra-groupal*, so that of a particular entrepreneur is *inter-groupal*. Workers and capitalists get their pay from results secured wholly within their own industries, while entrepreneurs get theirs from the fruits of mercantile transactions between earlier groups and later ones. Pure profit does not depend on the relation between capital and labour. Moreover, where this profit exists it is local, it depends on the relations between adjacent groups.

We have shown that there is no law of wages that is merely local. There is no force that gauges the pay of wool-spinning independently of the wages paid in other employments. There is a level toward which all wages tend. There is likewise a level toward which interest in every group tends. What is the law that fixes these levels? What is the general law of wages and interest? Here again we are on ground that is actively contested, and we

therefore only indicate the nature of a certain theory without claiming for it a position of general acceptance, and without arguing any points in controversy.

In presenting it we may utilise a Ricardian formula for determining the rent of land. If we apply to a fixed area of land an increasing amount of labour, we get returns that diminish *per capita*. The first man set working on 100 acres creates a certain amount of wealth as the result of the tillage. Adding a second man does not double the crop. Adding a third does not increase by a half the product due to the former two. Each man, as he comes into the field, adds less to the total output of the industry than did any of his predecessors.

This hypothesis makes the men enter the field in a certain order of time, and the one who is the final man is so in a literal sense—he is the last to arrive. Actually putting the men into the field one at a time is not necessary in order to reveal the principle that governs the final productivity of labour. Let the full complement of men occupy the field at once, and there will still be what may be treated as the final increment of labour. Take any man away from the force that tills the field, and the remaining men will gain in *per capita* productivity by reason of his absence. The departure of one man out of a force numbering twenty does not reduce the crop by a twentieth, since the nineteen men remaining work at better advantage by reason of the withdrawal of one. The final productivity of labour is gauged by what would be lost if one man out of the force were to stop working. We may, by way of illustration, actually set the men working one at a time, and find what the last comer creates; or we may set them all working at once and see what would be lost by the departure of one. The conclusion is the same in either case: the final unit of labour is the least productive.

If, now, land were the only form of productive wealth that figured in the case, wages would equal the amount created by this final or twentieth man. That would gauge the amount that the employer would lose through the departure of any one man in the force. It would determine what he could afford to pay to any one. Each man tends to get what he is separately worth.

What would be true in the case of labour applied to land, and using no other capital worth considering, is actually true of labour applied to a fixed amount of general capital, or to a fixed quantum of wealth in all productive forms, including both land and other instruments. For the field of limited extent in the Ricardian illustration substitute a fixed value, expressible in pounds or dollars, and invested in such appliances of every kind as

the needs of the working community require. If there are a hundred men in the force, the departure of one of them will not reduce the product by 1 per cent. His departure will add somewhat to the productivity of the remaining workers. After he is gone the capital will adapt itself in form to the needs of the ninety-nine, and it will be in a slight degree more ample in quantity per man. Wages are gauged, as in the former case, by the final productivity of labour. What on the whole is lost by the departure of one man fixes the importance to employers of every man. If each man gets what employers would lose by his absence, he gets what he is effectively worth.

This principle in a reversed application fixes the rate of interest. It is the productivity of the final increment of capital, as employed by a fixed labour force, that gauges the pay of each increment. Let there be 100 men using 100 units of capital. Take, now, one unit of capital away, and you will not reduce the product by 1 per cent. The 99 units of capital will have gained in productivity per unit in consequence of the departure of the hundredth. The loss inflicted on the entrepreneur by the withdrawal of the one unit of capital gauges the importance of any single unit. Each unit of capital gets as its compensation what would be lost if one unit of capital were withdrawn. This diminution of the total product due to the departure of the final unit of capital gauges the importance to the entrepreneur of each separate unit. It determines what he will pay for the use of each one. Interest is therefore gauged by the final productivity of capital. Each pound or dollar tends, under natural law, to secure for its owner what, in production, it is separately worth.

[For statements in harmony with this theory see J. B. Clark's *Philosophy of Wealth and Capital and its Earnings*, and Clark and Gidding's *Modern Distributive Process*. See also *Quarterly Journal of Economics* for April 1891.

For other views on the subject see F. A. Walker's *Political Economy*, and E. v. Böhm-Bawerk's *Capital and Interest*.—J. E. Cairnes's *Leading Principles of Political Economy*.—F. D. Longe, *Refutation of the Wage Fund Theory of Modern Political Economy*.—W. T. Thornton's treatise on *Labour*.—F. A. Walker's treatise on *Wages*.—Henry George's *Progress and Poverty*.—F. v. Wieser's *Natürliche Werth*, and the general economic treatises of Adam Smith, Ricardo, J. S. Mill, Jevons, Carey, Sidgwick, Marshall, Roscher, Wagner, Knies, Cohn, Schönberg, J. B. Say, Garnier, Gide, and others.] J. B. C.

DISTRIBUTION, USES OF THE TERM. In the early half of this century English economists fell into the habit of grouping their subjects under three heads, of which Distribution and Production were almost always two, while the third varied (*Consumption*, James

Mill; *the Nature of Wealth*, Senior and John Mill). Adam Smith had not followed the physiocrats and Turgot ("Formation et Distribution de la Richesse") in giving prominence to the term, and he has often been accused of neglecting distribution in favour of production (see Sidgwick, *Pol. Econ.*, pp. 24-25). Ricardo, on the contrary, wrote to Malthus in 1820: "Political Economy you think is an inquiry into the nature and causes of wealth; I think it should rather be called an inquiry into the laws which determine the division of the produce of industry amongst the classes who concur in its formation. Every day I am more satisfied that the former inquiry is vain and delusive, and the latter only the true object of the science" (*Letters*, p. 175). John Mill (*Pol. Econ.*, 1848) lays stress on the difference which, he says, exists between the laws of production and the laws of distribution. The former are physical facts; the latter are of human institution solely. It has seemed to later economists hardly possible to assert the purely physical character of the first (see Mill himself, *Unsettled Questions*, p. 133) or the purely arbitrary character of the second, or generally speaking to consider distribution quite apart from production, consumption, and the nature of wealth. But it has seemed desirable to define the several distinct notions clearly, for the purpose of methodic investigation, and the question arises whether (a) distribution is to be detached from exchange and transportation, etc., or (b) is to be the genus of which they are species. The latter is the view implied in the common language of men. The dividend is sometimes conceived as the total wealth, sometimes as the total income of the country, the participants being the inhabitants. Distribution of wealth is perhaps less strictly a question for the mere economist than distribution of income. The narrower view (advocated amongst others by Prof. Walker, *Pol. Econ.* (London, 1888), pp. 31, 187, 193, and by Ricardo in the words above quoted) is that distribution must be confined to the sharing of the product among the producers. It is urged again that it must not include mere transportation of goods, e.g. from the place where they are not wanted and not salable to the place where they are both,—this being not a distribution but a completing act of production (Sidgwick, *Pol. Econ.*, p. 171, etc.) According to this view it would exclude many cases of exchange, for exchange might mean a transfer from producers to non-producers. On the other hand, John Mill expressly regards distribution as including exchange (which is simply distribution under competition, see *Pol. Econ.*, III. i. § 1), and certainly to Ricardo exchange and distribution were nearly convertible terms. Professor Marshall even devotes a special section to "value or distribution and exchange" (*Principles*, bk. vii.) Professor New-

comb (*Pol. Econ.*, II. ii. 61) avoids the term and describes the three operations needed to present the consumer with the finished article as production, transportation, and exchange. If we confine distribution to a sharing among producers, we find that we must (1) include those who are not producers in the ordinary sense of the word, e.g. landlords, and (2) we must exclude middlemen and retailers into whose hands the goods pass by exchange on their way to the consumer, and (3) we must nevertheless include labourers and capitalists who have bargained for parts of the product, as wages and interest. Exchange would thus be partly excluded, partly included; and we are made to realise the difficulty of separating in theory what is conjoined in practice. J. B.

DISTRIBUTION, COST OF. See PRODUCTION AND DISTRIBUTION.

DISTRIBUTION, STATUTES OF. These Statutes (22 & 23 Car. II. c. 10 and 1 Jas. II. c. 17) regulate the distribution of the residuary personal estate of a person dying intestate—not being a married woman. In case of the intestacy of a married woman the husband takes the whole residuary personalty for his own benefit. In all other cases it is divided as follows:—

1. The widow takes one-third if any descendants survived the intestate, and one-half if none survived.

2. The children and descendants of deceased children take two-thirds if a widow survived the intestate, and the whole if the intestate left no widow; the descendants of deceased children in each generation together take the share which their deceased parent would have had if he or she had survived the intestate.

3. The half remaining in the case of a widow but no descendants surviving the intestate, or the whole in the case of neither widow nor descendants surviving him, goes to his father, and if the latter does not survive him, to his mother, his brothers and sisters, and the children (but not the remoter descendants) of brothers and sisters, the mother and each brother or sister taking equal shares, and the children of a deceased brother or sister together taking the share which their deceased parent would have had, had he survived the intestate. If none of the relatives named survive the intestate the next of kin nearest in degree are entitled in equal shares. (See BEQUEST, POWER OF; DESCENT OF PROPERTY.) E. S.

DISTRIBUTION OF THE PRECIOUS METALS. On this branch of the theory of international trade the conclusions of the "older school" of economists are still, in the main, unshaken. Adam Smith's contribution to the general theory, although invaluable (see MERCANTILE SYSTEM), was largely negative. It is to his successor Ricardo that we owe the first clear statement of the principles which

regulate the territorial distribution of the precious metals (*Principles*, ch. vii. p. 77). "Gold and silver, having been chosen for the general medium of circulation, are, by the competition of commerce, distributed in such proportions amongst the different countries of the world as to accommodate themselves to the natural traffic which would take place if no such metals existed, and the trade between countries was purely a trade of barter." Notwithstanding modern developments of trade and credit, this dictum, slightly supplemented, still holds good. To realise its full meaning it is necessary to go back a stage, and to recall the principle which regulates international trade when carried on by barter (see BARTER). This has been stated by Mill (*Principles*, bk. iii. ch. xviii.) "The produce of a country exchanges for the produce of other countries at such values as are required in order that the whole of her exports may exactly pay for the whole of her imports." This law of international values applies also, without essential alteration, after the introduction of the precious metals, and one of the leading functions of money in international trade consists in adjusting temporary disturbances of the equation, since (Tooke, *State of the Currency*) "an increased export of ordinary commodities cannot always be made with the promptness which a sudden exigency may demand." There is general agreement among economists in regarding prices as being now the chief agent in effecting the movements of gold and silver, both between mining and non-mining countries, and between non-mining countries themselves. It is by successive waves of price that the gold of Australia and California is exchanged for the products of commercially related countries, and, through those countries, is further divided among the nations of the world; so that any alteration in the stock of one is ultimately felt by all (for the differences in the case of India in relation to this process, see Bastable's *Theory of International Trade*, p. 67). In view of the number and variety of influences affecting prices, the frequency of the transmission of gold and silver is thus largely accounted for. One of these influences—improvement in production—may be selected for reference, both on account of its increasing importance, and because it is a favourite illustration with writers on the subject. Thus Ricardo (*Principles*, p. 80, and frequently elsewhere)—"The improvement of a manufacture in any country tends to alter the distribution of the precious metals amongst the nations of the world." That this is so may be easily seen. Leaving out of consideration, as being sufficiently obvious, the effect, in attracting a flow of money, of the cheapening of commodities not previously exported (see Mill, *Principles*, bk. iii. ch. xxi.), we find that an improvement in

a country's methods of production may have different results, according to the effect of the consequent cheapness upon the foreign demand. Unless that demand happen to be increased in proportion to the cheapness, there will be a movement of the precious metals in one direction or the other pending the re-adjustment of the disturbed international equation, and experience shows that, *ceteris paribus*, the influx is generally in the direction of the country which excels in manufactures. A national advantage in the production of commodities valued for export may have the same effect.

For the effect of improved banking facilities on distribution, see Lord Overstone, *Tracts, etc., on Metallic and Paper Currency*, p. 473 ff.

Recent improvements in foreign methods of production have been suggested as a possible partial explanation of the fact, of which there seems little room for doubt, that the quantity of gold in this country is now less than it was twenty-five years ago (see Bibliography at end.) Far more powerful causes than this, however, may be found in the great developments which recent years have witnessed in our banking and credit system, and in other economising devices which have enabled a greater volume of transactions to be carried on upon a comparatively smaller metallic basis. The great disparity, for instance, between the amount of money per head of the population in the United Kingdom, in France, Germany, and the United States, is largely due to the difference in the habits of these nations in regard to banking and credit. The amount in circulation in 1891 was estimated as follows:

Estimated stock of gold and silver, and actual amount of "uncovered" paper money on 1st November 1891 in the United Kingdom, France, Germany, and the United States.

(The £ converted as 5 = £1). Annual report of the secretary of the treasury (U.S.A.) on the state of the finances, 1891, p. 156.

The fact of the use of two metals, in different countries, as standards of value, though of the utmost importance in other connections, does not necessitate any re-statement of the question, since it will be found that the movements of both metals are regulated by the same general laws (see Del Mar's *History of the Precious Metals*, p. 190). The influence of legislation upon the distribution of the precious metals is worthy of notice. The marked increase which recent years have witnessed in the proportion borne by silver to the total metallic stock of the United States is chiefly owing to this cause (see BLAND ACT), and the reform of the Austrian currency cannot fail to alter, to some extent, the general proportions in which both gold and silver are at present distributed.

The following table, taken from statistics prepared by Mr. Leech, Director of the United States Mint, shows the circulation of gold, silver, and uncovered notes per head of the population in the various countries of the world. The date may be taken approximately as the year 1891. The statement, with the others quoted above, must be understood only as estimates.

F. E. S.

[N. W. Senior, *Three Lectures on the Transmission of the Precious Metals from Country to Country*, 1827.—J. E. Cairnes, “The Australian Gold Episode” (in *Essays in Pol. Econ., Theor. and Applied*, 1873).]

The actual course of the distribution of the precious metals depends largely on the position of the producing countries. Thus in classical antiquity their movement was from Asia Minor and Spain to Greece and Italy. The opening of the American mines in the 16th century gave an entirely new direction to the monetary current, which passed first to Spain and Portugal, to be thence, in spite of prohibitions, distributed to the principal centres of European trade, outlying countries being for a long time unaffected (Cliffe Leslie, *Essays*, 2nd ed., 1888, pp. 269-300). At present Australia, the United States, Mexico, and South America are the sources of monetary currents that flow to the countries most closely connected by trade (see GOLD and SILVER). Of equal importance is the tendency—noticed by Pliny (79 A.D.), and still in action—of the precious metals to move towards the east, in consequence of the habits of hoarding produced by industrial insecurity. India has always been the chief recipient, the export thither for the period 1853-1885 being estimated at:—silver, £278,448,224; gold, £91,480,004; total, £369,928,228—but China and the Dutch East Indies also absorb silver.

Besides these permanent movements, various agencies lead to temporary changes in distribution. Thus the AUTUMNAL DRAIN (*q.v.*) on the Bank of England is now well-known, and the same phenomenon is noticeable in the United States, where “moving the crops” leads to a demand for increased currency in the West, and a corresponding drain on New York. Such internal fluctuations are paralleled by international movements. A bad harvest in England is one of the causes of a foreign drain, sometimes ending—as in 1847—in a crisis. More generally, any trade disturbance will show its effect in redistribution of the stock of bullion, an adjustment facilitated and carried out through the mechanism of the EXCHANGES, FOREIGN (*q.v.*) Travellers may directly transport some portion of the money of the world, and governmental requirements may, apart from the exchanges,

lead to transfers of bullion as of other commodities (Clare, *Money Market Primer*, p. 109). State administrations often accumulate money in the process of collecting revenue, and further create hoards for military or other purposes, e.g. the German Treasure of £6,000,000 at Spandau. Both in France and in the United States, the sub-treasuries lock up coin, in the latter to a very large amount. The creation of central banks, on the other hand, has drawn a large proportion of the metallic circulation to a few points, and thereby—artificial restrictions apart—has made redistribution easier. The telegraph is an additional aid in securing speedy readjustment of the existing stock when required, and in connection with the refined system of the exchanges, and modern credit arrangements, reduces the need for money bullion to the minimum.

[G. Clare, *Money Market Primer*, London, 1891.—W. Jacob, *Production and Consumption of the Precious Metals*, 2 vols., London, 1831 (chs. iii. viii. and xiii. deal with movements of the metals).—A. Sötbeer, *Materials*, etc., trans. F. W. Taussig, in U.S. Consul's Reports, No. 87, Dec. 1887, pp. 515-528]. C. F. B.

DISTRIBUTIVE JUSTICE in political economy means justice in the distribution of wealth (see DISTRIBUTION, ETHICS OF). As to what constitutes a just distribution, opinions agree only in being chiefly of a negative rather than a positive character. The communist does not contend that perfect justice would be attained by his system of equality modified by differences of need, so much as that the injustice of the present great inequalities of wealth is obvious. The socialist says little about the distribution of wealth which would prevail if his arrangements for making the state the only proprietor of land and capital were carried out, but insists at length on the injustice of allowing private owners of property to enjoy a part of the produce of labour without having worked for it. The defender of private property seldom follows BASTIAT (*q.v.*) in maintaining that the present system is just, but contents himself with urging that the schemes of social reformers would be even less just. The ordinary person who has not thought much about the subject does not question the justice of the distribution which is the result of private property and exchange as a whole, but he is constantly denying the justice of essential parts of it. Compassion for poverty and sympathy with the worker as against the idler frequently lead him to deny the justice or fairness of perfectly honest and open bargains. Still more often it happens that self interest leads him to deny the justice of the existing distribution so far as he himself is concerned; the widely-accepted maxim of distributive justice, "a fair day's wages for a fair day's work," is often understood by the employed as meaning a little more wages or

a little less work, and by the employer as meaning a little more work or a little less wages, than the amount fixed by free competition.

Economists have usually declined to discuss distributive justice at any length, holding that it is a question of ethics rather than of economics (see COMMUNISM, INDIVIDUALISM, PROPERTY, SOCIALISM).

[Cairnes, *Leading Principles*, pt. ii., ch. v.—Sidgwick, *Pol. Econ.*, bk. iv. ch. vi.—H. Rashdall, "What is Justice?" in the *Economic Review*, October 1891 and April 1892.] E. C.

DISTRINGAS. A writ of distringas was formerly used for the purpose of protecting persons beneficially interested in stock standing in another person's name. This procedure does not exist any more, but a notice may now be sent to the bank or company in the books of which the stock in question is registered, accompanied by an affidavit stating that the person issuing the notice is beneficially interested in the stock. The bank or company to whom the notice is given, must, as soon as the person in whose name the stock is standing attempts to transfer the same, inform the person who issued the notice, who may thus take immediate proceedings to obtain an order of the court restraining the transfer. If no such restraining order be obtained within a week the transfer of the stock must take place. E. S.

DISUTILITY. See DISCOMMODITY.

DIVIDEND ON STOCK AND SHARES.—The amount of interest or profit divisible among holders of stock or shares; also the amount payable to each stockholder or shareholder.

Questions as to payment of dividends to shareholders in incorporated companies are frequently before the courts; it is now a well-established principle that such dividends must be paid out of profits and not out of capital, and that any clause in articles of association authorising payment of dividends from capital or guaranteeing a certain rate of interest to the shareholders in all events is invalid and cannot be acted upon (*Trevor v. Whitworth*, Law Reports 12 Appeal Cases 409; *Guinness v. Land Corporation of Ireland*, Law Reports 22 Chancery Division 349. As regards railway companies and similar companies, see the Companies Clauses Act, 1845, § 121, and as regards companies governed by Table A to the Companies Act 1862, see Table A, Art. 73).

The rule that dividends must not be paid out of capital would, among prudent business men, be thought to involve the further rule that only so much of the profits is available for dividend as remains after making provision for depreciation in any of the assets in which a company's funds are invested. A rule of this nature is frequently contained in articles of association, or acted on by directors when the

articles are silent on the subject. In the absence of such a rule, the directors cannot, however, be compelled by dissident shareholders to make such provision. The excess of money obtained by working the property of a company over the cost of working it may, in such a case, be divided among the shareholders, though the property itself is of a wasting nature—like a mine, a quarry, or a patent. It is also left to the discretion of the directors to decide what expenses are properly chargeable to revenue and what to capital (*Lee v. Neuchatel Asphalte Company*, Law Reports 41 Chancery Division 1; as to the desirability of legislation making it incumbent on directors to provide for depreciation of capital before paying dividends, see CAPITAL, *supra*, p. 221). In well-managed companies the directors provide that the valuation of the assets in the balance sheet is correct; which is not possible unless sufficient is taken from profits to provide for any depreciation.

Dividends in companies are not always paid *pari passu* to all shareholders. Companies frequently issue *preference* shares which receive a fixed percentage on their nominal amount, whilst the other shares, called *ordinary* shares, are entitled to whatever remains after payment of the preferential dividend. Dividends payable to preference shareholders must, like dividends on ordinary shares, come out of profits, and cannot therefore be paid when the profit is insufficient. It is generally stated in the articles whether preference shares are to be cumulative,—that is to say, whether a deficiency in dividend arising from insufficiency of profits in one year is to be made good out of profits of subsequent years, or whether preferential dividends are to be paid out of the profits of each year only—non-cumulative dividend. Should no special stipulation exist, dividends on preference shares in companies registered under the Companies Acts are cumulative (*Webb v. Earle*, Law Reports 20 Equity 556), but as regards railway companies and other similar companies governed by the Companies Clauses Acts, it is provided by Companies Clauses Act, § 121, that “if in any year ending on the day prescribed in the special act, and if no day is described, then on the 31st day of December, there are no profits available for the payment of the full amount of preferential dividend or interest for that year, no part of the deficiency shall be made good out of the profits of any subsequent year or out of any other funds of the company.”

Railway companies have of late years frequently used a privilege conferred on them by the Railway Regulation Act, 1868, § 13, enabling them subject to certain conditions to divide the whole or a part of their ordinary stock into *preferred* and *deferred* ordinary stock. The dividend available for that part of the ordinary stock which has been so divided is

apportioned as follows: the preferred stock receives a certain maximum dividend (generally six per cent), and any balance remaining over goes to the deferred stock. The latter is, of course, a habitual object of stock-exchange gambling, speculators always favouring securities liable to sudden rises and falls, and it can hardly be said that it was wise for parliament to create special facilities for speculative operations in railway shares, as such operations cannot fail to have an indirect influence on the management of the companies to which they relate.

Where dividends have been paid improperly to shareholders, the directors are liable to refund the amount out of their own moneys, and when the action has been brought before the 1st January 1890, they cannot plead any statute of limitations, being, in that respect, exactly in the same position as the trustees of a settlement or will who have committed a breach of trust (*In re Sharpe*, Law Reports (92) 1 Chancery 154).

As regards so-called “bonus dividends,” see BONUS.

[Lindley, *Company Law*.—Buckley, *Companies Acts*.—Palmer, *Company Precedents*.—Hodges, *Railways*.—Browne and Theobald, *Law of Railway Companies*.] E. S.

DIVIDEND, MEDIEVAL. One part or the other of an indenture or chirograph, a term confined to the practice of the exchequer. H. Ha.

DIVIDEND (IN BANKRUPTCY). The rateable share in money which a creditor who has proved his debts receives out of the proceeds of his debtor's estate is called a dividend. When the estate is a large one dividends are declared and paid from time to time as the estate is realised. When the assets do not exceed £300, the bankruptcy rules of 1886 direct that the estate shall, when practicable, be distributed in a single dividend. In other cases, under the Bankruptcy Act 1883, the first dividend is directed to be distributed within four months from the conclusion of the first meeting of creditors, and subsequent dividends at intervals of not more than six months (§ 58). Before the declaration of the final dividend, notice must be given to persons claiming to be creditors, but who have hitherto failed to establish their claims.

Unclaimed dividends are paid into a government account of the Bank of England called the “Bankruptcy Estates Account” (§ 162).

M. D. C.

DIVIDEND WARRANT. A dividend warrant may be described as a cheque for the payment of a dividend. It may be crossed in the like manner as a cheque, and is in the main governed by the same rules. In one respect, however, it appears to be peculiar. When a cheque is payable to the order of two or more payees, it requires the indorsement of them all, but if a dividend warrant be payable to the

order of two or more payees it is the practice of bankers to pay on the indorsement of any one of them. This practice appears to have received legislative sanction, for § 97 of the Bills of Exchange Act, 1882, in terms provides that nothing in that act is to affect "the validity of any usage relating to dividend warrants or the indorsement thereof."

M. D. C.

DIVISIBILITY OF MONEY. DIVISIONS OF MONEY. The divisibility of the material of money is an important factor in its usefulness. It is essential that the mass should be readily divisible into parts, great or small, with exactness and without deterioration; and, again, that the sum of those parts, if re-united, should be equal in value to the original mass. The precious metals fully meet these requirements; and this quality, in addition to their other merits in respect of durability and portability, has secured for them their position as the money of civilisation. The divisions and subdivisions of money are both the cause and effect of the scale of prices. They have not in many cases been selected for theoretical appropriateness, but have been determined by practical convenience, to suit the habits of the people among whom they circulate. In these instances they bear some reference to the scale of ordinary transactions, but it will be found not unfrequently that the denominations and divisions of money have prescribed prices. Especially is this the case with fees for personal services, where neither the value of the thing done nor the cost of doing it can be stated with accuracy. Such are the fees current in the medical and other professions, which are quoted in guineas or half guineas; such also are the legal fees of 6s. 8d. and 13s. 4d., corresponding respectively to the "noble" and the "mark." In all these cases the rate of payment was prescribed by a denomination of money formerly in use, and the price has survived while the coin has disappeared. Another instance is to be found in the parliamentary railway fare of one penny per mile. At the time that this rate was fixed there was no experience as to the cost of carrying passengers, nor was any pretence made of apportioning the rate to the cost or value of the service performed. The selection was purely arbitrary, and was suggested by the existence of the coin. It would undoubtedly have been 20 or 30 per cent more—or less—had the subdivisions of the shilling been less or more numerous. So also with the penny post. This point is further illustrated by the different rates charged in different countries for international postage, where charges would be uniform but for the difference in the divisions of money. In six countries of the Postal Union, as shown below, the rates differ by as much as 12 per cent among themselves, ranging from 6 per cent above the English rate of 2½d. to 6 per cent below it.

	Equivalent of 2½d.	Rate charged.	2½d. = 1000.
Germany	pfgs. 21·281	pfgs. 20	= 939
France	cents 26·272	cents 25	= 952
United States	cents 5·069	cents 5	= 986
Holland	cents 12·595	cents 12½	= 993
Sweden	ore 18·916	ore 20	= 1057
Portugal	reis 46·918	reis 50	= 1066

Again, increase or reduction in small charges will necessarily follow the subdivisions of money. Thus fares by omnibus or trams have been not unfrequently reduced or raised *e.g.* from 2d. to 1d. or *vice versa*, when there could be no ground for supposing that the cost of carrying a passenger had been reduced or increased by anything like 50 or 100 per cent. R. W. B.

DIVISION OF LABOUR. By the "division of labour," or, as it is sometimes called, the "division of employment," is understood the separation of the total labour required for the manufacture of a single product into various distinct processes, and the allocation of each of these processes to a particular labourer or body of labourers. It is to be distinguished from the simple combination of labour, which consists in the massing together of homogeneous labour to produce a great effect. Thus in road-making, although a hundred men are employed to lay the metal on a road, there is no division of labour, while in the publication of a newspaper, where one man arranges the types, another classifies the material, another corrects the proofs, etc., there is division of labour. The phrase division of labour has become current through its use by Adam Smith in the famous chapters in which he opens the *Wealth of Nations* (bk. i. chs. i.-iii.)

Historically speaking, the division of labour commences with the specialisation of industries, and the specialisation of processes in the same industry, to which alone we strictly apply the term, is only an extension of the same tendency. In an early state of society each man is his own smith, clothier, armourer; he is farmer, hunter, fisherman, carpenter, all in one. The earliest division of labour is made when one individual devotes his whole time to some special work, such as boat-building, or the making of bows and arrows; and we may therefore say that it is coincident with the first creation of capital. (See Bagehot's *Economic Studies*, pp. 57, 58). To the specialisation of industry follows its organisation, viz. the formation of groups of labourers whose efforts are all directed towards the manufacture of one particular product. The organisation of industry leads necessarily to the division of labour, which indeed becomes in time the principal feature of that organisation. In a state of society where industry is very highly organised a single product is frequently the result not only of a variety of different processes

in one industry, but the work of a number of different industries also. Some of these are termed "subsidiary industries," (see Marshall's *Economics of Industry*, p. 52). In the manufacture of machinery a whole series of trades are employed, from the digging of the mineral to the finishing of the machine. This combination of industries is in reality division of labour in an extended form.

Of the consequences of the division of labour the most important is the increase in the quantity of work which it enables the same number of people to perform in the same amount of time. For this improved effectiveness of labour Adam Smith assigns three causes. (1) The workman acquires greater dexterity in his work, because it consists of some one simple operation, and he can therefore do it better and more quickly than if he had to vary his labour. In other words, he has constant practice, and therefore approaches nearer to perfection. It needs no illustration to point out the extraordinary degree of skill which continuous practice in any branch of human employment is known to confer. (2) The workman also saves time when he is entirely devoted to a single process, because he does not require to pass constantly from one place to another, or exchange one tool for another. Adam Smith also suggests that where the work is continuous the application of the labourer is greater than it is where he has to begin new work every now and then. (3) By the direction of his whole attention to a single operation, or a single process, the workman becomes so thoroughly familiar with it that any advantageous change in the machinery he deals with will naturally occur to him more readily than it does to those who have their attention divided between several items of labour. To these causes (4) increased aptitude and skill has been added. The recognition of this is generally ascribed to Mr. Babbage, though that author stated that he found it in a foreign work (see C. BABBAGE) on economics (Gioja, *Nuovo Prospetto delle Scienze Economiche*, Milan, 1815). Increased aptitude and skill is created by the specialisation of labour; it consists in the economy of work that is gained when each man is employed on the kind of labour he is best fitted for. Where a workman has two or more things to do, he will be less fitted for some than for others; but the concentration of his energies on one single kind of work enables him constantly to labour at the things he finds most suitable.

That the division of labour, from the above causes, increases the productivity of labour, and that very greatly, is not denied. It is urged, however, that there are counterbalancing results of the division, less direct perhaps than those above noted, but still traceable to it, which have an opposite effect on the productivity of labour; and this apart altogether from other

advantages or disadvantages due to it. (1) Where labour is very highly specialised, the effect of perpetual concentration of the mind on a single operation is deadening to the mental faculties. We are all aware that variety of occupation produces a healthy state of mind, and that while perpetual practice of one thing brings about a kind of mechanical perfection, it has a deteriorating effect on the faculties in general. The principal way in which this consequence of the division of labour acts on its productivity, perhaps, is that it counterbalances to a large extent the probability of useful inventions which we counted among the results on the other side of the question. On the other hand, it is urged that work performed mechanically frees the mind and gives more time for thought. (2) A more important consideration, but one which affects not the labour of the individual so much as labour in the gross, is this—that the specialisation of labour of necessity involves the unsuitability of the average workman for any kind of work other than that he has been trained to. For example, suppose that a workman is employed on some small but delicate mechanical operation, which he has trained himself by long practice to perform with extraordinary celerity and accuracy. Some change in the market, or new invention, or development of mechanical science,—and where industry is highly organised all these causes are to be looked for—renders unnecessary the continuance of the particular piece of work he has hitherto done. Had he been in the habit of doing work in which there was variety or versatility, it would be much easier for him to turn his hand to something new; but in the highly-specialised condition of industry it is now unlikely that he will find any work corresponding to that he has been obliged to abandon. This disadvantage we may call want of elasticity of labour; and we may note that it tends to lessen the productive power of the total labour-force in existence. (3) Inasmuch as health and physical capacity are invaluable in their effect on the power of all labourers, anything which impairs or weakens the strength of the workman diminishes the efficiency of his work. The manifold division of labour has led in our time to the employment in the same business of far larger quantities of operatives than used to be massed together in Adam Smith's days. Therefore, though he states that "we can seldom see more, at one time, than those employed in a single branch," at the present time it is common to have all the branches of a great industry working together in the same place. For convenience' sake, this has led to the massing together of great populations in large centres of industry; and thus the conditions of life, as to health, have been rendered less advantageous to the labourers.

From these considerations it may be deduced

that while the division of labour increases to a great degree the productivity of labour, it has counterbalancing effects which modify the advantage. When we look at some of the other less obvious results of the division of labour, we see that it is in most cases open to argument whether they have a tendency to augment the net result of labour, or the reverse. We have already seen that the monotony of work which a great specialisation leads to must be regarded as an effect which modifies the advantages derived from long and continuous practice; and in its general influence on the workman we are bound to suppose it must have a tendency to impair his mental faculties. On the other hand, it is pointed out that concurrently with the progress of that specialisation, the labouring classes have attained to a continually higher standard of education, and to a greater development of mental power. This may be partly explained by the fact that another result of the specialisation of labour is that a greater and greater proportion of the total work done comes to possess in some degree the character of skilled labour; in other words, it makes demands on the mind of the labourer as well as on his body. Brute force counts always for less as the organisation of industry progresses, and the most striking example of this tendency which we see in our own day is the ever-increasing field for the work of women. The interdependence of industries is another consequence of which much may be said favourably as well as the reverse. When all farm labour is done by hand, movements in other branches of work can only very indirectly affect those engaged in agriculture. But when machinery is introduced for ploughing, reaping, etc., the business of farming comes to be intimately connected with ironwork, the making of machinery, and probably with the hewing of coal also. Therefore the cost of production to the farmer will be affected by inventions in machinery, by alterations in the wages of the classes of workmen who make machinery, and by variations in the price of coal and iron. The interdependence of industries, of which the above is a very obvious example, is a most important factor in modern life. On account of the hanging together in a greater or less degree of all trades, good or bad fortune has a tendency to visit all simultaneously. This interdependence also breeds a feeling of common interest among employers of all classes, and also between labourers on every field; with the result that we now see an increasing tendency, especially on the part of labour, to band its forces together for some general object, or for some special advantage. A universal strike in any large industry would paralyse the entire trade of the country.

The division of labour can be carried out much farther in some industries than in others;

and, as Adam Smith points out (*Wealth of Nations*, bk. i. ch. iii.), it is only limited by the extent of the market. This latter consideration, however, is of very much less importance now than it was in the days when he wrote. The improvements in the means of transit made within the last hundred years have been so great as in large measure to abrogate the old limitations of market. The expenses and difficulties of land-carriage, which Smith notices, have been so greatly reduced that goods are constantly sent to market by long journeys across country. Still, in the smaller industries, it must always be the case that in a market where the customers can only be drawn from a limited area, the division of labour cannot be carried to any great extent. As among different industries, the division is generally carried out furthest where two conditions are satisfied: a large employment of workers, and the continued repetition of identical operations. In a small business it is clearly impossible to subdivide the work done very minutely. Where the same work can be done continuously, again, a greater division of labour is possible than where it has to be varied at different periods. Thus agriculture is an industry in which the division of labour can never be very greatly extended, because the same people, from the very nature of their business, must be employed in different operations at different seasons of the year. On the other hand, in a cotton factory, the division of labour is probably extended to its farthest possible present limits. These differences form one of the many causes which bring about the continuous flow of population in this country from rural to urban districts; a tendency which it is hopeless to check so long as we purchase food in great quantities from foreign countries with our manufactured goods.

It is noticeable that in retail trades, in which a vast quantity of capital is invested and a multitude of labourers employed, there does not appear to be as much scope for division of labour as in manufacture. Here the tendency is not for a particular retailer of goods to confine himself more and more to the sale of a special kind of article, but for large retailers to spread their business over as many commodities, and over as great a variety of commodities as possible; and by this means it would appear that retail trade is more remunerative when it is general than when it is specialised. The profits of the retailer depend less on the amount of work done by his workmen or the percentage of profits on the sale of goods than on the total number of sales he can make: what is commonly called his turn-over. Causes which in manufacturing industries increase the power and value of labour, therefore, have no such effect on the labour employed in the retail trade. With the retail trades must be classed

hose great organisations called the carrying trades, which aim at the same object, viz. the bringing to market of goods already made.

[The question of the division of labour is discussed in all the standard English works which treat of political economy in general. See also *The Economy of Machinery and Manufactures* by Babbage, chs. xix. to xxiii., where many interesting facts in illustration of the division of labour are recorded. The socialist point of view may be studied in *Capital*, by Karl Marx, translated into English by Samuel Moore and Edward Aveling, and edited by F. Engels, and in Hyndman's *Historical Basis of Socialism*. The most complete monograph on the History of Division of Labour is that by Schmoller in *Jahrbuch für Gesetzgebung*, 1889.]

DIZAIN, a coin struck in France in the reign of Charles VIII. It was worth ten deniers, and was also known as a Carolus.

R. L.

DOBBS, ARTHUR (1689-1765), was the eldest son of Richard Dobbs of Castletown. He became high sheriff of Antrim in 1720, was member for Carrickfergus in the Irish parliament 1727-1760, and was appointed engineer-in-chief and surveyor general in Ireland by Walpole. His *Essay on the Trade and Improvement of Ireland* (Dublin, 1729-1731, 2 parts, 8vo, reprinted in Thom's *Collection of Tracts*, 1861, ii. 321, etc.) is full of valuable information on Irish trade and population drawn from official sources. The writer endeavours to give a true picture of the "state of the kingdom, and to lay down some hints that may put us upon thinking what may be done for the improvement and good of our country, and to endeavour to rectify the mistakes many in Britain have fallen into, by reason of a prevailing opinion, that the neighbourhood, trade, and prosperity of Ireland are detrimental to their wealth and commerce; and that we are their rivals in trade, which we can never be whilst under their government" (pt. ii. p. 527). Dobbs advocated an improved system of land tenure. In 1732 he introduced an enclosure act in the Irish Parliament (see Viscount Mountmorres, *Impartial Reflections on the Present Crisis*, 1796, 8vo).

He took an active part in promoting the search for a North-West Passage, and on his recommendation the admiralty sent out two vessels under Captain Middleton, with whom Dobbs carried on a pamphlet war (1743-45) partly in connection with the Hudson's Bay Company's monopoly. He wrote *An Account of the countries adjoining Hudson's Bay* (1744, 4to) in which he urged that the trade should be thrown open, as the exactions of the company had diverted the fur trade into the hands of the French. In 1754 he was appointed governor of North Carolina, where he died. He improved the administration of justice and pursued a conciliatory course in dealing with

the Indians, but his zeal for the royal prerogative caused incessant quarrels with the colonial legislature.

Development of the modern Dock System.—

The first commercial dock, properly so called, in this country, was the Howland Great Wet Dock at Rotherhithe, constructed in 1660 by private enterprise. This dock, area about 10 acres, known later as the Greenland Dock, now forms part of the system of the Surrey Commercial Docks Company. A contemporary engraving represents it as consisting of an entrance lock with gates, a water area with quay walls to which are moored several three-masted vessels; and on the Thames three slipways for building and repairing ships. The earliest example in this country of a dock owned by a municipality is the harbour at Port-Glasgow on the Clyde, constructed by the municipality of Glasgow in 1662, on account of the distance of the usual port, Irvine, and the necessity of conveying merchandise for twenty miles by pack horses (Deas, "The River Clyde," *Inst. of Naval Arch.*, vol. xxx. p. 20). The next important incident in dock history is the construction of the Mersey Docks in 1708. In 1665 the gross burthen of the 15 vessels that represented the shipping trade of Liverpool was 268 tons. At this time Liverpool possessed a natural harbour of about a mile in length, in a "small creek" off the north bank of the Mersey. The mouth of this pool became, in 1708, the first Mersey Dock—the Old Dock, now no longer in existence (Lyser, on "Recent Dock Extensions at Liverpool," *Inst. Civ. Eng.*, vol. c. pt. ii.) This dock was constructed by the Corporation of Liverpool, which secured from parliament a charter for 21 years. In 1717, in 1737, in 1761, in 1784, and again in 1799, the charter was renewed. Between 1708 and 1799 the corporation borrowed £233,000 and constructed 25 acres of dock area, 7 acres of basins, and 780 yards of quay wall (Rees, *Encyclopædia*, vol. xii., art. "Docks"). The number of ships entering and clearing at Liverpool rose from 1371 in 1757 to 4129 in 1793; and the dock dues from £2336 to £12,480 in the same period.

London Docks.—While the Liverpool docks had thus developed, no new dock had been constructed in London for about 130 years.

The crowded state of the river and the inefficient police arrangements had resulted in smuggling and plundering, which, though probably exaggerated by contemporary writers, must have been considerable (cp. Colquhoun's *Commerce and Police of the Thames*). Successive agitations by the merchants of London resulted in the appointment of royal commissions in 1762 and 1765, and of committees of the House of Commons from 1765 till 1798. In 1790 the Brunswick Dock at Blackwall was constructed by Mr. Perry, a shipbuilder. Thus the two earliest docks in London arose from individual enterprise. In 1795 the West India merchants promoted a joint-stock company for the construction of docks, and subsequently applied to parliament for powers. The Corporation of London opposed the measure, and promoted a rival scheme for the construction of a dock at the city boundary, and for cutting a canal across the Isle of Dogs. The West India Docks Act was ultimately passed in 1799. At the same time the Corporation of London was authorised to cut the canal across the Isle of Dogs, which in 1829 was sold by the Corporation to the West India Dock Company (10 Geo. IV. c. 130). The West India Docks were opened in 1802. The capital at the date of the opening was £800,000. The Company received the privilege of a monopoly for twenty-one years of the West India trade, both import and export, and the commissioners of customs were empowered at their discretion to order other vessels to discharge there. The dock dues alone were fixed at 6s. 8d. per ton register, besides landing charges. Within a few years there was constructed a system of docks which immensely increased the capacity of the port. Contemporaneously with the institution of the docks in London, a great change occurred in the regulations of the customs, by rendering it, from 1803 onwards, no longer necessary to pay customs duties on imported goods at the time of importation. The establishment of warehouses under the supervision of the customs, where goods liable to duty might remain in bond till the duty was paid on delivery, began in 1714 (Rep. Cust. Com. 1818). Its extension was urged by Walpole in 1733, but it was only tentatively adopted till the passing of the first Warehousing Act in 1803 (43 Geo. III. c. 132) (see BONDED WAREHOUSES, and WAREHOUSING). This act permitted the warehousing under bond of West India produce at the West India Docks, and of rice, tobacco, wine, and spirits at the London Docks. The system became general in London in the same year; in 1805 in Liverpool, Bristol, etc.; in 1822 in Glasgow; and in 1824 in Belfast, etc. The earlier development of the privilege of warehousing in bond in London gave that port an advantage over others, and promoted the development of the warehousing department of

the business of the docks to a much greater degree than elsewhere. The proposal of the Corporation of London to make a dock nearer to the City than the West India Docks was adopted by private promoters, and in 1800 an act was passed authorising the construction of the London Docks at Wapping. The Corporation of London was represented on the board of directors by the lord mayor. The capital of the company was £1,200,000, raised in 1804 to £1,700,000. The dividends were limited to 10 per cent. Privileges were granted for 21 years. All ships entering the Thames laden with wine, brandy, tobacco, and rice were compelled, under penalties, to discharge in the London Docks. The East India Docks, authorised by act of parliament in 1803, were opened in 1806. The capital was £400,000, and the dividends were limited to 10 per cent. Four directors of the thirteen were to be also directors of the East India Company. A monopoly of the East India and China import and export trades was granted to the East India Dock Company, the privilege extending, however, only to vessels trading direct to or from the East Indies or China. In 1801 the Surrey Canal Company was formed, and afterwards a small dock was constructed at the junction of the canal with the Thames. In 1807 the Commercial Dock Company was promoted for the purpose of acquiring the Greenland Dock and Norway Docks. In 1810 an act, passed for the improvement of these docks, provided for "the discharge of vessels laden with timber," the landing of other goods excepting by permission of the Commissioners of Customs being prohibited. In 1824 the exclusive privileges of the West India Docks expired, and the company did not apply for their renewal. While the monopoly secured them a considerable proportion of the foreign trade of the port, it exposed them to the fluctuations of a single branch of it, and deprived them of possible compensations in the fluctuations of other branches. The imminent emancipation of slaves in the West India Islands may also have rendered the commercial outlook in that direction uncertain at the time when the charter was about to expire.

From the beginning of the century until 1850, the extensions of the docks on the Thames had been comparatively trifling. In that year the Victoria Docks were constructed at a cost of £1,400,000. In 1870 the South-West India Dock was opened. These docks were followed in 1880 by the Royal Albert Docks, which cost £2,100,000; and in 1888 by the Tilbury Docks, which cost £2,600,000. The Victoria and Albert together form a single system, and belong to the London and St. Katherine's Docks Company (capital 1891, £10,789,462). The Tilbury Docks belong to the East and West India

Docks Company (capital 1891, £7,360,355). The administration of the London and St. Katherine's Docks and of the East and West India Docks was vested by act of parliament, in 1888, in the London and India Docks joint committee. The finances of the East and West

and sluggish stream. Its excavation into a deep waterway and its embankment by quays served the purpose of a large dock; but the Mersey at Liverpool is broad and exposed to the winds of the channel. Thus, while at Glasgow, docks were a late development, the

impossibility of loading and discharging in the river Mersey even the comparatively small craft of the 17th century, made docks necessary from the beginning of the development of the port of Liverpool. Up till 1858, when the Mersey Docks and Har-

d Preference Stock, No. 2.

India Docks were re-arranged in June 1889. The reserve had disappeared in 1887, and no dividend upon the ordinary stock had been paid since 1886; while in 1889 the company defaulted in the interest of the debenture stock. The scheme of re-arrangement involved the hypothecation of all funds available as at 30th June 1889, with future annual surplus funds, and the application of the fund so created for ten years to the payment of interest on mortgage and debenture stock, exclusive of deferred debentures, and of funded interest on these. The London and St. Katherine's Dock Company has arrived at the limit of its borrowing powers, but there is a sum of unissued capital amounting to £181,000. The Surrey Dock and Canal Companies were amalgamated in 1864. The Millwall Dock was opened by the Millwall Dock Company in 1868.

Provincial Dock Development.—While the dock system of the Thames was developing, that of the Mersey was growing rapidly. The growth of the cotton trade, and the increasing importation of American produce, especially wheat, stimulated the provision of docks and warehouses at the chief ports on the western seaboard. The Mersey and the Clyde became great industrial centres and great harbours. The Clyde at Glasgow was a narrow

bour Board was incorporated by act of parliament, the Liverpool docks were owned and administered by the Corporation of Liverpool and the Birkenhead Docks by the Birkenhead Docks Committee. The Liverpool docks extend along the margin of the river, and are protected "from tidal influence by a continuous sea-wall, except where entrances are required into the range of docks" (Lyster, *op. cit.* p. 11). The Liverpool dock system at present consists of 47 wet docks and basins. The Birkenhead docks consist of 2 "floats," 10 docks, 1 large and 2 small basins. The total water area of the Mersey docks is 545 acres, and the quay-space is 35 lineal miles. There are 24 graving or dry docks and 2 "griddions." The total area of the dock estate is 1611 acres. Hydraulic power stations are placed at suitable centres, the power being used for opening and closing the dock gates, and for working the hydraulic cranes. Double-storied sheds are built at Toxteth Docks for the storage of grain cargoes. The grain is discharged from the ship's hold direct to the place of storage by hydraulic cranes. At the Alexandria Grain Warehouses, owned by a joint-stock company, the grain is raised from the ship's hold in dock by a bucket elevator, and is transferred to an india-rubber band conveyor running underground from the

dock to the stores, it is there received by a system of smaller conveyors, and distributed into bins. By this process the grain is not shovelled or handled in any way. At the Herculaneum Docks, petroleum brought in tank steamers from Batoum and other ports is pumped from the vessel into a short pipe line which conveys the oil to tanks each capable of containing from 2000 to 3000 tons. The total tonnage entered at Liverpool in 1890 was 5,782,351, and the total tonnage cleared was 5,159,450 tons. The authorised borrowing powers of the Mersey Docks and Harbour Board are £20,475,351. The amount of loans (1st July 1891) was £17,211,333. Extensive works are at present in progress at the Canada Dock, which will increase the invested capital. The highest rate of interest on loans is $4\frac{1}{2}$ per cent, at which under £4,000,000 are borrowed; the bulk of the capital has been obtained at from $3\frac{1}{4}$ to $4\frac{1}{4}$ per cent. The lowest rate is $2\frac{3}{4}$ per cent. A sum of £920,000 consists of Mersey Dock annuities, representing an interest payment of $3\frac{1}{4}$ per cent to $3\frac{3}{4}$ per cent. The interest on loans absorbs about £700,000 per annum. The revenue of the board is derived from eight main sources. These are dock tonnage rates, dock rates, town dues, graving dock and gridiron rates, dock rent, dock railway, and warehouses. The total revenue of the board in 1890-91 was £1,530,000, of which the docks proper yielded £1,080,000, warehouses, £205,844. The proportion of working expenses to revenue is over all about 44 per cent. The proportion of working expenses to revenue on dock account alone is 40 per cent, upon warehouses account alone it is 80 per cent. The town dues, originally levied by the Corporation of Liverpool, were purchased by the Harbour Board in 1858 for £1,500,000. The amount received annually from this source has increased from £140,000 in 1858 to £260,000 in 1891. At an annual average of a quarter of a million this impost yields the harbour board interest at the rate of $16\frac{1}{2}$ per cent per annum on its investment. The dues were revised and reduced in 1881 and in 1884. In addition to their function of dock owners, the Mersey Harbour Board have charge of the conservancy of the river, upon which £62,000 per annum is expended, lighthouses and lightships in the Mersey, and pilotage (*Accounts of the Mersey Docks and Harbour Board for year ending 1st July 1891*). In addition to the property of the Mersey Docks and Harbour Board there are at Liverpool the Duke's Dock and Brunswick Branch Dock belonging to the Manchester Ship Canal Company, and the Garston Docks, belonging to the London and North-Western Railway Company.

At Newcastle the River Tyne Improvement Commissioners were incorporated in 1850, the Corporation of Newcastle, in whose hands the care of the river had previously been, having

been inert in improving the port. The commissioners constructed a dock in 1857. In 1859 a second dock was constructed by the North-Eastern Railway Company. In 1884 the Albert Edward Dock was opened. While the wet dock accommodation in the Tyne is limited owing to the extensive development of riverside wharves, there are 21 graving or dry docks, and 14 repairing slips. The deepening of the river and the deepening of the entrances to the docks have facilitated the development of the shipbuilding industry on the Tyne, as also on the Clyde. On the Wear, at Sunderland, the Wearmouth Dock Company constructed a dock, which was opened for traffic in 1838. This dock was a financial failure, and was purchased in 1847 by the York, Newcastle, and Berwick (now the North-Eastern) Railway. In 1850 the South Docks at Sunderland were built by a joint-stock company, from whom they were acquired by the River Wear Commissioners in 1859. In 1809 the Bristol Docks were formed by converting the bed of that part of the river Avon running through the city into a tidal dock, a new channel for the river being cut. The city corporation acquired the docks in 1848. At Swansea, under the harbour trust, a similar expedient was adopted, and the North Dock, formed in a bend of the River Tawe, was opened in 1852. The South Dock was opened in 1859; and the Prince of Wales Dock in 1880. The West Bute Dock at Cardiff was built in 1839 by the Marquis of Bute. The present authorised share capital of the Bute Docks Company is £3,500,000. The trade of the docks in 1880 was 6,291,137 tons, and in 1890, 9,217,960 tons. The docks do not at present yield any return to the capital invested. The Lewis and Hunter system of loading coal, by which 300 tons per hour are placed on board ship, is in use at the docks. An extension of the Bute Docks, to cost £700,000, has been decided upon by the company (1892). The principal export from Cardiff is Welsh coal, which is also shipped from Penarth, where there is a dock of 26 acres belonging to the Taffvale Railway Company, and from Barry Island, where are the Barry Docks belonging to the Barry Dock and Railway Company, promoted 1883, opened 1889, cost £850,000. The town of Hull was forced to construct docks by the commissioners of customs, who had excluded it from the list of legal quays as fixed in the acts of 1559 and 1674, and had insisted on the establishment of a dock to facilitate the collection of the revenue. The commissioners having threatened to establish a legal quay at some other port on the Humber, the Dock Company at Kingston-upon-Hull was formed in 1773. The share capital was originally £30,000, the Corporation of Hull, the Trinity House, and the Charter House sub-

scribing about one-sixth of the amount required. To enable the company to carry out its work the Government made a gift of the land occupied by the old fortifications of Hull, the customs made a gift of £15,000, and certain rights were granted to exact tonnage dues on vessels entering Hull harbour. The Queen's Dock was opened in 1779, and four docks followed in 1809, 1829, 1846, and in 1850.

In Dublin docks were opened in 1796, and in 1821. The administration of the docks is in the hands of the Dublin Port and Docks Board, which in 1867, as regards the control of the docks, replaced the Corporation for Preserving and Improving the Port of Dublin. At Newport (Mon.) docks were opened in 1842, owned by the Alexandra (Newport and South Wales) Docks Company.

At Glasgow the trustees of the Clyde Navigation, by deepening the river-channel and erecting quays upon the banks, had practically converted the Clyde into a dock; but the extension of trade caused the trustees, in 1867, to excavate the Kingston Dock, and in 1880 the Queen's Dock. The combined area of these is 39 acres. Cessnock Docks were begun in 1885, and their construction is still (1892) proceeding. There are no warehouses under the control of the Clyde Trust; but special accommodation is provided for landing and housing cattle and storing timber. The North British and Caledonian Railway Companies have access through branch lines to the docks, and the trustees own a harbour railway on the street level. The total cost of the harbour works at Glasgow from 1770 till 1892, including interest, has been £13,641,301. The revenue of the trust is £369,226, and the debt is £4,843,228. For further details see Table B.

TABLE B.
CLYDE NAVIGATION.

Particulars as to Glasgow Harbour and Docks, 1892.

First Act for improving the River Clyde	1759.
First Act for improving the Harbour of Glasgow	1800.
First Act for making a Dock at Glasgow	1840.
Length of Quays	10,853 lin. yds.
Areas of Quays, Roads, and Shed space	74·87 acres.
Area of Shed space	28·00 acres.
Area of Timber Yards	14·80 acres.
Area of Water space	100·33 acres.
Amount of Parliamentary Borrowing	
Flowers	£6,250,000
Amount of Debt	£4,843,228
Total Expenditure, including all working expenses on River, and Harbour and Docks, since 1770	£14,641,301
Total Income of Trustees from 1732	£8,390,279
Income for year 1891-92	£369,226
Depth of Water, at average Low Water Springs—	
In River	16 to 20 feet.
In Harbour	15 to 20 feet.
In Docks	18 to 20 feet.
Rise of average Spring Tides—	
In River	10 to 11 feet.
In Harbour and Docks	11 feet 2 inches.

At Leith, docks were constructed in 1819, in 1852, in 1869, and in 1881, the total area being 42 acres. The docks are under the control of the Commissioners for the Harbour and Docks of Leith. Application is being made to parliament for power to construct new docks, etc. A curious survival is the imposition of fish tithes by the kirk-session of North Leith Parish Church. The commutation of these is involved in the application to parliament.

Mechanical Appliances at Docks.—Steam hoists for dock manipulation were introduced at the Surrey Docks in 1861. There also hydraulic machinery was introduced for the same purpose in 1873. In 1877 the system of distribution by bands was adopted at the grain warehouses of the Surrey Dock Company. The use of hydraulic cranes, steam machinery of various kinds, grain elevators and conveyors, refrigerating plant, coal loading machinery, etc., has developed largely during the past twenty years. In America the development of mechanical aids for such purposes has probably been carried further than in this country.

Dock Warrants.—Under the system by which warrants are granted by the dock authorities at London, Bristol, and other places, for goods stored in their hands, goods may be sold repeatedly before they leave the warehouse. Goods in this way may be “mobilised like money,” and the tendency is necessarily for such goods to be stored at great financial centres under the control of public or quasi-public bodies. See CLEARING SYSTEM; CONDITIONING; COTTON CLEARING; DOCK WARRANT; SAMPLING AND GRADING.

Effect of Economic Changes upon Docks.—Apart from the general causes which contribute to the fluctuations of trade, and by which the business of docks is affected, certain special causes have had important influences upon them. These causes have not affected all docks equally. Their influence varies with the nature of the trade of the port, and with the incidence of the dock charges. At Liverpool the incidence of the charges upon ships and goods is as follows as disclosed by the revenue:—dock tonnage rate on ships, 40 per cent; dock rates on goods, 31 per cent; dues on goods, 26 per cent; warehousing, 3 per cent. At London warehousing yields 70 per cent, and all other charges 30 per cent. It is thus obvious that any changes affecting the custom of warehousing must have much more important effects upon London, where this system is so highly developed, than on Liverpool, or, indeed, than on any other port in the kingdom. Although the warehouses at the docks on the Thames are not exclusively for goods in bond, yet the system of warehousing grew up under a policy of protection, when hundreds of articles now free of duty were taxed, and on importation were stored under the supervision of the

customs, in the dock warehouses till the duty was paid. The successive steps in free trade were therefore successive blows to the revenue of the dock companies. The facilitation of commercial intercourse, too, through the submarine telegraph and the swift steamer, made warehousing at once less necessary and less profitable to the merchant. Markets became more closely drawn together and more sensitive, and the risks and expense of prolonged holding of goods became out of proportion to the possible profits. Thus in the case of many important commodities warehousing ceased to be customary, and the revenue from this, the most important branch of the business of the dock companies at London, fell off. Among the many economic effects of the opening of the Suez Canal were two in which docks were directly affected. The first of these was the impetus given, not alone to the building of steamers, but to the building of steamers of large size; the second, its influence on the entrepôt trade of Great Britain. Only 14 steamers of 4000 tons and upwards had been built prior to the opening of the Suez Canal. The great development of large vessels has taken place since then. From 1870 to 1891 about 200 vessels of 4000 tons and upwards were built. The entrepôt trade of this country has been affected by the reopening of direct trade routes between Europe and the East. The substitution of marine for land transport had made London, for at least a century, the common market for Eastern goods in Western Europe; but when the Suez Canal replaced the route by the Cape, as the main trade channel between east and west, and when the development of international commerce, resulting from this and other causes, enabled France and Germany to employ lines of steamers on direct routes between continental and eastern ports, the entrepôt trade of London gradually diminished. In addition to the changes traceable, directly or indirectly, to the alteration of trade routes, as by the opening of the Suez Canal, other causes, for example, the diminution of prices, had the effect of stimulating direct communication (cp. Dep. Trade Com., *Report*, III. Q. 10,848). The most potent cause was, however, the expansion of trade, enabling the continental ports to cultivate direct relations with the East. The ports which have developed most conspicuously in recent years are Antwerp, Havre, and Hamburg. Navigation laws (of France and Spain, *e.g.*) have stimulated direct intercourse by granting bounties on ships and cargoes. Although from a national point of view the importance of the entrepôt trade may be exaggerated, and although at its highest point it was not more than one-sixth of the total import of foreign produce, yet the fluctuations in it affect London, and specially the docks at

London, much more seriously than they affect any other port in the United Kingdom.

Individual docks have been subject to the influence of important changes in the technique of production. The alteration in the sugar trade through the extensive substitution of beet-root for cane sugar, has seriously affected the revenue of the West India Docks, while the substitution of artificial alizarine, and of the aniline dyes for madder, cochineal, and other products, has led to the almost entire disappearance of these, from the London import lists, and to the importation from Germany and France of their substitutes. These substitutes are mainly imported at the provincial ports, *e.g.* Hull, Newcastle, Harwich, and Leith.

Competition in relation to Docks.—One of the features which distinguish the port of London from the ports in the provinces is the circumstance that the docks at London compete not only with those at other ports but with each other, with the legal quay-owners and wharfingers, and even with lightermen discharging in some cases over the vessel's side in dock free from the payment of dues on the goods to the dock company. In almost all the provincial ports, on the other hand, the dock corporations, whether municipal, trustee, or joint-stock, exercise a local monopoly. Occasionally ports are so near each other as virtually to enter into competition for the same trade; but each dock and harbour authority in the provinces, with rare exceptions, enjoys a monopoly of the trade of the port. At Liverpool and Glasgow, *e.g.* there is no competition in docks, and rates are fixed exclusively with regard to the needs of the trust for maintenance and interest, although there is a necessary limit fixed by the competition of other large ports.

Incidence of Dock Charges.—The policy of dock owners as regards the incidence of charges varies very widely. No definite principle is discoverable beneath the multifarious methods of rating. The charges in each port have arisen largely through local custom, or have been altered in specific cases from time to time, owing to influential representations by oppressed interests. The charges may be broadly divided into charges on the ship and charges on the goods. Charges on the ship may be divided into dues and rent. Dues are usually charged on net register tonnage, though they have been from time to time charged on the gross tonnage, as in 1856 at Sunderland. (For discussion on the policy of charging on the net or on the gross tonnage, see Royal Com. on Tonnage, *Report*, 1881; also *e.g.* *Shipping World*, vol. i. pp. 274, 323, 365, and 402). Under the Harbour Docks Act of 1847 preferential rates are prohibited.

Dock rent is charged, as in London, on gross tonnage. In some cases rent begins on entrance, in other cases it begins after a certain period has elapsed. Yachts are free in most harbours,

they are charged for in the Thames Docks. Charges on *goods* may be divided into rates including landing, weighing, and delivery in the case of imported goods; collection, wharfage, and portorage in the case of exported goods; and warehouse rent. There are besides special charges on particular classes of goods. The rates on goods are fixed partly with regard to the difficulty, risk, and cost of handling them, and partly with regard to the value of the goods. At Bristol no rates are charged on exports. It is clear that dock rates so levied must act in a measure as a bounty on exports, and as a corresponding tax on imports. (On differential rates for freemen and foreigners, see *Maitland, History of London*.) There seems much need for simplification in dock charges. The classification adopted finally by the railway companies might form the basis of a classification for docks with advantage both to shippers and dock corporations.

Dock Finance.—The proportion of working expenses to gross receipts at the Mersey Docks was in 1892, 44 per cent, at Swansea 41 per cent, and at Bristol 60 per cent, at the Surrey Commercial 73 per cent, at the Bute Docks, Cardiff, 52 per cent, at Falmouth 70 per cent, at Swansea 48½ per cent, at Belfast 80 per cent. The capital invested in docks in the United Kingdom may be estimated as very close upon £100,000,000. This represents their probable cost. The water area is about 4000 or 4500 acres. This includes tidal basins, warehouses, and other adjuncts of docks; but excludes breakwaters on estuaries not constructed by dock authorities, or for the direct protection of docks.

The net return on capital invested is stated to be (in 1892) at the Bute Docks, Cardiff, at Ipswich, Southampton, Swansea, Montrose, and Dublin, 4 per cent; at Llanelly from 3½ to 4½ per cent; at Belfast 3½ per cent; at Millwall £3:18s.; Maryport 4½ per cent; at Newport 4½ per cent; at Penarth 5½; at the Surrey Commercial £6:16s. per cent. This last is the highest figure supplied to us by any dock authority. It is doubtful whether the total return on the capital invested can average from 3 to 3½ per cent.

Dock Ownership.—The ownership of the seventy-five docks in the United Kingdom is distributed as follows:

State Ownership	1
Municipal Do.	3
Local Public Trust Ownership	27
Public Ownership	31
Joint Stock Ownership	41
Private Do.	3
Private Ownership	44

Public Ownership.—The question of public ownership of docks has been discussed of late,

especially in connection with the docks at London and at Cardiff. There are three main points involved—1st, management; 2nd, public convenience; 3rd, finance.

(1) *Management.*—It is argued that a number of men selected by their townsmen for known fitness for administration may administer as efficiently as similar men selected for the same reason by a body of shareholders. No considerable support can be found for objecting to administration of docks by public trusts in the records of such bodies. The examples of Liverpool and Glasgow are very noteworthy as highly successful and efficient trusts, the Mersey Board alone dealing with a capital almost exactly equal to the aggregate capital of the London Docks. The same class of men is employed in the practical details of administration, both in companies and in corporations. The conventional answer to this argument is that directors who are pecuniarily interested in a concern are more likely to secure efficient management than trustees who are not pecuniarily interested.

(2) *Public Convenience.*—There is some reason for doubt whether any general case could be made out on this ground for or against public control. The slowness with which public bodies sometimes meet public demand has frequently been exemplified in the case of docks under both joint-stock and public management. Directors and trustees alike are sometimes compelled to meet the pressure involuntarily. The Tilbury Dock was constructed some years before their time in anticipation of public demand, while the trusts have usually lagged behind demand. This, however, is susceptible of two interpretations.

(3) *Finance.*—While dock property may one day be extremely remunerative, it is now in a period of transition. The joint-stock dock shareholder has had, during the past few years, in many cases, to go without his dividend, while the public trust bondholder has, as a rule, got his interest. In this reference it should be remembered that municipalities have other resources at their command than dock charges. Recent instances of defaulting trusts are, however, the harbour boards of Greenock and Paisley. The broad ground of the advantage in the public interest of public ownership and control of all services which are essentially local monopolies, is the argument usually employed in favour of placing docks under public control. (See *MONOPOLIES*.)

M.

DOCK LABOUR. The inaugural address of Mr. Charles Booth, President of the Royal Statistical Society, delivered 15th November 1892, records the results of an inquiry into the condition of waterside labour in the port of London. Since 1887, when Mr. Booth commenced the study of dock employment as a principal East End industry, he considers that the social position of the men employed in it has greatly improved; he ascribes this to the unions which have been founded since. Material improvement is less marked. A larger proportion of the men have regular work, but this is gained at the expense of the remainder, whose work is even more precarious than before. The terms of employment are, however, more satisfactory, and the pay higher in 1892 than in 1887.

Mr. Booth divides riverside labour into the following branches:

I. Import through the docks—(1) discharging from on board ship in dock; (2) receiving on quay and passing into warehouse; (3) receiving and stowing into lighters; (4) handling in warehouse. II. Import through the wharves, subject to the same subdivisions as the dock work. III. Import "over side" from ships lying in the stream. The men so employed are termed "shipworkers," and undertake also the loading of coasting vessels. IV. Export work, both dock and wharf. Handling goods on quay in preparation for the stevedores. V. Stowage of cargo, export, by stevedores. VI.

Lighterage of goods. VII. Handling of coals and ballast, dock, wharf, or stream—(1) discharging coal; (2) loading coal as cargo, by stevedores; (3) coaling steamers; (4) ballast heavers. VIII. Handling of ships in port—(1) tug boatmen; (2) ship scrapers and painters; (3) riggers and shore-gang men; (4) sailors in port. Of these Mr. Booth considers only sections 1 to 4 as “dockers,” and it is with their work and conditions that he deals. The numbers of the members of the Dockers’ Unions

appear to have fluctuated greatly. It is not improbable that the two Unions which were organised in 1890 had, within the London district, about 20,000 members against about 10,000 in 1892.

A large proportion of the work is necessarily irregular, as is shown in the following table of the employment for the twelvemonth from April 1891 to April 1892.

Taking docks, wharves, and warehouses together, it appears that there was work—

		Days' Work.
On 302-309 days for 12,500 men (or all the year round)		= about 3,840,000
„ 298-301 „ 500 more (all year except part of March)		= „ 150,000
„ 284-297 „ 500 „ (all year except part of March, May, and August)		= „ 146,000
„ 260-283 „ 500 „ (all year except part of March, May, and August)		= „ 138,000
„ 219-259 „ 500 „ (part of March, May, June, July, and August without work)		= „ 125,000
„ 158-218 „ 500 „ (no work in August, very little in March, not half work in May and June, and no month without some loss of time)		= „ 101,000
	15,000	4,500,000
On 121-157 days for 500 more (no work in March, May, June, or August, and not much in July; half work in April and September)		= about 75,000
„ 80-120 „ 500 „ (no work in March, and practically none 1st May to end of September)		= „ 54,000
„ 44-79 „ 500 „ (about half work in November, December, January, and February. No other work except a short spell at the end of September)		= „ 33,000
„ 24-43 „ 500 „ (only quarter work in November, December, January, and February)		= „ 18,000
„ 7-23 „ 500 „ (practically no work, except at end of November and beginning of December)		= „ 8,500
„ 7 „ 500 „ (needed at the beginning of December only)		= „ 1,500
	18,000	4,690,000

It seems probable that in the way the work is now distributed, 20,000 men are actually needed, and that there may be as many as 22,000 professional dockers. This number is made up as follows:—

Usually employed at Victoria and Albert Docks	3,500
„ East and West India	2,000
„ London and St. Katharine	4,000
„ north side wharves and warehouses	5,000
„ south	4,000
„ Millwall Docks	1,200
„ Surrey Commercial Docks	1,800
	21,500

	Days' Work.
Permanent men	4,000, working 294 days (309, less 5 per cent)=1,176,000
First Preference	4,000, „ 287 „ 7½ „ =1,148,000
Second „	4,000, „ 278 „ 10 „ =1,112,000
Third „	4,000, „ 266 „ 14 „ =1,064,000

Outsiders	16,000 average	4,500,000
	3,000 working 63 days average	190,000
	19,000	4,690,000

“Figured at 4s. a day, the preference men would average 22s. 1d., 21s. 4d., and 20s. 5d., or at 4s. 6d., 24s. 10d., 24s., and 22s. 11d. per week. The off-time of the third preference men would fall in the summer, mostly in August, and might be made of some value. If the outsiders, who it will be remembered are wanted mainly in the winter, could be drawn from those trades which are slack at that time, they too might find a sufficient amount of work between two sources of employment for a decent livelihood. This arrangement, if it were feasible, would dispense entirely with the services of 5000 or 6000 men. It is not to

The earnings of the regular labourers at the docks are also shared by men who seek work there because their own trades are slack.

“There appears to be good work actually for 14,500 to 15,000, or, with a margin for sickness and for unavoidable friction in distribution, for about 16,000 men. For these, with strict preferences over all outsiders, there would be an average of 281 days out of 309. This calculation assumes that when needed 3000 more men could be obtained from the unemployed in other trades. The year’s work would then be divided somewhat as shown below:—

be supposed that such a change could come about quickly.”

The way to obtain this lies in a careful regulation of the work.

Into the methods proposed to secure this we cannot go here. Mr. Booth truly says, “of all the causes of poverty and misery, irregular work, coupled, as it always must be, with irregular lives, is by far the greatest. A change in this would effect more than almost anything else could do for the welfare of the people.” To the owners of dock property also a proper arrangement for the supply of efficient and dependable labour is most important. The pre-

ent rate of wages appears to range from 4s. to 5s. a day. But it is regularity of employment which it is most desirable to secure. The more regularly employed men obtain also the higher rates of pay.

The statement given above refers only to the labour employed in the London docks. The circumstances of the other docks in the country differ considerably from these, but what has been stated will show the importance of this industry to the commerce of the United Kingdom.

[Booth, *Life and Labour in London*, vol. i. Evidence, transport section of Royal Commission on Labour.]

DOCK WARRANT. A document by which a dock company or other dock owner certifies that the holder is entitled to receive certain goods specified therein, deposited with such dock company or other dock owner (see *Dock warrants* in art. DOCK, p. 615). A dock warrant is generally transferable by indorsement; a holder, though in good faith, and though he had given value for it, was formerly in a less favourable position than the holder of a bill of lading; but since the Factors Act of 1877 a transfer of a warrant by the buyer or owner of the goods to which it refers, to a person who takes the document in good faith, has "the same effect for defeating any vendor's lien or right of stoppage *in transitu*, as the transfer of a bill of lading has for defeating the right of stoppage *in transitu*" (Factors Act, 1889, §10). (See COMMERCIAL INSTRUMENTS.) E. S.

DOCQUET. (1) Declaration by a notary authenticating an instrument of sasine (Scotland, before 1845); (2) Declaration by a notary, by a justice of the peace, or by the parish minister in his own parish, authenticating the signature of a person unable to write (Scotland); (3) Authentication of a mercantile account by signature, initials, or jotting.

[Scotland: Dickson on *Evidence*, §§ 797-800.]

A. D.

DOCTRINAIRE is a term of reproach designating one who applies theory without due regard to facts. The doctrinaire forgets that in social science a consilience between deduction and verification is generally requisite (see Mill, *Logic*, bk. vi. ch. viii. ix.) He is like the Aristotelian doctors in the age of Galileo, who continued to believe that bodies fall faster the heavier they are in spite of experiments proving the contrary. However, such open defiance of facts is rare even in political economy. An instance is the resolution of the British parliament that bank notes had not depreciated with respect to gold in 1811, when the guinea was commonly exchanged for 24s. shillings in paper money and silver. The more usual type of doctrinaire is one who has, so to speak, a tolerably correct theory of gravitation, but makes no allowance for the resistance of the air. The omission of this concrete fact may or

may not be serious according to circumstances. The abstraction may be legitimate in the case of a stone dropped from a height, but fatal in the case of a feather. An economic principle like *laissez-faire* may be valid in general, but in some important case be counteracted by peculiar circumstances. Such peculiarities distinguish the labour market from markets in general (see Marshall, *Principles of Economics*, bk. vii. chaps. iv. v. vi.) Those who opposed the Factory Acts on the principle of *laissez-faire* were doctrinaires—so time has proved. But prior to the additional experience of the last half century it was not easy to see who was the doctrinaire and who the empiric. A hesitation between the rule and the exception may often be reasonable. In general no short and handy rule can be given for steering between the Scylla of empiricism and the Charybdis which swallows up the doctrinaire. Some cautions against the more dangerous extreme, some education of the instinct or tact which is required in order to hold the right mean, may be obtained from the example of those who have made shipwreck, and from the precepts of the wise.

A signal example is afforded by the so-called currency principle in banking (see BANK NOTE; CURRENCY DOCTRINE), which was held by Lord Overstone, and largely influenced the Bank Act of 1844. Those who relied on this principle fixed too exclusive attention on the "quantity-theory" of money, neglecting incidents peculiar to a convertible currency, and the fact that bank notes form but a small part of the English circulation. The theory is contrary to the fact that after crises, while prices have greatly fallen, the notes in the hands of the public have greatly increased (see Palgrave, *Journal of the Bankers' Institute*, January 1890). Other examples are afforded by some of Ricardo's followers. Ricardo, as Professor Marshall says, is "more responsible than any one else for the habit of endeavouring to express great economic doctrines in short sentences;" for instance, "The natural price of labour is that price which is necessary to enable the labourers one with another to subsist and to perpetuate their race" (*Pol. Econ.*, ch. v.) "A tax on wages is in fact a tax on profits" (*ibid.*, ch. xvi.) "Nothing is more common than to see hats or malt rise when taxed . . . so with labour, when wages are taxed, its price rises" (*ibid.*) "The natural tendency of profits is to fall" (ch. vi.) Those who have interpreted these *dicta* literally, without regard to qualifying passages, both "the hangers-on of the science who have used it simply as an engine for keeping the working classes in their places," and also some socialists—may be considered doctrinaires (see Marshall, *Principles of Economics*, pp. 63, 532, 672). The appellation was probably deserved by McCulloch when he applied to the concrete case of Ireland his

abstract theory that a landlord does not injure, but rather benefits his countrymen by becoming an ABSENTEE (*q.c.*) However, in this and other instances, it may be proper to attribute the mistake rather to the reasoning process than to a neglect of experience. The holder of a false doctrine is not necessarily a doctrinaire. Still it is true that the bad consequences of wrong theories have been aggravated by neglect of ordinary experience and want of common sense. Examples of wrong theories and their consequences will be found in the articles on BALANCE OF TRADE; MERCANTILE SYSTEM; PHYSIOCRATS; WAGE-FUND, and many other headings—beginning with L. P. ABEILLE (*q.v.*) the doctrinaire who taught that a rise in the price of corn was beneficial to the community, and that high corn prices make high wages.

Such instances fully justify Burke's condemnation of the mathematical method in human affairs (*Reflections on the French Revolution, Letter to a Noble Lord, et passim*). Burke's indignation is directed chiefly against the political doctrinaires of his own time. But it is equally applicable to the "economists and sophisters" of a later age. It should be noticed that the same Burke does not on occasion shrink from applying economic theory with some severity (see *Thoughts on Scarcity*, remarks on the "Labouring Poor"). An instructive protest against the abuse of abstract reasoning is contained in Richard Jones's *Rent* and other writings. Whewell, in his preface to the works of R. Jones, aptly compares the doctrinaire to one who should assume that the surface of the earth was entirely determined by gravitation; making abstraction of the forces of cohesion by which the mountains are "in fluctuation fixed." To complete the metaphor, it should be observed that the abstract hypothesis works very well for the greater part of the surface of the terraqueous globe. The difficulty is to discern in each case what is the character of the subject matter, how far the hypothesis of perfect fluidity is admissible. The importance of facts cannot be stated more emphatically than by Mill in his *Unsettled Questions*. The economist must not rest satisfied until he has examined all the facts which appear contrary to his theory, and either made allowance for exceptions, or ascertained that the appearance was illusory. The theorist who will not take this trouble must be content to hold his opinions with great modesty. Mill repeats this lesson in his account of Auguste Comte; whose warnings against the danger of isolating political economy from social science deserve much attention. Another source of instruction is afforded in the German historical school. Those especially who have shown that they appreciate the value of abstract reasoning (see Wagner, *Quarterly Journal of Economics*, 1886) teach with authority that theory without experience is barren. The method of Prof.

Cofin is very instructive. In his classical work on English railways he overthrows by arguments drawn from experience the doctrinaires who preach an equal mileage rate and fares proportionate to cost. Over the ruins of this demolished doctrine he builds, upon a broader basis of fact, a new theory which differs from the old, not in being less simple—for it is capable of being expressed in mathematical form (see Hadley, *Railway Transportation*, Appendix; and art. on DUPUIT)—but in better representing the real circumstances. Among English economists who have stigmatised the intellectual vice which is the subject of this article should be noticed Cliffe-Leslie (*Essays*); Prof. Ingram (Presidential Address, Section F, British Association, 1878); Dr. Cunningham (*Growth of English Commerce, passim*). Even unscientific writers like CARLYLE (*q.v.*) may impart common sense. Literary humour is a potent antidote against the crotchets of doctrinaires. Take as examples: Voltaire's "L'homme aux quarante écus"; Scott's Malachi Malagrowther; some of Thomas L. Peacock's stories, especially *Crotchet Castle*; part of Ruskin's *Unto this Last* (ABSTRACT POLITICAL ECONOMY; FACTS, KNOWLEDGE OF).

F. Y. E.

DOCTRINE OF POPULATION (MALTHUS). See MALTHUS, Rev. T. R.; POPULATION.

DOGMA. This term, which properly should signify nothing more than opinion, has come to signify an opinion adopted without proof and maintained with passion. In political economy the term dogmatic, like the terms abstract, unhistorical, etc., is often applied to the old, or, as they are more indulgently described, the classical economists. These economists are sometimes supposed to have based their system upon certain arbitrary assumptions or dogmas such as the universal selfishness of human nature, the universal prevalence of competition, and the universal tendency of population to outrun the means of subsistence. They are sometimes contrasted with the later economists, who are said to have employed induction rather than deduction, and to have consulted history rather than to have employed arguments derived from the working of their own minds. The difference in so far as it exists is only one of degree. No economist—indeed no scientific inquirer—can avoid holding opinions which those who differ from him might stigmatise as dogmas. The processes of induction and historical inquiry would be both endless and fruitless to one who undertook them with a perfectly blank mind. Induction is possible only if we assume the uniformity of nature. History has no lessons for us if we do not assume a certain continuity in human character. In framing an induction or in writing a history there is always implied a process of selection among numberless facts. Such a selection can proceed only upon some principle adopted by

the inquirer; a principle which he does not find, but bring. "Let any one watch the manner in which he himself unravels a complicated mass of evidence; let him observe how, for instance, he elicits the true history of any occurrence from the involved statements of one or of many witnesses; he will find that he does not take all the items of evidence into his mind at once and attempt to weave them together; he extemporises from a few of the particulars, a first rude theory of the mode in which the facts took place, and then looks at the other statements one by one to try whether they can be reconciled with that provisional theory or what alterations or additions it requires to make it square with them" (Mill, *Lects.* bk. iii. ch. xiv.) Hardly any progress therefore can be made in political economy without assuming certain general propositions. On the other hand, such propositions must be regarded as merely provisional, and must always be liable to revision as research goes on. The same remark applies to the conclusions reached from such premisses which in turn afford a point of departure for new theorising.

[See articles CLASSICAL ECONOMISTS; DOCTRINAIRE, and the authorities therein cited.]

F. C. M.

DOITKIN. A small base coin—probably of Flemish origin—prohibited by Statute 3 Henry V. ch. i. Hence the expression "not worth a doit." H. Ha.

DOLE-FISH. The proportion of fish received as their allowance or share, according to custom, by the fishermen employed in the North Sea fisheries.

[Statute 35 Henry VIII. ch. vii.] H. Ha.

DOLES. A dole is defined by Dr. Johnson as "provisions or money distributed in charity," but the ordinary use of the term in modern times implies somewhat more than this. A dole is now generally understood to be opposed to regular or permanent help, and to be comparatively small in amount. Doles figure largely in the charitable bequests of old time. Thus at Oxford, on St. Thomas's Day, there were given away more than seventy such, ranging in value from 13s. 6d. up to £5, and hardly any town or parish in England is without them. Every kind of condition may be attached. They are confined to freemen, to residents in certain parishes, to regular attendants at church, to widows, to spinners, to servants, to young men, to old men, to cripples, to the blind. The modern spirit, embodied in schemes issued by the charity commissioners, has abolished large numbers of them, but they still survive in places which resist reform. The objections to the dole-system are numerous and weighty. "The practice of distributing doles," said Sir George Jessel in the famous Campden case, "should be more honoured in the breach than in the observance. There is no doubt that it

tends to demoralise the poor and benefit no one . . . the extension of doles is simply the extension of mischief." What are the grounds for so sweeping a condemnation? The first principle in administering charity is that it should be adequate to its purpose of relieving distress or re-establishing independence. Neither of these objects is secured by doles. They are not sufficient in amount to meet a crisis, nor continuous enough to provide for old age; in many cases it is expressly forbidden that the same person shall be a recipient on two consecutive occasions. Again, they are often so numerous, and so unimportant in amount, as to be given without any of that preliminary inquiry which is essential to wise almsgiving, and hence they fall largely into the hands of persons who make anything but a good use of them. The conditions attached to the receipt of doles are often of an absurd kind. They hardly ever further their object, they lead to gross hypocrisy. It is idle to suppose that any religious body receives moral support from the membership of those who are attracted by them; in the great majority of cases it is brought into disrepute by the inconsistency of the profession and practice. Hence, far from being strengthened by such gifts, religion itself comes under the suspicion of aiding and abetting unreal conformity, and its moral influence is weakened and its progress stayed. Add to these objections the canvassing for such gifts, the loss of self-respect involved, the temptations to dishonesty in appearance and in phrase, the melancholy effect on children of witnessing such conduct on the part of their parents, the inducement offered to give up the attempt to gain an honest livelihood and seek it by begging and fawning, the attractions which such periodical distributions have for the idle and self-indulgent from every quarter to settle in the favoured parish or town, and it is not difficult to see that charitable bequests in the form of doles tend almost inevitably to increase the very evils which their founders hoped to abate. A single example will illustrate this. The charities of the city of Bristol are estimated as follows:—endowed £50,000, subscription and Colston £41,000, private £50,000, in addition to a poor-law expenditure of £55,500—in all £196,500 annually spent on a population of 221,665 in the census of 1891. And what are the results of the system pursued in many cases? It is said to demoralise and pauperise. "The poor, qualified by residence in parishes in which endowments exist to receive their benefits, look upon them as a right, apply for them regularly, irrespective of need, and accept them with thanklessness. Jealousies and discontents grow round their distribution. The thought that they will fall in induces unthriftiness; debts are run up to be paid off by them; and if not this, being something beyond and

outside the ordinary sources of income, they are deemed fittingly applicable for some unwarranted and needless expenditure. Many waste their hearts in expectancy, and their time—years may be,—better spent in efforts to earn their living, in the continual pursuit of gifts. The adroit professional charity-hunters get the lion's share of them. The industrious old people find themselves too late. Much of the money, and even gifts in kind, quickly sold or pawned, are spent in drink" (*The Condition of the Bristol Poor*). So far doles have been treated as a form of bequest only. The same characteristics and the same results are seen in part in the case of indiscriminate charity by individuals, and of out-door relief given by boards of guardians.

DOLLAR

History of, p. 626; of Account, p. 627; Hard (Stock Exchange use of word), p. 627; Hard Spanish, p. 627; United States—gold and silver dollar, p. 627; Trade (United States), p. 627; Maria Theresa or Levantiner Thaler, p. 628; Mexican or Peso, p. 628; South and Central American Republics and British Honduras, p. 628.

DOLLAR, HISTORY OF. The name dates from the year 1517, when the Counts of Schlick directed a large coinage of the already familiar silver "gulden groschen" in Joachimsthal (*i.e.* St. James's Dale) in Bohemia, whence the coins came to be known as *Joachimsthaler*, or simply *thaler*, the coin of the Dale. In 1566, at the Convention of Augsburg, the thaler was adopted as an imperial coin, under the name of "reichs-thaler," or "rix-dollar." At this date the millesimal fineness of the coin was reduced from 937.5 to 888, though the weight remained the eighth of a Cologne mark, or about 451 grains troy. The standard was again settled at Leipzig in 1690, and subsequently in 1763; but these changes, and the history of the rix-dollar, are unimportant for the purposes of this article, seeing that with the close of the 17th century the name (modified to "dollar") was usurped—at least among English-speaking peoples—by a *Spanish coin*, the history of which it is now necessary to trace.

The unit of the (silver) monetary system of Spain had been the "real" or "royal" since at least the days of Pedro the Cruel (before 1369) and was retained by Ferdinand and Isabella in their Mint Edict of 13th June 1497. It was the multiple of this unit, the "piece of eight" reals, weighing by law 423.9 grains, of 931 millesimal fineness, and therefore containing some 394½ grains of fine

silver, which was poured forth from the Spanish-American mints after the conquest of Mexico and Peru, early in the 16th century, in such profusion as to become a universal coin, reaching even China—by way of Goa and the Philippines—before the close of the 16th century. Thus, as the rix-dollar and the "piece of eight" were practically of identical fine weight and value—4s. 6d. sterling being the accepted standard,—it came about that, the geographical meaning of "dollar" (or thaler) having been forgotten, the "piece of eight" obtained the name of the "Spanish dollar." And, as the rix-dollar began to lose, even in Germany, its earlier importance—except as money of account—the name "dollar," from the beginning of the 18th century onwards, was entirely usurped by the Spanish coin, which after 1686 ceased in the Peninsula to be a "piece of eight," and became a piece of *ten* reals of "new plate." In 1728 the Bourbon kings of Spain, in issuing the new device of the "globe dollar," took the opportunity to reduce the gross weight to 417.6 grains, and the millesimal fineness to 916.6, and in 1772 the fineness was further reduced to 902.7 for the later device of the "Carolus," or "pillar" dollar. The latter standard was preserved in Spain up to 1848, and survives to the present day in the Mexican dollar, the lineal descendant since 1821 of the Spanish dollar.

It should be added that under Spanish rule the dollar was uniformly below standard. Prior to 1728 its fine content was found by the English mint to be only 385 grains, as against 394.6 by law; between 1728 and 1772 only 377 grains, as against 382.8 by law; and between 1772 and 1810 only 371 grains, as against 377 by law. The Mexican dollar, dating from 1821, has steadily improved, until in the present day, as shown by investigations at the London Mint in 1891, the dollar is practically up to its legal standard.

Though Spanish America was lost to Spain by the revolutionary wars of 1810-21, and though with 1810 the Spanish dollar practically ceased to be coined, yet it still continues to circulate as the standard coin, to the exclusion of the Mexican dollar, the dominant coin of the far East, in certain Malay and Siamese-Malay States—Rhaman, Legé, Patani, and, to a less degree, Kelantan. But, of far greater importance than the modern circulation of the Spanish dollar itself is the line of its descendants. Apart from (i.) the dollar of the Philippines; (ii.) the Mexican dollar and (iii.) the debased piastre of Turkey; the Spanish dollar has originated the silver dollar of the United States, which, in 1785, was avowedly modelled on the average of the Spanish coins in circulation, and so indirectly of the gold U.S. dollar worth 49.316d. sterling. Another gold descendant is the two-dollar piece of Newfoundland. The Hong-kong Mint dollar of 1866-68, the

Japanese "yen," of 1871 onwards, and the recent Canton dollar, are immediately derived from the Mexican, not the Spanish dollar. Most of the South American dollars are now "dollars" only in name, being in reality five-franc pieces weighing only 25 (instead of slightly over 27) grammes. In Spain, which has adopted the monetary system of the Latin Union, the new five-peseta, or five-franc, piece is similarly known as a dollar.

[SYNONYMS. *Pieza de a ocho*, *Peso duro*, *Piece* (or *Royal*) of Eight, *Plastre*, *Colonato*, *Cob* (from *coba*, slang Spanish for Real) *Gourde*, *Esendo* de *Ulen*, etc.]

[*Bocher, Das Oesterreichische Manuzessen* (Wien, 1838).—*Harris, Mundus Hispano Christianus* (Madrid, 1865).—*Linderman, Money and Legal Tender in the United States* (1877).—*Zedler, Universal-Lexicon* (1745), s.v. "Thaler."—*Mint Report* for 1891.] R. C.

DOLLAR OF ACCOUNT. On the stock exchange of London it has been for many years usual to reckon the United States dollar as worth always 4s.; although the actual exchange value of the American dollar is usually near 4s. 2d. It is obviously useful to have, for purposes of quotation, a dollar which is worth exactly one-fifth of a pound sterling. American railroad shares are always quoted in these dollars, and the par value of 100 dollars stock in New York would be, as a rule, nearly 103 dollars in London; and the dollars in which dividends on those shares are paid give the shareholder a rather better percentage than appears when the rate of dividend is reckoned at so much per 100 of the nominal 4s. dollars in which London quotations are given. A. E.

DOLLAR, HARD (*Stock Exchange use of word*). This was the name given on the London stock exchange to certain bonds issued by the state of Buenos Ayres. A hard dollar was originally intended to mark the difference between two currencies of the Argentine Republic, the soft dollar having fallen to an indefinite depreciation in consequence of the over-issue of paper money by that state. The hard dollar, then, had a special value; but in the year 1889 it was found expedient to convert the hard dollar bonds into sterling bonds bearing $3\frac{1}{2}$ per cent. so discreditable was it found by the Argentine government that its "hard" dollars should be depreciating almost as much as the baser currency from which it was formerly distinguished. A. E.

DOLLAR, HARD (*Spanish*). The old Spanish dollar was known as the *peso duro*, or hard dollar. It was struck and issued from 1707 to 1868, when the *peseta* (franc) system of currency was adopted in Spain.

The following is a list of the various weights and finenesses at which this coin was issued at different times; from which it will be seen that, for a coin circulating for so long a period as 161 years, the variations were not great:

Year.	Weight.		Fineness in 1000 parts.	Value in silver 925 fine at 5s. 6d. per ounce.	Value in standard silver francs (900 fine).
	Grains.	Grammes.			
1707-28	423.89	27.468	930.500	pence. 58.638	francs. 5.680
1728-72	417.74	27.064	909.722	56.494	5.471
1772	417.74	27.064	902.778	56.064	5.429
1848	405.75	26.291	900.000	54.281	5.258
1850	402.87	26.105	900.000	53.887	5.221
1854-68	400.64	25.960	900.000	53.308	5.192

The subdivisions of the *peso duro* were all, until the year 1864, of proportionate weight and fineness to the *peso*. In that year the *escudo*, or *half-peso*, only was struck in metal of the same fineness as the *peso*, the remaining divisional pieces becoming merely tokens, with a millesimal fineness of 810. These coins, however, were still coined proportionate in weight to the hard dollar.

The hard dollar, which was first struck in 1772, is of exactly the same weight and fineness as the Mexican dollar, and was, in fact, the coin of which originally the Mexican dollar was the copy. F. E. A.

DOLLAR (United States). The standard of value in the United States, and both a gold and a silver coin.

Gold Dollar.—Standard gold coin first authorised by Act of Congress in 1849, and first issued in that year. Weight 25.8 grains, fineness 900. Value: English standard (916.6 fine at £3:17:10½ per oz.) 49.32d.; French standard (900 fine) 5.18 francs.

Silver Dollar.—Standard silver coin first struck in 1793. Weight 416 grains, fineness 892.4; altered in 1837 to weight 412.5 grains, fineness 900. Value: English standard (925 fine at 5s. 6d. per oz.) 55.184d.; French standard (900 fine) 5.346 francs. The coinage of silver dollars was discontinued in 1873, when the gold dollar was established the sole standard of value. In 1878, however, an act was passed reinstating the silver dollar as a standard coin, and their coinage was recommenced. F. E. A.

DOLLAR, TRADE (United States). A silver coin struck for use in the trade between the United States and China during the five years 1874 to 1878 inclusive. Weight 420 grains, fineness 900. Value: English standard (925 fine at 5s. 6d. per oz.) 56.19d.; French standard (900 fine) 5.443 francs. These coins were originally legal tender in the United States to the amount of \$5, but were demonetised in 1876, and were then only struck for depositors of bullion on the condition that they were exported. In 1878, however, their coinage was discontinued, as considerable quantities had found their way back to the United States, where they were put into circulation at a profit. The total amount coined was

\$35,959,360, equal to nearly £8,000,000 sterling. Those circulating in the United States (about \$7,000,000, or roughly £1,400,000) were redeemed by the government at their nominal value.

F. E. A.

DOLLAR, MARIA THERESA, or LEVANTINER THALER. Austrian silver (trade) coin, first struck in 1765. Since 1780, however, these coins have always been issued bearing the date of that year and the effigy of the Empress Maria Theresa. They are issued for use in the Levant and Asiatic trade. Weight 433·15 grains, fineness 833·3. Value: English standard (925 fine at 5s. 6d. per oz.) 53·6d.; French standard (900 fine) 5·2 francs. This coin has no subsidiary divisional pieces. It will continue to be coined under the new Austrian currency arrangements.

F. E. A.

DOLLAR, MEXICAN, or PESO. Silver coin; weight 417·74 grains, fineness 902·7. Value: English standard (925 fine at 5s. 6d. per oz.) 56·064d.; French standard (900 fine) 5·429 francs. The coins subsidiary to the Mexican dollar are $\frac{1}{2}$ Peso (50 cents), $\frac{1}{4}$ Peso (25 cents), $\frac{1}{10}$ Peso (10 cents), $\frac{1}{20}$ Peso (5 cents), all of which are 902·7 fine, and proportionate in weight to the dollar. This coin circulates in China, Hong-Kong, the Straits Settlements, and the East generally, being received by weight. It is also bought and sold as bullion in all parts of the world. "Chopped dollars," which are Mexican dollars that have been chopped or stamped with a mark by the Chinese, are a circulating medium in Hong-Kong, Foochow, Canton, and Amoy, where they are usually received at the rate of 717 Canton taels per 1000 dollars.

F. E. A.

DOLLAR (South and Central American Republics). In the Argentine Republic, Chili, Colombia, Ecuador, Guatemala, Honduras, Peru, Uruguay, and Venezuela, the standard of value is the silver dollar, a coin of 385·8 grains, 25 grammes, of silver 900 fine. Value: English standard (925 fine at 5s. 6d. per oz.) 51·613d.; French standard (900 fine) 5 francs.

The Guatemalan dollar is the standard of value in the colony of British Honduras.

F. E. A.

DOLLAR, SPANISH. See DOLLAR, HARD.

DOLUS. Expression of Roman law denoting wrongful intention in the widest sense. Fraud presupposes "dolus," but there may be "dolus" without fraud; for instance an incendiary, or a person committing an assault is actuated by "dolus."

E. S.

DOMAINE. In mediæval France, as in mediæval England, the king was expected to "live of his own," and to apply to his subjects for aid to meet any extraordinary expenses. Hence *domaine* comes to mean, not only the lands which the king possesses like any other landowner, but the whole of the ordinary

revenue of the crown, as distinguished from the extraordinary revenue or taxes. The *domaine matériel*, or crown lands, was declared inalienable by an edict of 1318, which was frequently renewed, and grants from it were frequently resumed by the crown. In spite of these measures, however, it continued steadily to diminish until the 17th century. The *domaine immatériel* consisted mainly of the almost innumerable rights which belonged to the crown. The most important of these were the *droit d'amortissement*, the payment by a corporation for leave to acquire real property, the *droit d'aubaine* (see AUBAINE, DROIT D'), by which the crown inherited the property of foreigners dying in France, the *droit de bâtardise*, by which the property of bastards fell to the king, the *droit de franc-fief*, and the *droit de régale*. The domain revenue also included the proceeds of the sale of offices, and the PAULETTE (*q.v.*) paid by members of the parliament and other courts. In the 18th century the *domaine* was calculated to bring in about forty-one million francs (£1,640,000).

R. L.

DOMBASLES, ALEXANDRE MATHIEU DE (1777-1843). With the support of M. de VILLENEUVE-BARGEMONT (*q.v.*) the author of the *Economie Politique Chrétienne*, at that time prefect of the department of the Moselle, he founded in 1822 the model farm of Roville, the first agricultural school established in France. His teaching was mainly experimental, and to the end he maintained that "in reality the agricultural improvements, which result from chemistry or vegetable physiology, amount hitherto to very little indeed. . . . The theory of agriculture consists of rules, which are to be deduced from the comparative observation of facts in a great number of various cases. . . . An agricultural school ought to be an agricultural *clinique*." (*Œuvres Diverses*, Paris, 1843, pp. 214-225). As an experimental teacher, Mathieu de Dombasles rendered immense services to French agriculture by the publication of his results in the *Annales de Roville* (9 volumes, 1825, and following years); he was one of the promoters of the beetroot-sugar industry, popularised the methods of breeding of Bakewell, and of farming of Sir John Sinclair, and in a pamphlet, *De l'Impôt sur les Eaux de Vie* (1824), tried to induce the French government to protect the distillation of spirits from potatoes. He also thoroughly explained the advantages and disadvantages both of small and of large farms in his essay on *L'Etendue des Propriétés Rurales dans ses rapports avec la prospérité de l'Agriculture* (1825).

In connection with agriculture, Mathieu de Dombasles often approaches economic questions (see the first part of his *Œuvres Diverses* entitled *Economie Politique*). He was a staunch protectionist and an opponent of French colonial enterprise in Algeria. He also objected to the

teaching of agriculture in country primary schools. E. ca.

DOMESDAY BOOK is the name which, at least since the 12th century, has been borne by the record of the great survey of England made by order of William the Conqueror. Apparently the decree for the survey was issued at a moot held at Gloucester at the midwinter of 1085-86, and the work was completed in the course of the following year. Royal commissioners (*legati*) were sent into each shire with a list of interrogatories, to which they were to obtain sworn answers from local juries. Their procedure seems to have been this—they held a great shire moot, at which every hundred or wapentake of the shire was represented by a jury, while every vill was represented by a deputation of villagers. From each hundred-jury they obtained a verdict about all the land in the hundred, the villagers being at hand to correct or supplement verdicts, while “the whole shire” was also present, and from time to time appeal could be made to its testimony. The statement thus supplied was “reduced into writing and duly transmitted to the king. It was afterwards methodised and abstracted, and fairly transcribed in the great volume of Domesday and deposited in the royal treasury at Winchester, amongst the other muniments of the realm. It still exists, fresh and perfect as when the scribe put pen to parchment, the oldest cadastre, or survey of a kingdom, now existing in the world” (Palgrave, *History of Normandy and England*, vol. iii. p. 575). Our best information about the form of the original verdicts is contained, not in Domesday Book itself, but in a document known as the “*Inquisitio Comitatus Cantabrigiensis*.” This seems to be a copy made in the 12th century of the verdicts delivered by the juries which represented some of the hundreds of Cambridgeshire. The verdicts having been obtained, they were sent to the king’s treasury, and a digest was made of them by the royal officers. This digest is Domesday Book. If we may draw a general inference from Cambridgeshire, the materials supplied by the commissioners were subjected to a process of rearrangement. A scheme that was wholly geographical gave way to one which was partly geographical, partly proprietary. Domesday Book deals with each shire separately, but within the shire it collects, under the name of each “tenant in chief,” all the estates that he holds, no matter in what hundred they may be. For example, the Cambridgeshire verdicts showed that Count Alan had lands in many hundreds. In the original verdicts the entries relating to his estates were therefore scattered about; in Domesday Book they are all collected together. Domesday Book consists of two volumes, sometimes called “Great Domesday” and “Little Domesday.” The latter deals with Essex,

Norfolk, and Suffolk; the former with so much of the rest of England as was surveyed. A document in the keeping of the cathedral chapter of Exeter, and known as “the Exon Domesday,” contains an account of a large part of the south-western shires, which is very closely connected with that given by what, for distinction’s sake, is sometimes called “the Exchequer Domesday.” Seemingly this Exon Domesday is independent of the Exchequer Record, and goes back by a different route to the original verdicts. The same may perhaps be said of the “*Inquisitio Eliensis*,” an account of the estates held by the church of Ely. This Ely inquest must not be confused with the Cambridgeshire inquest.

Domesday Book was printed and published in 1783 in two folio volumes. A third volume containing indexes was published in 1811, and this was followed in 1816 by a fourth volume containing the Exon Domesday, the Ely Inquest, and some other matters. Of late years useful facsimiles have been published by the Ordnance Survey Office of various parts of the great Exchequer Record, and can be obtained at moderate prices. The important Cambridgeshire Inquisition was first published by N. E. Hamilton in 1876.

A large literature has gradually been collecting round Domesday Book. Among the older books Robert Kelham’s *Domesday Book Illustrated* (1788) and the essays of Philip Carteret Webb deserve to be mentioned. Sir Henry Ellis, in his *General Introduction to Domesday Book* (1833), supplied valuable indexes, and summed up the older learning. In the fifth volume of E. A. Freeman’s *Norman Conquest* good use has been made of all that bears on political history, on the history of great men, great churches, great events. James F. Morgan’s *England under the Norman Occupation* (1858) is a good introduction to the study of Domesday, and the like may be said of W. de Gray Birch’s *Domesday Book* (1887). A new epoch in the scientific exploration of the record is marked by the various works of R. W. Eyton dealing with Dorset, Somerset, Lincoln, and Stafford, especially by the key to Domesday Book. Two volumes of essays by various writers, called *Domesday Studies* (1888-91), contain two valuable papers by J. H. Round, besides other matters. In some county histories Domesday has been well used, but here it is possible to name only the books of general importance. F. Seebohm’s *English Village Community* has done much to awaken a new and an economic interest in our oldest statistics.

Much remains to be done. The student who approaches Domesday from the economic side will at once see that he has before him a vast mass of detailed statistics which ought to tell him much about agriculture, prices, rents, and the like. At the same time he will feel that

he is debarred from making use of these precious materials by the difficulty of discovering the meaning of the crabbed formulas which are repeated on page after page. The difficulty is a very real one. Domesday Book stands alone. It is so far removed in time from the documents which most nearly resemble it, the extents of manors which are found in monastic cartularies, that we have to explain it out of itself or not at all, for we shall look in vain for help elsewhere. Then again the terms that it employs as technical terms are, we may say, derived from two different languages which have only of late come into contact with each other. About half of them have been introduced by the Norman conquerors, while the other half are words which were in use in England under Edward the Confessor. Hence many puzzles; for example, what word did English juries say when French clerks wrote down *villanus*? Then again, the more our record is studied, the more plainly do we see that one main purpose governs both its form and its matter. King William is not collecting miscellaneous information in the spirit of a scientific inquirer. He is in quest of geld. Domesday Book is a geld book, a tax book. Geldability, actual or potential, this is its main theme. If then we are to understand its statistics, the first thing necessary is a theory of geld, of the manner in which the great tax has been and is assessed and collected. Towards the construction of such a theory not a little has been done by modern writers, especially by Eyton and Round, but until the work has been completed, speculations about rents and values seem doomed to failure. Everywhere, for example, the question meets us whether we are reading of real areal units of land or of units which are the results of a rude system of taxation, and a great deal of labour must yet be spent on the book before this question will have been adequately answered.

F. W. M.

DOMESTIC SYSTEM OF INDUSTRY. This system is opposed to that of carrying on manufacturing industry in factories (*see* FACTORY SYSTEM). It was very general in England before the changes which were effected at the close of the last, and the opening of the present century (*see* INDUSTRIAL REVOLUTION). Until the introduction of any but the simplest machinery, manufacturing industry had been closely associated with agriculture, and had been carried on, with few exceptions, in country towns and villages, in the houses of craftsmen or handicraftsmen, who worked with their own hands, aided by simple tools and appliances, and were hence called manufacturers (Latin, *manus*, a hand, and *facere*, to make). They were assisted by apprentices (*see* APPRENTICESHIP) whose number and time of service were fixed by law, and by a few JOURNEYMEN (*q.v.*), or hired labourers, whose wages were, in theory

at least, settled by the magistrates. These apprentices and journeymen lived in the same house with the master-craftsman, and ate at his table. Thus in the woollen trade, which was the staple industry of the country, the spinning, weaving, and dyeing were carried on in the houses of craftsmen, few of whom possessed more than three or four looms, or had working under their direction more than eight or ten people—men, women, and children. There were apparently even now, and there had been for some time previously, cases of production conducted under the modern system, by which one individual supplies and controls the capital which is needed, but the actual processes of industry were pursued, with apparently few exceptions, in the houses of the craftsmen. This domestic system had its unfavourable side, but it seems to have often led to a feeling of warm personal attachment between the master and his men. With the introduction of machinery, however, and in a more marked and general degree with the employment of steam as the motive power of that machinery, the domestic system of industry gave place to the factory system; and, although it is still found in some employments, it is now the exception rather than, as it once was, the rule. The fact that steam can only be generated in a fixed spot, and that the motive power thereby furnished can only be distributed over a small area has, no doubt, tended to favour the concentration of industry in large factories; and it has been said that the discovery and substitution of some fresh motive power, such as electricity, or of some fresh source of motive power, such as petroleum, which can be distributed along wires or pipes from a common centre over a wide area, might lead to the revival of the domestic system of industry. But there are various economies of management, and of purchase and sale, which lend an advantage to production on a large scale (*see* INDUSTRIES, LARGE AND SMALL); and these would continue to operate, even if a fresh motive power, or source of motive power, were generally introduced. And they would probably outweigh, except in certain occupations where the domestic system is still found, the benefits of the close personal interest which is felt, and of the continual watchfulness which is exercised, by the small master. It should be noted that some of the instances, which now exist, of the domestic system meet with censure rather than approval on the part of the public. What is known by the ambiguous term of the SWEATING SYSTEM (*q.v.*) seems to be in reality one variety of the domestic system of industry. In many cases it appears to be a system under which work is carried on in the houses of small masters; and the conditions of labour of the chain-makers and others in some parts of England are so far similar to those of the workers under the sweating system in London

that they are instances of a domestic system of industry which has earned the severe censure of popular opinion. The characteristic evil of East London seems to be the multiplication in certain trades of small masters—the ease with which a man can start on his own account, and the reckless competition which of necessity ensues. It is the prosecution of industry in domestic establishments outside the sphere of the factory inspector; for the domestic system baffles that publicity, and tends to deaden that sense of responsibility to popular opinion, to which the employer in a large factory is subjected. The domestic system, in short, may be said to be suited to a small population, a limited market, and an unbroken routine; it is unsuited to a large population where publicity is less easily attained, and to a worldwide market which is subject to rapid and continual change, and requires the sustaining resources of considerable capital and the exercise of bold and vigorous enterprise.

[For an account of the domestic system, as it formerly prevailed, the student should consult Toynbee's *Industrial Revolution*, ch. iv. and lecture ii., and W. C. Taylor's *History of the Factory System*; and for a consideration of some of its modern illustrations, Booth's *Labour and Life of the People*, vol. i., esp. pt. iii. ch. i., and the Reports of the Committee of the House of Lords on the Sweating System.] L. L. P.

DOMICIL OR DOMICILE. The validity of a person's marriage, the legitimacy of his children, and the devolution of his personal property after his death, to a great extent, depend on the law of his domicile. A definition of this term is contained in the following passage of Justinian's Code (X. 40. 7): “ubi quis larem rerumque ac fortunarum suarum summam constituit, unde rursus non sit discessurus si nihil avocet, unde cum profectus est peregrinari videtur, quo si rediit peregrinari jam destitit” (where a person has established his household goods, and the centre of his affairs and his fortunes; the place he will not leave, if no special cause calls him forth, away from which he seems a wanderer, returning to which he is a wanderer no longer). Hence Prof. Dicey, *Law of Domicile*, defines domicile as the legal equivalent for “home.”

This definition would leave persons without a fixed abode, and persons who cannot choose a home for themselves, without a domicile; and in order to avoid the complications which would result from that fact, some artificial rules have been introduced into modern law, according to which a domicile is ascribed to everybody who has no “domicil of choice.” These rules are the following:—

(1) Every person on his birth acquires the domicile of his father. This is called the “domicil of origin.” A “domicil of origin” is retained until a “domicil of choice” is

acquired; on the other hand, a “domicil of choice” may be abandoned without the acquisition of a new domicile, and in such a case the domicile of origin revives; e.g. a person, whose father was domiciled in Germany at the time of his birth, establishes a permanent home in England with the intention of remaining there for the rest of his life. He has then an English “domicil of choice.” At some subsequent time he decides to leave England, but is undecided as to the country in which he wishes to settle; from the moment at which he leaves England his German domicile of origin revives.

(2) A wife on marrying acquires her husband's domicile, and whenever a father or a husband assumes a new domicile, his infant children and his wife assume the same domicile. If the father or husband abandons a domicile of choice without assuming a new one, the infant children and the wife assume the father's or husband's domicile of origin, in the same way as he does himself.

The importance of being able to ascertain a person's domicile at a given time may be illustrated by the following examples. If the father of an illegitimate child, at the time of the child's birth, was domiciled in England, the child can never become legitimate; if, on the other hand, the father at the time of the child's birth was domiciled in Scotland, he may legitimate the child by marrying the mother.

If a man marries his deceased wife's sister, both being at the time of the marriage domiciled in a country where marriage with a deceased wife's sister is permissible, the marriage is valid. If, on the other hand, he or she was at the time of the performance of the ceremony domiciled in England, the marriage is invalid; although the law of the country in which the ceremony was performed allows such marriages.

If a person who dies domiciled in Scotland, and leaving a wife and children, has bequeathed all his residuary personal estate to a stranger, the stranger will receive one-third only, and the other two-thirds will go to the wife and to the children; if, on the other hand, the testator at the time of his death was domiciled in England, no part of the residuary personality will go to the wife or children. If a person dying intestate and unmarried, leaving surviving him his father and his mother and a brother, was at the time of his death domiciled in France, the father, the mother, and the brother will each be entitled to a third of the intestate's property; if, on the other hand, the intestate was at the time of his death domiciled in England, the father will be entitled to the whole.

There are many circumstances imaginable under which it may be extremely difficult to ascertain what a person's domicile is. Many persons who have emigrated to a foreign country do not know themselves whether they

look upon it as a permanent home, or whether they will some day return to their native place; and even if they have a well-established intention, there may be no evidence from which it can be proved. With the increased facilities of international communications and the expansion of international trade, cases in which such doubts arise will become more and more frequent, and the question arises whether it would not be better to substitute the principle of nationality for the principle of domicile; in other words, whether it would not be better to establish the rule that an individual's personal rights should be determined by the law of the country whose subject or citizen he is. There are, however, many objections to this proposal, and as no rule can be suggested which will clear away all difficulties connected with the subject, the balance of convenience is in favour of the rule to which we are accustomed.

[Dicey, *The Law of Domicil*.—Westlake, *Private International Law*.—Foote, *Private International Law*.—Phillimore, *International Law*, vol. iv.—Nelson, *Cases, etc., of Private International Law*.]

E. S.

DOMICILE, SCOTLAND. Examples: (1) A person's father—or, if he be illegitimate, his mother—was a domiciled Scotsman (or Scots-woman) at the time of his birth—*domicile of origin*; (2) A person, his own master, has become a domiciled Scotsman by actual residence with the intention of remaining in Scotland, and the result of quitting his native country, a circumstance which must be proved—*domicile of choice*; (3) An Englishwoman, say, marries a domiciled Scotsman; she becomes a domiciled Scotswoman—*domicile by operation of law*. There is a general presumption in favour of the domicile of origin as against the domicile of choice, and thus the domicile of origin is readily held to have been recovered on a Scotsman's return to Scotland from life abroad. These are forms of that domicile which govern the legitimation of children, the succession to movable (personal) property, and, in general, the family relations: this is the *domicile of succession*. There are still some delicate questions not finally decided as to the domicile necessary to give jurisdiction to the Scotch courts in cases of divorce. *Domicile of citation* is by custom the place at which a person may lawfully be cited to appear before the court, this being the place where he has resided for forty days until he has ceased for forty days to reside there; but this is a domicile for the purposes of procedure (see **JURISDICTION, SCOTLAND**).

A. D.

DOMICILED BILL. A bill "drawn payable elsewhere than at the residence or place of business of the drawee" is said to be "domiciled." Such bills must be presented for acceptance before they are presented for payment, and if the holder, in consequence of this obliga-

tion to procure acceptance, cannot, with the exercise of reasonable diligence, present a domiciled bill in proper time for payment, he will be excused and the drawers and indorsers will not be discharged in consequence of the delay. Domiciled bills, whether accepted or not, must at maturity be presented at the place of payment, e.g. a bill in Liverpool payable in London remains unaccepted; the holder must, at maturity, present the bill in London, although no special address for payment be given; this can be done by handing the bill to a notary, who in his protest will declare that no address was given.

E. S.

DOMINIUM. Expression of Roman law denoting property in its fullest and most extended sense.

E. S.

DOMUS CONVERSORUM. See **JEWS IN ENGLAND**.

DONATIO MORTIS CAUSA. A gift given by a person believing himself or herself near death, subject to the implied condition that it is to be returned should the anticipation of death by the existing disorder prove unfounded. A gift of this sort is invalid if the delivery of the object of the gift remains incomplete, e.g. an undorsed bill of exchange handed over to the donee by way of *donatio mortis causa* cannot be retained after the donor's death.

E. S.

DONATION (Scotland). Gift, free or for some cause not enforceable by law. Must in general be explicit, and adequately proved; and is then enforceable if the subject be not yet delivered to the donee. Fathers and grandfathers may revoke gifts to children or grandchildren so far as to secure themselves a competence in the event of indigence. Free gifts between husband and wife are revocable at any time during the life of the donor, even after the death of the donee; but not if there have been a legal or a natural obligation to make the provision made. In doubtful circumstances it is generally presumed there is no donation; a debtor is not presumed to make a gift to his creditor; but these are really jury questions.

A. D.

DONATO, NICOLÒ, a Venetian who lived in the last century, known by his book on politics, which contains a treatise on public finance: *L'uomo di governo*, trattati due, Verona, 1753. This was translated into French: *L'Homme d'État*, par Nicolò Donato, Liège, 1767. In his book there is a classification of public finance under seven headings, and a statement giving details of public expenditure relating more particularly to the Venetian state. M. P.

DON GRATUIT. The *DÉCIMES (q.v.)*, the ordinary contributions of the clergy, were not sufficient to satisfy the French monarchy in the 17th and 18th centuries. The clerical assemblies were frequently called upon to make additional payments, and these grants, in theory voluntary, grew under Louis XIV. into

a practically compulsory payment of about 15,000,000 livres (£600,000), renewed every five years. This *don gratuit*, as it continued to be called, was nearly always raised, not by taxation, but by loan. The credit of the clergy was so good that it was easier for them to borrow than it was for the government. According to Necker the clerical debt, raised for payment of the *don gratuit*, amounted in 1784 to 134,000,000 francs. The Marquis du Bouillé, in his memoirs, asserts that the interest upon this debt was paid out of the DîMES (7.5%), and thus reduced the nominal contribution to the state to such an extent that the church was a source of expense rather than of revenue.

[Necker, *De l'Administration des finances de la France*, tome ii.—Gasquet, *Mémoires du Marquis du Bouillé*, p. 44.—*Précis des Institutions politiques et sociales de l'ancienne France*.] R. L.

DORIA. PAOLO MATTEI, born in Genoa 1675, died at Naples 1743. He wrote principally on mathematical and philosophical subjects. He lived nearly all his life at Naples, and is known to have been a friend of Vico. In his political tract *La vita civile con un trattato della educazione del Principe*, published for the first time in 1710 and republished in 1852 (Turin), he seeks to prove that the administration of a state by a prince, in its object and in its means, is qualitatively identical to that of private interests by private people, and is only more complex. The one fundamental rule for a sound administration of the state is a financial rule which consists in burdening the tax-payer least, whilst the prince takes most from him, and in taxing in such a manner "that although paying much, everybody should think he is paying little." Doria is a strict follower of St. Thomas Aquinas in his theories concerning the relative importance of agriculture and manufactures, in the functions attributed to money, and in his opinions about commerce. He has to be classed amongst the most inveterate of the mercantilists.

M. P.

DORMANT (or SLEEPING) PARTNER. A partner who takes no active part in the business of the firm, and who is not known to be a partner. Such a partner is liable for the acts of his co-partners in the transaction of business in the ordinary way, but he has no authority to bind the firm.

[Sir F. Pollock, *The Law of Partnership*, London, 1890.] J. E. C. M.

DORMER, DIONO JOSÉ, was born in Saragossa during the first half of the 17th century. He graduated as doctor of law at the university of Huesca, and became later on general chronicler of the kingdom of Aragon and archdeacon in the metropolitan church of Saragossa. He was all his life a most devoted and abundant historical writer.

In 1684 he published in Saragossa his *Discursos históricos-políticos*, a very scarce book, in which, according to Don Manuel Colmeiro (*Biblioteca de los Economistas Españoles*) he "explains with exquisite clearness the true character of commerce, the nature of exchange, the use and utility of money, and the inefficiency of the prohibitive system. . . . It is one of the most original works of its class, bold and precise in its economic doctrine. The author is greatly in advance of his time, and deliberately puts aside the prevailing prejudices, not only in Spain, but throughout Europe."

[For a complete list of his works, see Latasa, *Biblioteca Nueva de Aragon*, iv. p. 197.]

E. ca.

DOS. Expression of Roman law for the property brought by the wife into marriage. During the continuation of the marriage the wife retained the ownership, but the husband had the right of management and enjoyment. After the dissolution of the marriage the rights of the parties varied according to the special circumstances of the case.

E. S.

DOSES (or CAPITAL). A term introduced by James Mill (*Elements of Political Economy*) to denote the portions of capital which, according to the theory of RENT (*q.v.*), will be successively applied to land up to the point at which the portion last applied affords only ordinary profits. As Jevons observes (*Theory of Political Economy*, 2nd ed. p. 232), "He evidently means by a *dose of capital* a little more capital, and though the name is peculiar, the meaning is simply that of an *increment of capital*. . . . It is mere pedantry to insist upon calling that a *dose* in economics which in all the other sciences is called by the perfectly established and expressive term *increment*." As the equivalent of "increment," *dose* may be employed wherever the reasoning requires that we should consider a variable quantity as increased by degrees up to the MARGIN (*q.v.*) at which further increase ceases to be advantageous. Thus, Prof. Marshall speaks of a *dose* of labour as well as of capital (*Principles of Economics*, book iv. ch. iii. §2). Some difficulties attending the use of the term "dose of capital" are cleared up by Prof. Marshall at the end of the chapter referred to.

F. Y. E.

DOUANE (*Fr. Customs*). The earliest customs duties in France, as in England, were levied upon exports, and arose from the practice of buying permission to transport goods from the kingdom in spite of royal edicts prohibiting exportation. Import duties seem to have arisen from the fact that foreign merchants had to purchase leave to carry on trade in France, and hence came the practice of apportioning their payments to the goods which they introduced. These customs duties were originally called *droits de haut passage*. The name *douane* was introduced later, and was borrowed

from the Venetian term *dogana*. The great difference between France and England, which illustrates the much later development of unity in the former country, lies in the fact that the *douane* is originally a provincial, not a national charge. Every province had its own customs duties, often of great intricacy and variety; and these charges, dating from the days of provincial independence, were maintained as a source of revenue, after the provinces had been absorbed by the central monarchy. It did not require much economic insight to understand the enormous hindrance which such a system opposed to the development of internal trade and production. Colbert, the most practical if not the most enlightened of French financiers, made a vigorous attempt to abolish the provincial *douanes*, and to have no custom-house, except on the frontier, but he was successfully resisted by the "local protectionists." He succeeded, however, in establishing, in 1664, a sort of *zollverein* in twelve of the most important provinces, called the *cinq grosses fermes*, within which the circulation of goods was to be free. Beyond these were the *provinces réputées étrangères*, which refused to accept Colbert's scheme and retained their local customs, and the *provinces étrangères*, those which were added to the crown after 1664, and received special privileges at the time of their union. Colbert also succeeded in simplifying and making more uniform the charges which he failed to abolish. The system, as he left it, lasted with slight modifications till the Revolution, when the provinces disappeared, and with them the last trace of the provincial *douane*.

DOUBLE ENTRY. See BOOK-KEEPING.

DOUBLEDAY, THOMAS (1790-1870), son of a soap manufacturer in Newcastle, was a radical of Cobbett's stamp, of great influence during the agitation for the Reform Act of 1832. He deserves notice here chiefly for his book on *The True Law of Population shewn to be connected with the food of the people*, London, 1841, 2nd ed. 1843, which contained in an expanded form a theory he had brought forward in a letter to Lord Brougham in *Blackwood's Magazine*, March 1837. This theory, which he describes as a "great general law," is that "whenever a species or genus is endangered, a corresponding effort is invariably made by nature for its preservation and continuance by an increase of fecundity or fertility," the state of low nourishment or "depletion," being thus favourable while high feeding or "repletion," is unfavourable to fertility, both in vegetables and animals. Fertility is in inverse ratio to nutriment, even in the case of human beings. In poor and ill-fed communities population increases in the ratio of the poverty and poor living; in a highly-fed and luxurious nation population decreases and decays. He shows a goodly list

of examples, from the English peerage to Pitcairn Island, to countenance his conclusion. In his 9th chapter he uses his knowledge of the tallow and soap trade to support the position that there had been a decrease in the consumption of meat in England. But his law is an empirical uniformity of which he has not traced the deeper causes. Physiologists and biologists have emphatically pronounced against him. (See Dr. Charles Loudon, *Problème de la Population et de la Subsistance* (quoted by Doubleday himself); and Herbert Spencer, *Biology*, vol. ii. pt. vi., *Law of Multiplication*, ch. xii. pp. 455, 480, 483 note; Darwin, *Descent of Man*, vol. i. ch. iv. 132, ed. 1871.)

The book is indirectly an attack upon Malthus; but the Essay on Population is more directly criticised in Doubleday's *Financial, Monetary, and Statistical History of England from 1688 to the present time in 17 letters addressed to the Young Men of Great Britain*, 1847, Letter x., pp. 206 seq. The writer falls into the vituperative style of his master Cobbett.

Other writings of Doubleday are:—

Letters in the Newcastle Chronicle on the Petition of the Chamber of Commerce, Newcastle-on-Tyne, for the Continued Circulation of Local One Pound Notes (which he opposes), by a Member of the Chamber, 1828.—Two Letters to Lord Althorp in Cobbett's *Register*, 13th April and 25th May 1833 (on excise duties on soap). *Political Life of Sir Robert Peel*, 2 vols., 1856.—*Touchstone*, a series of political letters addressed to the newspapers, republished, with a preface by John Paul Cobbett.—*On Mundane Moral Government and its Analogy with Material Government*, 1852.—*Matter for Materialists, a letter in vindication of Bishop Berkeley*, 1870. He wrote also a romance, *The Eve of St. Mark*, and several stage plays, *Diocletian*, *Caius Marius*, etc.

[See "Life" by G. J. Holyoake in the *Dictionary of National Biography*.] J. B.

DOUBLE-FLORIN, English token silver coin of the nominal value of 4s., first struck in 1887, the year of Queen Victoria's Jubilee, in pursuance of a royal proclamation of the 13th of May of that year. It is (1892) of precisely the same design as the florin. Weight 349·09 grains, fineness 925. Value in silver francs (900 fine), 4·64 francs. F. E. A.

DOUBLE STANDARD. See BIMETALLISM; STANDARD OF VALUE.

DOUBLOON, HISTORY OF. A gold coin of Spain, prior to the adoption of the monetary system of the Latin Union. The name "doubloon" has been diverted by general consent from the Spanish pistole or *double escudo* (whence "doblon" in Spanish) to the quadruple pistole, or "doblon de á ocho." Like the DOLLAR (*q.v.*), the doubloon was a multiple, and not a unit. Corresponding to the silver unit, or real, was the gold unit, or escudo (= \$2), concerning the standard of which the emperor Charles V. and

his mother Donna Juana enacted, in 1537, that "the escudos which we have commanded to be struck shall be 22 carats fine, and shall weigh 68 to the mark of gold of our kingdoms of Castile, which is the fineness and weight of the larger escudos of Italy." As this makes the gross weight of the escudo 52.2 grains troy, the escudo was thus practically a ducat (see DUCAT). From 1537 to 1772 the 8-escudo piece or "doubloon," was 916.6 fine per mille, reduced in 1772 to 901, and in 1786 to 875, the legal weight remaining 417.6 grains troy from 1537 up to 1818. Both in 1772 and in 1786 the reduction in fineness was effected not by a public law, but by a *Real orden reservada* addressed to the mints. The doubloon (Peso Duro de Oro) never had the universal currency of its silver analogue the dollar: and even in the New World it was hard pressed by its Portuguese competitors, the "moidore" and the "johannes." The reason, in the words of Newton, was that "gold in Spain is of 16 times more value than silver of equal weight and allay. But this high price keeps their gold at home in good plenty, and carries away the Spanish silver into all Europe." The Spanish doubloon was superseded after 1821 by various South American doubloons, which enjoy a limited currency in the New World, and are specially quoted in the London bullion-market. In 1848 the "doblon d'Isabel" was introduced in Spain, to be supplanted by the 20-peseta piece on the entry of Spain into the Latin Union.

As the fine content by law was (1) 382.8 grains from 1537 to 1772, (2) 376.2 grains from 1772 to 1786, and (3) 365.4 grains from 1786 to 1848, in theory the sterling value of the doubloon (at £3:17:10½ per oz. of standard gold) was (1) £3:7:9, (2) £3:6:8, and (3) £3:4:8 for the same three periods respectively; but the results of assays reduce these values roughly by the odd pence. Thus, after 1786, the sterling value of a doubloon as issued was £3:4s. (see DOLLAR). R. C.

DOUBLOON. Spanish gold coin, not struck since 1808, when the *peseta* (franc) system of currency was adopted. Weight 129.43 grains, fineness 900. Value: English standard 916.6 fine, at £3:17:10½ an oz.; £1:9:7½; French standard (900 fine) 26 francs. Similar coins of slightly varying value circulate in the South American republics and in Mexico.

The old doubloon or escudo weighed 418 grains, fineness 875. Value: English standard £3:4:9; French standard 81.6 francs. This coin is still current in Spain, Mexico, and the South and Central American republics.

A doubloon (or 4-dollar piece) is current in the Philippine Islands. Weight 104.4 grains, fineness 875. Value: English standard 16s. 2d.; French standard 20.4 francs. F. B. A.

DOUGLASS, WILLIAM (about 1691-1752) was born in Gifford, Scotland; he settled as a

physician in Boston in 1718; and wrote much on medical subjects, in which he displayed violent prejudice and partisanship. He wrote a valuable *Summary, historical and political, of the first planting, progressive improvement, and present state of the British Settlements in North America*, Boston and London, 1755, in which frequent reference is made to the paper currencies of the several colonies. He was especially interested in the monetary policy of Massachusetts, and contributed to the current heated discussions on the subject of a land bank and paper bills: *Some observations on the scheme projected for emitting 60,000 l. Bills of a new tenour, to be redeemed with Silver and Gold, showing the various operations of these Bills and their tendency to hurt the Publick Interest*, Boston, 1738, pp. 25; *An Essay concerning Silver and Paper Currencies more especially with regard to the British Colonies in New England*, Boston, 1738, pp. 23; *A discourse concerning the currencies of the British plantations in America*, etc., Boston, 1740, p. 47 (also with *Postscript*, pp. 47-62). This was reprinted in London in 1751, and is included in a collection of tracts on *Paper Currency*, edited by Mr. J. R. McCulloch, printed by Lord Overstone in 1857. It is referred to in Smith's *Wealth of Nations*, bk. ii. ch. ii. Douglass clearly sums up and accounts for the infatuation for issues of paper money which prevailed at that time. The following reasons are assigned: that usurers might be prevented from imposing high interest upon borrowers; the scarcity of silver money, which was shipped away to settle foreign balances; that it might be available to meet the demands of a growing trade; and to relieve debtors, "since by large emissions lands rise in denomination value, and debts become really less."

[*A brief memoir of William Douglass, M.D.* By Timothy L. Jemison, M.D., in *Med. Com. of Mass. Med. Soc.*, Boston, 1836, vol. v. pp. 195-240.]

D. R. D.

DOVE, PATRICK EDWARD (1815-1873). Dove is one of the first notable writers of this century who advocated the complete nationalising of the land. In his *Theory of Human Progression and Natural Probability of a Reign of Justice* (dedicated to Victor Cousin) (Edinburgh) 1850, Dove lays down the philosophical foundation of his theories of reform. Three things are, in his view, indispensable to the well-being of the human race—(1) the Bible, (2) "a right view of material phenomena," (3) "a right view of mental phenomena." The science of politics gives us a right view of equity or justice, and leads us to the conclusion that humanity progresses from diversity of privileges to an absolute equality of rights; it points the way to a reconstruction of the natural and God-given order of society, from which the political institutions of actual history have so widely departed. We shall reach the millennium.—

first in mathematics, when *all* mathematical truth is discovered and applied, then in the physical and mechanical sciences and arts, and then in political science. The perfection of the last would bring the political millennium, and one of its conditions would be the abolition of the private ownership of land. This is Dove's central proposition. Though he is not otherwise communist or even socialist, he demands that the land should be held in common. His arguments are given at length in his later book *Elements of Political Science* (Edinburgh), 1854; but they are sketched in the earlier with substantial completeness. Legislation is needed not to grant rights but to secure rights already granted by nature, the chief being liberty and property. There is a progress towards absolute equality in regard to "natural property"; "the earth and all it contains belongs 'for the time being' to the existing generation," and its distribution must not be determined by the dispositions of past generations, when these have been contrary to equity. The assignment to private owners, for example, of the abbey lands, under Henry VIII., is "now exactly equivalent to the imposition of a taxation on articles of consumption, equal to the present rental of those lands, so that those who are labourers have actually the rental of the land taken away from them in the shape of taxes; were there no taxes the alienation of the lands would be of comparatively minor importance." Taxation must fall either on land or on industry; and it is no burden to the community unless, as now, it is taken from land and left to lie upon labour. Political economy is a non-moral science, and unlike political science it is inductive and statistical; it simply traces the effects of certain human actions on social welfare. But the two studies mutually depend on one another. "In the arts man creates form; in political economy he creates value; in politics he creates property." Evolution must proceed from the arts to political economy before finally attaining in politics to the "rational system of property," an open career for all human talents and all burden of taxation borne by the rent of land. Dove thinks this system will be only introduced by a very gradual change of public opinion. He is no revolutionist, but he does not discuss the practical steps by which the change would be introduced with least friction. He is content for the most part to enlarge on the defects of the present system. That a shilling a day should be given to one who labours, and £1000 a day to one who does *not* labour, seems to him to set Solomon at defiance. His discussion of rent is suggestive; but his strength lies elsewhere than in purely economical argument, and his criticisms of older economists are often founded on misunderstanding. He was from the first a free trader. His sketch of Andrew

Yarranton, "the genuine founder of political economy in England," is a useful contribution to economic history (see appendix to *Elements of Political Science*). A certain diffuseness of style may perhaps in some degree explain his failure to obtain the popular favour accorded to more recent writers of the same way of thinking, who have added nothing to his doctrines and have lacked his philosophical breadth.

[For a full list of the writings of P. E. Dove, and an account of his life, see *Dictionary of National Biography*.] J. B.

DOWER. The term dower is used in two totally different senses. In the first or popular sense it corresponds to the French *dot* and the Roman *dos*, a portion which the bride brings to assist in defraying the expenses of married life, whether originally her own or given by her father or other near relative. Over this portion the husband acquires certain restricted rights during the continuance of the marriage. In some countries, notably in France, it is a matter of course that every bride should have a dower, and one of the main objects of French thrift is to provide every daughter with a suitable dower. In England there is no general custom of this kind, although it is common for fathers in the middle and upper classes to settle some property on a daughter when about to be married.

In the second, or legal sense, dower signifies the provision to which a widow is entitled out of the land of her deceased husband. At common law a widow was entitled for her life to one-third of the freehold lands of which her husband died possessed. When the title to dower had once attached, it could not be defeated by any act of the husband, and thus the right of dower became a serious obstacle to the alienation of land. Accordingly the statute of uses (27 Henry VIII., c. 10) enacted that when provision for the wife had been made by way of jointure, she should lose her right to dower. Subsequently the right of dower was often defeated by means of a technical contrivance known as a conveyance to uses to bar dower. But by the Act 3 & 4 Will. IV., c. 105, known as the Dower Act, the wife's right of dower in her husband's land was rendered liable to be defeated by any act of alienation performed by him, or by a declaration executed by him under seal or inserted in his will. In short the right of dower is subjected entirely to the husband's discretion. Under these circumstances the right of dower has ceased to have any importance. The making of a suitable provision for a widow is one of the principal objects of marriage settlements, and such a settlement is almost always made on the marriage of persons in the landowning class. The origin of the common law right of dower is found by Maine in the influence of the

medieval church which was exercised in favour of the wife.

[Williams and Goodeve on *Real Property*—Kenslin Draby, *History of the Law of Real Property*.—Maine, *Ancient Law*, ch. vii.]

F. C. M.

DRACHMA. Greek modern unit of value equal to 1 franc, and divided into 100 lepta (centimes). Weight, 4.98 grains gold 990 fine, or 77.16 grains silver 999 fine. English standard value: gold (916.6 fine at £3:17:10½ per oz.) 9.52d., silver (925 fine at 5s. 6d. per oz.) 10.82d. The silver drachma piece is a token coin, 835 fine, weight 77.16 grains, value 48 drachma. The smallest standard coin, both in gold and silver, is the five-drachma piece. Greece is (1892) a member of the LATIN UNION (q.v.)

Drachma was the name of the ancient Greek unit of value. The Attic drachma was a silver coin weighing about 66 grains. F. E. A.

DRAFTS ON DEMAND. See CHEQUES, LAW OF.

DRAGONETTI, GIACINTO (end of 18th century), a Neapolitan, wrote in 1767 a treatise on virtues and remuneration of virtue, *Trattato della virtù e dei premi*; a spese di Giov. Gravier, 1767, in which he also discusses economic topics, and shows considerable knowledge of the most recent economic literature of his time. Agriculture especially is discussed by him and regarded as the pivot of the economic welfare of the state. He compares navigation to "a bridge crossing the seas which unites the whole inhabited globe"; he considers it so important that the state is bound to protect it. But social progress, though it takes its origin in agriculture and maritime commerce, must be maintained by a system which rewards virtue and punishes crime. Such a system would harmonise private with public interest, and—through private interest—encourage the promotion of public interests. M. P.

DRAGONETTI, LUIGI (early part of 19th century), wrote *Proposta di un modello piano di finanze per il Regno di Napoli*, 1820, Napoli, a book suggesting reform in the management of the finances of the kingdom of Naples, interesting as showing the defects existing at that date. Amongst other matters we find him urging on the government punctuality in payment of the interest on the public debt, in order to maintain the standing of the national credit, and to induce foreigners to invest capital. He recommends that the tax on land should be based on a cadastral survey (doomsday-book) and that personal property and capital employed in business should bear its fair share of the burden. Dragonetti advises that the tariff for the taxation of imports and exports should not be unduly high, and that it should frequently be revised, so as to bear a uniform proportion to the changes of value in commodities. M. P.

DRAIN OF BULLION. The stock of bullion held by the Bank of England is subject both to all the influences which produce movements of bullion between different countries, and to all those which arise out of the condition of internal trade. Some of these latter are periodical in occurrence and almost regular in extent (see AUTUMNAL DRAIN), whilst others are occasional and uncertain in both respects, but all, whether internal or foreign, if occurring alone, carry with them the elements of reaction, and thus the average level is fairly maintained. When, however, two or more of these influences, acting in the same direction, have come into play at the same time, a drain of bullion from the Bank has resulted, producing danger and alarm, and requiring special efforts on the part of the directors to counteract it. Continued drains of bullion, of more or less importance, have been recorded as occurring in the years 1780-83, 1791-93, 1795-97, 1817-19, 1824-25, 1830-32, 1834-35, 1836, 1839, 1846-47, 1857, and 1866. The points most worthy of notice in these movements are: (a) their cause; (b) their duration and extent; and (c) the measures by which they have been relieved.

The causes have been both general and special. So far as the general causes can be classified, they may be grouped as below, the occasions upon which each one was most strongly in force being annexed.

GROUP I. DOMESTIC.

Joint-stock speculation	{ 1824-25, 1834-36, 1847, 1866.
Banking panic	{ 1793, 1824-25, 1836, 1847, 1857, 1866.
Commercial distress	{ 1783, 1793, 1824-25, 1830-32, 1834-36, 1857.
Deficient harvests	{ 1783, 1795-96, 1830-32, 1839, 1847.

GROUP II. FOREIGN.

Loans or subsidies	{ 1793, 1795-96, 1824-25, 1834-36.
Joint-stock speculation	{ 1825.
Commercial distress	{ 1832, 1836-37, 1839, 1857.

It will be seen that no distinct line can be drawn between the groups, or the causes composing them. Commercial distress may give rise to banking panic, or vice versa; or either of these may be largely due to joint-stock speculation. So, also, a domestic cause may give rise to a foreign drain, as when a bad harvest leads to large importations of corn; or, a drain for foreign purposes may have a domestic origin, as in the granting of loans or subsidies, or floating foreign speculations on the home market. Or, a drain commencing in one cause may be

continued through other influences. There are also special causes to be found in almost every crisis.

In duration they have varied greatly. The earliest appear to have lasted during two or three years; thus, from August 1780 to October 1783; from August 1791 to February 1793; from February 1795 to February 1797; from August 1817 to August 1819. In these cases the records show continuous decline throughout each period, but as the figures are given only for February and August in each year, there may have been intermediate increases. In 1824-25, 1830-32, 1834-35 the decline lasted from one to two years, and in later times the movement extended over but a few months.

PERIOD AND EXTENT OF DRAIN.

From Maximum to Minimum.					
		£		£	
1780-83	Aug. 1780	4,179,000	Oct. 1783	473,000	
1791-93	Aug. 1791	8,056,000	Feb. 1793	4,011,000	
1795-97	Feb. 1795	6,128,000	Feb. 1797	1,086,000	
1817-19	Aug. 1817	11,668,000	Aug. 1819	3,595,000	
1824-25	Feb. 1824	13,800,000	Dec. 1825	1,261,000	
1830-32	May 1830	11,418,000	May 1832	4,919,000	
1834-35	Mar. 1834	8,901,000	May 1835	5,951,000	
	22nd Mar.	8,064,000	29th Nov.	3,840,000	
1839	1st Jan.	9,048,000	10th Sept.	2,412,000	
1846-47	29th Aug. '46	16,366,000	23rd Oct. '47	8,313,000	
1857	18th July	11,841,000	18th Nov.	6,485,000	
1866	21st Mar.	14,456,000	23rd May	11,858,000	

These figures should be studied in connection with some others that cannot be shown here, as the proportion held by the outflow to the initial stock: or with the average of the preceding year or period, and the rate of the decrease. For the years since 1844 a most important consideration is the state of the banking reserve. This it was that gave to the drain of 1866 an importance beyond that which would appear to attach to the figures as given above.

Since 1866 the outflow has rarely taken the form of a persistent drain, whilst the average stock having been much higher, decreases of considerable amount have not caused so much alarm. Movements of this character took place in 1876 when the bullion decreased from £29,394,000 on 18th August to £21,704,000 on 29th December; and in 1879 when from £35,694,000 on 30th July, it fell to £27,602,000 on 31st December. In each case the initial stock was very much beyond the average of preceding years, and the reserve was also abnormally large.

The manner in which a drain of bullion should be encountered has been the subject of much controversy, and very different methods have been followed at different times. In 1783 the directors laid down the maxim that a drain should be met by contracting their issues until the exchanges became favourable, and they were successful in acting upon these lines. In 1798 relief was obtained by extended powers being granted for the issue of exchequer bills.

In 1797 the drain was only arrested by the passing of the Restriction Act, and the subsequent suspension of cash payments. In 1819 the directors communicated to the House of Commons a resolution denying that the exchanges were to be regarded in regulating their issues. In 1825 the Bank endeavoured, in May, greatly to contract their issues, but finding that the outflow continued at an accelerated pace, they adopted in December exactly the opposite policy, and lent money freely. In 1830-32, and 1834-35, the outward movement appears to have been suffered to run its course without any special measures being taken. In 1836 the pressure was met by a generous policy, and large advances were made by the bank.

Up to this date the policy of the Bank fluctuated between leaving matters to right themselves, or taking action by contracting their issues, or by freely extending them. The plan of raising the rate of discount was not in any case adopted. It was indeed not so fully available as now, nor was it equally likely to be effective. The transit of bullion was more expensive and less expeditious, and a larger rise was necessary to produce an influx. There was also less floating capital ready for employment in any market offering, and therefore less probability of attraction by increased rates. Upon at least one occasion in earlier years a serious drain of bullion had occurred in the face of favourable exchanges. During all these years the USURY LAWS (*q.v.*) were at least nominally in force. No doubt in practice they were largely evaded, but they could not be publicly disregarded by the Bank of England. It was not till 1833 that these laws were relaxed at all, and they continued partly in force for twenty years longer. But in fact the directors did not make full use of such powers as they even then possessed. From June 1822 till July 1836 the bank rate remained at 4 per cent, with the exception of the period from December 1825 to July 1827, during which it was maintained at 5 per cent.

During the drain of 1839, which was more serious than any then on record, the rate was raised, on 20th June, to 5½ per cent, and on 1st August to 6 per cent, these being the first occasions since 1695 on which the official rate had been placed above 5 per cent. Since then, in seasons of pressure, recourse has always been had to increased rates of discount. In 1847 it was raised to 8 per cent; and in 1857 and 1866 to 10 per cent. This last occasion is noteworthy as one where a high rate failed to attract gold, as the bullion decreased by 2½ millions from 21st March to 30th May, notwithstanding that the rate was raised by successive stages from 6 per cent to 10 per cent. Yet during the same period the Bank of France, with a rate not exceeding 4 per cent, was constantly gaining gold. This was due to the great doubts felt on the

continent as to the state of commercial credit in England. In later years, when an efflux of gold has been anticipated, it has been prevented by a timely rise in the bank rate.

One other point in connection with drains of bullion requires notice. It is an almost invariable experience that such movements have an immediate effect upon the notes in reserve, instead of acting upon the circulation, as was expected by the framers of the Act of 1844. The following instances illustrate this clearly :

BANK OF ENGLAND.

1844-7.	Bullion.	Note Reserve.	Circulation.
23rd Aug. 1847.	£14,306,000	£2,430,000	£20,426,000
30th Jan.	12,002,000	3,704,000	20,407,000
17th Apr.	9,330,000	2,558,000	20,243,000
30th Oct.	8,432,000	1,177,000	20,333,000

1857.	Bullion.	Note Reserve.	Circulation.
18th July	£11,841,000	£2,637,000	£19,978,000
11th Oct.	10,110,000	4,024,000	19,990,000
11th Nov.	7,171,000	958,000	20,183,000

In both these instances the bullion was decreased by 50 per cent, whilst the circulation remained almost unaltered. Upon the next occasion the decrease of bullion was attended by a much greater decrease in the reserve of notes, whilst the circulation increased by more than 25 per cent.

1866.	Bullion.	Note Reserve.	Circulation.
21st Mar.	£14,456,000	£7,918,000	£20,636,000
9th May	13,156,000	4,951,000	22,344,000
30th May	11,878,000	415,000	26,019,000

An important movement in the opposite direction, of more recent occurrence, illustrates the direct action upon the reserve, instead of upon the circulation, of an influx of bullion.

1891.	Bullion.	Note Reserve.	Circulation.
23d Apr.	£21,287,000	£11,802,000	£24,857,000
27th May	24,207,000	14,921,000	24,647,000

[For history : H. D. M'Leod, *Theory and Practice of Banking*, also *Reports of Parliamentary Committees on the Bank of England, Banks of Issue, etc.* For fluctuations in circulation and effect on Bank of England Reserve and Rate, see paper by R. H. Inglis Palgrave on the Bank Acts and the Bank Rate, *Journal Institute of Bankers*, April 1892.] R. W. B.

DRAKE, JAMES (1667-1706-7), born at Cambridge, became M.D. in London in 1694, and Fellow of the College of Physicians in 1706. His high Tory pamphlets, among which two especially deserve attention, were the cause of much persecution to him. Besides being the author of medical treatises he wrote anonymously *A Short History of the Last Parliament*, 1699, in which he refutes the opinion that exchequer bills had the nature of "money"

created by government, and shows them to be mere money-saving instruments of credit. In his pamphlet *An Essay concerning the Necessity of Equal Taxes and the Dangerous Consequences of the Encouragement given to Usury among us of late years. With some Proposals to promote the Former and give a check to the Latter.* By the author of the *History of the Last Parliament*, London, 1702, Drake argues that money should be taxed by reducing interest, and that public credit "be rais'd to a Par with the best private security, and that no higher Interest or Praemium be allow'd upon it." This end will be answered "by a just and equal Tax obliging all Ranks and Degrees of men to pay to the support of the Government in proportion to their share in the Publick and the benefits they reap from it" (p. 5). He contends that "for the eleven first years of the late war, 10s. in the £ per annum, principal and interest, was paid by land, under which latter name husbandry, manufacture, and trade are comprehended as having their existence from and being no more than the product and improvement of land, which is the principal stock, and gives birth and maintenance to them all" (p. 2). This passage, as well as his struggle against stock-jobbing and trading companies, connects Drake with authors like Asgill, Barbon, Briscoe, and other Tory writers on finance.

[*Dictionary of National Biography*, vol. xv. pp. 446-447, where the last-named tract is omitted ; for the first tract see Philippovich, *Die Bank von England*, 1885, p. 68.] S. B.

DRAPIER'S LETTERS. In 1722 Ireland complained of the want of copper coin. Copper had apparently been undervalued as compared with silver, and in consequence had been driven from the country. In its place a number of tokens and worthless coins had been used as small change. The English government decided to remedy what was an undoubted grievance. Unfortunately Ireland, unlike England and Scotland, had no public mint, so that coinage was a subject of private contract, and such contracts, in the eighteenth century, were invariably occasions for jobbery and corruption. On 21st Sept. 1723 a patent was issued to William Wood to coin copper to the value of £108,000. The economic and other objections to the patent were unanswerable. Wood himself had purchased it for £10,000 from the Duchess of Kendal, George I.'s mistress. That his own profits would have been excessive is proved by the fact that he was compensated for the withdrawal of the patent by a pension of £3000 a year for eight years. The total issue was ridiculously out of proportion to the needs of the country, as it was estimated at more than a fourth of the whole currency. Finally the issue was debased. A pound of copper was worth at the outside 13d. ; in England it was coined into 23d. ;

but by Wood's patent it might be coined into 30d. To these objections it must be added that no Irish official, not even the lord-lieutenant, or the council, had been consulted about the terms of the patent.

The patent was itself a scandalous job, and it was also a needlessly irritating assertion of English sovereignty. Irish opinion was roused, and both houses of parliament, usually submissive, petitioned against the scheme. A haughty and threatening answer on the part of Wood only added fuel to the flame. In 1724 Swift came forward as the mouthpiece of the prevalent discontent in a series of letters which were signed M. B. Drapier, and professed to be the work of a Dublin tradesman. The importance of the letters is political rather than economic. Swift had no practical or theoretical grasp of currency questions. He made no attempt to state the real objections to the new coinage. On the contrary he adopted all the prevalent prejudices, and exaggerated and illustrated them with that suppressed yet masterful irony in the use of which he has never been surpassed. In the famous fourth letter he quitted the immediate question at issue, denounced the abuses of English misgovernment, and asserted the rights of the Irish nation to independence. The printer of the letter was prosecuted, but the jury rejected the bill in spite of judicial browbeating. The author, though his identity was notorious, was left unattacked, and the government found it necessary to yield to the storm which it had provoked. The whole importance of the episode lies in the impulse which it gave to the opposition to English rule in Ireland.

[The letters are to be found in Swift's collected works. For comments on them, see Craik's *Life of Swift*;—Lecky's *History of England in the Eighteenth Century and Leaders of Public Opinion in Ireland*;—Stanhope's *History of England*.]

R. L.

DRAWBACKS. In theory a drawback is a portion of the "mercantile system," and is intended to promote and encourage the exportation of commodities. It consists in the repayment of a duty which has been already paid in connection with the manufacture of the commodity in question, such repayment to be made on its export. Theoretically, therefore, drawbacks correspond to, and are similar to, BOUNTIES (*q.v.*), with this distinction—that a bounty is a direct gift to the exporter of goods, while a drawback should be merely the remittance of a tax in his behalf. It is this difference which caused Adam Smith to hold drawbacks to be the most reasonable form of encouragement to exportation; because, although they must from their nature favour certain classes of exporters, they cannot operate so as to draw more trade into any particular channel than would have been drawn had neither the tax nor the remit-

tance of it existed: in other words, they simply cancel the tax and leave trade free to follow its most natural course. It must always be remembered that Smith held very strong views in favour of absolute non-interference with industry, and was consequently averse to indirect taxation. Drawbacks may be manipulated so as to have the same effect as bounties and other devices for encouraging exportation. Where this is the case there is not only a loss of revenue to the country which repays the tax, but a subsidy is given on exports which amounts to paying the foreign consumer to buy certain goods.

Drawbacks, it will be seen, are much more restricted in their nature than bounties. As worked in this country they are comparatively unimportant. They are of no use in encouraging a rising industry in a new country, and are generally granted simply for the purpose of increasing the amount of export trade. Adam Smith's discussion of them (bk. iv. chap. 4) may be read with great interest. J. S. Mill, in bk. iv., where he deals with the various forms of protection, adverts to drawbacks; and generally all modern economists, who have written on the subject of political economy at large, treat of drawbacks along with bounties.

M. G. D.

DRAWER OF A BILL OF EXCHANGE.

The person giving the order to pay contained in a bill of exchange is called the "drawer." If the bill is not paid at maturity, he is bound to reimburse the holder, provided that all the necessary formalities have been observed (presentation in proper time, notice of dishonour, protest in the case of foreign bills, etc.) (See BILLS OF EXCHANGE.)

E. S.

DRAWING. This word is used to announce the redemption of certain bonds, as the borrower applies a periodical sinking fund to that purpose. The practice was originally connected with the simple process of drawing lots. A borrowing government, for example, may engage to pay off 1 per cent of its loan every year, and then the question arises as to which bond out of every hundred in circulation shall be redeemed in order to make the redemption fair. A drawing is announced, the function being attended by public officials and other persons of unimpeachable integrity, and the bonds which happen to be drawn by lot are then advertised for repayment at par, or at whatever the stipulated price of repayment may be. Cases have been known in which holders of drawn bonds have gone on receiving dividends in ignorance of the drawing, and other cases are on record in which the drawn bonds having been sold on the stock exchange, it has been discovered several months or years afterwards that the said bonds were not a good delivery (see DELIVERY, GOOD). A question also has arisen where, if a borrowing government formally promises the drawing of 1 per cent of its

abt each year, it is really empowered also to deem 2 or 3 per cent, or even the whole of the outstanding debt, and in the years of active redemptions—1888-90—borrowers found it so easy to raise fresh loans at diminished rates of interest that they were continually exceeding the rate of redemption by drawing beyond the proportion originally stipulated. The system of drawing is not altogether commendable, and was originally employed to give a kind of speculative attraction to bonds which would otherwise have been neglected by steady investors. That is, the objectionable element of hazard enters into the question, which ought to be purely one of the solidity of the borrower. A. E.

DRENGAGE. A form of land tenure, common in, if not confined to, the district comprised in the ancient kingdom of Northumbria. Drengs are mentioned in Domesday and in the survey called the Boldon Book. Sir Henry Ellis says: "The *drengs* or *drengs* were of the description of allodial tenants . . . and from the few entries in which they occur it certainly appears that the allotments of territory they possessed were held as manors" (*General Introduction to Domesday*, tom. i. fol. 269). But, as menial services were required of them or their servants, at least in Durham, they must have been inferior to military tenants. The instance in the Pipe Rolls of Westmoreland, 25 Henry II. of the enfranchisement of *drengs*, and the particulars given in the records of the palatinate as to the services attached, show that *drengage* was by no means a free tenure. The services of a *dreng* were to plough, sow, and harrow portions of his lord's land, to keep a dog and horse for his use, attend the chase with him, etc. "A *drengage* seems to have consisted of sixteen acres to be ploughed, sown, and harrowed" (Blount's *Fragmenta Antiquitatis*). The word is derived by Greenwell, in his glossary to the Boldon Book, from the Anglo-Saxon "*dreogan*," to work. Another derivation is from the Danish "*dreng*" a servant or boy. Spelman, however, defines *drengs* as those who at the coming of William the Conqueror were put out of their lands and afterwards restored by him on proof of ownership (Tomlins), and Cowel says "*drenched*" is an obsolete word meaning "overcome," and compares the German "*dringen*" (see also *CONRAGE*).

[Prof. Maitland, *Engl. Hist. Rev.*, October 1890. *Notes and Queries*, I. vii. 137, 298.—See below, *Village Communities*, 71.] B. H.

DRINKS, TAXES ON. See **TAXES**.

DROPLAND, OR DRYELAND. Apparently an ancient service in the nature of driving the lord's cattle to the fair, commuted for a quit rent; but according to Cowel (*Interpreter*, s.v.) a due payable to the lord for the right of passage with cattle through the manor (see **THISTLE-RENT**).

B. H.

DROIT, ANNUEL. See **PAULETTE**.

DROITS OF ADMIRALTY. In England the Lord High Admiral (an office that has still a legal existence) has the benefit of all captures made at sea by non-commissioned vessels, and also of all captures of ships or goods made in the ports of England and Ireland through vessels coming in by stress of weather or other accident, or by mistake of port or by ignorance, not knowing of the war, and also of all derelicts.

By the 1 & 2 Vict. c. 2 it was enacted that the profits derived from droits of admiralty should be paid into the exchequer for the benefit of the state. Phillimore's *International Law*, vol. iii. London, 1873. J. E. C. M.

DROITS D'AUBAINE. See **AUBAINE**.

DROZ, JOSEPH, born at Besançon in 1773, died at Paris 1850. The incidents of his life were varied, and so were his opinions. Belonging to a family of high legal standing, he commenced life as a volunteer when the Revolution broke out; but afterwards laying down his arms, became professor of rhetoric at the central school of Besançon. He subsequently returned to Paris, where he was closely associated with the habitués of the *Société d'Auteuil*. The members of this club, who were Epicurean in spirit and taste, in most things kept themselves detached from the life of the 19th century. He derived from this association a fund of sanguine optimism which never failed. Towards the close of his life, he came under the influence of religion. He joined the *Académie française* in 1824, and the *Académie des Sciences morales et politiques* in 1833. In 1829 he published his *Économie politique ou principes de la science des richesses*, 1 vol. in 8vo, a valuable work, but one in which he fails to distinguish, with sufficient exactness, moral from economic precepts. He also published in 1839-42 the *Histoire du règne de Louis XVI. pendant les années où l'on pouvait prévoir et diriger la Révolution française*, 3 vols. in 8vo. The dual title of this work is a sufficient indication of the line of thought pursued in it and the object proposed. A. C. F.

DRUMMOND, HENRY (1786-1860), banker, economist, and theologian, was the eldest son of Henry Drummond (d. 1794). He was brought up by his maternal grandfather, Viscount Melville, and was educated at Harrow and Cambridge, but took no degree. He became a partner in the well-known house at Charing Cross, and for many years had a leading share in its administration. Between 1810 and 1813 he was M.P. for Plympton Earls, and carried through parliament a bill against embolishment by bankers of securities under their charge, which became law (52 Geo. III. c. 63). With his wife he started in June 1817 on a pilgrimage to Palestine, but on passing through Geneva he stopped to contend with

the consistory on ecclesiastical discipline. In 1825 he founded the professorship¹ of economy at Oxford. He was an apostle, evangelist, and prophet of the Irvingite Church, and built a church for that community at Albury, where he lived. From 1847 to his death he was M.P. for West Surrey. He was a frequent speaker in the House of Commons. Sir Henry Holland speaks of "the genial temperament and masculine, though eccentric intellect of Henry Drummond . . . who could not tread along the highway of common opinion either in religion or politics, but his aberrant path was always pursued with honesty as well as vigour" (*Recollections*, 1872, p. 156). Some of Drummond's numerous speeches and pamphlets were collected by Lord Lovaine, 1860, 2 vols. 8vo. His economical publications are:

Elementary Propositions on the Currency, London, 1819, 8vo (reprinted with additions in 1826, again in 1848, and with *Speeches*, etc., 1860, vol. ii.).—*Cheap Corn best for Farmers*, London, 1826, 8vo (anonymous: the landlords are the only gainers by the tax, all others, including the farmers, suffer).—*Justice to Corn Growers and to Corn Eaters*, London, 1839, 8vo (in favour of repeal with restrictions).—*Causes which lead to a Bank Restriction Bill*, London, 1839, 8vo ("the Bank of England is the only body which ought to have the power of issuing paper money," p. 20).—*On the Corn Laws*, London, 1841, 8vo.—*On the Condition of the Agricultural Classes of Great Britain and Ireland, with extracts from the Parliamentary Reports and Evidence from 1833 to 1840, and remarks by the French editor published at Vienna*, London, 1842, 2 vols. 8vo (with preface by Drummond; translation of two volumes published by the Austrian government to show "the folly of supposing that it is commerce and manufactures rather than agriculture which constitute the true wealth of this country," pref. xi.-xii.).—*Letter to the Bishop of Winchester on Free Trade*, London, 1846, 8vo.—*Speech on Motion on Public Expenditure*, London, 1849, 8vo.—*Letter to the Working Classes in Trades and Manufactures*, London, 1859, 8vo (on the bad treatment received by them "from manufacturers, millowners, and poor-law guardians, and of the exertions made by noblemen and gentlemen to protect" them—p. 29).

[Lord Lovaine's *Memoir*, 1860.—*Olipphant's Life of Edw. Irving*, 1862, 2 vols.—*Dict. of National Biography*, xvi. pp. 28, 29.—*Historical Register of the University of Oxford*, 1888, pp. 67, 68.]

H. R. T.

¹ Drummond charged his estate with a yearly rent of £100 for the endowment. The commissioners of 1877 increased the emoluments to £300 from the revenues of All Souls, besides £200 attached to a fellowship of the college. The professorship is for five years, but holders of the office may now be re-elected. The following have been the professors: 1825, Nassau W. Senior; 1830, Richard Whateley; 1832, W. F. Lloyd; 1837, Herman Merivale; 1842, Travers Twiss; 1847, N. W. Senior (second time); 1852, G. K. Rickards; 1857, C. Neate; 1862, J. E. Thorold Rogers; 1868, Bonamy Price (again in 1873, 1878, and 1883); 1888, J. E. T. Rogers (second time); 1891, F. Y. Edgeworth.

DRUNKARDS, LEGISLATION RESPECTING.

The care and cure of habitual drunkards has, up to the present time, received little attention on the part of social reformers; yet it is as much within the province of legislation as the reception and detention of lunatics. A person with whom the craving for intoxicants has become an irresistible impulse, is not, strictly speaking, a person of sound mind, and it would be no undue interference with the liberty of the subject if such a person could be kept in confinement against his will. British legislation has, at any rate, recognised the principle that, if a dipsomaniac has once allowed himself to be confined in a licensed retreat, he cannot leave it before the expiration of the time during which he has undertaken to remain, unless he is previously discharged or allowed to go out on leave. Such retreats are, in England, licensed by the justices of the peace for the county or borough in which they are respectively situate, and are under the control of the Home Secretary and an Inspector of Retreats. Their number, so far, is very small, a fact which may be due to the circumstances that the Habitual Drunkards Act of 1879 was to remain in force for ten years only, and that the Inebriates Act of 1888 (by virtue of which the provisions of the first-named act, with some slight modifications, are now permanently in force) is of too recent date to have had its proper effect. There were at the end of 1890 seven retreats licensed to receive 100 patients, in which 59 patients were actually detained. Some interesting statistics are contained in the inspector's report relating to the Dalrymple House at Rickmansworth; 224 persons have been discharged from that retreat as to whose family history the following facts are stated:

Insanity in family	19
Inebriety in family—	
One or more of the parents	34
" " grandparents	10
" " brothers	14
" " uncles	35
	— 93
No history obtainable	112
	—
Total	224

Out of these 224 discharged patients there were:

Doing well	94
Improved	10
Not improved	74
Insane	10
Dead	1
Not heard from	35
	—
	224

The managers of most of the retreats are of opinion that a year, which is the maximum term for which a person may bind himself to remain in a retreat, is too short a period; also that there should be power to receive and

retain patients against their will, and further, that some provision ought to be made for paupers or persons of small means.

It would also be desirable to make it possible to protect the property of inebriates in some such way as the property of lunatics may be protected. The Lunacy Act, 1890 (§ 116), authorises the judge in lunacy to give certain directions as to the management and administration of the property of any individual "with regard to whom it is proved to the satisfaction of the judge in lunacy that such person is, through mental infirmity arising from disease or age, incapable of managing his affairs," and in such a case to appoint some person to act in a similar capacity as the committee of a lunatic's estate (see *COMMITTEE*); and the Lunacy Act, 1891, § 27 (4), provides that the last-mentioned power may be exercised with reference to individuals who are *not* lunatics. It might possibly be held that a dipsomaniac is suffering from mental infirmity and incapable of managing his affairs, but as far as the writer knows, it has not as yet been attempted to apply the section in such a case, and it is very doubtful whether the judges would consider it applicable. Under these circumstances it would be preferable if the legislature would deal with the point in a direct manner.

The bill relating to drunkenness which will shortly (1893) be submitted to the German Reichstag contains a clause which provides that a dipsomaniac who is incapable of managing his affairs, or who exposes himself or his family to the risk of impoverishment, or who imperils the security of any other person, may be placed under guardianship. The guardian is to have power, subject to the consent of the competent court, to cause the dipsomaniac to be confined in a retreat for inebriates, and in case of neglect on the part of the guardian to exercise the power, the court is to have authority to give the necessary directions in his place. A provision of this nature, if applied with care and discrimination, must be beneficial to the persons concerned, no less than to society at large.

E. S.

DRY EXCHANGE (*Combium siccum*). A euphemism applied to the "coverture" or "colouring" of the stringent statutes passed during the Tudor period against usury. "A *cleverly* term invented for the disguising of foul usury, in which something is pretended to pass on both sides whereas in truth nothing passes but only on the one side" (Cowley). Usury, which was condemned by religion and law alike during the middle ages, was from the middle of the 16th century no longer to be confounded with the legitimate employment of capital: but the sentiment which inspired the above enactments was that of governing classes associated with the landed interest.

[Cunningham, *Growth of English Industry and*

Commerce, 1890, 495 *et seq.*—Hall, *Elizabethan Society*, ch. iv.]

H. H.

DRY RENT (*Rent sec.*). An annual rent-charge reserved upon lands conveyed by deed, without the insertion of a clause of distraint.

H. H.

DUBOS, ABBÉ J. B. (1670-1742), a member of the French Academy, and author of historical works and of a treatise on poetry and painting.

The one book of his which requires notice here is entitled *Les Intérêts de l'Angleterre mal entendus dans la guerre présente* (Amsterdam, 1703), and professes to be a translation from an English book. Speaking thus as an Englishman, the Abbé remonstrates against the war policy of the English administration. He is well acquainted with contemporary English pamphlets on the Tory side, especially with Davenant, whom he often quotes. He successively examines the effect of war on each branch of English trade and manufactures, and distinctly states (p. 80) that "the attempts we (the English) shall be obliged to make in order to enforce in the (American) colonies the just obedience they owe to the state which has founded them, will perhaps lead them to rebellion, when they will have learned that they can do without us."

Voltaire addresses him in a letter dated 30th October 1738, as "the most useful and judicious writer he knows," but, when writing to other people, he indulges in sarcasm about the Abbé's "mistaken" notions as to the interest of England.

E. Ca.

DUCAT, HISTORY OF. A gold coin (worth about 9s. 4½d.) in extensive use on the continent till this century, and adopted by successive emperors as the standard coin of the empire in the middle ages. The coin first makes its appearance in 1140 A.D., when Roger II., King of Sicily and Duke of Apulia and Calabria, issued silver coins to which he gave the name "ducati," probably because they were first struck in the duchy of Apulia, especially called "il ducato," and bore, in an abbreviated form, the inscription—"Sit tibi, Christe, datus, quem tu regis, iste Ducatus" (Let this Duchy, O Christ, which thou rulest, be dedicated to thee). The coin then spread through Italy until, in 1252, it was formally adopted at Florence, and gold pieces were issued under the name of "ducati gigliati." These ducati gigliati, or *fiorens d'or*, as they were called elsewhere, were 24 carats fine, and 64 to the fine mark. Thirty-two years later, by a law passed in 1283 A.D. ducats were struck at Venice by the Doge John Dandolo, the second of the four celebrated Doges Dandolo, 67 to the fine mark, and each bearing the inscription of the original ducat of Apulia. In the 16th century, these ducats received the name of "zucchini" (sequins) from Zecca, the Venetian

mint, whence their Anglo-Indian name of "chicks" (Rs. 4).

By the beginning of the 14th century these florens d'or and Venetian ducats had spread throughout the states of Italy, and especially the Church states, where Florentine ducats were universally adopted and issued as "novelli ducati papales," with only slight variations from the original standard of 1252. The Florentine coin thence spread into Hungary, whither it was followed by the Venetian ducat, until in 1365, Venetian ducats were struck by the king Ludwig, at Kremnitz, of $23\frac{3}{4}$ carats fine, and $67\frac{7}{10}$ to the Cologne mark. Later on "imperial" ducats were issued at $23\frac{3}{4}$ carats fine, and $68\frac{1}{10}$ to the fine mark. From Hungary and Bohemia the Venetian ducat, preceded however by the floren d'or, was introduced into Germany, and continued to circulate as a foreign coin throughout its various states, right up to the Augsburg Convention of 1559. In this year the imperial diet of Germany adopted the ducat into the currency of the empire (Ferdinand I.) at a prescribed "dukaten-fuss" of $23\frac{3}{4}$ carats fineness, and 67 to the Cologne mark (and therefore $67\frac{7}{10}$ to the fine mark)—a "footing" subsequently maintained both by the Leipzig Convention of 1690, by the Austro-Bavarian Convention of 1753, and the Frankfurt Coinage Union of 1765.

This adoption of the ducat into the currency of the empire had the effect of causing the surrounding states to follow the lead of striking ducats for themselves. Yet in every case, though both the floren d'or and the Venetian ducat (by this time known as the sequin) had previously obtained in circulation, it was the latter coin that was adopted and struck as the standard of currency by the several states; by the cantons of Switzerland in the 16th and early 17th centuries, at fineness and weights varying from $23\frac{1}{2}$ carats and $68\frac{1}{10}$ ducats to the fine mark, at Berne, to $23\frac{3}{4}$ carats and $67\frac{1}{10}$ respectively, at Basel and St. Gallen; by Denmark in 1647 at $23\frac{1}{2}$ carats fine, and $68\frac{7}{10}$ ducats to the fine mark; by Holland, a little later, at $23\frac{7}{10}$ carats fine, and $68\frac{1}{10}$ to the fine mark; by Russia, Poland, and Sweden, about the same time, or a little earlier, at rates varying from $23\frac{1}{2}$ carats fine to $23\frac{3}{4}$, and 78 to $68\frac{7}{10}$ ducats to the fine mark, and continued to be coined till well into the present century. Ducats were even struck by the Porte, and some issued by Sultan Mahomet IV. are known (1649-1693 A.D.). A Barbary ducat was current in the West Indies early in the last century.

The history of the ducat in France, Spain, and Portugal is slightly different. As regards the latter country, Pope Calistus III. having in 1455 demanded supplies for an expedition against the Turks, Alphonso V., then king, had quarter-ducats, or "Crusados" struck in

1455, first at 23 carats fineness; later at 22 carats fine and $289\frac{1}{2}$ of these crusados to the fine mark. These Crusados or Portuguese quarter-ducats are the "Kreuz-dukaten" of the German middle ages. Still later (1722-1750), new crusados were issued at the same fineness as before, but at an increased weight, viz. 237 to the fine mark. In France, where the ducat was early introduced, the Florentine coin (64 to the fine mark) was adopted over its elsewhere successful rival, thanks to the fact that at this time (14th century) the Pope resided at Avignon; while in Spain in 1537, under Emperor Charles V., the Italian and French ducat, under the name of the "escudo" (22 carats fine, and 68 to the Castilian mark = $69\frac{1}{2}$ nearly to the fine Cologne mark) began and long continued to form the basis of the Spanish gold monetary system (see DOUBLON).

By far the most common "ducats" were those current in Hungary, Germany, Holland, and Russia, and averaged in value, each containing roughly 53.9 grains, about 9s. $4\frac{1}{2}$ d. apiece. The Swedish ducat, however, was only worth about 9s. $3\frac{1}{2}$ d., while the modern Italian gold ducat was much less. Silver ducats were also struck in several places, and varied in value much more than the gold; e.g. the silver ducats of Italy were worth 3s. 4d.; those of Holland (the daalders) 4s. 2d.; while the silver ducat of Sicily had the value of 3s. $4\frac{1}{2}$ d. Ducats were also issued made of platinum (Russia), and earlier of copper and lead (Venice, Germany, France, and Holland), while they were not infrequently struck as medallions.

[Vergara, *Monete del Regno di Napoli*, Roma, 1715.—Philippi Argelati, *De Monetis Italiane*, 5 vols., Mediolani, 1750.—Johann Tobias Köhler, *Vollständiges Ducaten-Cabinet*, 2 vols., Hanover, 1760.—Bonneville, *Traité des Monnaies*, Paris, 1806].

W. L.

DUCAT (Modern). Austrian standard gold coin, weight 53.86 grains, fineness 986. Value; English standard (916.6 fine at £3:17:10½ per oz.) 9s. $4\frac{1}{2}$ d.; French standard (900 fine) 11.85 francs.

Ducats were the principal medium of exchange in Italy for several centuries. (See DUCAT, HISTORY OF.)

F. E. A.

DUCHATEL, Comte TANNEGUY, born at Paris in 1803, died in 1867. He was on several occasions a minister of state and organised the commission of inquiry which resulted in the law of 24th May 1834. This replaced a large number of prohibitions on imports by customs duties (the report of this inquiry has been published in 3 vols. 8vo). In 1829 he published a work entitled *De la charité dans ses rapports avec l'état moral et le bien-être des classes inférieures de la société*, 1 vol. in 4to. This was reprinted in 1836 without any change except that of the title, which became *Considérations*

d'économie politique sur la bienfaisance ou de la charité, etc., 1 vol. in 8vo. Blanqui reproaches him with too unqualified an acceptance of the doctrines of Malthus; but this should rather be reckoned as a point in his favour. He was received in 1816 into the *Académie des Sciences morales et politiques*. His claims to be a descendant of the *Tanneur du Châtel* of the 15th century appear to be unfounded. A. C. L.

DUCKETIAUX, EDUARD, born in Brussels in 1801, died 1868. In 1828 he published several pamphlets on *Repressive and Provident Justice*, and on the penalty of death. Shortly after the revolution of 1830 he was appointed general inspector of the Penitentiary and Benevolent Institutions of the new-born kingdom. Ducketiaux was a prolific and indefatigable writer on the subjects which had from the beginning of his life attracted his attention. His principal works on the punishment of criminals are: *Progrès et État de la Réforme Penitentiaire* (1838), and *Des Conditions de l'Emprisonnement séparé ou cellulaire* (1857), in which he shows himself a consistent advocate of the cellular system as being the punishment best adapted to awaken a sense of morality in the prisoner, by the predominance of the principle of amendment over the principle of pure repression. He was no less devoted to the solution of the problems connected with the condition of the working classes. In connection with this we may mention his *Condition Physique et Morale des Jeunes Ouvriers* (1843), his *Paupérisme en Belgique* (1844), his *Mémoire sur le Paupérisme dans les Flandres* (1850), which obtained a prize from the Royal Academy of Belgium, and his important *Budgets Économiques des Classes Ouvrières en Belgique* (1855). All his works were published in Brussels.

His book on the condition of young operatives is a very full inquiry into their state and the legislation on this matter in the principal countries of Europe and in the United States; but his two essays on pauperism in Belgium are the most likely to interest the English reader. The former is rather too theoretical, but the second gives a very graphic account, based on statistics and exhaustive personal investigations, of the miserable state of the population of Flanders after the decay of the weaving by hand of flax and linen. In 1848 in the two provinces of East and West Flanders the average wages of the adult male weaver had fallen to 6d. a day, the number of deaths exceeded the number of births by 4341 (99,715 against 16,174) and about one third (453,658) of the population of Flanders had to be assisted by state charity. Ducketiaux ascribed this miserable situation to an excess of population, and to an excessive prevalence of *laissez faire*. He called upon the state to interfere by fostering the spirit of association, popular education, emigration, and securing labour to adult and able-bodied

paupers. Notwithstanding his appeal to the state, he is no friend to the English poor system, which he calls a devouring cancer (p. 272). He is not an antagonist of the factory system, and vigorously asserts that mechanical work is only degrading because it is too protracted (*Condition des Jeunes Ouvriers*, ii. p. 6).

Ducketiaux also promoted charitable congresses in Belgium. Towards the end of his life he changed political sides, passing from the liberal into the clerical party, but he remained to the last a steadfast adherent of Malthus's views on moral restraint, which were considered by his new political allies as having a tendency to immorality. E. Ca.

DUE (*geriht, rectitudo, rectum*). That which is owing to the crown or to any corporate body or to any individual subject by prescription or charter. There is this distinction to be made between a "due" and a "custom" that the former is warranted by the common law, being usually levied by virtue of written laws and contracts which are as ancient as the common law itself, while the latter, in its first origin at least, was a more or less uncertain and unauthorised impost, so that we find the term "recta" and "mala" applied to the respective forms of the custom which were authorised by statute or contract, or else levied at the will of the king or other lord alone.

Again, a "due" for the most part seems to arise from the ownership or cultivation of the soil itself, and therefore it is perhaps the most primitive form of tax; whereas a "custom" for the most part seems to arise from the exchange or conversion of the products of the soil by way of merchandise. The most typical due of any, CHURCH-SEED (*q.v.*), is certainly more than a century older than any other customary contribution. Several kinds of dues may be enumerated, as ecclesiastical, seigniorial, municipal, and fiscal or regal. Of these ecclesiastical dues are of very great antiquity, for those that are still familiar to us in the present day as tithes (see TITHES) and church-rates can be traced back to the English laws of the 8th century, although many others which were paid to the early church have long since disappeared. A still greater antiquity could even be claimed for them in this country by reference to the doctrinal writings of the 7th century, and the analogy of Frankish customs.

The well-known compact between the Anglo-Saxon sovereignty and the church in virtue of which the king's dignity and the archbishop's were respectively maintained, and the peace of the crown and church went hand in hand, is further exemplified by the arrangements enforced by the state for the temporal welfare of the holy order. Anglo-Saxon finance is no intricate problem, simply because whilst the king lived of his own, the working expenses of government were amply met by the threefold

allodial obligation. But in contrast to their reliance on the subject of lay taxation, the Saxon laws are replete with the most elaborate directions for the payment of ecclesiastical dues. "We enjoin to every Christian man by virtue of his Christendom," is the refrain of these laws, "that he pay tithe and church-scot and Rome-scot, and plough-alsms, and light-scot and soul-scot." These injunctions are found equally in secular and ecclesiastical *dooms*, and they take the place of honour in the proceedings of great councils like that of Greatanlea. Under the later Saxon kings the injunction of the pious sovereign becomes far more stringent until it is stereotyped in the precise legal definitions given in the Latinised version of the 12th century jurists, so that at length in the "laws of Henry I." we find tithe and church-scot and other dues embraced under the general heading *De placitis Ecclesiæ pertinentibus ad Regem*.

It is true that in Anglo-Saxon times the dues of the church were put in charge for the crown by means of a heavy fine for non-compliance or even by absolute distraint in which the king's reeve was required to assist the bishop's officer and the local incumbent; and we also find the doctrine prevailing that if the occupier were too poor to pay, the lord should pay for him.

It is possible that the rigour of this system of assessment and collection of church dues was somewhat mitigated by the reflection that these were eventually offerings made to God, a theory carefully fostered both by the crown and the church, so that the term God's dues (*godcunde gerihta* or *Dei rectitudines*) is actually synonymous with church-dues during the latter part of the Anglo-Saxon period at least, and thus perhaps the sentence of excommunication decreed by King Edmund's laws on all defaulters was justified. On the other hand, the refusal to pay Peter's pence was a contempt which led to the appearance of the offender before the court of Rome itself to make atonement. In addition to the above persistent injunctions, these early laws provided further for the payment of church dues to be made at fixed and appropriate seasons. Thus tithes became due always as the plough entered the tenth field, or more probably in actual practice, plough-alsms were rendered at Easter, tithes of cattle at Pentecost, the fruits of the earth at All-hallowtide, and church-seed at Martinmas; the tenth cheese as it was made, or the milk drawn on the tenth day. In the same way Rome-scot was payable on St. Peter's feast-day; and light-scot at Candlemas, Easter Eve, and All-hallows Eve. Finally, in order to mark the precision with which these dispositions were made, we find provision for the payment of soul-scot at the open grave, wherever the death might take place.

The statistics available for the purpose of estimating the nature and extent of these con-

tributions are unfortunately not nearly so abundant as these details of the means for insuring their payment, or at least they are not so authentic for the earlier period. It may easily be gathered, however, that the unit of assessment was the plough and the normal sum assessed on every plough the penny. In fact the Anglo-Saxon SCAET like the Anglo-Norman Denarius, was the synonym of money, while the medium of exchange in both periods might be equally treasure in kind or in currency. Add to this primitive basis of calculation the further connection between the plough and the hearth as representing the stake of one family in the soil, and it will be possible to account for nearly every ecclesiastical assessment that fell upon the husbandman free or unfree. Moreover, *denarius* might be, and does indeed appear to have been, used in its original meaning of a tenth part (see DENIER). Thus the thane is required to render a tenth of all that he has; a tithe which, reduced to terms of money according to the normal assessment of the hide, would be found equivalent to a tenth penny. The church-scot was originally a measure of corn that was probably equivalent to a tenth part of the produce of the normal virgate holding, and equally it was assessed upon every hearthstead at which the tiller was found seated in the midwinter before it fell due. So the plough-scot and Rome-scot were expressed in convertible terms of the hearth, the plough, or the penny. The light-scot was always a money payment of a halfpenny on every hide of land because candles were imported from the continent, but if wax were not available, other produce of the soil such as cattle was certainly rendered in kind, *pecunia* and *denarius* being once more convertible terms.

Although no secular institution was endowed with an oblatory revenue as ancient or as extensive as that arising from the dues of the church, it is perhaps possible to trace a certain analogy between the ecclesiastical and municipal corporations herein. Pious sovereigns who had invested the church by virtue of binding ordinances with the power of levying dues upon all products of the soil within the parochial "ministry," were succeeded in direct line of descent and policy by others who invested the towns one by one with a like implied privilege by the terms of royal charters. The one body held by free alms, the other by the *firma burgi*. The latter stood in need of contributions for the repair of streets or quays and general administrative purposes, the former distrained upon its flock on the plea that churches must be repaired, the poor relieved, and the clergy themselves housed and fed. Whatever the value of this analogy may be, it is certain that the dues legally raised for purposes of municipal self-government, pontage,

murrage, pavage, quayage, morrage, towage, orrage, strandage, crannage, mesonage, anchorage, keelage, bushelage, lestage, ballastage, measurage, average, primage, and the like afford by far the best-known, the most enduring, and the most regular examples of dues. Indeed it might be thought that the still more historic contributions known as gable tax, tallage, and the like, would fall under the head of dues in a system of common assessment for self-taxation, but here as elsewhere we must sharply distinguish between rent and taxation on the one hand, and between imperial or parliamentary taxation and customary dues on the other.

This necessary distinction brings our inquiry within still narrower limits in the case of seigniorial or manorial dues, as well as those that were levied by the king as lord paramount of the whole realm. Extents, court rolls, and ministers' accounts, together with surveys, such as Domesday Book, the Boldon Book, and the Hundred Rolls, present us with an infinite variety of payments in the nature of commuted rents and pecuniary mulcts, the legal definitions of which are set forth in the various *Expositiones Vocabulorum* appended to most of the fiscal registers of the 13th and 14th centuries, but none of these can properly be regarded as dues. Some such there are, however, but their existence was from the first anomalous, and they are chiefly remembered in the present day amongst the curiosities of manorial tenures. In certain cases, however, an inland town or seaport might continue for centuries under the jurisdiction of a lord who enjoyed the tolls and other dues, just as a layman might appropriate the dues intended for the support of the church, and in such cases the seigniorial interest takes the place of the ecclesiastical or municipal or fiscal.

The dues or "rights" of the crown *quâ* lord paramount of the whole land must be carefully distinguished from the normal sources of imperial revenue on the one hand and from the customary revenue by prerogative or grant of parliament on the other hand. What remained were the seigniorial dues received by the sovereign from the manors and farms composing his demesne, and from escheats and vacant churches, together with certain other rights appertaining to his kingly state alone. Even in the most primitive state of kingship the tribal ruler appears to have received a contribution from the products of the soil, the tradition of which still lingered in the *misses* and *prises* of the 15th century. That is to say, the king took toll of certain staple products to maintain the rude splendour which was as essential to a civil state of society as the ceremonies and "ministry" of the church. As far as we are at present enabled to distinguish between a recognised rent or custom and a specific due,

it seems probable that the several forms of purveyance were of the latter nature, together with those tolls or perquisites which are peculiar to the fiscal period that precedes the development of parliamentary supply. Such an assessment as the *avalage* is probably of this nature (Madox, i. 775). On the other hand, many more, which are popularly regarded as dues, are really in the nature of rent, such as the *firma unius noctis* of Domesday Book and the *gafol* or *gablum* (Round, *Domesday Studies*, vol. i.)

A considerable revenue was certainly obtained from the end of the 12th to the close of the 13th century by way of dues upon merchandise at the outports and inland barriers, which can scarcely be included under the head of customs. Thus in addition to the general exactions alluded to in several public charters, we have notices of a *disme* and *quindisme* levied as early as the reign of Richard I., chiefly, no doubt, upon foreign imports (Pipe Roll, 10 Ric. 1 m. 12b). These and other dues appear to have been more or less consolidated under the administration of the royal chamberlains at London and Southampton. The exactions of the king's officers at the Tower of London, forbidden in several of the city charters, were clearly of the same nature. It is interesting to note, moreover, the inclusion of the profits or *droits* arising from the sale of prizes of war and contraband goods amongst the chamberlains' accounts; these, like *deodands*, forming a link between the casual and the customary revenue of the crown.

With the statutory recognition and limitation of the ancient dues of the crown in respect of the products of the soil exported under the distinctive term of *Recta custuma* and the corresponding definition of the dues formerly payable at discretion upon imports, such as wines by the name of *Recta prisâ*, their history may be said to belong thenceforth to that of the customs revenue. *Prises* and *misses* are for the future associated with the unconstitutional abuses of purveyance, together with *caption* and *emption*, and other relics of the old tribal state. Certain other dues continued to be levied in the king's name, such as the penny (*denier* or *denoir* once more), by the gauger of wines and the aulnager of cloths, and even the Calais dues themselves (see *DENIERS DE CALAIS*); but these, like the god's-penny, and the cocket, and tronage dues, are properly to be regarded as official fees or *perquisites*, outside the customary revenue it is true, and yet not included in the revenue returns for fiscal purposes. It was by such dues as these, sanctioned by the authority of the crown, and even put in charge for the crown, that the royal ministers, from the smelter of the exchequer to the treasurer of England, eked out their scanty fees *in gremio sacrorum* itself.

H. HA.

DUE DATE (Bill of Exchange). This is the date at which the holder of a bill of exchange may claim payment from the drawee. The following rules, as to the way of ascertaining that date, are applicable in the case of bills payable within the United Kingdom. A bill is payable on demand: (a) if it is expressed to be payable on demand, or at sight, or on presentation; (b) if no time for payment is expressed (Bill of Exchange Act, § 10). The due date of a bill, not payable on demand, is found by adding three days (which are called the days of grace) to the time of payment named in the bill, but this rule is subject to the following exceptions: (a) when the last day of grace is a bank holiday, or a Sunday immediately following a bank holiday, the bill is payable on the *succeeding* business day (e.g. if a bill is drawn payable on the 23rd December in a year when the 26th of December falls on a Saturday, the due date would be the 28th December); (b) when the last day of grace is Good Friday, Christmas Day, or a Sunday (not immediately following a bank holiday), the due date falls on the preceding business day (thus, in a year in which Christmas Day falls on a Friday, a bill, drawn payable on the 22nd December is due on the 24th, whereas in the same year, a bill drawn payable on the 23rd, as shown above, is due on the 28th only). Where a bill is payable at a fixed period after sight the time begins to run from the date of acceptance, or in the case of an unaccepted bill from the date of noting or protesting (Bill of Exchange Act, § 14 [3]). On the continent a bill is sometimes stated to be payable after usance (or after two or more usances), the usance being either a fixed time, or a time varying according to the distance of the place of issue from the place of payment. In France the duration of a usance is thirty days, the time being computed from the day *following* the date of the bill (Code de Commerce, § 132); the German and Italian codes do not recognise this mode of fixing the due date. In all continental countries a recognised practice exists of making bills payable at some named fair or market ("Messwechsel" or "Marktwechsel"—German Code, §§ 4, 18, 35; "payable en foire"—French Code de Commerce, §§ 129 and 133; "pagabile in fiera"—Italian Codice di Commercio, §§ 252 and 286). If the fair or market extends over a day, such bills are payable on the day preceding the last day of the fair or market. The importance of those assemblages having much decreased of late years, bills bearing such indications are becoming scarce. E. S.

DUFAU, F. P., born in 1795, was the director of the Institute for the Blind in Paris, and wrote several works on the subject of their proper treatment. In 1840 he published a volume entitled *Traité de Statistique ou théorie de l'étude des lois d'après*

lesquelles se développent les faits sociaux, suivi d'un Essai sur la statistique physique et morale de la population française. In the theoretical part he does not approve of the adoption of coloured statistical maps, as being "only able to convey vague and indistinct notions to the mind." In the second part, he intended to apply the rules set down by himself to the study of the population, territory, and state in France; but declares that, owing to the want of sufficient materials, he has been obliged to give up the two last divisions of his investigations. This work received, in 1841, a prize from the Academy of Sciences in Paris. In 1847, under the title of *Lettres à une Dame de Charité*, he gave a complete description of the institutions and associations for the alleviation of the sufferings of the poor. E. Ca.

DUHAMEL DU MONCEAU, HENRI LOUIS (1700-1781) was inspector general of the navy, member of several learned societies, and author of numerous treatises on manufactures, forestry, and agriculture; the principal of which are his *Traité de la conservation des Grains* (1753); *École d'Agriculture* (1759); *Eléments d'Agriculture* (which went through several editions from 1754 to 1779); and the *Traité de la Culture des Terres* (1753-1761), written—at least the last—to advocate in France the methods of cultivation originated in England by Jethro Tull. He is mentioned as a distinguished agriculturist by Voltaire in his *Précis du Siècle de Louis XV.* (ch. xliii.) and in his *Lettre à l'Homme aux Quarante Écus*, although in the latter with some mockery on the pecuniary results of his experiments. A. Young calls him a "useful genius" (*Travels in France*, 1792, i. 55).

In 1764 Duhamel printed a small pamphlet of only fifteen pages (*Réflexions sur la Police des Grains*), in which he asserts that, in order to keep agriculture in a healthy condition, the price of corn must not fall below a price sufficient to meet the necessary expenses of the farmer, nor be carried too high, so as to cause famines, which grind the poor and the artisans. The natural regulations of a good policy would be (1) to allow an entirely free inland trade of corn; (2) to suppress all tolls on the inland carriage of corn, either by land or by water; (3) to allow every citizen to store corn until a time of dearth; (4) to grant free export, without any privilege of person, when the storehouses are full and the crops continue to be abundant.

Duhamel ends by distinctly denying that France ought to follow the example of England, there being a great difference in many respects between the conditions of the two countries. E. Ca.

DUMOULIN. See MOLINAEUS.

DUNCAN, HENRY, D.D. (1774-1846), a minister distinguished for his philanthropic labours and practical sagacity, is best remembered as the founder of savings banks. It is

true that he was neither the first to suggest the formation of such banks nor the first to establish them. Such banks existed on the Continent, in England, and even in Scotland, before Dr. Duncan founded the "parent institution" at Ruthwell in 1810. But the name of Dr. Duncan is as justly connected with savings banks as those of Cobden and Bright with Free Trade; he did for the one movement what they did for the other.

The attention of Dr. Duncan had been early drawn to the condition of the poor, and he thought and read much on the subject. One day there came into his hands a pamphlet bearing the title *Tranquillity*, the author of which, Mr. John Bone, propounded a scheme for the gradual abolition of poor-rates in England. A subordinate feature of this scheme was the "erection of an economical bank for the savings of the industrious." The suggestion germinated rapidly in the mind of Dr. Duncan. He saw in it the means of elevating the condition of the labouring classes and of preventing the introduction of a compulsory poor-rate, a measure which he regarded as certain to injure the community. The result of his study and efforts was the establishment in his own parish of a bank for savings, and the publication of its rules (Rules and Regulations of the Parish Bank Friendly Society of Ruthwell, instituted 26th May 1810). The rules set forth clearly and plainly the nature and advantages of the scheme, the system of management, the provision for deposits and withdrawals. The latter were in certain defined cases subject to the judgment of the managing body. The experiment at Ruthwell, though made in a parish of only 1100 people, purely agricultural, without resident heritors, and where the majority of those grown up were already members of friendly societies, was most encouraging. From the first Dr. Duncan intended that his scheme should be adopted everywhere, and by tongue and pen he spread the knowledge of what was being done in his parish. In 1814-15 the movement attracted a large measure of public notice and advanced rapidly. The rule of Dr. Duncan was heaped with letters of inquiry; and to save his time, and to promote the cause he had at heart, he published in 1815 an *Essay on the Nature and Advantages of Parish Banks*, a greatly enlarged edition of which appeared in the following year. The essay is in four sections. The first discusses, with caution and breadth of mind, the objects and principles of savings banks; the second relates their history so far as known to the author, who speaks of his own labours with singular modesty; the third advocates co-operation between savings banks and friendly societies; the fourth, consisting of miscellaneous remarks, deals vigorously with the morality of saving and the question of a poor-law. In

1817 Dr. Duncan was forced to take the field against Mr. J. H. Forbes, the future judge Lord Medwyn, who had denied that the Ruthwell bank was the "parent institution," claiming that distinction for Edinburgh, and who had exalted the management of the Edinburgh bank at the expense of that of Ruthwell. He showed without passion, and with dignity and courtesy, that both these assertions were erroneous (*Letter to J. H. Forbes, Esq.*). This same year a measure was framed by Mr. Rose in the interests of savings banks, but its provisions, while highly beneficial to depositors in England and Ireland, were disadvantageous to those in Scotland. Dr. Duncan convinced Mr. Rose that this was the case, and Scotland was not included within the scope of the act. Two years later, a bill adapted to the peculiar circumstances of Scotland, drafted by Dr. Duncan, and expounded and defended by him in Scotland and London, passed both Houses. The vindication of the measure is contained in his *Letter to W. R. K. Douglas, Esq., M.P., on the expediency of the Bill brought by him into Parliament for the protection and encouragement of Savings Banks in Scotland*. A *Letter to Managers of Banks for Saving in Scotland*, 1819, informed them of the steps they needed to take in order to take advantage of the act. In 1824 the Scotch banks were forced to reduce the interest of 5 per cent which they had hitherto allowed on deposits from savings banks, and Dr. Duncan sought to procure for the savings banks of Scotland the right to purchase, if they saw fit, those government debentures the acquisition of which was made compulsory, by the act of 1817, on savings banks in England and Ireland. But the treasury refused to treat Scotland exceptionally. In 1835 a measure was passed, with Dr. Duncan's hearty approval, making the regulations for savings banks uniform in the three kingdoms, but at the same time conceding to Scotch banks established before the date of the act the privilege which Dr. Duncan had advocated in 1824.

It should be added that Dr. Duncan was a free trader, and that he published in 1820 a letter to Mr. Douglas, M.P., in which he contended for the abolition of all commercial restrictions. In 1850 he published *Presbyter's Letters on the West Indian question*, in which, with his usual sobriety of statement and calmness of judgment, he argued against immediate and unconditional emancipation, and in favour of emancipation at a fixed but not distant date—substantially the policy which three years later was adopted by parliament.

[Besides the pamphlets cited, see *Memoirs of the Rev. Henry Duncan, D.D.*, by the Rev. G. J. C. Duncan (Edinburgh, Wm. Oliphant and Son, 1848), and the article by Prof. Blaikie in the *Dict. of Nat. Biog.*]

W. P.

DUNCAN, JOHN, according to M'Culloch (*Literature of Political Economy*, 1845, p. 286) was the author of the following work, directed partly against indiscriminate almsgiving:—

Collections relative to systematic relief of the Poor at different Periods and in different Countries: with observations on Charity, its proper objects and its influence on the welfare of Nations, Bath, 1815, 8vo.
H. R. T.

DUNCAN, JONATHAN (1799-1865) son of Jonathan Duncan, governor of Bombay, was born there, and died in London. He took his B.A. degree at Cambridge in 1821 and lived for some time in the Channel Islands. He edited the *Guernsey and Jersey Magazine* (1836-37) and published several historical works, original and translated. After 1841 he lived chiefly in London and devoted himself to currency reform, on which subject he wrote:

How to reconcile the rights of Property, Capital, and Labour—Tract I. of the Currency Reform Association, London, 1846, 8vo (all published; "money need not, and indeed ought not, to possess any intrinsic value" (p. 6), "value . . . is labour condensed" (p. 10)).—*The National Anti-Gold Law League; the principles of the League explained versus Sir R. Peel's currency measures, and the partial remedy advocated by the Scottish Banks*, London, 1847, 8vo.—*Letters on Monetary Science*; by Aladdin, London, 1848, 8vo (contributions signed by this pseudonym to Jerrold's *Weekly News*, written "to emancipate the human mind from the gross errors of bullionism and the servile idolatry of a comparatively useless metal").—*The Principles of Money demonstrated, and bullionist fallacies refuted*, London, 1849, sm. 8vo.—*The Journal of Industry*, 30th November 1850 to 15th March 1851, small folio (only sixteen numbers published; chiefly devoted to currency).—*The Bank Charter Act; ought the Bank of England or the People of England to receive the profits of the national circulation*, 2nd ed., London, 1858, 8vo.

[*Dict. of Nat. Biography*, xvi. 170, 171.]

H. R. T.

DUNDAS, HENRY (1742-1811), first Viscount Melville, successively solicitor-general and lord advocate of Scotland, and thereafter a prominent member in different offices in several administrations, honoured with the friendship of Pitt, and for many years the dictator of Scotland, was regarded during his lifetime as a high authority on questions of trade and commerce, more especially in connection with the East Indies. From the formation of the board of control, he was in fact, though not in name, the minister for India. In 1793 he moved the renewal of the monopoly granted to the company. The speech he delivered on this occasion was afterwards published, having as a preface the eulogy pronounced on it by Pitt in the course of the subsequent debate (*Substance of the Speech of the Right Hon. Henry Dundas, on the British Government and Trade in the East Indies*, 23rd April 1793, London, 1813).

From an economical point of view the most important statement in the speech is the declaration that the existing arrangement in India was "in opposition to established theories in government and commerce." The experience of nine years had however justified the system. The same views are expressed in his *Letters upon an Open Trade to India* (London 1813). He contends that the question cannot be treated as a purely commercial one and strenuously asserts that the trade to India should not be open.

[Stanhope's *Life of Pitt*.—Omand's *Lord Advocates of Scotland*, ii.—articles in *Dict. of Nat. Biog. and Ency. Brit.*]
W. P.

DUNNING, RICHARD (fl. 1685-1698), published *A Plain and Easy Method, showing how the office of overseer of the poor may be managed, whereby it may be £9000 per annum advantage to the county of Devon, without abating the weekly relief of any Poor* (1685); and *Bread for the Poor*, by R. D. (1698). He defended the old poor law (43 Eliz. c. 2), which he maintained was sufficient to reduce poverty, and suggested various methods for its better administration. The chief value of Dunning's pamphlets consists in the information they contain relative to the condition of the labouring classes in Devonshire at the end of the 17th century.

[Eden's *State of the Poor* (1797), i. 225, 248-252.]
W. A. S. H.

DUNOYER, CHARLES (1786-1862), born at Carennac (Lot), died at Paris. He studied law at Paris; then assisted in preparing the *Recueil de jurisprudence* of Sirey. He welcomed the fall of the empire, though he only accepted the legitimist monarchy so far as it respected the liberty of the people. In conjunction with Charles Comte he established, 12th June 1814, the journal entitled *Le Censeur*, but the *Terreur blanche* compelled them to discontinue the publication of this paper in 1816. They resumed it eighteen months later, but modified its title to *Le Censeur Européen*. The increasing severity of the press laws, however, seriously hampered them, and, finally, the assassination of the Duke of Berry, 13th February 1820, and consequent troubles led to the entire suspension of the paper. After this Comte and Dunoyer, notwithstanding the similarity of their political and economic opinions, were compelled to separate—the former went to Switzerland, while Dunoyer devoted himself exclusively to economics. He gave at Paris in the *Athenæum Institution* a course of lectures on political economy and moral science, which were afterwards published in a volume bearing the title of *L'industrie et la morale considérées dans leurs rapports avec la liberté*, in 8vo, 1825.

When the *Ordonnances* of the 26th July 1830

appeared, Dunoyer protested in writing against this breach of the charter of 1814. After this, despairing of the elder branch of the Bourbon family, he turned to Louis Philippe, whose accession to power he welcomed with enthusiasm. Appointed, shortly after the "three days," prefect of the department of the Allier, he was transferred in 1832 to the prefecture of the Somme; this he quitted in 1838 to enter the council of state. This last post was better suited to his disposition, which, though calm, was full of energy, and ill-adapted to the compromises and the half-measures which necessity requires of practical politicians.

In 1830 he reprinted his volume of 1825 with many additions, under the title of *Nouveau traité d'économie sociale*, etc., 2 vols., 1830, in 8vo; but just before the second volume was put into circulation a fire, in 1835, consumed nearly all the copies. Extending the scope of his work, Dunoyer republished it in 1845 under the title *De la liberté du travail ou simple exposé des conditions dans lesquelles les forces humaines s'exercent avec le plus de puissance*, 3 vols. in 8vo. Besides being the author of this masterly work, Dunoyer was a contributor successively to the *Revue Encyclopédique*, the *Revue française*, the *Journal des débats*, and the *Journal des économistes*. The revolution of 1848 was a heavy blow to him, royalist and liberal as he was in his political convictions; he remained, however, on the council of state, and only relinquished his seat there after the *coup d'état* of 1851. Bitterly hostile to the second empire, as he had been to the first, he wrote a work directed against the new order of affairs. This book, which was published after his death, and then only at Brussels, is entitled *Le second empire et une nouvelle restauration*, 2 vols., 1865, in 8vo. He was elected, in 1832, a member of the Institute (*Académie des Sciences morales et politiques*), and in 1845 president of the society of political economy. His miscellaneous works (*Vues d'économie sociale*), and the second edition of his book *La Liberté du travail*, were published, both at the same time, in 1886 (3 vols. in 8vo), through the filial care of his son Anatole Dunoyer.

Dunoyer was one of the great economists of the 19th century. He wrote with much force in support of the theory of "immaterial wealth," even going so far as to say that, from the economic point of view, no "wealth" could be other than "immaterial." He was a warm supporter of the theories of Malthus on population; but he was no believer in the theory of rent, considering that there was only one factor in production, *i.e.* labour. Firm and elevated in character, rigid in life and thought, even more severe towards himself than towards others, Dunoyer was one of those men whose career affords one of the highest examples. He

died in the enjoyment of that esteem which his frank and loyal conduct won for him in every public position that he had occupied.

A. C. F.

DUODECIMAL SYSTEM. The following remarks under this rubric are given simply because, as we have devoted considerable room to the subject of the decimal system, it might be supposed that we had not fairly considered the relative merits of an alternative, or, as some may imagine, a superior system. But the fact is that there never has been, and undoubtedly never will be, any true duodecimal system in use by mankind in notation, calculation, weights, measures, or coin. The fundamental reason for this is that whilst the number of digits in the universally-accepted decimal system corresponds with the natural number of fingers on the hand, or with what may be called the digital system, whereby all savage races, and even cultivated man, assist their arithmetic, this cannot be in a notation by twelves. The latter would require fresh additional integers beyond the nine in use. Enormous, almost insuperable, difficulties would be involved in this. It is true that a dozen, like a score, has always been a favourite group of numbers. But this has had no real effect on the more effective arrangement for large as well as small numbers into decimal groups of 10, 100, 1000, and so on, in preference to 12, 144, 1728, and so on. Even as regards money, although it is correct to say, as pointed out in the article DECIMAL SYSTEM, that all European nations once had a system of account, but not all of them of coinage, divided into twentieths of the pound or livre, and into twelfths of the shilling or sol, they have all, except England, deliberately discarded the duodecimal as well as the vigesimal part of this arrangement, so as to gain the superior advantages of the decimal subdivision. The division of the year into 12 months, the foot into 12 inches, and the now almost obsolete English apothecaries' pound into 12 ounces, are practically the sole remaining relics of the system.

F. H.

DUPIN. BARON CHARLES (1784-1873), born at Varzy (Nièvre), died at Paris. He came out in 1803 with distinction from the Polytechnic school, after having been at the head of the list in the entrance examination. Louis XVIII. created him a baron (1824), Louis Philippe, a peer of France (1837); he was appointed a representative of the people after the revolution of 1848, and Napoleon III. made him a senator. "The changes," he said satirically, "are not in myself, but in the powers that be!" Dupin, who was endowed with much ability, devoted his life to the extension of technical teaching in France. It was he who suggested that map of France in two colours (black and white) which shows by graduated shades the degree to which primary

instruction has been carried in every department. This most useful statistical method, though now familiar, was, in 1827, quite a novelty. Of his writings as an economist we may mention *Le petit producteur français*, Paris, 1827, 7 vols. in 8vo.

In a familiar yet witty style this little book describes, in the form of a dialogue, the strictly regulated system existing in France before 1789, and the commercial and industrial liberty which the majority of modern economists desire to see realised. The names of the two personages, the old "Prohibant" and the young "Lefranc," show clearly enough the side to which Dupin inclined then. Afterwards he became one of the pillars of the protectionist system. This time it was not the "powers that be" who had changed.

[See French *Dict. de l'Éc. politique*.—His work *The Commercial Power of Great Britain, exhibiting a complete View of the Public Works of this Country*, with atlas and plans, was translated from the French, 2 vols. (Knight), 1825.] A. C. F.

DUPIN, CLAUDE, born towards the end of the 17th century, died in 1769; he was the grandfather of Madame Georges Sand, née Aurore Dupin. First an officer in the French army, he became afterwards a *fermier général*. In 1745 he printed anonymously his *Oeconomiques* (Carlsruhe, 3 vols.), but the name of the place (Carlsruhe) appears to have been used to deceive the police. Notwithstanding these precautions, Dupin found it advisable to withdraw from circulation all the copies he could collect, and very few are known to exist in our days. The chapter entitled *Mémoire sur les Bleds* was published separately in 1748, and reprinted in the *Journal Économique* (February and March 1760). Dupin appears to be entitled to the honour of having been the first in France to advocate a more liberal policy concerning the corn trade, as Herbert's essay was only published in 1755. "When corn is dear," he says, "money is lavished to import it from foreign countries. Is it not a mistake not to be forgiven, to prevent its export when its price is gone down to nothing (vol. i. p. 205). . . . If the trade in corn were constantly free, corn would never be wanting (vol. i. p. 208)." However, he does not push his deductions from this principle to their legitimate conclusion, for in his proposed legislation on this subject, although he recommends a free inland trade, he shackles it with numerous formalities, and as for foreign trade, he only allows corn to be exported when the price is lower than 12 livres per sack; from 12 to 18 livres, corn may be imported against payment of a duty of 3 livres per Paris setier; from 18 to 24 livres, the duty is to be only of 5 sous per sack. At 24 livres a bounty of 2 livres is to be granted on imports.

Some terse and pregnant remarks may also

be gathered mostly from the rest of the first volume, for instance this one (p. 115), "Money ought to be considered like any other commodity and never restrained in its natural course"; but such enlightened opinions are not followed to their ultimate conclusion. "Never has money been drawn from a state without its being provided with the same value of goods or produce, and we must suppose that these goods were useful to the buyer, for the simple reason that he has bought them" (*Oec.* vol. i. p. 114). "Money, which flows out of a state, calls other money in; the money that comes in calls other money out. This is the mechanism of trade; to oppose it is to ignore and to destroy the principles of trade. . . . It is the interest of a state to have rich neighbours; if they are poor, they will not come to buy our superfluous goods. A shopkeeper sells nothing in a place peopled with beggars. . . . It is an absolute mistake to think that we can dispense with our neighbours, and that they cannot go on without us; the richer our climate, the more we need them to consume our excess of riches. If heaven has not granted us certain goods, or if the disorder of the seasons deprives us of our usual produce, these same neighbours will come to our help" (p. 115).

Besides this work Dupin wrote, also anonymously, and with the assistance of two Jesuit fathers, some very bitter *Réflexions sur quelques parties d'un livre intitulé l'Esprit des Lois* (1749), but Madame de Pompadour interfered, and almost the whole edition was suppressed by the author. In 1759, Dupin criticised Montesquieu's views on trade, finance, and the influence of climate under the title of *Observations sur un livre intitulé l'Esprit des Lois*, but in a more temperate style, and without any indication of author, date, or place.

For a very detailed account of the printing and suppression of Dupin's books, see Du Plessis' notice on Cl. Dupin in the *Bulletin du Bibliophile*, Paris, 1859, p. 309.

E. Ca.

DUPONT (or, as he himself wrote, Du Pont), PIERRE SAMUEL (1739-1817), received the addition of DE NEMOURS to his surname from the place which he represented at the constituent assembly, in order to distinguish him from another Dupont in the same assembly, and was one of the greatest of the "men of great learning and ingenuity in France" (Adam Smith) who were called "economists." Born at Paris, Du Pont early ranged himself on the side of the PHYSIOCRATS (*q.v.*) His first work (1763) attracted the friendship of Quesnay and other leaders. The most valuable of their doctrines, free trade, was ably advocated by him in his *Exportation et importation de grains*, 1764. If Quesnay was the father of physiocracy, Dupont was its godfather, for he gave it its

name by the publication of his *Physiocratie*, 1767; a collection of Quesnay's articles, which the editor introduced by a *Discours* (see DAIRE's *Physiocrates*, part i. tome ii. p. 19). To the same period belongs his *Origine et Progrès d'une Science nouvelle* (see DAIRE, *Ibid.* tome ii. p. 332), based upon that "little book written by Mr. Mercier de la Rivière," which Adam Smith calls "the most distinct and best connected account of this doctrine" (*W. of N.*, bk. iv. ch. ix.). Many other expositions of physiocratic doctrine were contributed by Dupont to the *Journal de l'Agriculture* . . . and the *Ephémérides* (q. v.), which he successively edited (1765-1772). He was aided in his editorial work by the pen and advice of Turgot. Almost the only cloud in the friendship between the two publicists arose when Dupont, with the usual indiscretion of editors, ventured to "touch up" the now celebrated "Réflexions sur . . . la richesse," contributed by Turgot to the *Ephémérides*. When Turgot became minister he did not forget his friend. Dupont was appointed to an important and confidential post; which he forfeited on the fall of Turgot, but was afterwards employed under Vergennes, in an office not altogether congenial to a great opponent of the commercial system, the "bureau de la balance du commerce." The practical ability of Dupont was displayed in the negotiation of the treaty which secured the independence of America (1783), and the treaty of commerce with England (1786). In the constituent assembly Dupont de Nemours played a considerable part. He was president for some time. His eloquent voice was often heard on the side of sound theory and good sense. His protests against the creation and increase of the issue of assignats were founded upon the justest reasoning. Siding with the king at the *émigré* of 10th August 1792, Dupont fell under the ban of the extreme party. While hiding from their pursuit, he wrote, during this period of enforced seclusion, his optimistic *Philosophie de l'homme*. Discovered at length and dragged to prison, Dupont would infallibly have been guillotined, but for the timely fall of Robespierre. Under the directory Dupont obtained the influence due to his financial ability; but on the revolution of the 18th Fructidor he abandoned politics and retired to America. He resided in France during the empire, devoted to literary pursuits. It was during this period that he edited the works of Turgot (1802), which he enriched with interesting notes. Dupont took office under Louis XVIII. in 1814, but on the return of Napoleon once more retired to America, where he died in 1817.

It is impossible in a curt abstract to convey an adequate impression of the exuberant genius which, during more than half a century, con-

tinued to pour forth eloquent discussions on varieties of subjects ranging from the "philosophy of the universe" to the habits of insects. If in political economy Dupont made no great advance; if, contrary to the advice of Turgot, he turned in one circle, confined to a narrow sect; he at least purified and embellished the doctrines of that sect. He emphasised what was best in its teaching, the principle of *laissez-faire*. With potent voice he bade trade, Lazarus-like, be loosed; "Otez-lui ses liens et laissez-le aller." The magic of his eloquence was enhanced by the influence of a character noble and disinterested. He lived up to his motto: *aimer et connaître*. The breadth of his public spirit corrected the narrowness of his theory (see EPHÉMÉRIDES).

[A full account of Dupont's economical career is given in Schelle's *Du Pont de Nemours et l'école Physiocratique*, 1888. Among earlier authorities may be mentioned DAIRE; who, in the first part of his *Physiocrates*, tome ii. p. 307, gives an outline of Dupont's life and a selection from his writings. Other authorities are referred to by Schelle, who also gives a list of Dupont's writings, occupying forty 8vo pages. The principal of these works have been mentioned above. Some more detailed references to the *Ephémérides* may here be added. The "impôt direct et unique" of physiocratic theory is discussed by Dupont in *Ephémérides*, 1770, tom. v. (*Principes des Finances*); the "liberty of commerce" *Ibid.* (1770, vol. vi.; *et passim*), the wastefulness of slave-labour (*Ibid.*, 1771, vol. vi.) The *Fragments in Ephém.*, 1771, vol. vii., contain some striking reflections on the theory of population, a subject which was resumed by Dupont in his last work, and according to Schelle one of his best, *Examen du livre de M. Malthus*, 1817. See also *Brieflicher Verkehr Carl Friedrichs von Baden mit Mirabeau und Du Pont*, 2 vols., Heidelberg, 1892.] F. Y. E.

DUPONT-WHITE, CHARLES (1807-1878), born at Rouen. After having practised as a barrister at the court of cassation from 1831 to 1843, he became, in 1848, general secretary at the ministry of justice. Distinguished by the elegance of his style, he was a sound economist and a resolute thinker, but too ardent a champion of centralisation and the extension of governmental authority. His earliest work, entitled *Essai sur les relations du travail avec le capital*, 1 vol. in 8vo, 1846, shows that the bent of his mind was adverse to liberty. In that volume he vigorously opposes the maxim of Quesnay, *laissez-faire, laissez-passer*. Of his other publications, the best known are: *De la suppression de l'impôt du sel et de l'octroi*, br. in 8vo, 1847 (he would gladly have substituted for these, taxes on landed property and capital); *L'impôt et l'état*, 1 vol. in 8vo, 1866, and *La Centralisation* (a sequel to the last mentioned), 1 vol. in 8vo, 1869. His other works are principally political. He also translated the works of John

Stuart Mill on *Liberty and Representative Government*. A. C. F.

DUPRE DE SAINT-MAUR, NICOLAS FRANÇOIS, born at Paris about 1695, died 1774. He is better known in the present time by his works on money than by his translation of Milton's *Paradise Lost* (Paris, 1729, 3 vols. in 8vo), which nevertheless secured his admission into the French academy in 1733. His economic writings mentioned below are now necessarily out of date, and their places taken by more recent works on the same subject. They may still, however, be consulted with advantage.

Essai sur les monnaies ou réflexions sur le rapport entre l'argent et les denrées, 1 vol. in 4to, 1746, and *Recherches sur la valeur des monnaies et sur le prix des grains avant et après le concile de Francfort* (1 vol. 12mo, 1762). A. C. F.

DUPUIT, A. J. ETIENNE-JUVENAL (1804-1866), was born in Piedmont and died in Paris. An engineer and mathematician, holding the office of *Inspecteur-général des ponts et chaussées*, Dupuit was led both by his occupations and studies to reflect upon the advantage which the public derive from means of communication, and on the method of measuring with precision that species of advantage, and utility in general. His profound reflections are embodied in two articles in the *Annales des ponts et chaussées*, viz., "De la mesure de l'utilité des travaux publics," 1844, and "De l'influence des péages sur l'utilité des voies de communication," 1849. The author of these papers "must probably be credited with the earliest perfect comprehension of the theory of utility," as Jevons says (*Theory*, preface, p. 30). By the example of water supplied at different prices to a town, Dupuit shows in the first paper that "tous les produits ont une utilité, non seulement pour chaque consommateur, mais pour chacun des besoins à la satisfaction desquels il les emploie." To measure the total utility obtained by a purchaser, Dupuit employs a construction similar to that which Professor Marshall has made familiar (*Principles of Economics*, bk. iii. ch. vi.). The curve in the annexed diagram represents the variation of demand with price; the abscissa measured along OP corresponding to price, and the ordinate measured along ON to the quantity of the commodity purchased. The construction is the same as that of COURNOT (*q. v.*), published in 1838; which Dupuit does not appear to have seen. Upon the principle that "il n'y a d'utilité réelle que celle qu'on consent à payer," the total utility corresponding to the consumption of the quantity *or* is measured by the area *ornp*. For the utility of each portion such as *r'r''* is represented by the amount of money, *r'n'n''r''*, which the purchaser is just willing to give for that increment of commodity. (The reservations with which this representation must be accepted are well stated by Professor

Marshall, *loc. cit.*). Such is the *absolute* utility, not taking into account what the purchaser has to pay for the quantity *or*. This value being subtracted, the "relative utility" (Professor Marshall's "consumer's rent"), is *npP*. By parity of reasoning the (relative) utility incident to the drop from the price *op'* to *op* is *ngn'*. Dupuit assumes the area of the triangle *ngn'* (a straight line being drawn through *nn'*) to be greater

than this relative utility, on the assumption that the curve is convex; which would seem not to be universally admissible. The paper concludes with some very weighty reflections on the mathematical method in political economy. Referring to the objection that statistical data for the measurement of utility are not obtainable, Dupuit replies "que quand on ne peut savoir une chose c'est déjà beaucoup que de savoir qu'on ne sait rien." If the earlier theorists, instead of formulating the balance of trade, had confined themselves to declaring that the question was above their powers, they would perhaps have done a greater service than those who afterwards exposed their errors.

In the second paper (1849), Dupuit applies these principles to the measurement of the advantage derived by the public from roads and other means of communication. First he shows that the method proposed by J. B. Say for evaluating this utility is inadmissible. He proves that a government seeking a minimum return to meet fixed charges and the maximum advantage of the public, will in general impose a different scale of charges for canals and railways, from a monopolistic company seeking a maximum return (cp. Marshall, bk. v. ch. xiii.) The incidents peculiar to a *régime* of monopoly, that price is not in general proportional to cost, that articles will be charged according to what they will bear, that a mileage rate is not to be expected, etc., seem to be stated here as perfectly as by the most recent writers on railway problems.

These important principles are restated by Dupuit in several of his articles in the *Dictionnaire d'Économie Politique*, of which the follow-

ing is a complete list—"Eaux," "Péages," "Routes," "Voies de Communication." It will be seen from the last that Dupuit is not blind to the advantages of competition; though, in cases where it is impossible, he accepts governmental management. With these articles should be read one which appears to have been originally designed for the *Dictionnaire*, and accordingly is referred to in the article on "Péages"—the admirable paper on "Utilité" in the *Journal des Économistes*, for July 1853; perhaps, as the editor of the *Journal* says, more "clear and methodical" than the memoirs upon which it is based, and which have been here described.

A full statement of the offices which Dupuit held, of the engineering works which he constructed, and of the books and papers which he wrote, both in his capacity of engineer and of economist, will be found in *Traité Scientifiques*, 1857 (British Museum, *sub voce* Dupuit).

F. Y. E.

DUQUESNOY, ADRIEN CYPRIEN (1763-1808). A member of the States General of France, where he generally voted with Mirabeau, he was *maire* of Nancy, and later on of an *arrondissement* of Paris, and one of the chief writers in the *Ami des Patriotes* (1792). He did most useful work by his *Recueil de Mémoires sur les Établissements d'humanité*, including translations of Rutherford, Eden, Bentham, Ruggles, Howard, etc. He also published, separately, translations of Hoeck's *Statistical View of the States of Germany*, and of Bentham's *Traité on the Poor* (*Esquisse d'un Ouvrage en faveur des Pauvres*), Paris, 1802. E. C.

DURATION OF LIFE (AS AN ELEMENT OF WELL-BEING). Length of days is referred to in the earliest literature as a blessing to the individual; but it has been reserved for modern statistics to estimate more exactly the advantage which a community derives from an increase in the longevity of its members. A rough measure of the prolongation of life is afforded by the EXPECTATION OF LIFE (*q.v.*). Thus, for the period 1871-80, as compared with the period 1838-54, the mean life-line of males (41.35 years), is longer by 1.439139 years. In other words a million of males born in the later period would live 1,439,139 years more than in the case of the former period. So a million of females would live 2,777,584 additional years, if born in the later period. Or, taking the mean annual number of births as 858,878—437,492 males and 421,386 females—the additional years lived by this annual number of children would be 1,809,947. But this addition of nearly two million years of life does not represent the whole advantage which the community derives from the change in the death-rate. For of these additional years the greater part—63 per cent in the case of males and 65 per cent in the case of females—are lived at the most *useful* period of life,

the period at which the individual is least dependent on others and most productive, namely, between the ages twenty-five and sixty-five. This calculation is taken from the supplement to the forty-fifth annual report of the Registrar-General (1885). A similar conclusion had already been reached by Dr. Noel Humphreys upon somewhat different and less perfect data (*op. cit.* x. note; and *Journal of the Statistical Society*, 1883).

As to the causes which have contributed to this gain of life, see the Registrar-General's supplementary report above referred to, and Dr. G. B. Longstaff's paper on "The Recent Decline in the English Death-rate," *Journal of the Statistical Society*, 1884; and his *Studies in Statistics*. Some other writers on the subject—not all wise—are mentioned by Dr. Humphreys at the beginning of the paper above referred to (*Journ. Stat. Soc.*, 1883).

F. Y. E.

DUSSARD, HIPP. (1798-1876), born at Morez, died at Nyer near Olette (Eastern Pyrénées). He commenced life as a publicist, writing in the *Revue Encyclopédique*, 1819-33; the *Bulletin de Ferrussac* (a periodical devoted to science and industry), 1823-30; and in the *Temps*, the journal founded 15th October 1829 by Jacques Coste, which ceased to appear 17th June 1842, up to which date he remained a contributor. He signed the protest of the journalists against the *ordonnance* of July 1830, but he did not, like many others, derive any advantage from the new régime, as he preferred to remain in opposition. He supplied, in 1844, working with Eug. Daire, the notes to the edition of the works of Turgot (2 vols. large in 8vo.) published by Guillaumin. He assisted from its commencement (in 1841) in editing the *Journal des Économistes*, in which he wrote many articles, having been editor-in-chief of that journal from February 1843 to May 1845. He was the traffic manager of the Paris and Rouen railway, and distinguished himself after the revolution of 1848 by placing himself at the head of the courageous volunteers who undertook the defence of the railways in the neighbourhood of Paris, which had been overrun by bands of incendiaries. His brave conduct gained for him the office of prefect of the Seine inférieure, in which position he successfully closed the national workshops (see *ATLERS NATIONAUX*); this judicious intervention brought to an end the labour disturbances, and restored the confidence of employers. He left this post for the council of state, in which he did not remain long; his name having been drawn as one of the members who had to retire. Returning to private life, he busied himself with various occupations, such as works of irrigation, forestry, and railways, in the management of all which he displayed great ability.

A. C. F.

DUTCH AUCTION. See *Auction*.

DUTCH SCHOOL OF ECONOMISTS. In Holland, during the 17th century, the most glorious period of Dutch history, economics were not regarded as an independent science, deserving separate treatment. Economic theory at that date must be sought for in the works of eminent writers on theology, jurisprudence, and politics. Perhaps the best information can be found by studying the means adopted to promote the general welfare of the country. Practice preceded theory. The discussions on practical questions of the day gave rise to innumerable pamphlets, and by searching these we may still trace the general ideas underlying action. *Laspeyres* and *Van Rees* among others have done good service in utilising these sources of information. The titles of their works are mentioned below.

In this place attention can only be called to some of the most illustrious writers whose opinions on economic questions were ahead of their times, although in many cases the living generation refused to be guided by their advice.

HUGO GROTIVS (1583-1645) advocated freedom of commerce as one of the natural rights of man. It leads to a useful division of labour between nations. Both parties gain by the exchange, the abundance of the one supplying the penury of the other. Grotius allows the right of free immigration to foreigners. In his opinions concerning value we find a forecast of the most recent theories, as he distinctly asserts the subjective element in the determination of price. "*Mensura ejus quod res quaeque valeat maxime est naturalis indigentia. . . . Non tamen haec unica est mensura. Nam hominum voluntas, quae rerum domina est, multas res magis desiderat quam sunt necessariae. . . . Et contra evenit ut res maxime necessariae minoris sint propter copiam*" (*De Jure Belli ac Pacis*, ii. ch. xii. § 14, n. 1). Grotius describes money as the common measure of value, and regards fixity of purchasing power as the first quality money ought to possess. Though gold and silver do possess that quality in a satisfactory degree, he recognises that abundance and scarcity in the precious metals, as in other goods, will bring with them variations in their purchasing power. Grotius was among the first to defend the taking of interest on scientific grounds, and distinguished the different elements in the interest, viz.—the price for the use of capital,—the wages of the creditor and the insurance-premium for his risk. Nevertheless he was opposed to taking compound interest, and advocated the fixing of a maximum interest by legislation.

GRASWINCKEL (1600-1668) is conspicuous for his defence of free trade in corn, and for his clear insight into the causes of the general rise of prices during the latter part of the 16th and the beginning of the 17th century. He describes the pernicious effects of forbidding the

re-export of foreign corn, as the doing this would deter foreign producers from sending their corn to our markets. Even in a state of famine, when it would be legitimate on general grounds, practical considerations make *Graswinckel* advise against such a prohibition, because the best remedy is the high price itself. As water flows to the lowest level, so corn flows to the highest market. Their own private interest will prevent merchants from exporting corn in times like these. A policy that proscribes itself ought not to be proscribed by odious restrictions. *Graswinckel* clearly sees the use of forestalling corn in times of approaching dearth. It is folly to consider speculators as the cause of the dearth. He that keeps in his granaries the corn he has got, in the hope of a rising price, does not cause the high price, but the expected rise causes him to keep what he has got. The best thing government can do for preventing excessive dearth is to collect statistics respecting the quantity of corn still in the country. The knowledge where this quantity is, which will probably be more than enough to feed the people for two years, will dispel unreasonable fears and prevent hoarding by private individuals. Apprehension of dearth is the principal cause of dearth.

Concerning the rise of general prices in his time, *Graswinckel* wrote: "The change has been one, not in the commodities, but in the money. As there is four times more money in the world than there was before, there must necessarily follow a decline in money and a rise in commodities, if such can be called a rise. For leaving money out of account, and measuring commodities against each other, wages among the rest, all things have remained at their former level." Considering these variations in the value of money, he expressed the opinion that the best way to fix the rent of land would be to stipulate for payment in corn.

SALMASIVS (1588-1658) was the most influential among the many writers who defended the taking of interest. But while most of them hoped to protect the lower classes against excessive rates by legislation or by the monopoly of a public body, *Salmasius* recommended confidence in free competition, as that would compel money-lenders to lower interest to a fair rate in order to augment their business.

The works of **PIETER DE LA COURT (1618-1685)** on economic subjects are among the best, not only of this, but of all other countries. One of his works, the *Aanwysing*, pub. 1669 (see below), has been ascribed by deliberate fraud to the statesman **JOHAN DE WITT**, in a French translation under the title *Mémoires de Jean de Witt*, 1709 (also in English, 1743, *Political Maxims of the State of Holland*, by John de Witt, pensionary of Holland, London, J. Nourse). De la Court deserves a high place in the history of economic

nought for his ardent defence of the freedom of industry against corporations and monopolies. In his native city, Leyden, he found ample evidence for illustrating his conviction that industry suffers under government tutelage, and that the interests both of producers and consumers are best served by free competition, even in freedom to make cheap goods, perhaps of low quality, but within the means of their customers. Producers ought to have absolute liberty in order to be able to follow the changing tastes and fashions of consumers. Regulations, even if they could be efficient in the beginning, could remain unaltered long after they had become obsolete, as, even under the best of governments, a law once made is only amended when much harm has been done. De la Court not only attacked the regulation of industry and the taxing of manufactured goods by public authority, but also all close corporations of producers. Under the pretence of protecting citizens against aliens, and of procuring work for native industries, these corporations deprive all their fellow-citizens of the liberty of buying where they find the commodity can be had the cheapest and the best; they retard the increase of the community by increasing the difficulty of finding a living in it; they give rise to all kinds of vexatious disputes concerning the limits of their rights, and in the end they do not even benefit those persons for whose profit they were intended, as by secure earnings and luxury men everywhere are made idle, lavish, and stupid. Still De la Court did not defend freedom of trade in the modern sense of the term. He recommended freedom of labour and of competition as the best policy for strengthening his native country, but he was not opposed to import and export duties on foreign manufactures as high as the interests of commerce would permit.

Of the statesman, *Johann de Witt*, we may mention here a memoir on the value of annuities, the one of his writings which, excepting his correspondence, has most attracted public attention.

We can only recall the names of other distinguished writers as *Van der Burch*, *Boxhorn*, *Haber*, *Eggershoek*, *Noordt*, etc.

In the 18th century we find among others the works of *Esnard*, *De l'Esprit*, and *Le Long* on commerce, of *Feutou* on credit, of *Luzac* on the wealth of Holland, and many treatises on the decline of prosperity and the means of reviving trade.

Among political arithmeticians *KESSEBOOM* deserves to be remembered as an original writer, who improved the method of *HALLAY* in constructing life-tables by following out the history of a generation of persons of a certain age, individually, till all of them had died. *Struyck* and *Nieuwenhuyse* worked in the same direction.

In the 19th century political economy has

found a place in the curriculum of the Dutch universities. Along with statesmen like *VAN HOGENDORP*, *VAN HALL*, and *THORBECKE*, the Professors *ACKERSTYK*, *VAN REES*, and *YSSERING* are to be named among its most distinguished representatives. The central figure among Dutch economists of the last generation was *W.C. MEES*, for many years (1863-1884) the president of the Netherlands Bank. His works on economics are not very numerous, but all of them are characterised by great power and originality of thought. He never joined in the optimism of the French school of *BASTIAT* and other partisans of *laissez-faire*. Neither could he assent to the principles of the German economists who regarded economics as a purely historical study. Against the French he maintained the fundamental truth of *MALTHUS'* doctrine on population, against the Germans the necessity of abstract economic reasoning. In questions of economic method he followed *Ricardo*, but with a fuller understanding of the limitations of the abstract treatment, and a much more careful handling of his hypothesis. His book, *Chapters in Political Economy*, a model of sound reasoning and clear insight into the problems of distribution and foreign trade, has not met, even in his native country, with the degree of attention it deserved, as it was more difficult reading than most of those who concerned themselves with economics were accustomed to. It may be considered as the best exposition of the general theory of economics before the works of *Jevons* and the Austrian school of economists. In 1869 Mees deduced from a correct theory of value the principles of international bimetallicism which, since that date, have steadily gained ground among students of monetary science in all countries. In other papers, read before the Dutch Royal Academy of Science at Amsterdam, he treated of the incidence of taxation and of the elementary conceptions of political economy. In his youth he published an exhaustive history of banking in the Netherlands.

Among living economists *N. G. Pierson*, the successor of Mees as president of the Netherlands Bank and at the present time chancellor of the Dutch exchequer, holds the first rank. In his *Manual of Political Economy* he has succeeded by the brilliancy and lucidity of his exposition in interesting cultivated people in general in the study of scientific economics. By means of this work the latest improvements in economic theory, initiated by *JEVONS*, *Menger*, and others, and their application to the problems of distribution, have penetrated wide circles of readers. Pierson combines an extensive knowledge of the literature of political economy and a full appreciation of the historical inquiries of our eastern neighbours, with the gift of prudently using the deductive method. Though his mode of treatment is less systematic than that of Mees, it is much more attractive; he always

tries to interest his readers in the general knowledge he wishes to impart to them, by reference to the practical problems on which the theories throw light.

The study of Mees and Pierson by the younger generation of economists explains the slight influence in Holland of the German school of Schmoller and others, who recommend an exclusively inductive treatment of economics, and the favourable reception of the doctrines of the Austrian school. The question of economic method was much discussed in the Netherlands a few years before the work of Menger on the subject appeared. *Borgesius* and *Levy* had recommended the inductive treatment, and were refuted, among others, by *D'Aulnis*, *Pierson*, and *Heymans*. Since 1880 the controversy may be considered as closed.

Following the lead of Mees and Pierson, many young authors have attempted to work out special problems on deductive principles. In this spirit *Beaujon* wrote on the theory of international trade, *Harte* on interest, *Falkenburg* on the rate of wages, *Verrijn Stuart* on socialistic theories of value. Much highly original work has been done by applying the principles of Jevons and Menger to the theory of taxation, in the works of *Cohen Stuart* on the progressive income tax, and by *Tasman* on the incidence of taxation.

Another feature of the Dutch economic school of the present day is its adherence to the fundamental ideas of Malthus' doctrine of population. Excepting a few writers, among others, Professors *Vissering* and *Cort van der Linden*, all are convinced that the great mass of the people cannot permanently better its standard of living, if it does not diminish competition by limiting its numbers. A lively controversy arose about Malthusianism and so-called Neo-Malthusianism about the years 1875-76. *Greven* and *Van Houten* defended neo-Malthusianism against the objections of Professor *Evers* and others. Pierson lately declared in his treatise that all the objections to that doctrine which an economist was competent to judge of, appeared to him to be invalid, and that the question ought to be definitely settled on medical grounds. Professed neo-Malthusians were called more than once to professorships at the public universities, and a neo-Malthusian league has set up an active propaganda since 1880.

Next in importance to a due regulation of numbers, Dutch economists regard all kinds of measures for "social reform." They do not proclaim Malthusianism as a panacea for all evils, but they are convinced that all other measures for elevating the masses, however useful in themselves, will avail little, unless "peopling up to them" as *MILL* expressed it, is prevented. The theory of *laissez-faire*, which never had been accepted without qualification,

even by the older generation of economists, such as *DE BRUYN KORS* and *Vissering*, is visibly losing ground in the minds of the general public, and is regarded as insufficient and incomplete by all scientific writers on economics. Here the impulse came from Germany. The new German school of the "Kathedersocialisten" found eloquent and ardent expositors in *Van Houten*, *Kerdijk*, *Borgesius*, and others. Van Houten initiated the factory-legislation in 1874, and since that date public opinion has been steadily ripening for more extended state interference. Since 1886 parliamentary and royal commissions have collected materials for further legislation concerning the interests of the working classes, outside agriculture. A weekly paper on social questions, under the able editorship of *Kerdijk*, has worked since 1887 in the same direction. Compulsory insurance has been recommended by various writers, and government seems not unwilling to propose such a measure. Trade-unionism and the co-operative movement not having attained among the working classes that degree of development their friends had wished for, the necessity of state interference begins to be recognised by many who would have preferred self-help.

Socialism in its most uncompromising shape is actively propagated by *Domela Nieuwenhuis* and others by means of papers and public meetings, and finds an increasing number of adherents among the younger generation in the great cities and in the northern provinces. *Quack* has been occupied for many years in writing an extensive history of socialism, which has now been carried down to the year 1850. *D'Aulnis* has given an able criticism of modern socialistic theories from *MARX* downwards.

In commercial matters there is but one opinion among economists in Holland. Free trade is considered the best policy for countries generally, and more so for a small country, where trade flourishes and combinations among producers would easily dominate the market if foreign competition were excluded. *Beaujon* defended free trade with great acumen in the second part of his essay on international trade. An agitation for duties on corn, set up a few years ago, vigorously defended by *Diepen* and in a more scientific spirit by *Harte*, has met with energetic resistance on the part of our best writers, e.g. Pierson and the younger *Mees*, and may be said to have subsided since that date.

In the "battle of the standards," Dutch economists, since the exposition by Mees of the principle of bimetallism, are agreed that theoretically that would be the best system, because it would give the greatest guarantee of fixity of value in the standard coins. We possess many valuable articles on the question by *Bois-sevain*, who recently gave a very able defence

of the bimetallic theory against its English and continental opponents in his work *The Monetary Question*.

The necessities of the exchequer and the need of reform in the fiscal system have directed attention in an unusual degree to questions of finance. Sickenga has published, commencing with 1863, an historical exposition of the rise of the present system, in establishing which men like GODEL, Van Hall, and Esté took a prominent part; Sprenger Van Eyk wrote a masterly resume of the present situation with all its imperfections; Pierson, Van Nierop, Cort van der Linden and Traub are among the most distinguished writers on the principles of taxation.

Holland possesses a *Monthly Review*, now in its forty-first year, exclusively devoted to economics, edited from the first by De Bruyn Kops and after his death (1888), by a committee, including many of the writers mentioned above.

Statistics are much indebted to De Bosch Kemper, who founded the Dutch statistical society and has edited since 1849 the year book of that society.

Below are given the titles of the works mentioned in this article.

Laspeyres, *Geschiede der volkswirtschaftlichen Anschauungen der Niederländer und ihrer Litteratur zur Zeit der Republik*, 1863.—Van Rees, *Geschiedenis der Staatshuishoudkunde in Nederland tot het einde der achttiende eeuw* (History of political economy in the Netherlands to the end of the 18th century), 2 vols., 1865-68.

17th century: Grotius, *Mare liberum*, 1609; *Inleiding tot de Hollandsche Rechtsgeleerdheid* (Introduction to Dutch jurisprudence); *De jure belli ac pacis*, 1625.—Graswinckel, *Aenmerkingen ende betrachttingen by 't Placaetboek op 't Stuck van de Lijfvocht* (Remarks on the edicts concerning the trade in corn), 1651.—Salmasius, *De usuris*, 1638; *De modo usurarum*, 1639; *Dissertatio de foenore typico*, 1640.—Pieter de la Court, *Het welken der stad Leyden* (The Welfare of the city of Leyden), 1659; *Interest van Holland ofte gronden van Hollandse Welaren* (The Causes of the wealth of Holland), explained by V. D. H. (Van der Hove, = De la Court), 1662; *Aanwysing der heilsame politieke Gronden en Maximen van de Republiek van Holland en West-Friesland* (Demonstration of the salutary political maxims of the Dutch Republic), 1669.—Johan de Witt, *Calculatie van de waarde der Ly renten* (Calculation of the value of Annuities, etc.), 1671.

18th century: Le Moine de l'Espine, *De Koophandel van Amsterdam (Le Commerce d'A.)*, 1715 (new editions by Le Long).—Ricard, *Traité du Commerce*, 1715; *Le usages d'Amsterdam*, 1722.—Kerschaum, *Proeve van politieke Rekenkunde, eerst in drie verhandelingen tot een proeve om te ontdekken de waarschynlyke des volks in de provincie van Holland en West-Friesland* (Essay in Political Arithmetic, contained in three dissertations on the probable numbers of the population of the provinces of Holland and West-Friesland), 1748 (the original editions from 1738 to 1742).—Plato, *Traité de la circulation et du crédit*, 1773.—Luzac,

Hollands rykdom (The Wealth of Holland), 4 vols., 1780-83.

19th century: Van Hogendorp, *Bydragen tot de huishouding van staat in het Koninkrijk der Nederlanden* (Contributions to the Political Economy of the Kingdom of the Netherlands), 10 vols., 1818-25.

De Bruyn Kops, *Beginselen der staatshuishoudkunde* (Principles of Political Economy), 1850.—Five editions.—Vissering, *Handboek der praktische staatshuishoudkunde* (Manual of Practical Political Economy), 1860.—Four editions.—Mees, W. C., *Overzicht van eenige hoofdstukken der staatshuishoudkunde* (Sketch of some Chapters in Political Economy), 1866.—Pierson, *Grondbeginselen der staatshuishoudkunde* (First Principles of Political Economy (1875-76).—Three editions.—*Leerboek der staatshuishoudkunde* (Manual of Political Economy), 2 vols., 1884-90.

Heymans, *Karakter en methode der staatshuishoudkunde* (Scope and Method of Political Economy), 1880.—Harte, *De rentestand* (On the Rate of Interest), 1883.—Falkenburg, *Bydrage tot de leer van het arbeidsloon* (On the Theory of Wages), 1890.—Verryn Stuart, *Ricardo en Marx*, 1890.—Cohen Stuart, *Bydrage tot de theorie der progressieve inkomstenbelasting* (On the Theory of the Progressive Income-tax), 1889.—Tasman, *Afwenteling van belastingen* (On the Incidence of Taxation), 1889.

Greven, *De Ontwikkeling der Bevolkingsleer* (The Development of the Theory of Population), 1875.—Articles in the periodical *Vragen des Tyds* (Questions of the Times) since 1875, by Van Houten, Kerdijk, Borgesius, etc.—*Social Weekblad* (Weekly Paper on Social Questions), since 1887, ed. Kerdijk.—Quack, *De Socialisten, Personen en stelsels* (The Socialists, the Men and the Systems), 1875 seq., 3 vols.—D'Aulnis de Bourouill, *Het hedendaagsche Socialisme toegelicht en beoordeeld* (A Description and Criticism of Contemporary Socialism), 1886.

Beaujon, *Handel en handelspolitiek* (On Foreign Trade and its Policy), 1886.—Harte, *Vrijhandel en Bescherming* (Free Trade and Protection), 1890.—Mees (M.), *Nuilen van het protectionisme voor de werkende klassen* (Why the Working Classes lose by Protection), 1891.

Mees, W. C., *Proeve eener geschiedenis van het bankwezen in Nederland* (Essay on the History of Banking in the Netherlands), 1838; *De muntstandaard in verband met de pogingen tot invoering van eenheid van munt* (On the Monetary Standard and an International Unit of Money), 1869.—Boissevain, *The Monetary Question*, 1891.

Sickenga, *Bydrage tot de geschiedenis der belastingen in Nederland* (Contributions to the History of Taxation in the Netherlands), 1864; *Geschiedenis der Nederlandse belastingen sedert het jaar 1810* (History of Dutch Taxes from the year 1810), 1883, 2 vols.—Sprenger van Eyk, *De algemeene gemeentebelastingen in Nederland* (General and Local Taxation in the Netherlands), 1891.—Traub, *Ontwikkeling en verband van de Ryks, Provinciale en Gemeentebelastingen in Nederland* (On the Development of and the Relation between Imperial, Provincial, and Local Taxes in the Netherlands), 1885.—Cort van der Linden, *Leer-*

boek der financiën. De theorie der belastingen (Manual of Finance. The Theory of Taxation), 1887.

Sloet tot Oldhuis, *Tijdschrift voor staathuishoudkunde en Statistiek* (Magazine of Political Economy and Statistics), 1841-75, 28 vols.—De Bruyn Kops, *De Economist*, 1852-91, 69 vols.—*Staatkundig en staathuishoudkundig jaarboekje* (Annual of the Dutch Statistical Society), 1849-84, 36 vols.—*Jaarjfers. Annuaire statistique des Pays-Bas*, since 1881; *Bijdragen van het Statistisch Instituut*, since 1885 (Publications of the Statistical Bureau of that Society).—Falkenberg, *Bijdrage tot de leer van het Arbeidsloon*, on the lines of the Austrian economists.—Cossa, *Introduzione allo Studio della Econ. Pol.*, 1892. H. B. G.

DUTENS, JOSEPH MICHEL (1765-1848), born at Tours, was inspector-general of roads and bridges (*ponts et chaussées*) from 1830 to the time of his death. In his writings he manifests a spirit retrograde even relatively to the time when he lived, and favourable to government regulation. With all this he was conscientious and hardworking. In 1840 he was admitted to the Academy of Moral and Political Science.

The economic works published by him are entitled: *Analyse raisonnée des principes fondamentaux de l'économie politique*, 1 vol. in 8vo, 1804.—*Philosophie de l'économie politique ou nouvelle exposition des principes de cette science*, 2 vols. in 8vo, 1835.—*Essai comparatif sur la formation et la distribution du revenu de la France en 1815 et 1835*, in 8vo, 1842.—Finally, *Des prétendues erreurs dans lesquelles, au jugement des modernes économistes, seraient tombés les anciens économistes, relativement au principe de la richesse nationale*, in 8vo, 1846. A. C. f.

DUTOT. No biographical details respecting this author are discoverable. It is only known that he was cashier of the India Company in which the well-known John Law was concerned. (The name of this company was changed from that of *Compagnie d'Occident* to that of *Compagnie des Indes*, May 1719.) The book of which Dutot was the author is entitled *Réflexions politiques sur les finances et le commerce* (2 vols. 1718-1738, reprinted in 1743, 1754, and also in the collection of Guillaumin). In it he examines the questions what would be the effect on the public revenue, on the price of merchandise, on the foreign exchanges, and in consequence on trade, of the increase and diminution of the monetary value (*i.e.* of the purchasing power) of the circulating medium (money). This work, although too partial to the *Système* of Law, is very instructive reading, especially when its date is remembered. It was written in opposition to the views of MELON (*q.v.*)

[“Les Réflexions de Dutot sont incontestablement ce qu'il y a de plus profond sur le système de Law, et sur la cause de sa chute,” Thiers. See reference in M'Culloch's *Literature of Pol. Econ.*, p. 344.] A. C. f.

DU VERNEY. See PARIS DU VERNEY.

DUVILLARD DE DURAND, ETIENNE (1755-1832), born in Geneva of an ancient French Huguenot family. He was member of the French *Académie des Sciences*, and head of the statistical department of population in the office of the French ministry of the Interior; he is best known by his *Tables of Mortality*, which are inserted (p. 159) in his *Analyse et Tableaux de l'Influence de la petite Vérole sur la Mortalité* (Analysis and Tables of the Influence of Small-pox on Mortality), Paris, 1806. They have long been in use in France. According to Quérard (*France Littéraire*), he left mathematical dissertations in manuscript under the titles of “social mathematics,” “mathematical statistics of population,” and “A mathematical theory of banking and finance,” which are the object of a report to the *Académie des Sciences*, given as an appendix to the *Analyse et Tableaux*. In 1787 he published his *Recherches sur les Rentés, les Emprunts et les Remboursements*. E. Ca.

DWELLINGS, INDUSTRIAL, may be defined as homes for the poorer wage-earning classes specially constructed with a view to meeting the particular needs of the occupants, and ameliorating their physical and moral condition. Since about the year 1840 the construction of such dwellings, in or near centres of labour, has been, in this country, the object of public and private enterprise, as well as of extensive national and local legislation (see DWELLINGS, REGULATION BY THE STATE IN ENGLAND, and bibliography of same). The object of such enterprise has been “to provide, instead of miserable house accommodation for which extremely high rents are charged, which is ill arranged, insanitary, overcrowded, and lacking the conditions under which the ordinary decencies of life can be observed, clean homes at moderate rents, with proper ventilation and sanitary arrangements, and not too far from the places where the occupants have to work” (*Report of Dwellings Committee of Charity Organisation Society*, August 1881, the whole of which report may be advantageously studied on the subject). The various evils resulting from the unsatisfactory dwellings of the poor will be found detailed in the evidence given before the Royal Commission on the Housing of the Working Classes, 1885, and in the First Report of the Commissioners issued in 1889; but it may be briefly stated that in the design, construction, and location of industrial dwellings it is specially intended to mitigate or remove the following defects:—(1) Undue crowding, either of houses on a site or of occupants in single apartments. (2) The immorality which is the frequent result of so large a number occupying one room as to make decency impossible. (3)

the wasteful disposal of tenants on a given area, owing to their homes being inconveniently planned or designed originally for a different class of occupant. (4) Unduly high rents resulting partly from the last defect. (5) Unhealthy conditions arising from the overcrowding above mentioned, from faulty construction, or from lack of proper sanitary appliances. (6) Unconvenient distance from the daily work of the tenants.

Whereas it has been stated that, in a specially constructed building, from 1200 to 1600 tenants can be accommodated per acre without overcrowding, while the same area would, even in a "crowded" district contain only some 300 or 400 if housed in the old-fashioned manner and in old-fashioned dwellings, it is reasonable to expect that a great financial profit to the owners should accompany the substitution of "model" dwellings for houses of the old unsatisfactory class. According to reports, events did not, in the earlier days of the movement, altogether justify these expectations, though some of the companies owning industrial dwellings realise substantial interest on their capital. It appears that legislation while facilitating the acquisition of land for the purpose of building model blocks, has occasionally given such delay and publicity to the transaction as to prejudicially affect the cost. Hence in some of the provincial towns of Great Britain the more cautious movements of the purchasers, even when backed by legislation, have been attended with more successful results than similar but more open negotiations in the metropolis, where the knowledge of the compulsory powers has led to exorbitant demands for compensation. (At the same time see the evidence on p. 418 of the *Royal Commission Minutes*, and the suggestions there made as to the terms on which the Peabody Trust bought from the Board of Works.) Further it has been stated by experts specially called in to advise on the financial aspects of these schemes, that "to build for the lowest self-supporting class in central positions in London the land must practically be given." This statement and the fact that more than one "Dwellings Company" now secures a satisfactory interest on its outlay, are to be reconciled partly by the circumstance that it is not always, nor perhaps often, the lowest classes who occupy the "model" dwellings, partly by the fact that not all the dwellings even of one company are built on "central" sites, and partly also by the consideration that the associations which promote these buildings may be broadly divided into two classes:—(1) Those which are purely philanthropic, or at least do not make a dividend their first aim. (2) Those whose primary object is to realise a large proportion of rental to outlay. It is satisfactory, however, to learn from the published accounts of 1890 that, with the exception

of the Peabody Trustees, even the most philanthropic of these institutions realise a dividend of from 4 to 5 per cent, the percentage of gross rental upon cost varying from 7·6 to 9·1. During that year the Peabody Trust received a gross rental of 5·1 per cent on cost, and spent 2·1 per cent. The Improved Industrial Dwellings Co., whose undertakings have been amongst the most extensive, pay a 5 per cent dividend, while 4½ per cent is reached by the Metropolitan Association, which has been nearly fifty years in existence. The Peabody Trust, which was instituted in 1862 during the lifetime of Mr. Peabody, naturally ranks among the most important of the metropolitan agencies. The Return to the House of Lords, 1888, shows how large a number of the areas dealt with under the Citizens' and Labourers' Dwellings Imp. Acts, 1875-85, have been put into the hands of this body. It was stated in 1881 that whereas the rents of three-room tenements in their buildings varied in a period of five years from 3s. 11d. to 4s. 4½d. per week, the average wages of the tenants occupying these rooms was from £1 : 3 : 1 to £1 : 5 : 10. Thus less than one-fifth of the wages was expended in rent, a satisfactory condition in face of the evidence given before the Commission that in dwellings of the unimproved class 88 per cent of the poor population paid more than one-fifth of their income in rent, 46 per cent paying from one-fourth to one-half, while 3s. 10½d. might be taken as the average rent of one room let as a tenement. The Trustees at the time of the commission were stated to let their rooms at about 20 per cent less than the commercial companies, their charge for a single room being 2s. and upwards. No doubt the lowness of their rents has served to keep down the rental in the "model" dwellings of other proprietors. There is great competition for admission to the Peabody Buildings in the more popular neighbourhoods, recommendations of good character are required of the applicants, and thus it is a sort of guarantee of respectability to have lived in a Peabody Building. A result of this competition and the consequent selection of applicants is that the better class are chosen and consequently the Trustees' dwellings are practically not available for the lowest or poorest classes.

An epoch in the early history of the "dwellings" movement was marked by the erection, on ground adjoining the Great Exhibition of 1851, of a model dwelling from designs of Mr. Roberts, and under the initiative of Prince Albert, who was at the time President of the Society for the Improvement of the Condition of the Labouring Classes. The special feature in the construction of this block, which contained four complete dwellings on two floors, was its fireproof nature. The walls were of special hollow bricks, and the floors of a similar material set in arches and covered with "metallic lava."

Each tenement contained a living room, parents' bedroom, two small bedrooms, a scullery, and a w.c. (For illustrations and descriptions of this building see *The Builder*, 1851, pp. 174, 311, 343.) In the following year a competition was instituted at Nottingham for designs of similar buildings; and a block of dwellings, more or less on the "Prince Albert" model, was erected at Windsor. About the same date various efforts were made in the provinces to improve labourers' dwellings, chiefly in the north of England, by the enterprise of large owners of land or employers of labour. Such were the building of the workmen's colonies at Saltaire and Copley, by Mr. (afterwards Sir Titus) Salt and by Mr. Akroyd respectively, the latter building also the village of Akroydon. In 1851 Mr. Denison built a set of single men's lodgings at Leeds, and similar lodgings were built in Huddersfield in 1854. Sir Sydney (then Mr.) Waterlow was among the first promoters of the typical modern metropolitan artisans' dwellings. In his Langbourne buildings he is said to have produced by great economy in materials, and by the use of artificial stone, a profit of $8\frac{1}{2}$ per cent. He began his operations in 1860, at first with his own capital, and built no fewer than ninety tenements. His next step was the formation of the Improved Industrial Dwellings Company, the above-mentioned "Society for the Improvement of the Condition of the Labouring Classes," and the "Metropolitan Association," being already established. As early as 1867 thirty towns in the provinces of England had formed an association or taken some definite action towards improving the dwellings of artisans. Among them were Bath, Bristol, Bradford, Brighton, Cambridge, Liverpool, Newcastle, Norwich, Southampton, and Wolverhampton, besides the localities already mentioned. Scotch societies were established in Edinburgh, Glasgow, and several other towns, and Dublin had also taken up the movement.

Any detailed account of the present state of the industrial dwellings movement in London is impossible here, for there are over 475 block dwellings in the metropolis, representing nearly 36,000 tenements. In the central and western districts the better-managed dwellings are invariably full, but the pressure of applications is not so great in remoter quarters. Besides the buildings erected for the Peabody Trustees, and for the many companies engaged in this work, various model dwellings are built in London, as in the large provincial towns, by public corporations. There are also several instances in London of buildings erected by large employers of labour for their own workpeople—these, of course, differ largely according to the taste or requirements of the builders and the occupants.

To meet the difficulties which attend the acquisition of the ownership of a tenement in

a block dwelling, the Chambers and Offices Act was passed in 1881. Its purpose is "to facilitate the management of blocks of buildings occupied in sections as separate tenements, and the disposal of each separate tenement." The number of small houses purchased through BUILDING SOCIETIES (*g.v.*) by members of the working classes, shows a great desire on their part to own their homes. But it does not appear that tenants have availed themselves to any extent of the facilities offered by the Act. In this connection, however, should be mentioned the work of the "Tenant Co-operators, Limited," a small society formed in 1888, with the object of applying to the owning and letting of workmen's dwellings the principle of co-operation. The property of the society consists both of old buildings and new; fair rents, according to the locality, are charged to the tenants, who must be members of the society. After providing for depreciation, etc., and the interest on loan stock, a dividend limited to 4 per cent is paid on the share capital, and the remainder of the profits are divided among the tenants in proportion to the rents paid by them, being carried to the credit of their share accounts until a tenant holds shares equivalent to the value of his house, after which he is entitled to receive his share of surplus profits in cash. The houses of this society, which are suburban, are let at from 7s. 6d. to 10s. a week, and the last division of surplus amounted to 2s. 6d. in the £ on the rental.

A great work in the "housing of the poor" has been carried on for more than twenty years by Miss Octavia Hill upon a system of her own, which is known by her name. Miss Hill, who is opposed to the prevalent methods of building and conducting "model dwellings," objects to them, among other reasons, because they do not help the most necessitous poor, nor can they in any way ameliorate the actually criminal classes, who are obviously undesirable tenants for blocks. They are a nuisance to more respectable neighbours, and if grouped together are destructive to property. The cardinal point of Miss Hill's "system" is a carefully organised method of rent collection. She has at her service a body of unpaid collectors whose self-imposed duty is, while collecting the payments due, to inspect the tenants and their manner of life, and by every means of personal influence to assist the more degraded to improvement. Though Miss Hill has built several new houses, her work has principally consisted in buying up old buildings, generally for the sake of tenants already occupying them, over whom she is desirous of exercising moral influence, while at the same time ameliorating the condition of their homes. The first act on acquiring a property is, if needful, "to put the drains, water supply, and roofs to rights."

Other improvements follow in proportion as the tenant shows himself appreciative of these attentions, and ready to protect his dwelling from misuse and destruction at his own or others' hands.

The difficulty of obtaining a sufficiency of sites in central positions has induced the building of many blocks of artisans' dwellings in suburban districts. The consequent distance of the occupants from their work leads to two fresh difficulties: the impossibility of return for the midday meal, and the expense of travelling. The former of these has been obviated by the action of many employers who have erected or provided mess-rooms for their workpeople. The second difficulty, the expense of travelling, is partly met by the institution of workmen's trains. Under the Cheap Trains Act, 1883, the Board of Trade have power to order any railway company, who may appear to them not to provide a sufficient number of workmen's trains at convenient hours and low fares, to forthwith provide such trains, and failing compliance they may deprive the company of the benefit from the remission of duty to which they are otherwise entitled under the Act. Before the passing of this Act provision for workmen's trains had been made in the special Acts of several of the railway companies serving the metropolis. These trains have been of great service to the working classes living in the suburbs. But a family in which there are two or three wage-earners has still so much to pay in travelling that the cheapness of workmen's trains is not a sufficient compensation for the added expense of living remote from the work. Again there are some classes of work, such as mending and other small jobs for tailors, in which whole families are often engaged, which cannot be carried on if the distance between the shop and the home is great.

As regards the general principles of construction which are found to be most successful in block dwellings, it may be noticed that the buildings of the best types, though varying, have certain essential features in common. They differ from ordinary tenements in having a staircase, or staircases, which are not only common to the tenants, but open to the public; the door, if any, at the entrance being open at least by day. Five or six stories is the usual height; the buildings commonly stand round a wide square or quadrangle entered by an archway from the street, the entrance to the staircases being from within the square. Light and air are primary considerations, and tall dwellings should not stand in a narrow street, but with an open space round them, or the tenants of the lower rooms will have insufficient light. The staircases are sometimes open to the air, but if built within the block should be lined with

glazed bricks. They are generally so tall and narrow that top light is insufficient, and in the best buildings they are provided with good windows. All windows of rooms should open direct into the space in front or back of the buildings, not into narrow areas, as it is important to get direct daylight. Sanitary accommodation is one of the debated problems among designers of these buildings. For convenience, cheapness, and simplicity, it is better to collect the apparatus into a distinct portion of the building. Where the tenements are arranged on the external gallery system, with only one or two staircases in a block, the w.c. accommodation is sometimes grouped together by the staircases. But among the more respectable class of residents greater privacy is preferred, and a separate w.c. is provided for a small group of tenants. An approved arrangement is that on each floor of a staircase there should be four sets of rooms, one wash-house (with copper washing trays and a bath) serving the whole set of four, and two sinks and closets. By means of this distribution a certain privacy is maintained, and in the matter of the wash-house an objection is met which is almost fatal to the prospects of some of the dwellings in which a wash-house common to the block is provided in the upper part of the building. There is a strong objection among the quieter women to the noisiness and publicity of this arrangement.

Tenements in model dwellings vary in size from one to six rooms, but by far the greater number consist of two. The rents for one-roomed tenements range from 1s. 9d. per week to 6s., and a two-roomed tenement can be obtained in a good building at 5s. In all modern block dwellings it is customary for every living room to have a fireplace.

The occupations of the tenants vary so greatly as to defy analysis; all whose work is inoffensive or is not done at home are considered suitable tenants if respectable; but in well-managed blocks those trades are considered inadmissible which can be in any way obnoxious to occupants of the building, *e.g.* costermongers may not keep their goods nor donkeys in Peabody Buildings, nor may French polishers conduct their trade in them. It is important to realise the proportion of wages to rent. In a set of one-roomed tenements rented at from 3s. to 4s. the wage-earners were found to make from about 15s. to 28s. a week, in another building, three-roomed tenements at 4s. 6d. were occupied by families in which the father earned from 25s. to 30s. The difficulty of forming a ratio between rent and wages lies in the fact that in many cases the latter are not constant, and that the earnings of the head of the family are supplemented by the occasional gains of the other members.

The rural employers of labour have, in a large

number of cases all over the country, built improved and sanitary cottages for their employés. In many cases this work has been one of pure philanthropy, for it is impossible at the present rates of wages to demand of an agricultural labourer a rent which will remunerate the builder of a model cottage in a genuinely rural district. A landlord who lets allotments with his cottages may receive some return for the total outlay, but generally speaking his expenditure in labourers' dwellings can only be said to indirectly "improve the estate."

P. W.

DWELLINGS, MODEL, OF WORKING CLASSES IN FRANCE. The problem of housing the working classes in France is complicated by several peculiar considerations. Where towns are fortified, military policy forbids the erection of buildings within a certain distance of the fortifications; but the pressure upon this rigid zone has, in some cases, become so severe that the fortifications (as at Lille) have been demolished. The purchase of house property by yearly instalments is hampered by the French law of succession, whose operation breaks the continuity of the transaction. Nor can this difficulty be entirely overcome by insuring the life of the purchaser. Conscription, again, may remove from the family a son whose earnings were essential to the payment of the instalments. The taxes on doors, windows, and furniture, the contributions exacted for drainage, water, cleansing the streets, etc., form serious obstacles to the erection of cheap model dwellings. Complaint is also made that legal formalities of acquisition, transfer, and eviction are tedious and expensive.

Under the empire a subvention of 10,000,000 francs (£400,000) was decreed (22nd June 1852) in favour of improvements in workmen's dwellings. 6,000,000 (£240,000) were devoted to raising *asiles* at Vincennes and Le Vésinet; 2,000,000 (£80,000) to the construction of seventeen houses in Paris (now occupied by well-to-do persons); and the remaining 2,000,000 (£80,000) were granted to builders. Of this last sum, 1,200,000 francs (£48,000) were awarded on conditions in Paris, at the rate of one-third of expenses actually incurred in building; but the financial results appear to have been unsatisfactory. Napoleon III. built forty-one houses at Paris, and offered to give them to a workmen's society which should subscribe 100,000 francs (£4000) of its own. The *Société co-opérative immobilière* accepted the offer. Its net receipts

have not, however, reached 5 per cent of its capital.

While the population of Paris has been increasing, the habitable space within the walls has been seriously diminished by the widening of streets (now required to measure 12 mètres across—say 39 ft. 6 inches), the demolition of old dwellings and the substitution of warehouses, railway stations, and the like. Land is, therefore, very dear. Building materials are, also, subject to *octroi*, and the cost of construction is high. M. Cacheux gives as his experience that 6000 francs (say £240) is the lowest sum which a detached workman's residence could cost in Paris. His lowest estimate for contiguous model dwellings is 5000 francs (£200) per house; and, in each case, the rent is fixed at about 8 per cent per annum upon the capital. A group of ten houses, sold by M. Cacheux at cost price (5500 francs [£220] each) to the *Société des habitations ouvrières de Passy-Auteuil*, is let out upon the Mulhouse system (*v. infra*). Each house contains two rooms, a kitchen, cellar and garden, and may be bought by a twenty years' tenancy at from 450 to 500 francs (£18 to £20) a year.

The main difficulties encountered in Paris in this connection are the low wages of the workmen concerned, their deficient sanitary education, and want of attachment to a particular residence. They live largely out of doors, and remove for the most trifling reasons.

At Mulhouse (now German territory) was founded in 1853 the *Société mulhousienne des Cités ouvrières*, under the presidency of M. Jean Dollfus. Its shares of 5000 francs (£200) apiece originally numbered sixty, and were held by twelve persons, but were increased to seventy-one divided among twenty holders. 300,000 francs (£12,000) of the subvention above referred to were received from the emperor. Numerous small houses, each with a separate garden, were built from the plans of M. Émile Müller, and offered to tenants at a yearly rent of 8 per cent on the cost price. Share capital may not receive more than 4 per cent. Any surplus after payment of expenses is devoted to works of public utility. The distinguishing feature of the society is, however, its system of sale. By advancing about one-tenth of the cost of the house the tenant may become its incipient owner. A yearly rent of about 10 per cent on the cost paid for a period ranging from 12 to 15 years makes him the absolute owner. Interest upon the cost of the house is calculated at 5 per cent, and the same interest is allowed upon all sums paid by the tenant over and above ordinary rent. The amount standing to a tenant's credit is paid over in full in case of his death, removal, etc. The experiment has yielded excellent financial and moral results. On the 1st January 1889, 1124 houses costing 3,485,275 francs (£139,400) had been built and

sold; 4,584,020 francs (£183,360) had been received; sums due amounted to 424,950 francs (£17,000). Rents are always regularly paid. The occupants of the houses exceed 8000. The rules forbid sub-letting. One family only is to reside under each roof. And a house once acquired may not, without the directors' sanction, be resold within ten years. The price of a house, originally about 2500 francs (£100) is now (1890) upwards of 5000 francs (£200). The rise is partially explained by the exhaustion of the subvention in the construction of roads, drains, and so forth at an early stage. Such expenses are now thrown upon houses as they are built. Dr. Horkner (*Oberclassische Baumwollindustrie und ihre Arbeiter*) asserts that several of the houses are mortgaged by their tenants. The houses are much in demand, rents in other parts of Mulhouse being nearly as high as the instalments of purchasing tenants.

At Lille, in 1865, a society very similar to that of Mulhouse was started,—the municipality guaranteeing 5 per cent interest on its capital up to 2,000,000 francs (£80,000). Up to the present time recourse to this guarantee has not been necessary. The few houses of two stories built by this society do not sell readily. Over 200 houses of one story had been sold on the 1st January 1886. Many more have since been erected. Napoleon III. presented 100,000 francs (£4000) to the society.

At Havre the Mulhouse system was adopted by a society founded in 1871, capital 200,000 francs (£8000). The municipality voted it a subvention of 25,000 francs (£1000) and, following the example of Lille, offered a guarantee of interest upon capital up to 500,000 francs (£20,000). 117 houses have been built, and half of them sold. The society pays 5 per cent.

At Orleans a society, founded by two workmen in 1879, has built and sold 220 houses, and paid 5 per cent upon its capital—now amounting to 450,000 francs (£9000).

At Nancy a society of 200,000 francs (£8000) capital has built and sold 57 houses, costing from 4500 (£180) to 7000 francs (£280). It is said that this society paid too much for its land. Having paid 5 per cent up to 1884, it then fell to 2½ per cent, and is now (1890) being wound up.

At Rouen a society with 200,000 francs capital (£8000) was formed in 1885, and built a block of six houses capable of lodging ninety-five families. Interest on shares is limited to 4 per cent, and bids fair to reach that amount. On the 15th April 1890 there were seventy tenants in residence, of whom twenty are small employes. The wages of tenants range from 600 francs (£24) (in the case of women) to 1200 francs (£48) a year. Rents range from 87 francs (£3:10:0) (one room) to 450 francs (£18) (four rooms) a year. These prices compare

favourably with those of other lodgings far less comfortable and healthy in the same central quarter.

Societies similar to those already described exist at St. Quentin, Amiens, Nantes, Lyons, Rheims, and elsewhere. That of Rheims is co-operative, and includes the improvement of old dwellings as well as the construction of new. At Lyons, Marseilles, and other towns, advantage has been taken by savings banks of a recent permission to invest their profits in aid of the construction of workmen's houses.

Employers engaging regularly a large number of hands have, in many cases, supplied their operatives with suitable houses rent free within easy distance of their work. Among others may be named the settlements of Anzin, Beaucourt, Blanzay, Commeny, Le Creusot, Maine, and Noisoul. The remarkable experiment of M. Jean Godin at Guise is described under the article FAMILISTÈRE (*q.v.*)

There is substantial agreement among French writers as to the superiority of suburban cottages over town dwellings. But the time and money spent in locomotion, the necessities of particular industries, and the advantages of proximity to good markets, often outweigh other advantages.

DWELLINGS (REGULATION BY THE STATE IN ENGLAND). The regulation of dwellings by the state in England is of very modern origin. Down to the present century the responsibilities of the government in matters of health was entirely ignored or confined to the ideals of individuals. The first impetus to any recognition of such responsibility was given by the poor-law commissioners in their fourth and fifth reports (1838-39), and probably originated with their secretary Mr. Chadwick (afterwards Sir E. CHADWICK). The commissioners utilised the opportunity afforded by a purely financial

question to direct inquiries into the "prevalence of certain physical causes of fever in the metropolis," and also into "some of the physical causes of sickness and mortality to which the poor are particularly exposed." A further report on the sanitary condition of the labouring population of Great Britain was issued by them in 1842, in which attention was directed to "the condition of the residences of the labouring classes where disease is found to be most prevalent" and also to "circumstances connected with the internal economy and bad ventilation of places of work, lodging-houses, dwellings, etc." Already in 1840, the subject had attracted the attention of the House of Commons, and a select committee had reported in favour of a general buildings act, a general sewerage act, the establishment of a central board of health, and the appointment of sanitary inspectors in large towns. From that time forward legislation on the subject falls under two principal heads, viz. (I.) that which is intended to enforce sanitation, and (II.) that which is designed to facilitate the repair or removal of unsanitary buildings.

I. Under the first head may be mentioned the following:—(a) Two acts (14 & 15 Vict. c. 28, 14 & 15 Vict. c. 34) passed by the influence of Lord Shaftesbury in 1857 to provide for the control of common lodging-houses. By the second of these power was given to the local authority to build such lodging-house, but the power has never been exercised. Subsequent acts passed in 1866-67 have placed the control of these houses, which are usually distinguished by having a common sitting-room, in the hands of the police. (b) The principal acts governing the metropolis, viz. the Nuisances Removal Act of 1855 (18 & 19 Vict. c. 121), extended and amended by 29 & 30 Vict. c. 30 (1866), and 37 & 38 Vict. c. 89 (1876). By the first of these the sources of a nuisance are defined to include foul and defective drains and cesspools, accumulations of filth of any kind, and overcrowding; and of any such information may be given to the local authority by persons immediately affected, by any two inhabitant householders, or by any official person. The local authority is bound to ascertain by inspection the truth of the information, and if satisfied, to call on the person responsible—in cases of structure, the owner—to remove the nuisance. Failure to do so may be met by an order issued by a magistrate, and ultimately by the closing of the house. Under the act of 1866 the local authority is empowered to make regulations in the case of houses occupied by more than a single family (1)—for fixing the number of inmates, (2) for registration, (3) for inspection, (4) for general supervision, (5) for cleansing, and to inflict penalties in cases of neglect. To these powers the act of 1874 added similar powers with respect to ventilation, paving, and drainage, separation of the sexes,

notification of infectious or contagious disease, which last was made compulsory in 1889 by 52 & 53 Vict. c. 72. Further regulations, of a more minute kind, and also as to new buildings, are contained in the Metropolis Management Acts of 1855 and 1862. Whilst the above refer wholly to existing buildings, the erection of new buildings in London is regulated by the Metropolitan Building Acts of 1855 and 1878. (c) Outside London the action of the local authority is governed by the Public Health Act of 1875 (38 & 39 Vict. c. 70). Here, as in London, the local authority is empowered to make bye-laws dealing with all houses occupied by more than a single family, and also for the notification of disease, it is compelled to appoint medical officers and inspectors of nuisances, who are to report on the sanitary condition of the district generally.

II. The acts which are designed to provide for the demolition of unsanitary buildings fall into two classes, viz. Torrens' Acts, so called from their promoter W. T. Torrens, M.P. for Finsbury, and Cross Acts from Viscount Cross. (a) Torrens' Acts are 31 & 32 Vict. c. 133, 42 & 43 Vict. c. 64, 45 & 46 Vict. c. 54. They apply to single houses or small groups of houses only; the local authority is to call in the first instance on the owner of unsanitary houses, either to repair or to demolish them, and he, on his side, may compel the local authority to purchase them at a valuation; should he neglect or refuse, the local authority may act for him, destroying the buildings if need be; should the local authority neglect to do its part the Metropolitan Board of Works was to act in its place, but this clause has never been put in operation. (b) Cross Acts, 38 & 39 Vict. c. 36, 42 & 43 Vict. c. 64, 45 & 46 Vict. c. 54, refer to large areas, the clearing of which is necessary for sanitary reasons. Under these the local authority acts at once, purchasing and demolishing; they apply only to the metropolis and places with more than 25,000 inhabitants.

It remains to notice the changes made by the legislation which followed upon the report of the commission upon the housing of working classes. By the Housing of the Working Classes Act of 1885, 48 & 49 Vict. c. 72, the due administration of the various sanitary acts is made compulsory upon the local authority, instead of permissive; all contracts with regard to buildings presuppose a sanitary state; the power of the owner under Torrens' Act to compel purchase by the local authority is abolished; the Cross Acts are extended to every urban sanitary district; the local authority is empowered to build lodging-houses and to make loans to building societies. A bill to consolidate, and on some points to amend the above act is now (1890) before parliament.

EAGLE. United States standard gold coin of the value of ten dollars, weight 258 grains, fineness .900, value—English standard (916.6 fine at £3 : 17 : 10½ an ounce) £2 : 1 : 1½, French standard (900 fine) 51.83 francs. Also double, half, and quarter eagles of the same fineness and of proportionate weight.

F. E. A.

EARNEST MONEY. Probably derived from the same root as the word *ARLES* (*q.v.*), which is used in some English dialects, and can be traced from the Latin word *arrha*, a sum of money paid down on conclusion of a bargain as a security for its due performance. It generally becomes forfeited in case the bargain remains unperformed, but this depends on the arrangement between the parties. The payment of earnest money establishes the validity of a contract for the sale of goods of a value exceeding £10, which might otherwise be void under the statute of frauds (*e.g.* the administration of the estates of deceased persons, the taking of partnership accounts, foreclosure and redemption of mortgages, the execution of trusts, partition actions, guardianship matters, etc.)

E. S.

EARNINGS AND INTEREST FUND. This term was employed by Professor and Mrs. Marshall (*Economics of Industry*, bk. ii. ch. vi. § 3, old edition) to denote that part of the "net-income of the country" which remains "after deducting rent and taxes." The share of this income which "the landlord can claim as rent" is, they remarked, "fixed by definite economic laws," and the share taken by the state as taxes is arbitrary in character; and the amount, therefore, "which remains after deducting rent and taxes from the net annual income" may be regarded as a "given fund," and called the "Wages and Profits Fund," or the "Earnings and Interest Fund." The latter expression is preferred because the earnings of management are "similar in nature" to those of other kinds of labour, and "are in the long-run governed by the same laws." It seems therefore better to classify the receipts of the employer (see *EMPLOYERS* and *EMPLOYED*), so far as they represent earnings of management, together with other earnings, and to include his receipts, so far as they represent interest on capital, under the same head as interest generally.

[See also Professor Marshall's article on "Theories

and Facts about Wages," printed in the *Report of the Industrial Remuneration Conference*, 1887, pp. 186, etc. In his *Principles of Economics*, 2nd ed., bk. vi. ch. ii. § 1, footnote 2, Professor Marshall adduces reasons for withdrawing the expression as being liable to misunderstanding. He would substitute the idea of a stream or flow for that of a fund, and would not "put rent aside," in the way the phrase might suggest.]

L. L. P.

EARNINGS OF MANAGEMENT. A technical term for one of the elements of profits, according to classical English economics. Profits, regarded by Mill as the return to capital, are divided by him into three portions: interest, insurance for risk, and wages of superintendence, or earnings of management, as they are now more commonly called. They consist of all the profit that is left over after the other two elements have been abstracted; and unfortunately, according to the threefold division, it is impossible in any other way to allocate the share which falls to management. We have an exact criterion of interest on borrowed capital, on first-class security in consols and corporation stocks. Risk generally fixes its own price by means of insurance; but there is no scale or measure for the earnings of management, and in consequence they are held to vary with each individual case, though as a greater profit may be considered as roughly representing a greater quantity of business capacity, the one should roughly measure the other.

The earnings of management, being in reality a payment for skilled labour, are in a proper sense wages; and they appear in the market as such in the countless instances where business supervision is delegated to subordinates. As understood generally, they embrace the great bulk of profits, however. There is thus a difficulty in bringing under the same term the great percentages on capital frequently earned as profits, and the comparatively small salaries attached to the delegated management of business—a difficulty which the admitted superiority of personal supervision is not sufficient to solve. A limited liability company for banking, insurance, or other purposes divides among its shareholders say 8 to 10 per cent. Half of this, at the very least, is earnings of management, according to hypothesis. But it goes to people who do not manage the concern; while, as to those who do, their salaries are fixed by the demand for and supply of

business power, so that the management of the business is paid for at its full price. It would therefore seem that there is still an element in profits, unaccounted for, which cannot properly be held as covered by the term earnings of management.

With this proviso, however, the form of wages may be in general considered as the price accruing to the capitalist for the services he renders in managing his business, and his capacity as being measured and determined by that price. The exercise of this capacity cannot, by any careful method of reasoning, be counted as anything but labour, unless indeed that term be unscientifically restricted to manual labour only,—a labour which is employed to develop a visible and material product. It is, in the highest meaning of the words, skilled labour; and yet it differs in one singular respect from almost every form of work so classified. The skilled workman in general, whether his energy be that of brain or muscle, whether he be mechanic or scientific, artisan, journeyman, lawyer, doctor, or writer, works in a particular industry, within the compass of which his sphere is limited. In a word, his labour is specialised. The work of business management, on the other hand, is as little specialised as anything outside of mere muscular labour-power can be. Professor Marshall gives two reasons for this (*Principles*, 1st ed., vol. i. p. 643): first, that every one has to manage the business of his own life, and secondly, because technical knowledge is becoming in most cases subordinate to the non-specialised faculties of judgment, resource, and the like. It may be suggested that perhaps the cause of the wide scope of business power is that it rests upon just those faculties which underlie all technical or special skill, plus versatility. It would be a great mistake to suppose that this faculty is not a talent in itself, and quite apart from other species of ability. Many men possess qualities which place them in a distinguished position in some sphere of activity, who yet are not fitted to manage any public business, and sometimes show themselves, notwithstanding the universal training above mentioned, singularly unfortunate in the management of their own. No more striking instance of the existence of a special faculty of business power can be found than that of the number of men, eminent in thought and action, who have turned out indifferent or incapable statesmen.

Earnings of management, being in reality a species of wages paid for a particular kind of labour, are regulated by the supply of business capacity in a community, and the demand for managers. It must be noticed, however, that the phrase is commonly used to denote all that remains of profits after rent and interest are deducted. In purely productive industries there may seem to be little distinction between

the two; but in retail business the difference is important. In the latter, the gross profit does not principally depend on the amount of capital employed, but on the number of transactions performed; and in these industries, as to a lesser extent in all, the profits proper which accompany success are far in excess of the market value of the business capacity of the capitalist. Used in the wider sense, the phrase covers all the advantage that fortuitous circumstances, monopoly, or other causes in trade may confer on an owner or investor of capital (see CONJUNCTUR; DEARNESS, ARTIFICIAL; MONOPOLY).

M. G. D.

EASEMENT. The owner of one piece of land may be allowed to exercise certain rights over another piece of land belonging to a different owner. If these rights consist of the privilege of taking away tangible objects (*e.g.* peat, underwood, fish, etc.), they are called profits; in all other cases they are called easements. The piece of land to which the benefit of an easement attaches is called the "dominant tenement"; the one which is subject to its burden has the name of the "servient tenement." If the owner of the dominant tenement is entitled to use the servient tenement for certain purposes (*e.g.* for the purpose of walking over it or driving cattle over, or taking a drain through it), the easement is called an "affirmative" one; if, on the other hand, the owner of the servient tenement is restrained from exercising his privileges of ownership in certain ways (*e.g.* from erecting buildings which obstruct the lights of the dominant tenement, or from removing buildings so as to take away the support from a wall on the dominant tenement), the easement is called a "negative" one. Easements are acquired (1) by express grant from the owner of the dominant tenement; (2) by implied grant; this arises when part of the property is sold having apparently privileges in the nature of easements relating to another part of the property, *e.g.* when a house is sold enjoying certain lights, in consequence of an adjoining piece of land belonging to the same owner not having been built over, the owner will not after the sale be allowed to erect buildings obstructing such lights; (3) by prescription, *i.e.* by enjoyment for a certain number of years. The subject of easements is treated very fully in the notes to *Sury v. Pigot*, in Tudor's *Leading Cases on Real Property*; see also Gale on *Easements*; Goddard on *Easements* (see PROPERTY, LAW OF).

E. S.

EASTERLINGS. This name was given in the middle ages to the German merchants who visited England, and ultimately came to be applied generally to the members of the Hanseatic League. Mediæval law in all countries connected the licence to trade with nationality. The foreigner had no rights, except such as could be acquired by individuals or communities

who could afford to purchase them from the ruler of the country. In order to obtain such trading privileges in England, the German merchants formed themselves into a *hansa* or guild. The original *hansa* in London, which has its origin in the reign of Edgar, was formed by the merchants of Cologne. They continued to have a monopoly of trading privileges until the 13th century, though the natives of other towns had succeeded in gaining admission, and the association had grown to include traders from the Rhine valley and Westphalia. But the rising towns of northern Germany resented the exclusive pretensions of Cologne, and set themselves to break down the monopoly. In 1266 and 1267, Hamburg and Lübeck were allowed to form hanses of their own, on the model of that of Cologne. Under Edward I. these three associations were united into the great German *hansa*, of which we find the first documentary mention in 1282. The buildings of this corporation on the banks of the Thames, consisting of dwellings and warehouses, were known as the STEELYARD (*Stahlhof*). The corporate property and discipline were administered by an alderman elected annually, with the help of two assistants and a council of nine. For their privileges from the state, the Easterlings contracted for the payment of customs duties, while they discharged their obligations to the city by annual payments to the lord mayor and by maintaining a watch and ward at the Bishop's gate. Originally the *hansa* was an independent community, but in the course of a long struggle with the jealous and rival native population, it came to rely more and more upon the growing league of towns in North Germany, and ultimately became a "counter" or depot of the HANSEATIC LEAGUE.

Although the Easterlings were traders and left money-dealing in the hands of the Lombards, yet their name came to be applied to money. Probably this was due to the excellent quality and uniform weight of their own coins. Matthew Paris tells us (*sub ann.* 1247), that "*moneta esterlingorum, propter sui materiam desiderabilem, detestabili circumcissione cepit deteriorari et corrumpi.*" The statutes of Edward I. refer to a definite coin called "sterling," which is thus described: *Denarius Anglie, qui vocatur Sterlingus, rotundus sine mensura, ponderabit 32 grana frumenti in medio apice, et 30 denarii faciunt unciam, et 12 unciæ faciunt libram.* From England these coins passed to France, and we find frequent references to them in the middle ages. That the quality of the coins was for the time excellent is proved by the survival of the term *sterling*, to denote money of standard weight and quality, to the present day.

R. L.

EAST INDIA COMPANY (1600-1858). The circumstances attending the formation and the aims present to the minds of the promoters of the East India Company did not differ materially from those which influenced the foundation of the other "venturer" COMPANIES of the same epoch, from among which it stands out pre-eminent by reason of the magnitude of its operations, and its profound imperial importance. Like them its early attempts were ventures for the sake of quick gains; like them it owed much to the spirit of daring enterprise characteristic of the age. The difference which became so marked afterwards was due to several causes; partly to the larger sphere of its activity; partly to a difference in its management; and partly to certain embarrassments in which it found itself involved through its relations with native powers and the rivalry of continental companies and European nations.

From very early times the East had been viewed as a great source of wealth, and consequently as a great goal of trade. This feeling was accentuated rather than lessened after the Portuguese had discovered and at first monopolised the passage round the Cape of Good Hope. Many schemes of adventure had been formed, and some of them tried. The LEVANT COMPANY had striven, but without much success, to extend its operations overland in the direction of India. On the other hand, attempts had been made to open a north-west passage which should be to the English what the Cape route had been to Portugal. One of these found place in 1591, when a license was granted by Queen Elizabeth to send out three ships. They were sent under Captain Raymond, but without success. But the hope of trade with India was not abandoned; the prospect was too promising. In 1599, no doubt after some preliminary action, the project which was to issue in the formation of the East India Company was first put on a substantial basis. On 22nd September of that year a record was drawn up of the people who had agreed to subscribe to the intended voyage to the East Indies. On 24th September a meeting of the subscribers was held, and in due course a charter was applied for. For a time operations were checked owing to negotiations of the government with the Dutch, but in the autumn of the next year the matter was proceeded with; and on 31st December 1600 a charter was issued to the *Governor and Company of Merchants of London trading to the East Indies*. The charter was drawn on the lines of those previously issued to other companies, from which it differed in no important point.

The history of the company can only be reviewed in its essential features. These cluster chiefly round two points; (1) the mode of conduct of the company; (2) its negotiations with

native powers, and rivalry with other European companies and powers.

(1) The early voyages of this company were like those of certain others, of the nature of separate "ventures," that is, members of the company subscribed in varying proportions towards a certain expedition, the proceeds of which were afterwards distributed among them according to their respective shares. This method endured till 1612, when what was termed the first joint stock was subscribed. This, however, is a term which is likely to lead to misunderstanding. It did *not* imply the formation of a permanent capital divided into shares and distributed among the members of the company in varying proportion. It was little other than a somewhat prolonged series of ventures. Subscriptions were taken up in the most various amounts from members, none of whom were necessarily bound to subscribe, and paid into the hands of the governor and directors, who then applied the money at their discretion for the equipment of a number of expeditions for the benefit of the subscribers. Thus the first joint stock subscribed in 1612 was distributed among four voyages, and came to an end in 1617; the second joint stock, contributed 1617-18, furnished three voyages, and so on. Such a method, while in some respects a decided improvement on that previously pursued, had serious drawbacks. With each succeeding voyage the amount of "dead plant" belonging to the company, in the form of factories in India, etc., was increased; and so the relations of the members of future to those of preceding joint stocks were rendered somewhat complicated.

Meantime the company was experiencing a foretaste of the difficulties and dangers which finally caused it to assume political responsibilities. On the one hand it had to contend with private rivals (*INTERLOPERS, q.v.*) at home; on the other, the rivalry of continental powers and companies¹ threatened its existence in India. So early as 1602 a factory had been founded at Bantam, despite the keen opposition of the Portuguese. As operations extended, new factories were established, notably one at Surat in 1612, and new enmities incurred. The relations with the Mogul were rendered more amicable by the tact and capacity of Sir Thomas Roe. But the Dutch were about to prove the most formidable opponents of the young company. The friction which had arisen owing to various causes, chiefly perhaps to the

efforts of the company to establish a trade with the Spice Islands, assumed such serious proportions, that the attempts to bring about a peaceful settlement by the Treaty of Defence made in 1619 proved unavailing, and the opportunity of much future quarrel was given by the massacre of Amboyna. The immediate result was the withdrawal of the English from the neighbourhood of the Malay archipelago. In a few years new efforts were made in the mainland and a factory was established at Armagaon, which growing, absorbed that at Masulipatam. In its time abandoned, it was supplanted by the settlement of Fort St. George (1639-40). The acquisition of this station marked a new step in the progress of territorial aggrandisement. In 1646 grants were made in Bengal, and in 1661 Bombay was ceded to the British Crown as part of the dowry of Catharine of Braganza on her marriage with Charles II. The quarrel with the Dutch had been rendered of less importance than it threatened, through the energetic action of Cromwell, who in the treaty of 1654 had inserted a clause dealing with the demands made on both sides for compensation for injury. To adjust these, a commission of award was appointed and began its sittings 30th August 1654. But owing to events such as these, and in part, no doubt, to the increasing importance of the companies' factories, a more definite territorial aim would seem to have presented itself to the minds of some. It became a matter for consideration whether the company was to be considered one of commerce alone, or one which had other beside trade interests. But yet another point. Assuming that commerce was its chief aim, could its attainment be assured without the acquisition of territory by the company? Such territory would need to be protected. The appointment of Sir Josiah Child as governor in 1686 was without doubt a distinct advance in the direction of this new policy. Again, in 1687, when the question of the grant of charters and commissions was mooted with the king (James II.) and his council, he had agreed that it would be better if such charters and commissions were granted by the court of the company instead of emanating from himself. The company, it should be noticed, had in 1624, supplemented its ordinary judicial authority by the power of punishing its servants by martial law. Matters were such, that further advance was natural, and in 1689-90, instructions were sent from home to the regency of Bombay, as also to Madras, which contained the following noteworthy sentences: "The increase of our revenue is the subject of our care as much as our trade; 'tis that must maintain our force when twenty accidents may interrupt our trade; 'tis that must make us a nation in India; without that we are but as a great number of interlopers, united by His Majesty's royal charter, fit only to trade where no body of power thinks it

¹ The following is a list of the chief foreign companies licensed to trade to East Indies. The Dutch Company, founded 1602. The French Companies; the first founded 1604; the second, 1611; the third, 1615; the fourth by Richelieu, 1642; and the fifth, 1644. In 1719 the French Company of the Indies was established, and lasted till 1796. The first Danish company, 1612, and the second 1670. In 1723 the Ostend Company was established; in 1731 the Swedish Company; and in 1733 the Royal Company of the Philippine Islands.

their interest to prevent us; and upon this account it is, that the wise Dutch, in all their general advices which we have seen, write ten paragraphs concerning their government, their civil and military policy, warfare, and the increase of their revenue, for one paragraph that they write concerning trade."

These words are an open declaration in favour of the new policy. Commerce, if still a main aim, was henceforth to be undertaken on a secure basis of territorial possession and political dominion.

At home, however, the company had found, and were still to find, their exclusive rights questioned and combated. At the outset their progress had been hampered by the grant of a royal license to trade to Cathay, Japan, etc., given to Sir Edward Michelbourne, who had made full use of his opportunities to wring booty from the natives. They had convinced the king (James I.) of the need of maintaining their powers, and had received a renewal of their charter. But a more serious rival menaced them in the next reign. In 1635 a license was granted to an association formed by Sir William Courten. This association, afterwards known as that of the Assada merchants, sent out ships and entered upon commerce to the detriment of the East India Company, both by reason of competition and, as was also alleged, by reason of the bad treatment the natives experienced at the hands of its servants. In answer to the petition of the company, the king (Charles I.), in 1639, promised the withdrawal of the license, but the promise remained unfulfilled. In 1650 a kind of amalgamation took place, and the Assada merchants became members of the company. But in so doing they did not wish to deprive themselves of the right to trade in their own bottoms, in other words, they wished to bring about a return to the earlier principles of separate ventures, in part accordance with which the commerce of the company had been carried on before 1612. In consequence, they appealed to the Protector against the enforcement of the joint-stock trading. The company replied, and in 1654 obtained a decision from the council of state in favour of joint-stock management and exclusive trading.

Such had been the history of the company before its important declaration in 1689. Almost immediately after that events took place in England which nearly brought about its extinction. The arbitrary and severe measures which had marked several of their acts in India had excited the animosity of the House of Commons, already prejudiced against societies not of their own creation. In 1690 a committee reported in favour of the formation of a new company which should be constituted by act of parliament and not derive its authority from royal charter. In accordance with this recommendation, next year the king (William III.)

was petitioned by the Commons to dissolve the old company. His apparent neglect of this request does not seem to have aroused much feeling. Not so, however, his renewal, in 1693, of the charter. A declaration was drawn up and passed, asserting the right of all Englishmen to trade to East Indies and elsewhere unless prohibited by act of Parliament, and the king gave way. In 1698 a new association, termed the English Company, was formed (with right of *exclusive* trading after 1701), and the existence of the old company was limited to the three years from date for which they could claim notice. To maintain their control over India, members of the old and now-condemned company bought up shares in the new company. During these three years the two companies traded in rivalry, in which the older association, fortified by experience and provided with stations, ships, and stock, had a distinct advantage. As the last year (1701) ran on, the old company not unnaturally showed itself more willing to entertain the idea of a compromise, to which the members of the new company were not averse, and in January 1702 a partial union was effected under the title of "The United Company of Merchants trading to the East Indies." Several causes of difficulty and dispute remained over; but the need of harmonious working was too great to allow of their long continuance; and in 1708, on the arbitration of Lord Godolphin, a complete and final union was brought about.

The early opponents of the company had been overcome; its right as against home competitors was established; a settlement in India obtained. It was an acknowledged political power as well as a trading company.

(2) In this direction it had to progress, for the animosities aroused by its dominion, coupled with the ambition of France, made it impossible for it to exist as it was, one power among many others. It had soon to choose between supremacy or political extinction.

The death of Aurungzebe (1707) and the consequent disruption of the Mogul empire afforded the opportunity, and in part created a necessity for further political action on the part of those European companies whose interests were involved in India. The French under La Bourdonnais initiated a policy of advance, which under the more skilful and more ambitious guidance of Dupleix became a policy of aggression and conquest. They sought to subordinate or expel their rivals, the English, and to establish themselves as a ruling, if not predominant, power in the country. Inaction on the part of the English company was impossible, and ill-prepared though they were, a strenuous resistance was offered to the designs of the French. Under the leadership of Clive the English, too, progressed towards sovereignty, and the battle of Plassey (1757) made them virtual masters of

the Nawab's dominions. Their creature, Meer Jaffier, whom they placed upon the throne, made them a grant of territory in Bengal. A few years after they stepped into the position of what we may term definite individual sovereignty, receiving from the Mogul emperor an acknowledgment of their right to the revenues of the three provinces—Bengal, Behar, and Orissa, which they combined into a presidency of Bengal. Other acquisitions were made in the neighbourhood of their other stations. The French war was a turning point in the history of the East India Company. When it emerged successful, the political ambitions, inchoate till then, had realised themselves in power, destined ultimately to become imperial. The task of its control was in fact too important to be committed to the sole will of a trading company—and henceforth governmental interference and supervision begins.

The economic interest of the new period centres chiefly in two subjects—the economic settlement of India, and the successive acts whereby the state drew affairs more and more within its own control.

By the act of 1773 an important change was made in the government of India. Till that date the government of each province had been separate, the direction in each case resting with a council composed of the senior civil members in the company's service. By this enactment alterations were made in certain directions. A governor-general was appointed and a supreme council specially constituted for Bengal. To this governor and council the other presidencies were placed in subordination so far as the making of war and the entering into treaties were concerned. In addition the home government, while recognising for the first time the possession by the company and its servants of administrative functions, provided that everything in the company's correspondence which related to civil or military affairs, which concerned either the government of the country or the administration of the revenue, should be laid before the ministry. In the constitution as thus established, there were three grave defects:—The governor was left dependent on the will of the council; no definite connection was established between the various presidencies; the relations between the ministry and the Indian government were but ill-defined. It was to remedy the two latter of these that the act of 1784, which established the board of control, was passed. This body consisted of six members of the privy council, of whom the chancellor of the exchequer and one of the chief secretaries of state were to form two. But, as in the absence of these two *ex-officio* members the senior of the remaining four was to preside at the board, the chief power was vested in the hands of one man who, under the title of the president of the board of control,

performed many of the functions which now fall to the lot of the secretary of state for India. The first defect noticed above was largely remedied by the act (26 Geo. iii. c. 16), which Lord Cornwallis obtained when he took the post of governor-general. By it he and his successors were empowered to override the council in cases of emergency.

To Lord Cornwallis is due the organisation of the young empire. Under his rule British officials became something more than mere collectors of the revenue; under him the outlines of the land system were laid down; and it was owing to him that the administration became so effective and so honest. In 1793 the charter was renewed for another twenty years. Lord Cornwallis had regulated the condition of the country and Lord Wellesley established the preponderance of the British power. His policy, though it was not formally assented to by the company, was necessary for the sake of peace and stability. When he left India the company was established as the great sovereign power. In 1813 the charter was once more renewed. When in 1833 it came up again for renewal changes were made. The power of trade was taken away from the company, despite the protest of those who, still faithful to earlier conceptions, continued to view trading as its main function. A further access of power was granted to the governor-general and the supreme council.

Further progress was made in the direction, both of the acquisition of wholly new territories and of the subordination to active government of the protected or dependent native states. But the rule of the company was about to end after a period of some two and a half centuries from its beginning. The fanatical outburst which swelled into the mutiny aroused a feeling, whether right or wrong cannot be here discussed, that the government of India was too important to be left to the directors, however controlled, of a company originally formed for the purpose of trade, and in 1858 it was formally and finally transferred to the crown.

E. C. K. G.

EASTLAND COMPANY (established 1568).

This company was an association of the English merchants trading to and from the Baltic. From the wording of their charter it seems that they were formerly called the Dantzig merchants. In 1568 a charter was issued to the traders desirous of associating themselves, granting to them "to enjoy the sole trade through the Sound," into Norway, Sweden, Poland, Lithuania (except Narva, the trade with which was claimed by the Russian Company), Prussia, and also Pomerania, from the river Oder eastward to Dantzig, Elbing, Königsberg, Ebling,

Braunsberg, also to Copenhagen and Elsinore, and to Finland, Gothland, Bornholm, and Oland. The company thus constituted was a "regulated one," and the members of it were entitled to trade "in their own bottoms." The provisions of the charter were much the same as those laid down in other cases. The various privileges were confirmed in 1629, with the single proviso that the trade in grain between the countries and districts enumerated and England was thenceforth to be free. During the early as well as during the latter portion of its existence, the difficulties encountered by the company were considerable; in particular they found themselves impeded in their passage through the Sound. Thus in 1602 complaints were made with regard to the excessive charges levied on their vessels when passing through; in 1658 they petitioned Cromwell on account of the detention of their ships in Denmark. At home they met with disfavour from the strong and growing feeling against monopolies. But on the whole they received considerable support, an ordinance being passed in their favour in 1647. The privileges so warmly cherished did not long survive the Restoration, for in 1672 it was decreed, firstly, that there should be a free trade to Norway, Denmark, and Sweden; secondly, that any one should be entitled to trade to the other Baltic ports within the limits of the Eastland Company's charter on his joining that company, which, it provided, any trade could do on payment of 40s.

E. C. K. G.

EATON, DANIEL ISAAC (1752?-1814), a London bookseller who upheld the cause of freedom of the press, at the cost of eight prosecutions, for the publication of works by Thomas Paine and Pigot, of his own periodical (see below), and of a free-thinking work of doubtful authorship called *Ecco Homo*. Very few of the trials ended in a conviction. His weekly periodical, *Hog's Wash, or Politics for the People*, 1794, dealt, not systematically, with political and social subjects in a violently revolutionary spirit. Rhetorical hatred of kings appears as a set-off to real consideration for the poorer classes. The unequal distribution of wealth was treated as the fundamental mischief; parliamentary reform, peace, the lowering of taxes, especially of duties on necessities, subscriptions for poor labourers, republican government for the sake of economy, the recognition of the natural equality of men; these are some of the various remedies proposed.

Eaton translated Helvetius's *Less of Nature and True Sense and meaning of the System of Nature*, 1810, and *Péru's Preservative against Religious Profusions*, 1810.

[Howell's *State Trials*, xii. 759-822; xiii. 1013-1054; xvi. 927-958.—*Notes and Queries*, 3rd series, vol. x. 336.—*Dict. Nat. Biog.* xvi. 536.

R. G. P.

EBAUDY DE FRESNE, born (c. 1760) at Vesoul, published in 1788 his *Traité d'Agriculture considérée tant en elle même que dans ses rapports avec l'Economie* ("Treatise of Agriculture considered in itself and in its relations with Economy"), 3 vols. 8vo; and presented in 1790 his *Plan de Restauration et de Libération*, based on the former work for the National Assembly of France. According to De Fresne, French agriculture was suffering from the undue extent of corn-growing, and an excessive consumption of fodder in large towns, resulting in a loss of manure. He advocates the extension of pasture lands, and a more developed production of cattle and consumption of meat (instead of bread), but most of the methods he suggests to reach this end are very unpractical. E. ca.

ECK, JOHANN (1486-1543), was professor of theology at Ingolstadt, and is best known as the antagonist of Luther; he played also an interesting part in the movement of economic thought. He was among the first, if not indeed the very first, to maintain that a contract to pay a certain percentage for the use of money was not necessarily usurious. His justification he apparently found in the theory of "the triple contract," *contractus trinus*, which had grown up before his time, but which he would appear to have been the first to popularise. A contract of partnership (*societas*), where both partners shared in the risk and gain according as their undertaking prospered, had long been recognised by theologians as lawful. It was argued that as another sort of contract, a contract of insurance, was also in itself free from objection, it was permissible for one partner to contract with the other to receive a less return than he might otherwise fairly expect, on condition that in any case his capital should be restored to him. It would then be equally lawful to add a further contract by which the investor insured himself against the chances of fluctuating dividends by surrendering a further portion of the return he might otherwise look for, in exchange for the promise of a definite annual percentage. By the combination of these three contracts in one—"the triple contract," the investor obtained a security both for the return of his capital and for a certain annual percentage; so that the contract, though still technically one of partnership, was essentially one of loan.

Eck, who before his controversy with Luther had already sought fame as a public disputant, announced himself in 1514 at Ingolstadt as ready to maintain the thesis that merchants might lawfully bind themselves to pay 5 per cent. The Bishop of Eichstätt, as ordinary and chancellor, forbade the disputation; and the university of Mainz, being consulted by its archbishop, gave the opinion that it was inexpedient. Thereupon Eck, assisted with money and letters of recommendation by the great

German financiers the Fuggers, set off for the university of Bologna, and there defended the same proposition with much applause from the jurists. This Bologna disputation excited general attention; it was ironically referred to in the *Litteræ Obscurorum Virorum* as showing that usury was allowed by "theology"; and the humanist Pirkheimer wrote to Eck that now the great merchants dared to say that any bargain was just. About the same time Eck stated a case for the Sorbonne; and although the faculty gave no decision, the opinion of Eck was adopted by the distinguished Scotch divine at Paris, John Major. The subject fell into the background with the appearance of the Lutheran controversy. It is probable that the extremely conservative position taken up at first by the Protestant divines on the question of usury prevented for a time the development of opinion among Catholic theologians in the direction pointed out by Eck. A bull of Sixtus V. in 1586 condemned all contracts for insuring either the capital or a certain rate of profit. But this was explained away; and "the triple contract" was very generally recognised as lawful by Catholic divines and faculties from the beginning of the 17th century.

Rechtslehre*, vol. i. 1874, pp. 384-385.—Funk, *Zins u. Wucher*, 1868, pp. 84-86 (where the argument in defence of the triple contract is spoken of as justified by circumstances), and *Geschichte des kirchlichen Zinsverbotes*, 1876, pp. 57-64 (where it is described as mere sophistry).—Ashley, *Economic Hist.*, vol. i. pt. ii.—Th. Wiedemann, *Dr. Johann Eck*, 1865.]

W. J. A.

ECONOMIC FREEDOM. This is a term properly signifying a condition in which competition acts without influence from other causes. If used in the same popular sense as free trade, it ought to mean merely freedom from legislative imposts or governmental supervision. In order to meet the requirements of a scientific phrase, however, it must be given a more extended meaning; and include the absence of such determining causes of value as combination, custom, immobility of capital and of labour, etc. Professor Marshall uses the term as generally descriptive of modern industry as compared with the economic condition of the middle ages; and this is a singularly happy definition from a literary point of view. Those influences which are most powerful at the present day in affecting exchange values are styled economic causes, which in reality expresses the fact that competition has a much

wider range than it had in past centuries. This is the necessary result of the discoveries and inventions of modern times. The railway, the steamboat, the telegraph, all combined towards the amalgamation, for fixing of prices, of all the markets of the world; the breaking-up of much that was ancient and customary, which went on simultaneously with these innovations, introduced strict contract and commercial principle into every sphere of industry. Education, spread throughout all classes, introduced an equality between contracting parties previously unknown. Economic freedom, however, though correctly applied to describe modern industry in a wide sense, is not properly a scientific term; and if it is so used, it may lead to great confusion. In the first place, there are points in which the industry of to-day is not so free as it was in earlier times; in the matter of wages, for instance, although industry is now, in Great Britain generally, free from legislative interference, it is more liable than ever to interference from combinations, whether of masters or of men; moreover, the very conditions of modern trade cause an interlacing between different branches so intimate that they affect each other in greater measure than at any earlier period. Again, in using such a phrase, we must not forget that the era it applies to has been as yet very brief; and that, though it is an important era to ourselves, it may turn out to be of merely passing value in the progress of a science yet so young as that of economics.

Strictly speaking, economic freedom involves a great deal more than we admit even in industry under present conditions. The repeal of differential duties, which established free trade, is the most prominent sign of the economic tendencies of the age in England; but absolute freedom involves no less the repeal of duties on tea, sugar, wine, etc., and in fact the abolition of all indirect taxation. The absence of all restrictions on the hire and sale of land, and of all regulation of the hours of labour, are essentials to economic freedom in the strict application of the words. Freedom of combination is to most minds a necessary attribute of economic freedom; yet the results of combination are such as to destroy that absolutely unfettered competition which is of the essence of the term.

M. G. D.

ECONOMIC GOODS, see **GOODS**, **ECONOMIC**.

ECONOMIC HARMONY. A phrase rendered classical by Bastiat, the title of the last of whose works it forms (*Harmonies Économiques*). In this work (chap. x.) may be found the key to the meaning of the term, "the constant approximation of all men towards a level which is always rising—in other terms, improvement and equalisation—in one word, harmony." This sentence, if understood as a precept of action, combining legislative and

social effort, might stand as an expression of the aims of a collectivist or socialist of the present day. But with Bastiat it expressed a doctrine, not a precept; and therefore bears an interpretation diametrically opposed to the theory of the communist. For indeed Bastiat's fundamental principles of harmony he termed property and liberty; and his doctrine of economic harmony is that, under absolutely free exchange of labour and other commodities, and the fullest security of private property, whether in land or other things, the arrangements of providence are such as to continually improve the condition of the human race; and that any disturbance of these fundamental laws retards that improvement. Professor Marshall (*Principles*, 1st ed., vol. i. p. 453) states the doctrine thus: "The maximum satisfaction is generally to be attained by encouraging each individual to spend his own resources in the way which suits him best;" and he follows with some interesting criticisms of the theory, or rather limitations, of its operation. The latter definition, which is a description of what has been termed "enlightened self-interest," scarcely includes all that is involved in the individualist theory of Bastiat; but it is an accurate statement of the principle which underlies it.

The phrase economic harmony represents, in another form, the extreme individual theory, and can hardly be properly called an economic doctrine; it is rather an ethical or utilitarian deduction from economic data. But it is used as a normal rule chiefly to exhibit the limitations to which it is subject. It rests really upon the premiss that it is indifferent to any one except the consumer in what manner wealth is consumed; a position not seriously maintained by any economist, and explicitly opposed to the last of Mill's four classical propositions regarding capital—"a demand for commodities is not a demand for labour." The importance of consumption as a factor in economics has of late years come to be more highly appreciated; and its effect on an idea of maximum satisfaction will be found to modify greatly, if not to destroy as a normal principle, the doctrine of economic harmony.

[See HARMONIES OF INDUSTRY.] M. G. D.

ECONOMIC HISTORY. As to the relation between economic history and economic theory, five views are possible, which may for convenience be given the following brief designations:

(1) "The *no-connection* view." This was the view of those who regarded political economy as a purely deductive science, derived infallibly from a few simple abstract postulates which every reasonable being must necessarily grant. Political economy, in this view, was not only not "greedy of facts"; it could be constructed in absolute disregard of any alleged facts except

the assumed postulates. To those who held this view, economic history had no direct interest, any more than heraldry or genealogy.

(2) "The *hand-maid* view." This view, which is but a slight modification of (1), is still very generally current. It is that of those who while believing that "economic laws" are to be obtained by deduction from given assumptions, are interested to find illustrations or confirmations of their conclusions in facts furnished by economic history. If the facts agree with the theory, so much the better for the facts; if not, then they are left alone, and the implication is that the historian is mistaken with regard to them.

(3) "The *corrective* view" is again a modification of the preceding. It grants that economic history may sometimes furnish reason for questioning abstract conclusions, and proposes in that case to re-examine the original postulates, and either to modify them, or, if they are still tenable, to examine into the disturbing influences which have affected the result. This is a position which has been avowedly held by many recent writers, e.g. by Cairnes; but there are few examples of the practical application of the implied rule.

(4) "The *concurrent* view" is one appropriate to a period of compromise following upon one of controversy, and it is at present not infrequently expressed. It is that economic history and economic theory have each an interest and importance of their own which will attract students whose bent is in one or other direction; and it leaves to the future the decision of the question what bearing historical work may have on economic method.

(5) Finally "The *supersession* view," which is one often held by what are called "economists of the historical school," teaches that the science of political economy, as it has been created by the classical economists, will ultimately be replaced by, or incorporated in, a science based on historical investigation. Among the writers of this school, again, there are two divergent tendencies. Some think that the political economy of the future will resemble that of the classical school in containing "laws" or brief generalisations concerning rent, wages, profits, interest, etc., but derived wholly or chiefly from induction from observed facts past or present. This view, however, is seldom directly formulated, and may perhaps be said to be due to a certain vagueness of thought as to the character of economic "laws." Others hold that political economy will ultimately be replaced by a doctrine of economic development—a philosophy of economic history; a view which is largely due to the influence of modern conceptions of evolution, and of the organic nature of society (see HISTORICAL SCHOOL AND HISTORICAL METHOD). In their view, abstract deductive theory will continue to

be of use, as a *minor* method of investigation, and as a useful preparatory training, but it will no longer dominate the field of economic thought.

Menger, *Methode der Sozialwissenschaft.—Die Irrthümer des Historismus* (1884).—J. N. Keynes, *Scope and Method of Political Economy* (1891), ch. ix., note B.—W. J. Ashley, *Economic History*, vol. i. pt. 1 (1888), preface; and *On the Study of Economic History* in the (Harvard) *Quarterly Journal of Economics* for January 1893.—J. K. Ingram, *History of Political Economy* (1888), ch. vi. These books, especially those of Ingram and Keynes, will guide the reader to the very considerable literature upon the subject.] W. J. A.

ECONOMIC LAW. This phrase has frequently given rise to confusion. Law, in its imperative sense, belongs to no science; properly speaking, it is a term in the art of legislation. Law, in its indicative sense, as a statement of cause and effect, is purely scientific; and when political economy is treated as a positive science, it is in this sense that the phrase is used (see Marshall, *Principles*, introd.). In common parlance, however, an economic law is frequently understood to be something imperative, or at least a statement that a certain course of action is wise or just; and the confusion between the art of legislation based on economic formulæ and the science of economics itself (from which the works even of the classical English economists are not free) has done much to spread this misunderstanding. To break the laws of a science is in one sense impossible, as they are merely generalised statements of fact; yet it is not uncommon to hear it said that a certain course of action will break the laws of political economy; when what is intended to be conveyed is that it will lead to a result different from that expected, and that the laws of economics prove this. Thus it is often said that to regulate the hours of labour, or to introduce differential import duties, is to break economic law; and M. de Laveleye, in his very able effort to include the science of economics in an art of sociology, evidently considers luxury liable to be condemned in a similar manner. (See also his *Elements of Political Economy*, for an account of economics treated as an art with definite moral aims.)

The laws of a science are always in themselves useful as guides to action, merely because of the deductions we draw from them. The objection made to this view of the subject, that such laws are entirely barren and uninformative, is therefore one which would apply equally to every science. In another form, however, the objection has considerable force. A scientific law presupposes unchanging circumstances; and any alteration in these introduces a new law to

vary the relations of cause and effect. In physical science we find uniformity to a far greater extent than in economics. It is this uniformity which has caused the phrase "exact science" to be used; and mathematics, in which the circumstances never change, is the most exact of all sciences. But in economics, where the conditions are dependent, not on the inanimate forces of nature, but on the variations of human feeling, passion, sentiment, and taste, it may well be thought that no generalisation, comprehensive enough to be useful, can be made. The older English economists were aware of this; and to get out of the difficulty they presupposed a state of matters in which mankind is governed by one single passion, viz. the desire for wealth. Happily they never adhered to the limitation they set for themselves; indeed, a science of economics on these lines is as inconceivable as a science of dynamics where every force is neglected excepting that of gravity. The great complexity and variety of circumstance which surround every economic problem are such as to render the enunciation of general laws, on a large scale, barely possible, and if possible barely useful. In consequence of this, few efforts have been made to reduce any economic truths to theorems; nor is it probable that any such theorems will be found of great value. Economic laws are rather expressions of tendencies than actual predictions of cause and effect (see LAWS OF POLITICAL ECONOMY).

[See *Der Gebrauch des Ausdrucks "Gesetz" in der National Ökonomie*, by J. Bonar, *Zeitschrift für Volkswirtschaft*, 1892.] M. G. D.

ECONOMIC MAN. This term has been often used to indicate a more or less imaginary being postulated for theoretical purposes by ABSTRACT POLITICAL ECONOMY (*q.v.*) Those writers who defend the use of the conception, have regarded it as analogous to the perfectly rigid or perfectly smooth body assumed in theoretical mechanics. Speaking roughly, the economic man is one who in his economic relations is moved only by regard to his own material interests. But in reality there is considerable ambiguity in the use of the term. It can be most clearly understood when applied to the sphere of *contracts*. Thus Dr. Keynes, maintaining in a qualified form the legitimacy of the conception, writes (*Scope and Method of Political Economy*, 1891, p. 121): "Is it not a patent fact that in buying and selling, in agreeing to pay or to accept a certain rate of wages, in letting and hiring, in lending and borrowing, the average man aims at making as good a bargain for himself as he can?" Hence in relation to contract, the notion of the economic man is tolerably clear. He may perhaps be best defined negatively, either as one who is not moved by regard to the interests of the opposite party to the contract; or, more gener-

dly, as one who is not influenced by such motives as class-prejudice, public opinion, resentment, compassion, or personal partiality. When we pass to economic actions outside the sphere of contract, it is not so easy to define the economic man. We may consider first the nature of the objects upon which a man's material resources are expended. So far as economists have treated the problem of demand and consumption on a deductive basis, they have certainly not assumed that the economic man normally or necessarily expends such wealth as he may have acquired only upon objects subserving his individual interests. For example, the family, rather than the individual, is often taken as the unit in economic science. But the economic man may be admitted to determine his expenditure under an indefinite variety of influences, such as philanthropy, love of ostentation, etc. In fact, the deductive economist, in his indifference to the purposes for which wealth in general is desired, cannot rightly be charged with recognising none but egoistic motives to its acquirement. Passing from consumption to production, we have to recognise the universally antagonising principles to the desire of wealth, namely, aversion to labour and to the postponement of enjoyments. These aversions are no doubt of a purely egoistic kind. But, as all economists have recognised their importance, they clearly have not represented the economic man as inspired merely by a desire for accumulation, irrespective of the effort or sacrifice involved. Indeed, they have gone further in differentiating the various motives operating in industry. For, from Adam Smith downwards, they have allowed, not only for aversion to toil in general, but also for various degrees of aversion corresponding to various kinds of employment. But another and somewhat different qualification is necessary in concrete applications of economic doctrine. In the abstract sciences it is frequently convenient to take no account of forces of the nature of friction. Thus there are influences which retard, and perhaps permanently modify, the tendency to equilibrium of supply and demand. These influences are mainly those of custom, habit, and ignorance. For example, a labourer is not, or has not been, easily moved to change his abode or mode of employment, in circumstances in which he would immediately do so if he were deliberately to balance its advantages and disadvantages, including risk of adventure and breach of old associations, etc. Similarly, important limits to the mobility of capital exist. The actions neither of the labourer nor of the capitalist are wholly the result of cool, unimpassioned, and completely informed reason. Economists of all schools have, of course, recognised these facts. But it may specially be noted that the deductive

economists of the most declared type have attributed to the working classes a character which is the reverse of economic. An important part of the doctrines of Ricardo and of his followers is based on the tendency of the labouring class to multiply until their resources are reduced to the level of bare subsistence. In this notable case, the chiefs of the deductive school have postulated a particularly uneconomic man.

With respect to the range of application of the conception of the economic man, there are some not unimportant differences of view among the supporters of the abstract method. Bagehot, for example, regards the conception as applicable only to the latest phases of economic development. Mill and Cairnes, on the other hand, hold that the results of the abstract method indicate universally operative tendencies, the realisation of which is, more or less, actually interfered with by conflicting forces. A slight modification of this view represents the motives of the purely economic man as manifesting themselves *in the long run*,—on the ground that other and conflicting motives cancel one another when a sufficiently large area is contemplated.

[Mill, *Unsettled Questions of Political Economy*, Essay v.—Cairnes, *Logical Method of Political Economy*, Lecture ii.—Bagehot, *Economic Studies*, Essays i., ii.—Keynes, *Scope and Method of Political Economy*, chs. i., iv., vii.—Sidgwick, *Principles of Political Economy*, Introduction, ch. iii.—Marshall, *Principles of Economics*, 1891, vol. i. pp. 71-81.—Cliffe Leslie, *Essays in Political Economy*, 1888, Essays i., xv.—G. J. Goschen, Address on "Ethics and Economics," to the British Economic Association, *Economic Journ.*, Sept. 1893.]

The idea of a *semi-economic man*, one for whom the advantage of another counts, not indeed for as much as his own, but still for something, is suggested by Prof. Edgeworth in his *Mathematical Psychics*, pt. i. end of § 2. A similar conception is more usefully employed by Prof. Marshall in his consideration of the *compromise benefit* of a monopolist (*Principles*, bk. v. ch. xii.). The whole subject of egoism and sympathy in their economic aspect is well treated by Prof. Pantaleoni in the beginning of his *Principii di Economia pura*. See also Mr. Bonar's discussion of utilitarianism in his *Philosophy and Political Economy*, 1893. W. E. J.

ECONOMICS, for other articles under this heading see *POLITICAL ECONOMY*.

ECONOMIC SCIENCE AND ECONOMICS. The terms "economy" and "economic" or "economical," are now used chiefly in two meanings, which it is well to distinguish clearly; since, though divergent in their history, they are liable to fusion, and therefore in some degree to confusion.

"Economy" originally meant, in Greek, the management of the affairs of a household, especially the provision and administration of its income. But since both in the acquisition and in the employment of wealth it is

fundamentally important to avoid waste either of labour or of its produce, "economy" in modern languages has come to denote generally the principle of seeking to attain, or the method of attaining, a desired end with the least possible expenditure of means; and the words "economy," "economic," "economical," are often used in this sense, even without any direct relation to the production, distribution, or consumption of wealth. Thus we speak of "economy of force" in a mechanical arrangement without regard to its utility, and of "economy of time" in any employment whether productive of wealth or not.

On the other hand, as there is an obvious analogy between the provision for the needs of a state and the provision for the needs of a household, "political economy," in Greek, came to be recognised as an appropriate term for the financial branch of the art or business of government. It is found in this sense in a treatise translated as Aristotle's in the 13th century; and so, when, in the transition from mediæval to modern history, the question of ways and means obtrusively claimed the attention of statesmen, "political economy" was the name naturally given to that part of the art of government which had for its aim the replenishment of the public treasury, and,—as a means to this,—the enrichment of the community by a provident regulation of industry and trade. And the term retained this meaning till the latter part of the 18th century without perceptible change—except that, towards the end of this period, the enrichment of the people came to be less exclusively regarded from the point of view of public finance, and more sought as a condition of social well-being.

But in the latter part of the 18th century, under the influence primarily of the leading French "Economistes" or "Physiocrats"—Quesnay, De la Rivière, and others—the conception of political economy underwent a fundamental change, in consequence of a fundamental change in the kind of answer which these thinkers gave to the question "how to make a nation wealthy." The Physiocrats proclaimed to France, and through France to the world, that a statesman's true business was not to *make* laws for industry and trade in the hope of increasing wealth; but merely to ascertain and protect from encroachment the simple and immutable laws of nature, under which the production of wealth would regulate itself in the best possible way if governments would abstain from meddling. A view broadly similar to this, but less extreme, and, partly for this reason, more directly influential, was expounded in Adam Smith's *Wealth of Nations*. Instead of showing the statesman how to "provide a plentiful revenue or subsistence for the people"—which was one of the two main objects of political economy, according to the traditional view—Adam Smith aims

at showing him how nature, duly left alone, tends in the main to attain this end better than the statesman can attain it by governmental interference. Accordingly, so far as the widespread influence of Adam Smith's teaching went, that branch of the statesman's art which aimed at "providing a plentiful revenue for the people" tended almost—though not altogether—to shrink to the simple maxim of *laissez faire*: leaving in its place a scientific study of the processes by which wealth is produced, distributed, and exchanged, through the spontaneous and partly unconscious division of labour among the members of human society, independently of any governmental interference beyond what is required to exclude violence or fraud. A part, indeed, of the old art of political economy—that which aimed at "supplying the state with a revenue sufficient for the public service"—remained indispensable to the statesman; but it was held that this traditional art required to be renovated by being rationally based on the doctrines of the new-born science just described. It is, then, this scientific study of a department of social activity that most writers on the subject now primarily mean by the term "political economy": such part of the old governmental art so called, as the doctrine of the new science is held to admit, being commonly regarded as "applied political economy." In consequence of this change the adjective "economic," instead of the too cumbersome "politico-economic," has come to denote the matters investigated by the science of political economy, and the propositions and arguments relating to them.

By thinkers and duly-instructed students this distinction between "science" and "art"—between the study of "what is" and the study of "what ought to be"—is usually regarded as simple and clear; and accordingly when such persons speak of the "laws of political economy" they mean not rules by which the process of the social production and distribution of wealth *ought* to be governed, but general relations of co-existence and sequence among phenomena of this class, ascertained by a scientific study of this process as it actually takes place. This distinction, however, has been found difficult to establish in common thought: even well-educated persons still occasionally speak of the "laws of political economy" as being "violated" by the practice of statesmen, trades-unions, and other individuals and bodies. It is partly in order to prevent this confusion that the terms "economic science" and "economics" have recently come more and more into use, as a preferable alternative for political economy, so far as it is the name of a science. As to the scope of this science,—it would be generally agreed that it is a branch of a larger science, dealing with man in his social relations; that it is to an important extent, but not altogether, capable

of being usefully studied in separation from other branches of this science; and that it is mainly concerned with the social aspect—as distinct from the special technical aspect—of such human activities as are directed towards the production, appropriation, and application of the material means of satisfying human desires, so far as such means are capable of being exchanged. It would also be generally agreed that the method of economic science is partly deductive, partly inductive and historico-statistical. But to attempt a more precise determination of its method and scope, and especially of its relation to the art or system of practical rules which should guide the action of governments or private individuals in economic matters, would require us to enter into questions of a highly controversial kind; which will be more conveniently discussed when we come to deal with the older and wider term *POLITICAL ECONOMY* (*q.v.*) H. S.

ECONOMISTES. The narrower term *PHYSIOCRATS* (*q.v.*) is now generally applied to the writers who were known in their own time, and to ADAM SMITH, MALTHUS, etc., as the *Economistes*. The chief members of the "sect" were QUESNAY, the elder MIRABEAU, Mercier de la RIVIERE, DU PONT de Nemours, ABEILLE, BAUDRAT, ROWLAND, SAINT PÉRAY, LE TROSNE.

As to the origin of the name compare Mirabeau (Letter of 20th December 1767 to J. J. Rousseau): "De ma part, je fondai chez moi un diner et une assemblée tous les mardis. J'y reçus tous les étrangers qui viennent voir le bâton flottant sur l'onde, les magnats qui me viennent voir, et surtout la jeunesse. C'est de ces assemblées, qui ont été fructueuses à l'excès, que nous est venu le nom d'*Économistes*." Levallois, *J. J. Rousseau, ses amis et ses ennemis*, Paris, 1865, ii. 385.

[For further remarks on the *Economistes*, see *PHYSIOCRATS*.] H. H.

ECU. A French coin, so called from the shield covered with fleurs-de-lis which was stamped upon it. It was originally a gold coin, and was first struck in 1336. But the historic *ecu* of the 17th and 18th centuries was a silver coin (*écu blanc*), corresponding to the English "crown," and worth six francs. There was also *petit écu* or *denier-écu*, worth three francs. These coins were in circulation at the beginning of the present century. In recent times the term *ecu* has been applied to a piece of five francs. R. L.

The gold *ecu* of 1336 was made of pure metal. (See *Traité Historique des Monnaies de France*, Le Blanc, Paris, 1822.) The silver *ecu*, first struck in 1641, was of silver, 915 fine. (See *Traité des Monnaies d'or et d'argent*, Bonnesville, Paris, 1806.) R. E. A.

EDEN. SIR FREDERICK MORTON, BART. (1766-1809), graduated at Oxford, and was chairman and one of the founders of the Globe

Insurance Company. Eden's independent position was favourable to his completing, in the thirty-second year of his age, his principal work, involving much study and expensive research, *The State of the Poor*. This book, called by M'Culloch, "the grand storehouse of information respecting the labouring classes of England," entitles its author to rank with Arthur Young as one of those immediate successors of Adam Smith who best developed the inductive branch of political economy. The importance of facts as a foundation of theory is insisted on in the preface and opening pages of this work (p. xxix and p. 4); "These and many similar questions [relating to the poor laws] cannot, as it seems to me, be fully and satisfactorily answered, unless many minute circumstances are previously stated, which have rarely been sufficiently attended to in the plausible and ingenious but unsolid speculations of several merely theoretic reasoners." Such writers "voluntarily impose upon themselves the task, so much and so justly complained of by the Israelites, of making bricks without straw." "The edifice of political knowledge cannot be reared without its 'hewers of stone' and 'drawers of water.' I am content to work among them." "I have purposely and almost wholly abstained from drawing conclusions from the facts here presented to the public." Fortunately not "wholly." In the first chapter of his second book Eden discourses freely "of national establishments for the maintenance of the poor, and of the English Poor Laws, and of Mr. Pitt's proposed bill for the better relief of the poor." His reflections upon the events and opinions which he records are just and striking: for instance, on the "fathers of the poor," whom CHILD (*q.v.*) proposed to create, "not only clothed in the garbs, but vested with the powers of papal inquisitors" (p. 188); or, with reference to Henry VIII.'s confiscations, on the danger of reposing confidence in "the most specious promises made by any reformers by violence, whether they be overbearing despots like Henry the Eighth, canting Puritans like the parliament and their adherents in the time of our First Charles, or blustering and boastful constitution-mongers like many of the modern revolutionists." Although Eden declares, "I have never wasted that time in polishing a sentence which I thought I could better employ in ascertaining a fact," he enhances by considerable literary attractions the curious and important information which he has collected.

The subjects which Eden principally dealt with are sufficiently indicated by a title which is almost a catalogue: *The State of the Poor, an history of the labouring classes in England from the Conquest to the present period, in which are particularly considered their domestic economy with respect to diet, dress, food, and habitation, and the various plans which from time to time have been proposed*

and adopted for the relief of the poor, together with Parochial Reports relative to the administration of Workhouses, and Houses of Industry; the state of Friendly Societies, and other public institutions, in several agricultural, commercial, and manufacturing districts, with a large appendix, . . . 1797. A translation of the less detailed parts of this work is published in Duquesnoy's *Recueil de Mémoires sur les Etablissements d'Humanité*, No. 21, 1799; and also separately, 1800. There is an analysis of Eden's work by Cabanis, in the *Mercur Français*, Nos. 29, 30, 32, an. vi. (1798). Eden is also the author of (1) *Porto-Bello, or a Plan for the Improvement of the Port and City of London*, 1798.—(2) *An Estimate of the Number of Inhabitants in Great Britain and Ireland*, 1800, written on the eve of the first census, and estimating, by means of the number of baptisms, the population of Great Britain and Ireland (inclusive of sailors and soldiers) as 10,710,000. (The real number, according to the census, was, in round figures, 14,991,000).—(3) *Eight Letters on the Peace and on the Commerce and Manufactures of Great Britain*, 1802, defending the peace with France, and illustrating the economical position of England by statistics and interesting reflections.—(4) *Address on the Maritime Rights of Great Britain*, 1808 (first edition 1807), commending the orders in council of 1807, and "offering some suggestions on the measures necessary to render the United Kingdom independent of other countries for the most indispensable articles now supplied by foreign commerce." The suggestions comprehend a plan for the encouragement of Anglo-Merino sheep, which the author defends against "Adam Smith, the great enemy of bounties," having regard to "what, on the whole, in pecuniary or political advantage, will be the gain to the country when the measure is carried into full effect." Eden is stated (in Walford's *Insurance Cyclopaedia*), to have privately printed a considerable pamphlet *On the Policy and Expediency of granting Insurance Charters*, 1806, to which M'Culloch refers in his *Literature*. There is among the Bentham MSS. (*Brit. Mus. Addit. MSS.*, 31,235) a letter from Eden to Vansittart, containing observations on Bentham's scheme of annuity notes. F. Y. E.

EDGEWORTH, MARIA (1767-1849), daughter of R. L. Edgeworth, owing to the great popularity of her moral tales for children, has had considerable influence on the attitude of thought in England regarding economic questions. An intimate friend of Malthus, Richard Jones, and Ricardo, and well acquainted with their works, her writings evince considerable power of applying economic principles successfully in everyday life. Her novels and tales were directly written to inculcate a utilitarian morality, and the virtues which she specially exalts are those assumed to exist in the economic man of abstract theory—intelligence, honesty, love of truth, industry, prudence, and judgment; she excelled in her truthful portraits of the stupid, the wilfully ignorant, the extravagant, and the sentimental, against whom she directed a keen wit and

satire, the more deadly because good-humoured. Her books for children dwelt on the pains of idleness and the pleasures of industry, an aspect of the labour question now too little regarded. Her pictures of life among the Irish peasantry and the English working classes contain frequent reference to the lucrative employment of young children; but although she believed that work was pleasurable even when remunerated, and goes so far as to make four orphans under thirteen years of age support themselves (see *Parent's Assistant*:—*The Orphans*), the children in her stories always seek and receive facilities for educating themselves. Numerous instances of generous and yet discriminating relief of the distressed, to be found both in her fiction and in her life, show her to have been in advance of her time in her views on almsgiving; her stories, *Rosamond* and *Egerton Abbey*, exemplify this. (See also article in *Charity Organisation Review*, Nov. 1889). To the economist the most valuable of her writings are the novels dealing with the relations of landlord and tenant in Ireland. The land agent, middleman, or "journeyman gentleman" is presented in all his aspects, good, bad, and indifferent. *Castle Rackrent* is a delightful history of three generations of Irish spendthrift and absentee landlords, written from the point of view of an old family retainer. The hero of *The Absentee*, whose parents have deserted their Irish estates for London society, travels incognito to inspect the condition and treatment of their tenantry; and the account of his adventures, given by one who had herself acted as land agent on her father's estate and who was entirely free from party spirit, is well worth studying apart from its artistic merits. The nearest approach to definite exposition of economic theories is to be found in *Ennui*, in the criticism of the well-meant actions of an Irish landlord by his Scotch agent. Mr. M'Leod "doubted whether the best way of encouraging the industrious was to give premiums to the idle." "He was told that some Indian Brahmins were so very compassionate that they hired beggars to let fleas feed upon them. He doubted whether it might not be better to let the fleas starve." "He doubted whether long leases alone would make improving tenants." "He doubted whether, if a farm could support but ten people, it were wise to encourage the birth of twenty. It might be doubted whether it were not better for ten to live and be well fed than for twenty to be born and be half starved." "He doubted whether it would not encourage the manufacturers to make bad stuffs and bad linen, since they were sure of a sale and without danger of competition," and "he doubted whether it would not be better for a man to buy shoes if he could buy them cheaper than he could make them." The admirable portrait of King Corny in *Ormond* elicited warm praise from Macaulay.

[Helen Zimmer's *Maria Edgeworth*, 1883. The books for children still widely read are: *Frank, Rissamond, Harry and Lucy, The Parent's Assistant, Moral Tales, and Popular Tales*. See also article in *International Journal of Ethics* for April 1892, where the writer has treated this subject at greater length.] E. E. C.

EDMONDS, THOMAS ROWE (1803-1889), born at Penzance, educated at Cambridge (B.A., 1826), was actuary of the Legal and General Life Assurance Society from 1832 to 1866. He wrote *Life Tables*, 1832; *Inquiry into the Principles of Population*, 1832; *Laws regulating Human Mortality*, 1866; and contributed many papers on the same subject to the *Lancet*. He also published:—

Practical, Moral, and Political Economy, or the Government, Religion, and Institutions most conducive to Individual Happiness and to National Power, London, 1828, 8vo. ("The social system is the limit towards which all governments tend, and at which they cannot fail to arrive sooner or later," p. 283. The author considers that labourers should work six hours a day, and proposes a tax on marriage.)

[Walford, *Insurance Cyclopaedia*, ii. 470-74.—F. Boase, *Modern English Biography*, i. 961.—Marr, *Misère de la Péninsule*, pp. 49-50.] H. R. T.

EDUCATION, ECONOMIC ASPECTS OF. Trade and industry may be affected by education in two ways. In the first place, their progress may be assisted by *General Education*, which, though developed without any immediate or particular reference to their well-being, must necessarily promote it by quickening the intelligence and calling into play the latent capacities of the people of any country. In the second place, a particular industry will be advanced by means of *Technical Education*, which renders those employed or likely to be employed in any industry more fully acquainted with the nature of its processes and with such branches of general education as may be deemed to have a direct and immediate bearing on these. It is education directed to an end, and a particular end. *General Education*, in its early stages, may be the same for all classes, notwithstanding their differences of calling; in its later or specialised stages it will direct attention to certain cognate branches of study with the view of inducing students to concentrate their powers on the problems presented by these studies. Should these problems coincide with or resemble those involved in the profession or trade they may adopt, they will be additionally benefited. *Technical Education*, on the other hand, will have regard to the special requirements of the profession or trade in which the students in question are, or are likely to be employed. It will be evident that the term *Technical Education*, though usually employed as above, may be extended so as to include or imply an education more fitly described as specialised education.

General Education.—In order that the advantages of such education may be fully felt it is necessary that it should (1) in its primary stages be national; (2) in its later or specialised stages be open to all those fitted to avail themselves of it. The first of these conditions has been recognised by civilised nations. As a rule it has, so far at least as a certain minimum, been made compulsory. There is overwhelming testimony to the benefits conferred on industry by such a state of things. The second condition is less fully regarded, little provision being made in many countries, among which we must include England, where the higher education is costly. The advantages of a high standard of General Education may be seen from many examples, as for instance the position of America and in some degree that of Germany. England, where in industry the standard of workmanship is high, owes her position to causes somewhat different. She owes much to her political condition, and much also to the free and fair intercourse of life common to her.

Technical Education.—The early recognition of the desirability of such training may be gathered from the evidence before Royal Commissions, etc. (see especially "Royal Commission to inquire into condition of the Handloom Weavers," Parl. Paper, 1841, vol. x.), in which the difference in artistic merit between English and French work is instanced and the demand made for the establishment of schools of design, etc. But England made much less rapid advance in this respect than most of the chief foreign countries, where highly-organised systems of technical instruction have been adopted (see *L'Enseignement Commercial*, par Eugène Leautey). In this country, on the contrary, little was achieved till 1890.

[The "economic value" of the intelligence of the population is borne witness to by all our leading economic authorities. See e.g. Marshall, *Principles of Economics*, 1st ed. pp. 264-276.]

E. C. K. G.

EDWARDS, BRYAN (1743-1800) was born at Westbury. In 1759 he went out to Jamaica to the house of his uncle, a merchant in that island. On his uncle's death he succeeded to the business and other property. His chief interests lay in the West Indies, and though shortly before his death he returned to England and sat in parliament as member for Grampound, he continued to act chiefly in the interest of the West Indies. His principal work is *The History, Civil and Commercial, of the British Colonies in the West Indies*, published in 1793; a third edition of this work appeared in 1807 in an enlarged form, containing a brief autobiography and chapters on the French colonies in the West Indies. These were first published in 1797 as *A Historical Survey of the French Colony in the Island of San Domingo*. The economic importance of the book which

reached a fifth edition in 5 vols. 8vo, in 1819, lies (a) in the full and accurate account of the West Indies contained in it; (b) in an able and temperate discussion of the slavery question from the point of view of a defender, though not an advocate of it. He considers it impossible to abolish the slave trade, but insists that it should be placed under government regulation, and considers that the importation of a larger number of negroes would bring the trade to a natural end. His arguments in defence of slavery are of the usual type, but he admits that the institution has a tendency to injure the character of the planters.

He also wrote *Thoughts on the Late Proceedings of Government respecting the Trade of the West India Islands with the United States*, 1784; *Speech at a Free Conference between the Council and Assembly of Jamaica on Wilberforce's Proposition concerning the Slave Trade*, 1790; and some other pamphlets on West Indian Questions.

EDWARDS, GEORGE, M.D. (1752-1823). George Edwards took his doctor's degree at Edinburgh in 1772, and practised at Barnard Castle in Durham, and afterwards in London, where he died. Besides a few medical works he published a large number of pamphlets upon social questions, propounding various remedies for the social ills which weighed upon England in the early part of the 19th century. He seems, however, to have been more impressed with the evils than capable of studying them scientifically; and to have been little more than a political visionary. His chief discovery in his own eyes was the invention of the income tax. The British Museum contains about forty pamphlets by him, which are principally devoted to recommending the precepts contained in his larger books.

Their titles are: *The Aggrandisement and National Prosperity of Great Britain*, 1787.—*The Royal and Constitutional Regeneration of Great Britain*, 1787.—*The Practical Means of effectually exonerating the Public Burthens of paying the National Debt, and of raising the Supplies of War without new Taxes*, 1790.—*Effectual Means of providing against Scarcity and High Prices of different Articles of Food*, 1800; *A Plan of an Undertaking . . . for the improvement of Husbandry*, etc., Newcastle, 1783, 8vo.—*Radical Means of counteracting the present Scarcity and preventing Famine in the Future; including the Proposal of a Maximum founded on a New Principle*, etc., London, 1801, fol.—*A Plain Practical Plan by which Great Britain may extricate herself from her present Difficulties*, etc., London, 1808, 4to; with many more of the same kind.

EFFECTS. This is one of the vague and undefined words which often occur in legal documents, and are a frequent cause of litigation. A gift of the testator's effects in a will, unless restrained by the context, means a gift of the whole of the personal property, and may, in other circumstances favour such an interpretation, include even real estate. The word also occurs in partnership deeds in the combination "estate and effects of the partnership," which has been held to include all the property of the partnership "available for the purpose of discharging the debts and liabilities." (*Stewart v. Gladstone*, 10 Chancery Division 626.)

E. S.

EFFECTUAL DEMAND. See DEMAND, EFFECTUAL.

EFFICIENCY OF LABOUR is the resultant of combined (1) strength, (2) skill, (3) diligence and care on the part of the labourer. The product of his labour is manifestly governed very largely also by the efficiency of the tools he is supplied with, and the efficiency of the superintendents under whom he serves; but these are rather external aids furnished from the side of capital than constituent conditions of efficient labour itself. The most perfect tools are valueless in the hands of the inefficient, whereas the truly efficient workman, according to an eminent practical authority, Mr. Nasmyth, the inventor of the steam hammer, is a man who can always produce his result with the tools that lie to his hand, or, as the same idea is expressed in the curious maxim of another eminent engineer, Maudsley, the criterion of the thorough mechanic is to be able to cut a plank with a gimlet and bore a hole with a saw. The workman who can do as well with bad tools as his neighbour does with good, will accomplish with good tools much more remarkable results; but the secret of his efficiency in both cases lies in the physical, mental, and moral energies of the man's own being.

(1) The first condition of the fit workman is physical vigour—not merely muscular, but general vigour, for as Professor M. Foster observes "the power of doing work hangs not on the muscle alone, but on the heart, the lungs, the nervous system, and indeed the whole body" (*Text-book of Physiology*, p. 845). Nervous energy is of especial moment, because fatigue is much more a nervous than a muscular condition. Professor Foster considers it doubtful whether men ever, even in their severest efforts, draw on more than a portion of the store of energy lodged in their muscles; it is the store of energy in the nerves that gives out. People differ much in their power of sustaining hard and continuous exertion, and in the degree of ardour and "go" they throw into it, and the difference depends on the general conditions of sound physical health, especially on original constitution, more or less

plentiful diet and adequate or inadequate repose. A mountain stock has more grit than the average, even though it has been more poorly fed; and Mr. Jones, one of Mr. Brassey's managers, always preferred mountaineers for railway making when he could obtain them. English workmen enjoy better fare and shorter hours than other workmen, and they are noted for their physical strength, their endurance, and their rapidity at work. Mr. Brassey found English navvies able to do heavier work, to do more work in the day, and to remain afterwards fresher for an extra spurt if required, than any other navvies in the world. In constructing the Paris and Rouen railway, in which he employed 4000 Englishmen and 6000 Frenchmen, he took great pains to ascertain the relative industrial capacity of the two nations, and he came to the general conclusion that three Englishmen did the work of four Frenchmen. In "shifting" materials the English navvy was found to do twice as much work in the day as the French, though he worked two hours less, and he received twice the wages, and a half-franc more, because he could be counted on for additional speed under pressure; while for the hard work of mining and tunnelling, Mr. Brassey employed none but Englishmen; and even in Italy, where he found the Piedmontese excellent workers—in some respects better than the English—and employed them in tunnelling in dry rock, he still reserved the more arduous labour of tunnelling in clay for English limbs (Brassey, *Work and Wages*, pp. 118, 146). For mere strength Englishmen excel even their better-fed but longer-worked American kinsmen. "When we want physical force combined with skill," says the well-known American ironmaster, Mr. A. Hewitt, "we get Englishmen" (*Trade Union Commission Report*, qv. 6989). In girder rolling he said the Americans were more active and better rollers, but when it came to puddling the heavy bars there were no workmen like the English; and the reason was, what he thought every observer must remark, that the English were superior to the Americans in physical development. Sir I. L. Bell, in a comparison of five American furnaces with those of Cleveland, calculates that the workers in an English furnace, with a shorter working day, move 2100 tons of fuel, ore, and limestone in the week, while the same number of Americans move only 2100 tons (*Iron Trade of United Kingdom*, p. 137). Luxembourg ironworks, again, is not harder to work than Cleveland limestone, but two Cleveland mines turn out 10½ tons of stone in an eight hours' day, whereas two Luxembourg mines turn out only 10 tons in a twelve hours one (*ib.* 86). In continental textile mills Mr. Mundella always found five hands doing work that was done in England by three. During the eight hours strike in Melbourne in

1859, it was ascertained for a wager that an English bricklayer laid half as many bricks again in the day as a German. Then in England itself, the well-fed Midland labourer will do twice the work of the ill-fed Dorset hind; whilst the Australians, the best-fed and shortest-worked race of work-people in the world, strike even English eyes for the extraordinary vigour and "go" they put into their work. Lord Brassey praises the "remarkable physique" of the Australian navvy, and Captain Henderson, R.N., said Australian dockers coaled a ship three times as fast as English ones (*Proceedings of Royal Colonial Institute*, xix. 122). More specific proof still exists of the connection between work and feeding. Mr. Brassey often employed agricultural labourers for navvy work, and when they first came they would lie down utterly exhausted about three in the afternoon, but after twelve months of good wages and better diet than they enjoyed before, they became quite fit to do their work without any difficulty. Irishmen in their own country are the poorest of workmen, mainly because of their poor fare. Arthur Young said, in his time, that an Essex labourer at half-a-crown a day was cheaper than a Tipperary labourer at five-pence; and Mr. J. Fox said to the Trade Depression Commission that, though he paid the hands in his Manchester mill 20 per cent higher wages than the hands in his Cork mill, the real cost of the work was the same in both. But when the Irish come over to England and get better diet their working power soon improves; Sir I. L. Bell says, many young Irishmen come to Cleveland ironworks, and though not worth much at first, yet "as soon as their improved style of living permits it," they become equal to any workman in Cleveland, both for ability and will to work. M. Chevalier mentions that when Messrs. Manby and Wilson started their French foundry at Charenton in 1820, they brought over a few of their English hands with them, and found these did far more work than the French labourers. Suspecting the reason to be better nourishment, they took steps to get the French work-people to eat as much meat as the English; and the result was, that in a short time they did nearly as much work as the English too. The effect of shortening hours of labour in improving industrial energy will be treated separately, but even the minor changes in the sanitary conditions of work, effected by the Factory Acts, have caused such a perceptible increase in productive capacity that Dr. J. Watts says Lancashire cotton operatives are far more about being employed in a good mill, with plenty of air and light, than about the exact price per lb. they get for spinning or per piece for weaving, because "they know practically what is the effect of these conditions upon the weekly wages" (*Facts about the Cotton Question*, p. 44). The same sound

physical conditions which enlarge productive capacity at the time also extend the term of efficient working life.

(2) Skill is a compound of general mental intelligence, special technical culture, and acquired manual dexterity. All work involves head work. The good workman must be a thinking and planning being, and according to his general intelligence will be his share of the supreme industrial qualities of resourcefulness, versatility, and precision. The intelligent man needs a shorter apprenticeship and less superintendence, and is less wasteful of materials, all simply because he understands better than the ignorant man the nature of the stuff he handles, the working of the tools and machinery he uses, and the end and object of the commodity he is making. Hence the immense industrial value of general education. The want of education has hitherto been the chief industrial defect of the English workman. Escher, a Swiss manufacturer, who employed about 2000 hands of all nationalities, said, in 1840, that while the English workmen were the best in what they had actually learnt, they were of less value outside their own specific work than the Swiss or the Scotch, because of their inferior education (Mill, *Political Economy*, bk. i. ch. vii. § 5). But on the other hand, a later Swiss manufacturer, Herr Wunderley, who also employed men of all European nationalities in his mills, stated to the Technical Instruction Commission that there was a certain practicality and method in English labour—a mechanical genius, he termed it—which seemed to enable it to do, without much knowledge, what continental labour did with it (*Technical Instruction Commission Report*, p. 269). Mr. Mundella, too, thinks that English labourers naturally more inventive than foreigners, more apt in devising means for ends, but this is probably due in some degree to their greater physical energy, their greater determination not to be mastered by a difficulty; for Mr. E. Rose, in 1832, stated one of the chief differences between French and English work-people to be that the French got much sooner bewildered with a difficulty and gave in, while the English still kept on trying to find a way out until the thing was done (Senior, *Political Economy*, p. 150). But all are agreed that this and other industrial capacities would be greatly developed by better education. Mr. E. Peshine Smith states that the Massachusetts Board of Education procured from the owners of factories in that state, some fifty years ago, a report of the different rates of wages paid and the education of the recipients, and the amount of wages varied exactly as the education, the lowest being foreigners who signed their name with a mark, and the highest the girls who went to school in winter and worked in the mills in summer. He adds that it was estimated that popular

education gave an advantage of 20 per cent to the American manufacturer in competition with foreigners (*Manual of Political Economy*, 151). American manufacturers used to say that, from their better education, two American mill hands would do the work of three English ones, and Mr. Harris Gastrell, in his report to the English Foreign Office in 1873, admits that this may be so still in the mills—now apparently a minority—where American has not been superseded by foreign labour (p. 682). Sir W. Fairbairn said, that for difficult engineering work they always looked out for the best-educated workmen; and when Mr. Mundella asked a Swiss manufacturer how his countrymen had taken the ribbon trade from the French, he was answered, "We beat them by means of an educated people."

Special dexterities are, generally speaking, the result of special training and practice. No doubt cunning of hand may be inherited like other faculties, but even then greater facility still comes from repetition. This is the source of the increment of production obtained through division of labour. The jack-of-all-trades never has the chance of becoming master of any; but when every man confines himself to a separate trade, the sum of their total work is improved, both in quality and quantity, through the greater perfection each man acquires in the performance of his special branch of work by means of constant repetition. On the other hand, an extreme sub-division of labour may involve a certain monotony which is not favourable to efficiency even in the special branch of work concerned, and is certainly adverse to general efficiency. Marx, however, exaggerates the ill effects of specialisation when he calls the modern "detail workman" a mutilated and crippled monstrosity, a mere bit of the machine he sits and watches. Mr. Nasmyth, with much more practical experience, says he has often been struck to observe how this process of watching the beautiful and precise working of machinery exercised a positively intellectualising effect upon the labourer which was not unfavourable to versatility. Another essential for good work, hardly behind manual facility, is visual accuracy, and Mr. Nasmyth thinks the average workman comes far short in this quality; he found that his own men in general spent most of their time in applying the rule and straightedge, while the dexterous workman seldom used these tools at all; his eye was enough.

Intermediate between this cunning of eye and hand, and general mental intelligence, stand certain special mental capacities, such as artistic taste and mastery of sciences cognate to the workman's trade, which are of great importance for good work, though some authorities contend they are less the concern of the manual labourer who executes the work than of the designers and

managers who direct it. The French have long excelled all other nations in taste, and the Germans have pushed to the front in some industries through their better technical and scientific instruction.

(3) Diligence and care are the moral virtues of labour, and in the national distribution of industrial qualities they are the portion of the Germans. The English, as Defoe said, are the most diligent-lazy people in the world, very strenuous in their work while they are at it, but prone to breaks of idleness after pay-days, or at other times, for purposes of dissipation. This is, of course, a great advance in diligence over the uniform sluggishness and aversion to labour of many inferior races, but it stands much below the diligence of the Germans, who are not only steady and docile in general, but have a conscientiousness and power of taking pains which alone render them, says Sir C. W. Siemens, preferable to other work-people for many special kinds of work. No race is incurably indolent. The Scotch in the last century were counted the laziest people in the United Kingdom, and in this century are the most industrious. The Irish are still thought idle in Ireland and found active out of it. The diligence is always due to circumstances, to a change from conditions in which nothing was to be made by working to conditions in which present work is seen establishing future comfort, and is made pleasant and cheerful by the hope so inspired. The great encourager of willing industry is good wages. It is an old contention—which was already successfully refuted with a considerable induction of facts by Adam Smith (*Wealth of Nations*, bk. i. ch. viii.)—that good wages only make men indolent, enabling them to supply their wants with so much less labour; and Professor Cairnes (*Some Leading Principles of Pol. Econ.*, p. 240) has made a kindred objection, that good wages are a bad thing, because they always encourage dissipation; but both these objections err by drawing an unwarrantable conclusion as to the general operation of good wages from the experience of their operation in particular instances only. The countries of the highest wages are also the countries of the highest productivity; and while wages have been generally rising for half a century, drunkenness has been lessening.

J. R.

EFFICIENCY OF MONEY. This term is proposed by Mill to express "the average number of purchases made by each piece in order to effect a given pecuniary amount of transactions." According to the "quantity theory," in that rudimentary form which makes abstraction of *credit*, the value of money will be inversely proportional to the quantity multiplied by the efficiency thereof. This proposition is not true of the *rapidity* of circulation, when defined, e.g. by Roscher, as the number of

purchases made by each piece per year (or other unit of time); unless indeed the total amount of transactions is regarded as constant.

A wider definition of "efficiency" covers the circulation of *instruments of credit* as well as coins. Thus Mill: "as money tells upon prices not simply in proportion to its amount, but to its amount multiplied by the number of times it changes hands, so also does credit." Mr. Macleod has in view this wider sense when he introduces the happy phrase "*duty*" of money (*Economic Philosophy*, i. p. 211).

There is reason to believe that the efficiency of money in both these senses varies from time to time. Mill says (*Pol. Econ.*, bk. iii. ch. xii. § 3), "the money of the community is virtually increased in a time of speculative activity . . . by increased rapidity of circulation." So Walker (*Pol. Econ.*, art. 174), "the rapidity of circulation varies from day to day with the state of trade and the temper of the public mind." But precise observations of the extent of variation are wanting. "On that subject there are no statistics," says Prof. Marshall (*Evidence before the Royal Commission on Recent Changes in the value of Silver and Gold*).

Much the same may be said of efficiency in a third sense in which the term is sometimes used, namely, to denote the amount of pecuniary transactions which a given quantity of the metallic standard either effects directly by hard cash payments, or supports and renders possible by acting as a *reserve*. We may say that the efficiency of money in this sense is greater in one country (e.g. England) than another; but an accurate measure is not to be expected; for even if we could ascertain (1) the total amount of metallic money, whether in active circulation, or in reserve, and also the "efficiency" (in the first sense of the term) of that part which is in active circulation; and (2) the total volume of things on sale; we should still require to know the average number of times each of these things changes hands during the year, the rapidity of the circulation of goods, and, as Prof. Marshall says (*loc. cit.*), "with regard to that we have no statistics whatever; indeed there has never been any attempt to obtain statistics on the subject."

(Mill, *Political Economy*, bk. iii. ch. viii. § 3, ch. xii. §§ 3, 4.—Walker, *Political Economy*, art. 174.—Money, p. 62.—Roscher, *System of Political Economy*, § 123, and authorities there cited.—H. D. Macleod, *Economic Philosophy*, i. p. 211.)

On the statistical aspect of the subject some hints may be obtained from the following: *On Currency*, anonymous, attributed to Sir J. W. Lubbock, London (Charles Knight and Co.), 1840 (included by Jevons in his list of Mathematical-Economic books).—Dr. Franz Kral, *Geldwert und Preisbewegung* (Staatswissenschaftliche Studien, Dr. L. Elster.) See RAPIDITY OF CIRCULATION.

F. Y. E.

EGOISM. This term may be said to have a popular and also a philosophic meaning. In

popular usage it is nearly equivalent to selfishness, and expresses the temper of mind which sacrifices to one's own welfare the welfare of others. Economists have often been accused of assuming that all men are egoists in this sense, and of giving practical precepts in conformity with this assumption. In philosophic usage egoism has a more subtle meaning. Egoistic psychology finds the only possible motive of action in the desire to attain pleasure and to avoid pain, although it allows that this desire may often prompt to actions which in ordinary parlance would be called unselfish. Egoistic ethics, taking its premisses from egoistic psychology, defines morality as the intelligent pursuit of that which instinct compels us to pursue, as the rational pursuit of pleasure and avoidance of pain, although it tries to show that such morality is compatible with what is commonly known as unselfishness. The founders of modern political economy have often been censured for assuming the truth of egoistic psychology and the validity of egoistic ethics. This charge is quite distinct from the other charge, although the two are commonly confused. The first has excited most odium. The second is more difficult to disprove. No distinguished economist has said that men all are and ought to be selfish. But many distinguished economists have held that self-love is the mainspring of human action.

Adam Smith's view respecting the influence of self-love on economic action is most plainly stated in his account of the principle which gives occasion to the division of labour (*Wealth of Nations*, bk. i. ch. ii.): "Man has almost constant occasion for the help of his brethren, and it is in vain for him to expect it from their benevolence only. He will be more likely to prevail if he can interest their self-love in his favour and show them that it is for their own advantage to do for him what he requires of them. . . . It is not from the benevolence of the butcher, the brewer, or the baker, that we expect our dinner, but from their regard to their own interest. We address ourselves not to their humanity, but to their self-love; and never talk to them of our own necessities, but of their advantages. Nobody but a beggar chooses to depend chiefly upon the benevolence of his fellow-citizens." At first sight this passage seems to assert that selfishness is the only economic motive. But on further consideration it will appear that the operation of self-love here described is not of that injurious kind which would commonly be considered selfish. Tradesmen who undertook to supply everything gratis would be far less useful to society than tradesmen who expect a fair price for their goods. Such an expectation is not selfish in the popular sense of the term. It is only conformable to common sense. Similarly, when Adam Smith recommended complete

economic liberty and trusted to self-love to generate the best economic system, he did not mean to preach selfishness in the popular sense. The self-love to which he trusted was self-love restrained by the criminal and civil law, by public opinion, by conscience, and by social and amiable instincts. With his sentiments we may compare those of Malthus expressed in the Appendix to his *Essay on Population*: "The great Author of nature . . . by making the passion of self-love beyond comparison stronger than the passion of benevolence, has at once impelled us to that line of conduct which is essential to the preservation of the human race. . . . He has enjoined every man to pursue as his primary object his own safety and happiness and the safety and happiness of those immediately connected with him. . . . By this wise provision the most ignorant are led to promote the general happiness, an end which they would have totally failed to attain if the moving principle of their conduct had been benevolence. Benevolence indeed as the great and constant source of action would require the most perfect knowledge of causes and effects, and therefore can only be the attribute of the Deity."

Here self-love is not only stated as the actual, but justified as the best, motive of ordinary human action. Yet the self-love here justified is not selfishness commonly so called. Thus it includes "those immediately connected with" oneself, *i.e.* one's family. Again the benevolence here disparaged seems confined to the desire of doing good directly to others. The scope of such benevolence must always be narrow for most men. In ninety-nine cases out of a hundred the greatest service which a plain man can render to society is to do his own work well. His work will doubtless be ennobled by his perceiving that it has a value for society as well as for himself. But if he were to forsake it and devote himself entirely to works of charity he would be less useful than in his old calling. Malthus felt that he had laid himself open to misinterpretation, for he adds in a note: "It seems proper to make a decided distinction between self-love and selfishness, between that passion which under proper regulations is the source of all honourable industry and of all the necessities and conveniences of life, and the same passion pushed to excess when it becomes useless and disgusting and consequently vicious."

These quotations do not justify the inference that Adam Smith and his successors alleged that mankind universally were or ought to be selfish in the plain sense of that term. "This opinion may be dismissed at once as a popular error which finds no support in the teaching or practice of the best economists" (Marshall, *Principles of Economics*, bk. i. ch. vi., "Economic Motives.") But the above quotations do show

that the founders of modern political economy accepted an egoistic psychology and an egoistic ethics. In other words, they took for granted the current philosophy of their day. That philosophy regarded man simply as a subject of pleasure and pain, and defined morality as the line of conduct which led to happiness. The motive of duty to one's fellows was found in the gratification of the social instinct. Human shortcomings were made good by the overruling benevolence of God or of nature which led every man to promote the good of others even when thinking solely of his own. It may well be that such a philosophy is inadequate or even corrupting; but it is unfair to blame an economist for accepting the philosophy current in his own day. With the ultimate solution of psychological or ethical problems an economist has nothing to do. As a man of science he has only to estimate the motives which actuate men in producing, distributing, and consuming wealth. As an adviser of individuals or of states, he has only to take for granted the highest morality known to his age.

Egoism or selfishness in the popular sense is perhaps more conspicuous in the economical sphere than in any other sphere of human activity. Yet even here it affords no universal key. "Ethical forces," says Prof. Marshall in the preface to his *Principles of Economics*, "are among those of which the economist has to take account. Attempts have indeed been made to construct an abstract science with regard to the actions of an 'economic man,' who is under no ethical influences, and who pursues pecuniary gain warily and energetically, but mechanically and selfishly. But they have not been successful, nor even thoroughly carried out. For they have never really treated the economic man as perfectly selfish; no one could be relied on better to endure toil and sacrifice with the unselfish desire to make provision for his family; and his normal motives have always been tacitly assumed to include the family affections. But if they include these, why should they not include all other altruistic motives, the action of which is so far uniform in any class at any time or place that it can be reduced to general rule? There seems to be no reason." And in the chapter on economic motives above referred to, Prof. Marshall points out that it is the measurable, not the selfish character of motives, which brings them within the range of economic inquiry. Of course the motives thus measurable are not simple but highly complex. We may be able to measure, e.g. the force of the complex motive which leads a particular class in a particular country to spend money on the education of their children. But we cannot measure, nor for economical purposes is it necessary to measure, the relative importance of the ele-

ments in this complex motive, such as desire for the worldly advancement of one's children, desire for their spiritual perfection, etc. Nor need we determine how far each particular motive approaches to pure selfishness or pure unselfishness.

In giving practical advice the economist must equally take account of ethics. It will be useless or mischievous to give advice which the common conscience of mankind declares to be immoral; and equally useless or mischievous to give advice which assumes that great masses of human beings are exempt from human weakness. In estimating the force of egoism under actual conditions, and the possibility of controlling it to higher issues, the economist will be guided aright only by a sagacity which is the gift of nature, although it may be improved by study. It would not be hard to show that even so well-informed a writer as Mill thought contemporary men more selfish than they are, and expected men in the future to be less selfish than they are likely to prove.

[See Goschen in *Econ. Journ.*, Sept. 1893, and *ECONOMIC MAN.*]

F. C. M.

EGRON, ADRIEN CÉSAR, born in Tours, was a printer and publisher in Paris (fl. first half of 19th cent.). He printed in 1844 his *Livre de l'Ouvrier; ses devoirs envers la Société, la famille, et lui-même* and in 1847 his *Livre du Pauvre; devoirs de celui qui donne et de celui qui reçoit*. Both works consist mainly of a series of extracts out of different writers from the Bible and Aristophanes to modern times, illustrating the duties of the rich and of the poor respectively. These are connected by rather prolix considerations of his own. He is much more a Christian moralist than an economist. E. ca.

EIGHT-PIECE (or piece-of-eight). A Spanish silver coin of the value of eight reals, was for many years known as a "piece-of-eight" throughout the British, American, and West Indian colonies, where it was the principal coin in use from the time of the foundation of those colonies until the early part of the 19th century. It circulated in the United States until as late as the year 1857, when it was withdrawn from circulation in that country and demonetised. Pieces-of-eight were also to be found in circulation in New South Wales during the early years of that colony's existence; and they are still used in some of the islands of the East Indian archipelago. The title "piece-of-eight" fell into disuse about the end of the 17th century, when the coin began to be known as the "Spanish" or "hard" dollar (see *DOLLAR, HARD*).

F. E. A.

EIGHT HOURS MOVEMENT. An agitation for a universal eight hours day of labour—for eight hours work without diminution of pay—was begun in England as far back as 1838, by two large employers, John Fielden, M.P., and Robert Owen, and a special or-

ganisation, the National Regeneration Society, as it was termed, was formed to carry on the agitation, but it led to no results, and the question was not practically raised in this country again till the present energetic movement sprang up here and on the continent simultaneously about the year 1887. Meanwhile a successful beginning had been made with the eight hours movement by the working class in Victoria in 1856, in New South Wales in 1863, and in the United States in 1866, and under the same general influences which brought the question up in Europe, this Australian movement took a fresh start in 1884, and the American in 1886. Of the fifty-two trades of Melbourne which now enjoy the eight hours day, thirty-two obtained it since 1884. In the United States, where the agitation died away altogether after the industrial depression of 1873, in which its previous gains were all lost, the struggle is renewed every spring now with a great campaign of strikes, and the eight hours day is spreading among the more powerful trades.

A special plea for the eight hours' day is set up on behalf of certain exceptional trades on account of their dangerous, unhealthy, or exhausting character, but with respect to the mass of ordinary occupations the demand is usually based on one or other of two different and indeed opposite grounds. The advocates of one section base it on the necessity of the eight hours day for realising the recognised claim of modern workpeople to reasonable leisure for the culture, enjoyments, and duties of life, and on the small cost, if any, at which the claim can, in their view, be realised, inasmuch as experience seems to justify the expectation that the personal efficiency of labour would be so much improved under an eight-hours system that the rate of individual production would remain as high as before. Another section plead for the eight hours day because they believe it will result in the contrary alternative of a general diminution of individual production, and they think it will prove, on that account, a sure means of increasing the demand for labour, thinning the ranks of the unemployed, and raising the general rate of wages. The latter plea, though apparently the most prominent and influential in the present movement, is unsolid, going against the possibilities of the case in its view of the effect of a general diminution of individual production, and against its probabilities in its view of the effects of a general eight hours day. On the former point it is admitted, by those who use this plea with discrimination (cp. Webb and Cox, *Eight Hours Day*, p. 107), that if a general diminution of individual production involved a corresponding diminution of the aggregate production of the country, it would necessarily cause a fall instead of a rise in the

demand for labour, because the amount of work which society requires done at any given time depends strictly on the extent of the produce of society at that time. But they contend that the aggregate production of the country will not be diminished, inasmuch as any shortcomings will be made up by the work of those who are at present unable to obtain employment at all. They seem to believe it possible to make work for the unemployed by means of capital that only comes into existence as the product of the work it is supposed to make, but if they can do that under an eight hours system, why cannot they do it now?

As a matter of experience the eight hours day has surprisingly little effect on the numbers of the unemployed. In Victoria, for example, where three-fourths of the population now work only eight hours a day, the unemployed are strangely enough a greater and more constant trouble than they are here, and, stranger still, they seem to have become even a greater trouble since the eight hours day became general a few years ago than they were before. Whatever are the causes of this redundancy, the eight hours day has had little influence to check them; and the reason of this is twofold. First, shortening the hours of labour has no possible effect on the ordinary causes of fluctuations of employment, bad harvests, injudicious speculations, wars, bad weather, sudden changes of fashion, etc.; and second, shortening the hours of labour involves no corresponding shortening of the product of labour, because it enables the labourer very largely, in many cases completely, to recover by the greater intensity and energy of his work what he loses by its shorter duration.

The degree of this recovery naturally differs in different occupations, but we have now had extensive experience of the eight hours day, and the results of that experience show (1) that there are extremely few occupations in which no recuperation at all takes place, but the diminution of work has been exactly proportional to the diminution of time of work; and (2) that in the majority of trades in which the experiment has been tried, the recuperation has been, not partial merely, but complete. Nay, in a number of cases there has been a positive increase of product. Mr. W. Allan, Scotia Engine Works, Sunderland, for example, found the labour cost of his engines to have become slightly less. Mr. Beaufoy, M.P., vinegar and jam manufacturer, gets more work done in the year, and without any overtime, than he ever got done even with some months' overtime before, and he did not employ a single additional hand except three or four gate-keepers. The South Yorkshire miners had their hours reduced in 1858 from twelve to eight, and turned out much more in the short day than they did in the long one. The men in some of the depart-

ments of the Springfield Armoury, U.S.A., were found in 1868 to have done considerably more work in eight hours than they used to do in ten; and in the other departments the old rate of production, though not similarly exceeded, was fully maintained. The same result of a full maintenance of the old rate of production is reported of many other eight hour experiments in trades so various as iron shipbuilding, chemical manufacture, engineering, glass-making, cabinet-making, printing, masonwork, cutlery, soda manufacture, typefoundry. There is more than one instance of this occurring even in cotton-spinning, when the mills were working slack time. The reason is in all cases the same; less lost time and more physical energy. While the period of nominal work is shortened, the period of effective work is really lengthened. The large number of the trades in which the eight hours day has been already introduced without interfering with the amount of production certainly suggests the probability of its similarly successful introduction into most other productive trades. The London gas-workers, indeed, did not maintain their production, but then the reduction in their hours was very great, from twelve to eight, and as it was, their product per hour was so much improved that, though their hours were shortened by a third, they did in one of the gasworks one-sixth, in another one-seventh, and in a third only one-twelfth less work. There are other trades, like gate-keeping, and perhaps certain branches of tram and railway service, in which the work is not susceptible of compression into shorter time, but they are not numerous. And it is worthy of notice that the Huddersfield Tramways, on substituting two eight hours shifts for one fourteen hours day, did not require twice as many conductors and drivers as before, but only half as many again. Under all these circumstances the very current expectation that the eight hours day will do anything considerable in thinning the number of the unemployed is illusory, and the true hope of the movement lies in the probability—the very great probability—that the eight hours day may be generally introduced without in any way impairing production, and therefore without in any way either lowering the rate of wages or lessening the competing capacity of the nation.

Those who believe in this probability will not be greatly concerned whether the eight hours day is to come by trade-union agency or by legislative enactment, the aspect of the question on which opinion in this country is chiefly divided. There cannot be said to be two opinions about the desirability of the eight hours day in itself; for experience of previous shortening of hours justifies the expectation that the leisure will be a much more abundant source of good than of ill to the working

classes; but even among these classes themselves there is a strong, though declining, opposition to obtaining it by compulsory legislation. Unconditional compulsion, indeed, is not contemplated by any one, except in the case of certain special trades, such as mining and baking, which are alleged, rightly or wrongly, to be more dangerous or unhealthy than the rest; what is commonly demanded by the advocates of legislation is an eight hours law conditioned by trade option in some form: either (1) in the form of making the law enforceable only on such trades as petition for it by a clear majority of their members (or of their organised members) in the whole country; or (2) in the form, carried by decisive votes in the trades-union congresses of 1891 and 1892, and known as the trade exemption principle, of making the law enforceable on all trades which do not petition by a majority of their members (or of their organised members) to be exempted from its operation; or (3) in the form—commended by Mr. Gladstone in 1892, and known as the local trade option principle—of giving the right of option or exemption to the majority of each trade in each district. These limitations proceed from a general recognition that an eight hours day cannot be equally practicable or suitable for all the twelve thousand different occupations of England, and that any law fixing the hours of ordinary adult labour must be applied with considerable elasticity in accordance with the desires and circumstances of diverse trades. But legislative interference is alleged to be necessary in order to enable trades to get what they desire, inasmuch as under present conditions, though a majority of adult labourers in a trade might want an eight hours day, they could always be prevented from obtaining it as long as a minority were willing to work longer, and the interference is accordingly represented as really promoting instead of infringing the freedom of adult labour.

On the other hand, the opponents of eight hours legislation contend that it makes a prejudicial inroad on the freedom and independence of the labourer, that it will prove disastrous to production and trade, and that in any case it is unnecessary since trade-union agency will answer the purpose more safely and more effectually. Trade-union agency has certainly proved sufficient in Victoria. Of the fifty-two eight hours trades of Melbourne, not one got the eight hours by law, and though the miners in other districts have had an eight hours act since 1883, many of them had the eight hours day long before. A factory act, restricting women's hours to eight, has existed in that colony since 1874; but in accordance with one of its clauses, its operation has been very generally suspended by the minister at the request of the workers; and though the number of suspensions is now diminishing, the enforcement of

the eight hours day in the factories depends more really on opinion than on the law. On the other hand, many eight hours laws were passed in the United States in the first heat of the movement, twenty-five years ago, but they have all, for one reason or another, long been mere dead letters, and all recent gains have been won by trades-union agency. It must be admitted however that long labour conflicts are extremely costly and hurtful to trade, while their results are often short-lived, and the inclination for legislation among English trade unionists is due largely to the desire to avoid the expense and misery of a strike, and to their belief that law will better secure permanence in the arrangements.

H. R. T.

EJECT, EJECTMENT, EJECTION. The object of proceedings in ejectment is to recover possession of land. The action of ejectment, properly so-called, was abolished by the Common Law Procedure Act of 1852. It was used as a means of ascertaining the title to land. It involved a remarkable series of fictions designed to escape from the inconveniences attaching to what were known as real actions (*i.e.* actions for the recovery of real estate). The party claiming delivered to the party in possession a declaration containing the names of imaginary parties, John Doe and Richard Roe. The declaration set out that John Doe was lessee of the land in question, holding of the real plaintiff, and had been ousted by Richard Roe. A notice signed by Richard Roe was served upon the real defendant, to inform him that Richard Roe had no real title to the land, and that judgment would go against him by default, so that the real defendant would be turned out, unless he appeared to defend his title. The action was then tried as between John Doe and the real defendant. If John Doe obtained judgment, this was tantamount to a judgment in favour of the real plaintiff, under whom John Doe claimed. The place of the old action of ejectment is now taken by an action for the recovery of land, which differs little from other actions in the High Court. Proceedings brought by an undisputed proprietor wishing to get rid of a tenant whose term has expired, or who has made default in payment of his rent, are commonly described as proceedings in ejectment. Such proceedings may be taken either at common law or under the Common Law Procedure Act of 1852. The action at common law cannot be brought unless the landlord, or his agent authorised for that purpose, has made a demand of the precise amount of rent then due, and on the precise day on which the rent becomes due under the terms of the agreement. The demand must be made before sunset of that day, and the tenant may pay at any time up to midnight. It must be made either at the place where the rent is payable or on the land itself. The necessity for the demand is the same, even though there be no person on the land to pay. But any or all of these require-

nents may be dispensed with by the express terms of the lease. The Common Law Procedure Act, 1852, dispenses with the formal demand if half-a-year's rent be owing, and no sufficient property to meet the claim can be found on the premises. But this enactment applies only when the agreement of tenancy gives the landlord a right of re-entry for non-payment of rent. When half-a-year's rent is in arrear, and neither the value of the premises nor the annual rent amounts to £50 a year, the county court can order that the landlord shall be put in possession of the premises. By whatever procedure effected, ejectment is the ultimate remedy of a landlord against a defaulting tenant. By means of ejectment he recovers possession of the land for which he no longer receives rent. Unless he could in the last resort employ this remedy, the premises which he has let would often be practically valueless to him. For there may be no sufficient goods on the premises to distrain upon, and the defaulting tenant may not be substantial enough to make it worth while to bring an action against him personally. Besides default might be made again and again by a tenant remaining in possession. The circumstances which make ejectment of defaulting tenants peculiarly unpopular seem to be these:—sympathy with the instinctive attachment which almost all persons feel for a place which they have long inhabited; a vague notion of proprietary right in a tenant who has occupied the land a long time, and a more definite feeling of injustice when the tenant, although a defaulter, has in years past executed improvements which have added to the permanent value of the land. In this last case, adequate compensation should be made, but the power of vindicating proprietary right is essential to the well-being of society. Ejectment and eviction are, legally speaking, the same process, but eviction is perhaps the term oftenest used in common parlance (see EVICTION).

[Wharton, *Law Lexicon*, Art. *Ejectment*.—Woodfall, *Landlord and Tenant* (14th ed.), ch. 22.—Copinger and Munro, *The Law of Rents*, chs. xxiv. and xxv.] F. C. M.

ELASTICITY is a technical term employed by Prof. Marshall, to denote the sensitiveness of the response which a certain thing returns to changes in another thing that stands in a causal relation to the former; i.e. the ratio between the percentage increase (or, it may be, diminution) of one thing, say x , and the percentage increase (or diminution) of another, say y . (1) in symbols:

$\frac{\Delta x}{x} \div \frac{\Delta y}{y}$, or $\frac{\Delta x}{\Delta y} \frac{y}{x}$ (cp. Marshall, *Principles of Economics*, 2nd edition, bk. iii. ch. iv. p. 160, *et seq.*, *Journal of the Statistical Society*, Jubilee Vol. 1885, p. 256).

An important case is the "elasticity of

demand." "The elasticity of demand in a market is great or small according as the amount demanded increases much or little for a given fall in price, and diminishes much or little for a given rise in price" (Marshall, *Principles of Political Economy*, bk. iii. ch. iii. 1st ed.). The difference in this respect between different commodities has been felt, though not so accurately conceived and expressed, by some other writers. Thus Mill: "If the article is a necessary of life, which, rather than resign, people are willing to pay for at any price, a deficiency of one-third may raise the price to double, triple, or quadruple" (*Political Economy*, bk. iii. ch. ii. § 4). And again, "Some things are usually affected in a greater ratio than that of the excess or deficiency, others usually in a less. . . . The amount of what people are willing to expend on it . . . may be affected in very unequal degrees by difficulty or facility of attainment" (*ibid.* bk. iii. ch. viii. § 2). [Compare Auspitz and Lieben, *Theorie des Preises*, p. 41, *et seq.*—Seligman, *Shifting and Incidence of Taxation*, p. 148, *et seq.*—Irving Fisher, *Mathematical Investigations in the Theory of Value and Prices*, p. 46, *et seq.*] Prof. Marshall holds that in general the elasticity of demand "is small, when the price of a thing is very high relatively" to the means of a class of purchasers, "and again when it is very low; while the elasticity is much greater for prices intermediate between what we may call the high level and the low level" (Marshall, *Principles of Economics*, bk. iii. ch. iv. § 2). The elasticity of demand is a prime factor in determining the interest which the consumer has in a fall of price (see CONSUMER'S RENT), and the effects of bounties and of monopolies (*op. cit.* bk. v.).

F. Y. E.

ELASTICITY OF DEMAND. See previous article and DEMAND.

ELDER, WILLIAM (1806-1885), was born in Pennsylvania, and died in Washington. He practised medicine and wrote frequently for the press. Besides several volumes in general literature, he published *The Debt and Resources of the United States*, Philadelphia, 1863, pp. 32; *Questions of the Day*, Philadelphia, 1871, pp. 367; and *Conversations on Political Economy*, Philadelphia, 1882, pp. 316. Elder belonged to the Carey School, and advocated a political economy which was national as opposed to cosmopolitan. He introduced the term "guarantism" to denote the various charitable, savings, and philanthropic agencies to promote thrift.

D. R. D.

ELECTION. The doctrine of election was introduced by the courts of equity (see EQUIT), and may be shortly stated as follows: if by a will or deed a testator or donor disposes of property belonging to another person, and by the same instrument confers a benefit on that

person, such person cannot at the same time accept the benefit conferred upon him and refuse to surrender his property in accordance with the disposition of the testator or donor. He must choose ("is put to his election") as to whether he will accept the benefit and surrender the property in question, or whether he will keep his property and forego the benefit, or at least part of it, the principle being that where the value of the benefit under the will or deed exceeds the value of the property with respect to which the election arises, the party disappointed by the election is not entitled to compensation beyond the value of that property. Thus if a testator by his will gives A an estate belonging to B, of the value of £10,000, and by the same instrument gives B a legacy of £20,000, B may elect to conform to the will by conveying the estate in question to A and receiving the legacy of £20,000; but if he elects against the will, he must pay £10,000 to A by way of compensation and may retain the remaining £10,000. In many cases the facts are not so simple and the doctrine frequently gives rise to considerable difficulty. E. S.

ELEGIT (WRIT OF). A writ of execution (see **EXECUTION**), by virtue of which a judgment creditor is enabled to take possession of the debtor's land. The writ does not in itself authorise the creditor to sell the land, but an order for that purpose may be obtained by application to the chancery division of the high court (27 & 28 Vict. c. 112, §§ 4-6). Execution by "writ of elegit" was introduced by the Statute of Westminster (13 Ed. I. c. 18), and originally extended to the debtor's chattels (excluding beasts of the plough), but was restricted to one-half only of the land. The last-named restriction was removed by 1 & 2 Vict. c. 108, whilst on the other hand the Bankruptcy Act 1883, § 146, enacts that writs of elegit are no longer to extend to chattels. A recital is contained in the writ, showing that the creditor has chosen this means of execution in preference to others, which in the original Latin form (quod "elegit") included the word from which the name is derived. E. S.

ELEVATOR. Part of the machinery in unloading vessels (see **DOCKS**, *Mechanical Appliances at Docks*). In America a public warehouse for produce (see **WAREHOUSES**).

ELIBANK, PATRICK MURRAY, fifth lord (1703-1778), lawyer, soldier, and pamphleteer, was admitted a member of the Faculty of Advocates at Edinburgh in 1723, and served in the Carthage expedition under Lord Cathcart in 1740. He thought the existence of the national debt a very great calamity, and stockholders and stock-jobbers a most pernicious class of men, whose ill-gotten wealth gave them the power to further their speculations by embarking the nation on harmful lines of policy. He accuses them of having caused the

war of 1739; and suggests that their property might with advantage be confiscated, like the property of the monasteries in 1537, and the proceeds devoted to encouraging our manufactures by bounties.

On economic subjects Lord Elibank wrote *An Inquiry into the Origin and Consequences of the Public Debt*, Edinburgh, 1753-1754.—*Essay on Paper Money and Banking from Essays on the Public Debt, Frugality, etc.*, 1755. This essay is reprinted in M'Culloch's *Select Tracts on Paper Currency, etc.*, London, 1857. M'Culloch says of this, "It is a poor performance."—*Letters on the proposed Plan for altering Entails in Scotland*, Edinburgh, 1765.—See also Douglas's *Peerage of Scotland*. A. H.

ELIOT, FRANCIS PERCEVAL (c. 1756-1818), entered the civil service, and for some years before his death was a commissioner of audit at Somerset House. His economic writings are chiefly on subjects connected with currency and banking. He considered that notes might safely be issued on good securities, and need not be restricted to representing actual deposits of bullion. He belongs to a class of writers fostered by the Bank Restriction, who, in Sir Robert Peel's words, "would not admit the doctrine of a metallic standard." Eliot advocated an "ideal money" which "admits of invariable value, because it is not formed of substantial and therefore variable materials." . . . "The money of account remains in itself fixed and undepreciated, while the precious metals may either be suffering an intrinsic depreciation," or the converse (*Observations*, p. 33). As General Walker remarks, it is scarcely worth while to separate the parts of truth and error here. Otherwise a rudimentary conception of the standard which is formed by an **INDEX NUMBER** might be ascribed to Eliot. Compare the context of the passages above cited (and *Observations*, p. 41), where reference is made to Sir George Shuckburgh. Consistently with this view, Eliot maintains that during the war it was the gold which was appreciated not the paper depreciated. He wrote:

Demonstration or Financial Remarks with occasional observations on Political Occurrences, 1807 (the first part discussing sinking funds, the latter part "noticing in a summary way some of the principal events since the decease of that ever to be regretted statesman," Pitt.)—*Observations on the Fallacy of the supposed depreciation of the Paper Currency of the Kingdom with reasons for dissenting from the Report of the Bullion Committee*, 1811; Second edition, with a supplement replying to criticisms, 1811.—*Letters on the Political Situation of this Country*, addressed to the Earl of Liverpool by Eliot under the signature of Falkland.—*Pamphleteer*, Nos. vi. and vii. (1814), No. x. (1815), No. xiii. (1816).

ELIZABETHAN LEGISLATION. For notice of the legislation of the period of Queen Elizabeth, in its reference to economic changes, see LEGISLATION.

ELKING, HENRY (fl. 1720), who was at one time extensively engaged in the Greenland whale fishery, published (1) *The Interest of England considered with respect to its Manufactures, etc.*, London, 1720, 8vo. This pamphlet was directed against the importation of calicoes by the East India Company, to which Elking attributes "the decay of trade, the melting of coin, the scarcity of silver, and the increase of poor." The importation of East India calicoes was, in accordance with these principles, prohibited in the following year (1721). (2) *A View of the Greenland Trade and Whale Fishery, with the Natural and Private Advantages thereof*, London, 1722, 8vo, 2nd ed. 1825. Reprinted in vol. iv. of the *Overstone Collection of Select Economical Tracts*, 1859. This is one of the most valuable of the early pamphlets on the whale fishery. Elking gives an account of its origin, and progress of the fishery and its condition at the time he wrote, and suggests means for getting it once more into English hands. (3) *The Interest of Great Britain considered, etc.*, London, 1723.

ELLIOTT, EBENEZER (1781-1849). Ebenezer Elliott, the "corn-law rhymers," was born at Masborough near Sheffield, and was the son of a manufacturer who had obtained a share in a small iron-work in that place. He received very little education, but at an early age he began both to read largely and to write verses. His early attempts in verse writing are not of much value. On his marriage he invested the money his wife brought him in his father's business. But the trade was declining at the time; his father died worn out by business anxieties; and after a few years spent in a hopeless struggle, Elliott found that he was a ruined man, ruined, he always maintained, by the corn laws. In the year 1821, however, he made a fresh attempt, and for some years he prospered. But after the year 1837 trade again began to fall off, and when in 1842 he gave up business, he was only able to take with him the sum of £6000. The losses of these five years were another result of the bread-tax he so hated. This hatred was the passion that inspired all his best poems. He was filled with fierce indignation against the law that had kept him poor, as an employer, and that pressed so hardly on the workers whom he wished to benefit. In *The Splendid Pillage, The Village Patriarch*, and above all, in *The Renter*, the reader feels the depth of his feeling for the poor and his hatred of the landlord class. In the *Corn-Law Rhymes* (1831) the whole of his bitter anger breaks out. No one can read them with-

out feeling some share of the indignation that inspired them, and as a picture of the state of men's minds at the time their force and brevity make them invaluable. C. G. C.

[Watkin's *Life, Poetry, and Letters of Ebenezer Elliott*, 1850.—*Athenæum*, 12th January 1850.—*Poetical Works*, 1876.]

ELLIS, WILLIAM (died 1758), a self-taught farmer of unusually wide agricultural knowledge. His early writings made his name. He was afterwards employed by a bookseller to write in monthly instalments, but made the mistake of producing the required quantity by padding with quack receipts, old wives' tales, etc., and thereby injured his reputation. He was too much occupied in travelling about the country, acting as a consulting farmer and selling seeds and agricultural implements, to work his own farm at Little Gaddesden, Herts, according to his own teaching; on his journeys, however, he learned the methods of farming prevalent in different counties, and his habits of observation enabled him to enrich his writings with shrewd criticism and comparisons. He treats most fully of the management and breeds of sheep, the use of manures, the growing of timber, especially of oaks, the need of different soils, and the latest improvements in ploughs. His style is homely, often rough, and sometimes ungrammatical.

The following is a list of his works :—

The Practical Farmer; or, The Hertfordshire Husbandman, 1732.—*Chiltern and Vale Farming explained*, 1733.—*The London and Country Brewer* (see *Country Housewife*, p. 12).—*New Experiments in Husbandry for the Month of April*, 1736.—*The Timber Tree improved*, 1738.—*The Shepherd's Sure Guide*, 1749.—*A Complete System of experienced improvements, made on Sheep, grass lambs, and house lambs*, 1749.—*The Modern Husbandman*, 1750.—*The Country Housewife's Family Companion*, 1750.—*Every Farmer his own Farrier*, 1759.—In 1772 was published Ellis's *Husbandry abridg'd and methodized*, the original padding and some of the less intelligible and interesting matter being omitted.

[Biographical notice in preface to last named work.] E. G. P.

ELLIS, WILLIAM (1800-1881), ably discharged for fifty years the duties of chief underwriter to the Indemnity Insurance Office. Ellis is mentioned by Mill in his *Autobiography* (among the disciples of Bentham) as "an original thinker in the field of political economy, now honourably known by his apostolic exertions for the improvement of education." Of these distinctions the latter appears the more permanent. Ellis used to convey to the young a knowledge of political, or as he preferred to say "social," economy and of "right conduct," by the method of "Socratic" dialogue. His method deserves this epithet, so far as it inculcated the homely virtues with the zeal of the Socrates of Xenophon. A Platonic vein of

speculation is not to be looked for in Ellis's dialogues.

A good account of Ellis's "conduct teaching" is given in the *Memoirs* written by his granddaughter, Ethel Ellis, 1888. The *Life*, by E. K. Blyth, 1889, describes his economical, as well as his educational, work; and contains a complete list of his writings. Of these may be mentioned: various articles in the *Westminster Review*; including one on McCulloch's *Political Economy* by Ellis and J. S. Mill jointly (July 1825); *Outlines of Social Economy*, 1846; *Progressive Lessons in Social Science*; *Philosophy*, 1861-64.

J. S. Mill refers to an essay by Ellis, published in the *Westminster Review* for January 1826, as "the most scientific treatment of the subject which I have met with" (*Pol. Econ.*, ch. iv. § 2). The subject is "the effect of the employment of machinery on the happiness of the working classes," an effect which the writer pronounces to be beneficial with less qualification than economists would now generally employ.

F. Y. E.

ELLMAN, JOHN (1753-1832). A successful farmer of Glynde in Sussex, best known for his improvements in the breed of Southdown sheep, for the origination of the Sussex Agricultural Association, and as one of the founders of the Smithfield Cattle Show. As an agriculturist he was so much esteemed by his contemporaries that his biographer, Walesby, writing shortly after his death, claims that Ellman had by his discoveries so increased the productiveness of agriculture as to effectually disprove the doctrines of Malthus. Ellman himself abstained from abstract economics, and is chiefly interesting to students of the science for his helping ARTHUR YOUNG (*q.v.*) with materials for the latter's *Annals of Agriculture*. Ellman appears, from his correspondence with Young in this connection, to have supposed that the POOR RATE (*q.v.*) and similar imposts fell almost exclusively on the farmers, who had to support the used-up labourers when past work in factories. He also urged very strongly that the wages of labour should be proportional to the labourer's skill.

[See life of Ellman in preface to Baxter's *Library of Agriculture*, 4th ed., 1851.—Young's *Annals of Agriculture*, London, 1784, etc.; and *Dictionary of National Biography*, London, 1888.] A. H.

ÉLUS were financial officers in France who superintended the collection of taxes in those provinces which had not estates, or assemblies, of their own. They are to be distinguished from the *trésoriers*, who collected the domain revenue. The *élus* originated in 1356, when the states-general made the most notable attempt to impose constitutional checks upon the crown. Not content with claiming the sole right of imposing taxes, they insisted upon entrusting their collection to their own elected officials (*élus*). Charles V. subsequently maintained both the taxes and the collectors of 1356, though he turned the latter into royal officials, and they continued

till the revolution. The district of an *élu* was called an *élection*, and hence the provinces which had no estates came to be called the *pays d'élection*, as distinguished from the *pays d'états*. The provincial estates were quite distinct from the ÉTATS GÉNÉRAUX (*q.v.*)

[De Tocqueville, *L'Ancien Régime*.] R. L.

EMANCIPATION. The general subject is dealt with in connection with SERFDOM, SLAVERY, ENFRANCHISEMENT OF LAND, and VILLENAGE, but the emancipation of the negro slaves in America offers some points of special economic interest. The main influences which led to abolition were unquestionably moral and religious; but there had been growing up a strong suspicion that the system was wasteful, and it was too palpably an outrage upon the prevalent *laissez-faire* principle to last far into the 19th century, wherever English ideas were in vogue. A close scrutiny brought out that the one solid basis of efficiency was the easiness of direction of unskilled labour in large masses, but the following objections left a large adverse balance.

(1) Slave labour wasted the soil through its lack of intelligence; (2) it confined agriculture to certain products, especially sugar, cotton, tobacco; (3) it prevented the rise of manufactures; (4) it degraded labour, and thus arrested immigration of fresh white people, and prevented the formation of an industrious middle class; (5) it prevented the industrial development of which the negro population was capable; (6) it kept down the gross production of a community in favour of net-production; and further, kept back net-production in general, in favour of the net-production appropriated to a small portion of the community. Allowing for the general material progress of the world as a stimulant, and in the case of the British West Indies for the equalisation of the sugar duties in 1846 and the rise of beet sugar since 1860, as obstructions, a comparison of the present condition of the countries affected with their condition before emancipation substantiates this arraignment of the slave system in every point.

(1) With greater intelligence and better appliances the soils are no longer wastefully exhausted. Mr. Briggs, an intelligent Barbados planter, who resolutely improved his methods, made a large fortune soon after emancipation, and the soil of that island now appears likely to continue to yield its 50,000 tons of sugar a year indefinitely. (2) Agriculture has been extended and varied. In the West Indies the once despised "subsidiary" products have, in gross, taken the chief place from sugar, except in Barbados; lands hitherto thought useless have been brought into cultivation—50,000 acres were added to cultivated areas in Jamaica alone between 1880 and 1890; in South Carolina the forests are giving employment to 700 timber mills; in Brazil coffee-production increases every decade. (3) Manufactures have sprung

into existence in the Southern States. In South Carolina minerals are being worked, notably the phosphate rock; and manufactures have passed from 8½ million dollars before emancipation to 16½ millions in 1880 and 32 millions in 1884. In the West Indies to turn to manufactures would be pernicious waste of natural advantages, and no one desires to see it done. (4) The lower classes of the white race are rapidly improving their position. Professor Bryce says of the South, "The chasm that used to divide the poor whites from the planters has been in many places bridged over by the growth of a middle class of small proprietors in the country and of manufacturing industries in the coal and iron regions" (*American Commonwealth*, iii. p. 95). In the West Indies there is no change in this respect; the employing class has diminished (Jamaica from 40,000 to 17,000), and opinion is, on the whole, against the suitability of these colonies for any other class of white people. (5) There has arisen in the West Indies a peasant class of negroes of whom it is no exaggeration to say that they have the most favoured lot that has ever fallen to any considerable portion of their race. In Barbados, where there was no unoccupied land available for squatting, the emancipated negroes at once became wage-earners, and they so continue; in Jamaica there was abundance of land available, and the planters were so ill-tempered in their attitude to the new status that the negroes in large numbers became independent peasants, and the separation of labour from capital has therefore been far wider than it needed to have been. There are now over 90,000 small holdings among the 100,000 families in the colony. In Trinidad and Demerara also the negroes abandoned plantation work, and resort was made to East Indian coolies for this purpose; still the negro population increases and prospers on other products—cocoa, for example, and fruits not requiring much capital and adapted for small-scale production. In the Southern States, whatever is to be allowed as to their low political and social condition from a European point of view, it cannot be gainsaid that there are now millions of negroes industrially wealthy in comparison with the condition of their fathers, whose labour had little influence upon their own material well-being. (6) The gross produce of all the countries affected has more than kept pace with the growth of population, and the wealth is more widely distributed. Whereas, in former times 60,000 families worked in Jamaica on slave rations, while some 8000 received an abnormal return for both capital and superintendence, an examination of the imports now shows that there is a very considerable net-produce in the hands of the common people of the colony. If the summit of luxury has fallen, the level of subsistence has risen to a stage of comfort and civilised

life. The statistics of all the countries in question indicate a similar change. Even in Cuba, where the emancipation has not led to any extensive industrial change, the output of sugar has not been affected so far.

The following remarkable figures are given for Brazil:—Annual produce of coffee, 1835-1840, slave-trade in existence, 88 million lbs.; 1855-1860, slave trade abolished, 264 millions; 1872-1877, emancipation by purchase in progress, 389 millions; 1890, emancipation completed, 880 millions.

Of course fixed capital was lost during the transition, but when the old capitalist class still represents Jamaica, for example, as a standing reproach to Great Britain, serious inquirers will find this unsupported by the official statistics of the colony. If a colony with an increasing area of cultivation, an increasing public revenue, and increased expenditure on public institutions of all kinds, increased support of voluntary religious bodies including a now disestablished branch of the Episcopal church, and a pauperism of less than one per cent, is a reproach, where are the jewels of an imperial crown to be sought?

[The economic chapters and appendices in Cairnes's *The Slave Power*, 2nd ed., 1863, excellently introduce the subject, which can be further studied in the histories of the various colonies (especially Gardner's *Jamaica*, 1873), of the United States of America, of Cuba, and of Brazil. For the present condition of the countries affected, the many statistical works published in America show the situation in the southern states; whilst our colonies can be studied in the Reports in their Blue Books, issued from time to time by the colonial office for a few pence each. Amongst noteworthy articles of recent issue are N. Lubbock, *Our West Indian Colonies* (from sugar-merchant's point of view).—*Royal Colonial Institute Proceedings*, vol. xvii.—H. Fowler, "Capital and Labour for the West Indies," *ibid.*, vol. xxi.—Lord Brassey, "The West Indies in 1892," *ibid.*, vol. xxiii.—D. Morris, "Fruit as a Factor in Colonial Commerce," *ibid.*, vol. xviii.—C. S. Salmon, *Capital and Labour in West Indies*, Pamphlet, 1883.] A. C.

EMBARGO. The word "embargo" used in a general sense means any prohibition affecting commerce; in a more special sense, it is a term of international law implying the seizure of foreign ships. Formerly ships belonging to a foreign power were placed under embargo in contemplation of war, but in modern times this practice has been discontinued, and the only occasion on which an embargo of ships is now resorted to is when it is sought to use reprisals in the case of any specific wrong committed by any foreign state. If in such a case the relations between the two powers concerned re-assume their normal condition, the ships which have been placed under embargo are released; if on the other hand war is declared, the ships are confiscated (see *ANGARIE, DROIT D'*).

[Hall's *International Law*, 3rd ed. 1890, pp. 366, 373.] E. S.

EMBEZZLEMENT. This offence is defined in Mr. Justice Stephen's *Digest of the Criminal Law* (Art. 309) as "the conversion by a clerk, or servant, or person employed in the capacity of a clerk or servant, of any chattel, money, or valuable security delivered to or received or taken into possession by him for or in the name or on account of his master or employer." Embezzlement differs from theft principally in the circumstance that the thing embezzled has not yet come into the possession of the person entitled to it, and is not taken out of his possession by the offender, whilst in the case of theft the thing stolen is taken by the offender out of the possession of the person entitled to it. Thus, if a shopman receives money for goods sold by him for his employer and puts this money into the till and then takes it out of the till and appropriates it, he commits a theft of the money. But if the shopman, after receiving the money, puts it into his pocket and afterwards applies it to his own purposes, this is embezzlement. If a clerk or servant appropriates a thing given into his custody by his employer, this act is not embezzlement but theft. For the thing so misappropriated is regarded by law as still in the possession of the employer. A further distinction between theft and embezzlement lies in the fact that theft may be committed by anybody upon anybody, but that embezzlement can be committed only by a clerk or servant or person employed in the capacity of a clerk or servant and with reference to property belonging to the employer. Accordingly, before an offence against property can be described as embezzlement, it must be shown that the property was in the possession of the offender, and that he stood in the relation of a clerk or servant to the injured party. The ascertainment of these points is often a matter of great nicety. Embezzlement is a felony, and renders the criminal liable to a maximum penalty of fourteen years' penal servitude.

[For the present state of the law regarding embezzlement, consult Stephen, *Digest of the Criminal Law*, Arts. 297, 309-312, and 325. For the history of the law regarding embezzlement, see Stephen, *History of the Criminal Law*, vol. iii. pp. 151-156.] F. C. M.

EMBLEMENTS (from the med. Latin word *embladare* = to sow with corn), technical name for growing crops. Where the owner of land dies intestate, the emblements do not go with the land, but devolve on the personal representative for the benefit of the next of kin (*e.g.* if a man dies leaving two sons and one daughter, the land goes to the eldest son, and the emblements are divided between the three children in equal parts). A person entitled to land for his own life, or during the life of another person, is entitled to the crops sown during his tenancy and reaped after its termination; but

it is now provided (by 14 & 15 Vict. c. 25) that in the case of land held at rack rent, the tenant or his representative may after the termination of the tenancy hold on the same terms to the end of the current year; and the rule as to emblements does not therefore come into operation in such cases. E. S.

EMERSON, GOUVERNEUR, M.D. (1796-1874), was born in Delaware and settled as a physician in Philadelphia. He devoted much of his time to scientific and agricultural inquiries; and gave special attention to medical and vital statistics. In 1872 he translated and prepared a preface for *The Organisation of Labor* by F. Le Play, Philadelphia, pp. 417, preface, pp. v.-xiii.

EMIGRATION — ITS EFFECTS ON THE COUNTRY OF ORIGIN. In all that has been written on the subject of emigration, a minor place has been assigned to the discussion of its effects upon the population of the country which the emigrant leaves. The assumption, however, that these effects must be in every way beneficial underlies most of the pamphlet and other literature on the subject of emigration and colonisation which exercised the public mind in this country during the period from 1820 to 1850, or thereabout.

It would be idle to dwell on the pre-historic migrations of the Indo-European races, or the hardly less remote expatriation of the Phenicians. Nor will our knowledge of the economic condition of the ancient Greeks justify us in drawing too confident conclusions from the most regular system of emigration which the ancient world exhibited. The Romans were not given to emigrate in the sense in which we now use the term, although they made great political use of their "colonies." Nor can the descent of the barbarous hordes of the north on the declining Roman empire in the early centuries of our era, or the victorious career of Spanish conquest in the new world in the 16th century, be considered to furnish any economic lesson. Such movements of population as those of the Flemings and Huguenots to England in the 14th and 17th centuries were pregnant with economic results, but were too partial and irregular to constitute an era of emigration.

The beginning of emigration, as we have to consider it, may be placed in the 17th century; and the nations which chiefly furnish instances of it are the English, the French, the Dutch, and Portuguese. The motives which prompted these earlier streams of emigration were usually love of adventure or political discontent. The feature which marked this emigration off from previous movements was its steady set towards new countries; the freshness and emptiness of

the new lands swelled the volume of the stream which they attracted. There can be little doubt that the new impulse reacted with a considerable effect on the conditions of life in the countries which the emigrants left behind; the Dutch being at that time the first to feel the influence.

With the present century emigration entered on a new phase, and then England was in the van. She was suffering from acute commercial distress at home, and anxious about her vast possessions abroad. It occurred to a certain section of thinkers that the latter could be utilised as a remedy for the former, and various schemes of state-aided emigration to the colonies were much debated throughout the second quarter of the century, both in and out of parliament. Such were those to facilitate emigration from the south of Ireland to Canada (1823) and to relieve distress in the Highlands of Scotland (1841). At this time, indeed, the idea of emigration became merged in the more complex idea of colonisation. "Of colonisation," writes WAKEFIELD, "the principal elements are emigration, and the permanent settlement of the emigrants on unoccupied land." We refer again later to the distinction between the secondary results of emigration to a foreign state, and those of emigration to a colony or similar possession.

What was thought of the economic bearing of emigration at the time alluded to may best be gathered from the following passage from Wakefield's book:

"My fancy pictures a sort and amount of colonisation that would amply repay its cost by providing happily for our redundant people; by improving the state of those who remained at home; by supplying us largely with food and the raw materials of manufacture; and by gratifying our best feelings of national pride, through the extension over the unoccupied parts of the earth of a nationality truly British in language, religion, laws, institutions, and attachment to the empire."

The first words of this passage strike the keynote of the modern intention in emigration. The movements of the individual and the larger schemes projected by the state are alike connected with the sense of undue pressure and competition at home. Love of adventure, political complications, religious difficulties, which have been active forces in causing emigration formerly, play a less conspicuous part now. Yet they are still not absolutely unimportant: the existing movement of the Jews from Russia is strongly influenced by these motives. The circumstances are too recent to enable us to judge whether the effect on the prosperity of Russia may not be similar to that experienced by Spain after the expulsion of the Jewish-Mahommedan population in the time of Ferdinand and Isabella. The present large emigra-

tion from Germany, which is usually assigned to the existence of conscription, may with greater probability be traced to the pressure of financial burthens resulting from military expenditure. Professor Mayo Smith, in his recent work, laid it down that persons rarely emigrate in order to better themselves, but because they are actually pinched at home.

And this at once suggests the most important of the questions which our subject presents. The effect of emigration on any particular state must largely depend upon the functions which have daily been discharged by the emigrant. We must ascertain then, what are the classes of people who do emigrate. It is not enough to speak about "relieving one labour market and supplying another"; we must discover if we can what branch of labour is chiefly affected, and to what extent its efficiency is impaired by the removal of its active members.

Next in importance is the question of volume of emigration and drain on the population.

Thus emigration must be examined both as to quantity and quality; but having arrived at some decision on these points in any particular case, and at an estimate of the actual loss to the country which they involve, we shall have to set off against it the advantages gained by the persons left behind, the freedom from over-competition, the raising of the standard of comfort, and so forth—a subtle and difficult inquiry. In this way we should gauge what may be considered the primary results of emigration.

The secondary results are partly commercial, partly political. Mill kept the first-named very clearly before him when he penned the following passage:—

"The question is in general treated too exclusively as one of distribution—of relieving one labour market and supplying another. It is this, but it is also a question of production, and of the most efficient employment of the productive resources of the world. Much has been said of the good economy of importing commodities from the place where they can be bought cheapest; while the good economy of producing them where they can be produced cheapest is comparatively little thought of. . . . The exportation of labourers and capital from old to new countries, from a place where their productive power is less to a place where it is greater, increases by so much the aggregate produce of the labour and capital of the world. It adds to the joint wealth of the old and the new country what amounts in a short period to many times the mere cost of effecting the transport. There needs be no hesitation in affirming that colonisation, in the present state of the world, is the best affair of business in which the capital of an old and wealthy country can engage."

Similarly Wakefield, in a work which followed

Mill's: "The practice of colonisation . . . has reacted with momentous consequences on old countries by creating and supplying new objects of desire, by stimulating industry and skill, by promoting manufactures and commerce, by greatly augmenting the wealth and population of the world"; and he goes on to add in words which we may quote without tying ourselves to accept them, "it has occasioned directly a peculiar form of government, the really democratic, and has been, indirectly, a main cause of the political changes and tendencies which now agitate Europe."

The above sketch of the lines to be followed in an investigation into the effects of emigration may be considered to hold good generally for all times and for all peoples; but it is questionable whether any sufficiently trustworthy data exist to enable us to draw fair inferences concerning the earlier emigrations. Even in regard to the last few years we shall do well if we can arrive at fairly accurate conclusions in respect of one or two countries, such as England or Germany, in which statistics are becoming understood. It is hardly necessary to observe that the case of the United States, whose statistics are sufficiently careful and elaborate, furnishes no illustration of the effect of emigration. Such emigration as may take place from the States is so individual and spasmodic that, compared with the large volume of IMMIGRATION (*q.v.*), it may be neglected.

In considering the results of emigration from Europe in the 17th and 18th centuries, it is almost impossible to separate political and economic phenomena.

Spain suddenly found an area for her development which has been unequalled even by Great Britain; she subdued many native peoples and settled a vast territory. There was a constant flow of Spaniards to Central and South America. The ease of conquest and the lust of gain had a large share in the deterioration of the national character; loss of population and a false conception of wealth completed the downfall of an empire. If it be sought to fasten a portion of the blame on emigration it will not be forgotten that, while the drain on the resources of the old country was excessive, the Spanish emigrants were for the most part the worst type of mercenary soldiers.

The history of Portugal presents rather different features. The Portuguese in those days, as now, were deeply imbued with the trading instinct; they had far more capacity than the Spaniard for settling down on new territory. The effect of discovery and conquest in this case is parallel to that upon Holland; a people dwelling in a circumscribed area suddenly rose to the level of a first-class state; the more rapid loss of power by Portugal was probably due to the weakness of its political constitution as compared with that stern combination of free

mēn who had gone through the fire of oppression and emerged a fresh nation.

The Netherlands form the best instance, besides our own country, of the beneficial effects of regular emigration. To them it was a safety-valve: the closing years of the 16th century had purged away the dross of the nation; it was composed of men, on the whole, remarkably even in power, will, and capacity; to avoid fretting and wear and tear at home a proportion of such men must find an outlet abroad; the emigration from Holland accordingly included many of the best of its citizens, and they did not hesitate to settle permanently in their new homes, and reproduce the political constitutions and commercial aptitude of the mother country. On the other hand the volume of emigration was not large, and we have De Witt's authority for the fact that there was a constant immigration into the free republic from surrounding nations; the centre of the system was never exhausted. The new settlements distinctly increased the trade and power of the Netherlands; the monopoly which they established of the East India trade was only partly due to the chartered company; it could not have lasted so long but for the Dutch merchants on the other side of the world.

We may pass over France, which furnishes no further lesson, and take the early history of English emigration. There we find emigration proceeding along two distinct lines—the intentional transportation by the great companies of such persons as would form a useful community, and the voluntary expatriation of large bodies of persons of the same political or religious persuasion. The class of emigrants who left England at that time was thus, in the main, a very good one. It was only natural that the intention of the founders of the settlements should be better than the results attained. The proposal in the case of Carolina—that not more than 100 or 150 settlers should be sent over the first year, and none but labourers, artisans, and skilful seamen should be sent during the next two or three years—is a fair sample of the way in which the nucleus of a colony was intended to be constituted. But in practice it was impossible to avoid an influx of worthless characters; and in spite of Bacon's warning, adventurers and government alike could not resist the temptation of sending out condemned prisoners, vagrants, gipsies, and bad characters,—people "divers ways gathered up in England."

England, however, did not lose by the exodus. "Virginia," says Doyle, "was the offspring of economical distress:" in fact, Great Britain could at the time afford to part with a large slice of population. The ablest workmen and richest merchants did not go; those who did emigrate, whether honest men or rogues, left a feeling of relief among those who remained

behind them; there was more elbow-room, but there was no gap; the work at home went on better.

The number that emigrated at this period was considerable; although our information is not sufficient to be tabulated. To Virginia alone 1261 persons went in 1619, 1000 in one year previous to 1635, 2000 the next year, 1600 the next, and so on—many thousands in all; and the movement was steady year by year. In 1639 an order in council was issued with the object of restraining the efflux of population. There was an alarm that this was becoming a drain on the country's resources. But the very next year there were appeals for the rescission of the order in whole or in part; and Sir Josiah CHILD, writing in 1692, denies that there ever had been a drain on the people.

In the large extent of this emigration lay the germs of its future benefit to England. The plantations called out enterprise and activity on the part of those who remained behind. "I say," writes Child, "that for provisions, clothes, and household goods, seamen and all others employed about materials for building, fitting, and victualling of ships, every Englishman in Barbadoes or Jamaica creates employment for four men at home." The emigration of a considerable number of men, and the successful growth of their settlements in new lands, transformed England into the first commercial and carrying nation of the world.

In the 18th century the stream of emigration flowed more slowly; the severance of the United States, and the wars in which Great Britain was engaged, both contributed to check it; and when next it assumed larger proportions a new era had begun—the era of emigration without conquest or settlement, directed as much to foreign countries as to British possessions. In 1815 the number of emigrants from the United Kingdom was 2081, in 1820 it was 25,729, in 1830, 56,907; in that year the Colonisation Society was formed; in the next year the first effort was made to regulate emigration; an agent general for emigration and certain "South Australian" commissioners were the chief centres of authority for some years, and in 1840 the Colonial Land and Emigration Board was established in Downing Street. It had become clear that the matter was one of great interest both to the mother country and the colonies. On the one hand was the theory described as "shovelling out the paupers," on the other was the demand that no emigrant should be sent to the colonies except under proper safeguards, and with some guarantee of his fitness. And on the lines which were settled fifty years ago, the attitude of the state towards emigration has remained ever since. The activity of societies and other quasi-public influences has, however, been grow-

ing, till we are confronted at the present day with the efforts of Mr. Arnold White, Baron Hirsch, and the projects of the Salvation Army.

We can now examine in more detail, in the case of our own country, the answers to the questions propounded above.

1. As regards the stamp of the emigrants from England it is specially noted in 1845 that one-half were unskilled labourers, and four-fifths of the remainder agricultural labourers and farmers, the great bulk being exceedingly poor and depending on immediate employment for subsistence. And a study of the Board of Trade returns for the last few years confirms the same opinion. "There seems no doubt," says Mr. Giffen in a recent report, "of the broad facts that the majority of the adult male emigrants are labourers, and of single adult female emigrants, domestic servants." In 1891 (a good sample of the years), out of 189,756 adults of British origin, 112,256 were males, and 77,500 females, and the adult males were classified as follows:

Agricultural labourers . . .	14,797
Unskilled labourers and miners, etc. . .	36,521
Occupation not stated . . .	26,663
Mechanics and skilled labourers . . .	9,717
Farmers and graziers . . .	3,704
Clerks, shopkeepers, etc. . .	4,773
Professional men . . .	11,467
Miscellaneous . . .	4,614

It may reasonably be assumed that the majority of those whose occupations are not stated were also unskilled labourers; hence it is probable that some 70,000 out of 112,256, about sixty-three per cent, were of this description. The reports of the Emigrants' Information Office may at first sight appear to contradict this, as the larger percentage of their recorded inquiries has been from mechanics; this, however, is natural from the position of the office in London, and the general readiness of the mechanic as compared with the unskilled labourer in availing himself of an institution of this kind.

It would appear to be the fact that neither of the ordinary tenets as to the class of persons who leave the country is correct. The pauper cannot go—despite the theory that emigration was to relieve the weakest portion of the community; the receiving country rejects him, and the regulations which agents of government here and abroad have sought to enforce constantly tend to encourage the better class of emigrant. Macintyre, writing fifty years ago, insisted on this: "Emigration, as it is carried on from this country, does not afford any relief to the masses of the people reduced to the verge of starvation." "The conditions required of the persons selected for emigration show that they are picked individuals." Emigration has done little or nothing towards elevating the lowest classes of our people. But, on the other hand, it appears to be untrue that only

the best of them are leaving us. With some reservation as to what stamp of man is really the best and strongest in a community, we need not accept that theory. While it is obvious that a man must have some capital before he can emigrate to Australasia or the States, especially if he take his family with him, and that he must have some energy to cause him to make the effort to move, the fact seems to be that the best and most skilled workers, those who feel they can make their way, remain at home; the less competent hands emigrate. The figures given above support this opinion, which is endorsed by Mr. Giffen (comp. Francis Galton's *Hereditary Genius*, new ed. p. 346). Hence it appears that the loss of productive power to the country is not serious. And if the productive capacity, the skill and worth of the emigrants is improved in their new sphere, there is a clear economic gain to the world at large. A more real disadvantage to a country is found in the tendency of males to emigrate in greater numbers than females. Emigration in this aspect appears as contributing indirectly to the greater immorality and pauperism which usually result from the excess of females. Similarly there may be a loss to the community in having to educate and bring up a new set of children to take the place of adult emigrants.

The questions of the effect of the removal of labour on wages, and the prospect of thereby raising the standard of comfort amongst the labouring classes, are matters which bring us to the consideration of the volume of emigration. To raise wages in any particular trade it is necessary that an ample number of that particular craft should be removed at one time; and that is an event which does not occur. Some effect might be produced on all trades by the removal of a very large mass of general labour; but neither is that at present attainable; though there is a growing tendency towards encouraging emigration in families and small communities, *e.g.* to the state colonies of the Argentine Republic.

In computing the volume of emigration, we must obviously set off against it the total of immigration in each year. The two proceed side by side; thus in 1891 the gross number of emigrants from Great Britain (including foreigners and children), was 334,543; the number of immigrants was 151,369; the net emigration being thus 183,174. Mr. Giffen notes that both vary in well-defined cycles, guided by the state of trade; when prosperity is at its height there is a decline of gross emigration, accompanied by increase of immigration. It has unfortunately happened of late years in England that the immigrants who take the place of our British emigrants are foreigners of a lower stamp than our own people; so that there is a double loss apart from mere figures; for these foreigners not only replace better men,

but tend again to lower the standard of comfort and depress the status of the workers.

The annual average number of persons of British and Irish origin who have emigrated in the last half-century is as follows:

Annual average	1851-60	164,085
"	1861-70	157,182
"	1871-80	167,891
"	1881-90	255,853

and the proportion of this emigration to the population of the United Kingdom was as follows:

Average for years	1856-60	·43 per cent.
"	1861-65	·48 "
"	1866-70	·56 "
"	1871-75	·60 "
"	1876-80	·42 "
"	1881-85	·73 "
"	1886-90	·69 "

These figures (taken from the board of trade returns) include tourists and travellers as well as emigrants. They show that while the proportion has, on average, risen, it has not at the highest reached 1 man in 100. There cannot be said to be anything in them to affect vitally the interests of our nation either for good or evil. And when we take Mr. Giffen's figures for the net emigration of persons of British and Irish origin, we find the proportion far lower.

Of the emigrants from Great Britain at the present time about 72 per cent go to the United States, and the rest in almost equal proportions to British North America, Australasia, and "all other places" abroad.

The secondary results of emigration are (*a*) commercial; (*b*) political.

(*a*) They differ according as the emigrants go to a foreign country or a colony. In the early part of the century it made a great difference whether the emigrant went to a colony or not: nowadays, when the colonies are as ready as the foreigner to protect themselves against British goods, it does not commercially so much matter. The general effect is well described by Wakefield.

"The emigrants would be producers of food . . . and raw materials of manufacture for this country; we should buy their surplus food and raw materials with manufactured goods. Every piece of our colonisation, therefore, would add to the power of the whole mass of new countries to supply us with employment for capital and labour at home. Thus employment for capital and labour would be increased in two ways and two places at the same time; abroad, in the colonies, by the removal of capital and people to fresh fields of production; at home by the extension of markets or the importation of food and raw materials."

How true this is may be seen by the growth of trade between Great Britain and her colonies (see IMPORTS and EXPORTS). The enhance-

ment of Great Britain's commercial prosperity, owing to emigration to her colonies and the United States, is an admitted fact. But when the emigrant goes to a foreign country and is lost in the general mass of its population, it is impossible to earmark his particular effect on increase of trade: if trade were free, old association might do much; but in the vast majority of cases the matter is determined by other causes. Of all the nations who have most increased the national commerce with foreigners through emigration, we should select the Germans as the most successful at the present day.

But a large emigration may sometimes produce a transfer of trade which is a distinct loss to a country. England seems to be on the verge of experiencing something of this sort in consequence of the McKinley Act of the United States; if, as is possible, the plush or mohair manufactures are transferred bodily to their best market there will be a loss of people and of profits to England. But in this case emigration is a result rather than a cause, differing herein from the emigration of the Flemings from the Low Countries in the 14th century, which produced a transfer of the woollen manufacture to England.

(b) With purely political results of emigration we are not here concerned. On the one hand, it tends to the union of nations and to the establishment of peace; on the other, it is always increasing the responsibility of a nation towards foreign powers. England with her many subjects scattered over the globe, and her vast possessions across the seas, is the great example of the double responsibility. We are not likely now, as the Romans did, to make emigration a distinct method of control over subject peoples.

In reviewing the foregoing results we have purposely selected Great Britain as their chief exponent. And we have dealt with the kingdom as a whole: in Scotland and Ireland, taken separately, we find two well-marked opposite results. Scotland has sent out a steady stream of emigrants whose departure has only strengthened those who were left behind. Ireland, partly from poverty, partly from political causes, has been rapidly depleted of the stronger part of her population. In examining the emigration from other countries, we also find special phases to arrest us. Norway and Sweden have both been centres of a large emigration, which now appears to be losing strength. In Norway the causes and effects have been akin to the case of Scotland. In Sweden the parallel is rather with Ireland. In Italy the large annual emigration is becoming a serious drain, and the face of the country is already showing this. The loss of the more enterprising peasantry is making more helpless those who are left behind. Germany, on political grounds, is struggling with the tendency to emigrate;

she does not wish to lose her soldiers at the best period of their lives.

The comparative strength of emigration in certain European countries may be gauged by the following figures for 1887-88:

Great Britain and Ireland .	7.46 per 1000
France	61 "
Germany	2.10 "
Italy	6.87 "
Norway	10.58 "
Sweden	9.86 "

These figures show the gross emigration; we have to go further to find the net result. In the last three countries mentioned there is little immigration and there is consequently the heavier drain. One of the best instances where population has, decade after decade, been kept stationary by emigration is that of the Leeward Islands in the West Indies.

Before concluding, a reference is required to the considerable annual emigration from India to the British tropical colonies, and from China to the Australian colonies and the United States. The Indian government do not encourage emigration, except under very strict conditions and safeguards. The Chinese law, till recently at any rate, prohibited it; but pressure of population set the law at defiance, and the government, as is its wont, connived. In 1852 Sir E. Bowring expressed the opinion that it left greater ease to those who remained and cleared the country of vagrants. Hardly any women leave China, and this gives the movement a special feature. An indirect effect of slow growth may be expected in the case of Indian coolie emigration, especially that to the West Indies. The lowest classes of the population go: their return at a stated period is part of their agreement; they come back much improved in circumstances, with standards of living greatly raised. But the population of both China and India is so crowded that hardly a mark can yet be said to have been left upon it by emigration.

[The aspect of emigration here discussed is but slightly referred to in most published works. Special attention may be called to chapters II. and IX. of *Immigration and Emigration: A Study in Social Science*, Prof. Mayo Smith, London, 1890: this book has a full bibliography.—The reports of the Emigration Commissioners from 1832 to 1870.—The annual statistics of the Board of Trade, especially the reports for 1877 and 1891. First and second reports on the Emigrants' Information Office, 1887-88.—*An Essay on Plantations*, by Sir Francis Bacon.—*A Treatise*, by John de Witt, Pensioner of Holland.—*A Discourse concerning Plantations*, by Sir Josiah Child (all three re-published amongst select tracts, London, 1827).—*The Effects of Distant Colonisation on the Parent State*, Thomas Arnold, 1815.—*Thoughts on Population and Starvation*, by J. J. Macintyre, London, 1841.—*Letter on the Condition of England*, by R. Torrens, 1843.—*A View of*

the Art of Colonisation, by E. Gibbon Wakefield, London, 1849.—An essay *Ueber italienische Auswanderung und Feldarbeit in Italienische Gyps-Figuren*, von W. Kaden, Leipzig, 1891.]

C. A. H.

[For the effect on the country which receives the emigrants, see IMMIGRATION.]

EMINENT DOMAIN. This term, in constant use among American lawyers and publicists, but still hardly familiar in England, seems to be derived from a phrase of Grotius (*De Jure Belli ac Pacis*, l. i. ch. iii. vi. § 2) where, speaking of the attributes of supreme public authority in a state, he says: "in quibus comprehenditur et dominium eminens quod civitas habet in cives et res civium ad usum publicum." That is to say, there is in every state a paramount authority over the persons and property of its subjects for matters of public advantage. It will be carefully observed that this is not a right of property, and is quite independent of the laws or doctrines as to the tenure of any kind of property which prevail in this or that state. Where the state, or a public department, in a corporate capacity, or as an ideal or "moral" person, is the owner of any property, its rights are the ordinary rights of an owner. The right or power now in question is to supersede the ordinary rights of the subject, whatever they may be. In other passages Grotius calls it "supereminent," as if to make this clear. Being a power above ordinary legal rights, it can be set in motion only by an exercise of legal sovereignty; in other words it can take effect in a civilised state, except perhaps in singular emergencies, only by express legislation or under some authority conferred by express legislation. This passage alone does not make it clear whether Grotius contemplated the right or power of "eminent domain" as something capable of being in frequent and normal action, and having a settled place in the institutions of public law. Perhaps he was here thinking rather of impressing men for service against an invader, entering on private land to make fortifications (a power attributed to the crown from ancient times by the common law of England), taking horses and provisions for urgent military needs, and the like. But in a later chapter (l. iii. ch. xx. vii. § 1) he distinctly says that it is not merely an emergency power, but exists for the sake of the public weal in general. In modern usage we speak of "eminent domain" only as exercisable with regard to property. Experience has shown that many objects of public utility and necessity cannot be effected without overriding the ordinary rights of owners, and especially the right of parting with one's property, if at all, only on such terms as one thinks fit to accept. On the other hand it is found necessary or expedient to make interference of this kind as

little burdensome to the individual as is consistent with accomplishing the public objects in view, and to avoid, both in fact and in appearance, anything like arbitrary disturbance of private rights. Hence the exercise of sovereignty in this kind is reduced to rule and brought under legal and judicial categories. Under names denoting either the power itself, as "eminent domain" in America, or the principal mode and effect of its exercise, as "compulsory purchase" in England, "expropriation pour cause d'utilité publique" in France, "Zwangseenteignung" in Germany (where, however, "Expropriation" is in more general use), we find the matter dealt with, on substantially similar lines, in the legislation and jurisprudence of most civilised countries.

The principles recognised, it is believed, in all jurisdictions, though secured by various forms of procedure, are that private property is not to be taken by compulsion unless for some object of which the public utility has been proved, that it must not be taken without just compensation, and that the compensation must be paid or at least put in the way of impartial ascertainment before possession can be required. The enactment of the French Civil Code "Nul ne peut être contraint de céder sa propriété, si ce n'est pour cause d'utilité publique, et moyennant une juste et préalable indemnité" (art. 545) may be taken as a concise and typical statement. It is copied or translated in many other codes (*e.g.* Civil Code of Lower Canada, art. 407). The exercise of eminent domain on terms of just compensation goes back, in France, to the early 14th century (see Philippe le Bel's ordinance quoted, *Law Quart. Rev.*, iii. 316). A law of 1841 (to be found in the collections of *Lois usuelles*) now regulates the procedure in France; it has probably served as a model for similar legislation in many of the countries which have adopted the Napoleonic codes or come under their influence. In England the method has been for promoters of public works, such as canals, bridges over navigable rivers, and in later times railways, to apply to parliament for incorporation, and at the same time to seek the grant of compulsory powers. Parliament cannot of course be bound by any positive law in the exercise of its supreme power of law-making, but the settled practice of Parliament in dealing with private bills embodies all the essential safeguards. What is called "proving the preamble" of a private bill is really a quasi-judicial process of establishing, by full and often keenly-contested argument, the utility of the proposed undertaking. Compensation used to be separately provided for in every Act granting compulsory powers to take land: at length "the multiplicity of such statutes and the general similarity of their provisions led to the enactment of various general laws, notably the Lands Clauses Con-

solidation Act of 1845, which," together with later amending Acts dealing with particular matters of procedure, "is really a coderegulating the law and practice of the eminent domain." (Mr. Carman F. Randolph in *Law Quarterly Review*, iii. 323). "Lands Clauses Acts" and "Compensation" are the English lawyer's practical catch-words on the subject. The ultimate feudal superiority of the crown has nothing to do with eminent domain, although the two things have sometimes been confused even by able writers. It is sufficient to say that the principles are the same, and the practice alike in all essential matters, in France, where feudal tenures have long been abolished, and in the United States, where they never had any effective existence.

Eminent domain has been described by the highest American authority, the Supreme Court of the United States, as "the right which belongs to the society or to the sovereign of disposing in cases of necessity, and for the public safety, of all the wealth contained in the State"—*Pollard's lessee v. Hagan* (1844), 15 Curtis, 391, 395, s.c. 3 How. 212. It is carefully distinguished by American publicists from the right, which they call the *police power*, of restraining the use of private property in ways which may be dangerous, offensive, or otherwise injurious to the public weal. The specially full discussion and definition of these topics in the United States proceeds from the fact that the legislative power, both of the federal and of the state governments, is not unlimited, but must be exercised in conformity with the constitutions of the United States and of the respective states of the union.

[American treatises on Constitutional Law; Kent's *Comm.*, ii. 339, and ch. xv. of Cooley on *Constitutional Limitations* will suffice for most general purposes; also recent works on *Eminent Domain* by Lewis, 1888; and Mill, 2nd ed. same date.—In England, Cripps on the *Principles of the Law of Compensation*, 3rd ed. 1892. Mr. Randolph's article above cited, *L.Q.R.*, iii. 314, gives a convenient general view.] F. P.

EMMERY DE SEPT FONTAINES, HENRI CHARLES (1789-1842), was chief engineer of the *Ponts et Chaussées*. He superintended the construction of the canal of Saint Maur, and of the bridge over the Seine at Ivry, and about five miles of sewers and six miles of water-conduits were laid by him in Paris between 1832 and 1840. He principally wrote on subjects connected with his profession, but published in 1837 a short pamphlet of thirty-two pages, *Amélioration du sort des Ouvriers dans les Travaux Publics*, in which he condensed the results of his own experience of the state of workmen employed in extensive public works. He strongly advocated the arbitration of the State *Ingénieurs* in all contentions arising be-

tween contractors for the State and their workmen, and the responsibility, according to the case, of the State or of the head contractors for accidents or ill-health resulting from unhealthiness of work. He gives some interesting statistical details on the amount of indemnities allowed under these heads of the principal works he had superintended. On an average, they amounted to 35 francs (say £1:8s.) per case, and to the proportion of 3, 2.25, and 0.50 francs per 1000 francs (2s. 5d., 1s. 10½d. and 5d. per £40) of the gross cost of works performed. E. C.

EMPANEL. To put the names of jurymen on a list which is called the panel. E. S.

EMPHYTEUSIS. An expression of Roman law, for the permanent letting of land at a chief rent, called *pensio*. The tenant was, for all practical purposes, the owner of the land (cp. FEU). E. S.

EMPIRICISM. Empiricism is a term of somewhat vague import. Perhaps it is oftenest used in an unfavourable sense to describe the frame of mind of one who cannot or will not reason from general principles, but guides himself in every emergency by reference to particular experiences. Consistent empiricism in this sense is, strictly speaking, impossible. The empiric who most loudly disclaims recourse to general propositions must employ them as soon as he begins to apply his empirical wisdom. He must reflect somewhat after this fashion:—The present case resembles, or does not resemble, certain cases which I have known. Therefore certain results which followed in those cases are likely, or are unlikely, to ensue in this case. Therefore I ought, or I ought not, to take such and such measures. Here the most scrupulous empiric is reduced to employ both induction and deduction, to form a theory applicable to more than the single case before him; in a word, to have recourse to general reasoning. It is true that he may not utter his argument aloud, that he may be himself unconscious that he is arguing. Men of practical genius, whether soldiers or statesmen, men of business, or medical men, often carry out extremely complicated and subtle processes of reasoning which they have no time to note, which language is hardly adequate to express, and which produce upon bystanders the effect of a happy unaccountable knack. Such men are often mistaken for mere empirics, but that is only because they theorise so rapidly and so well.

Empiricism, in so far as it is serious, may be described as an illogical protest against the abuse of logic. Most persons of systematic mind are in such a hurry to complete a system that they will not take time either to ascertain all the facts important to be known or to give to each known fact its due place and significance. Accordingly they make wild work when they apply their systems to the facts of life.

The mischief thus occasioned has often led men of real sagacity to express themselves as though all reasoning were useless in practice, whilst they only meant to say that any reasoning which is to be of use in practice must be difficult.

The empiric and the theorist have by turns exerted a dominating influence upon the study of political economy among all nations. Until the 18th century books of economic theory were comparatively few, and their practical influence was comparatively small. Statesmen and the public sought economic guidance chiefly from persons actually engaged in industry and commerce. Of this empirical wisdom Sir Thomas GRESHAM may be taken as a favourable instance. If its admonitions were now and then disregarded, this was less in deference to the opinion of economic theorists than in deference to a supposed interest of government or doctrine of religion or morals. But in the course of the 18th century theoretical writers upon political economy began to acquire an unprecedented authority. To their teaching chiefly was due the revolution in favour of individual freedom and unrestrained competition which filled the first half of the 19th century. Since the middle of the century empiricism has perhaps regained some of its former power. The views of Adam SMITH and his immediate successors were perhaps more deeply coloured by the circumstances of their own age than they themselves could be conscious of, or would have admitted at the time, for nothing is more difficult even for the deepest thinker than to clear himself of the influence of the atmosphere in which he moves and has moved all his life. The correction of economic doctrine by later students has made the main theory enunciated at once more accurate and comprehensive, and less easy of practical application. Political power has passed to classes who do not read political economy, and politicians do not think it prudent to quote economists. But political economy may regain its former influence when it is more generally studied and its lessons are enforced by the stern teaching of actual experience. F. C. M.

EMPLOYERS AND EMPLOYED. During recent years economic writers have been bringing into greater prominence the functions of the employer in industrial affairs. The older English economists regarded the agents concerned in the production of wealth as three in number, viz. land, labour, and capital; and in a similar way they considered that the classes concerned in the distribution of wealth were three in number also, viz. landlords, labourers, and capitalists. The landlord received rent, the labourer wages, and the capitalist profits. They analysed indeed the share of the capitalist or PROFITS into the constituent elements of interest on capital, insurance against risk, and wages of superintendence or manage-

ment; but they did not apparently establish any distinct conception in their own minds—nor did they endeavour to instil any such conception into the minds of their readers—of the employer as separate from the capitalist. And it was natural that they should adopt this position; for it is only with the modern development of the BANKING and BILL-BROKING system, which permits of the systematic lending of capital by one man, or body of men, to another, and only also with the modern growth of large industries (see LARGE AND SMALL TRADE) that the functions of the employer have acquired a marked and separate importance of their own. Under the DOMESTIC SYSTEM OF INDUSTRY, which previously prevailed, manufacture was carried on mainly in the houses of craftsmen, who were generally employers on a small scale, working for the most part for a market near at hand, the conditions of which varied but little, and supplying in the main from their own resources the capital needed for conducting their business. But, with the changes consequent on the INDUSTRIAL REVOLUTION at the close of the last and the opening of the present century, manufacturing industry passed from villages to towns, and from the house of the craftsman to the factory of the employer. The functions of the employer as such became important; for he had to anticipate the fluctuating demands of a world-wide market, and to direct the operations of a multitude of workmen who were engaged under an organised system of minute DIVISION OF LABOUR on small portions of work, all of which were necessary to, and formed part of, a complete manufacture. He now acquired also to some extent a separate character from that of the capitalist; for, although he generally possessed some capital of his own, he could, through the agency of bankers and others, obtain the loan of further capital from those who did not wish to enter on active business for themselves, but were glad to receive interest for the use of their surplus wealth. And hence at the present time, while it is recognised that the functions of the employer and of the capitalist are to some extent as a general rule combined in one person, and while it is still held by most writers that the term profits should be understood as including interest on capital as well as wages or earnings of superintendence or management, it is also considered that an adequate classification of those among whom the wealth produced in a country is distributed should assign a distinct place to employers as such, and by some writers it is urged that the term "profits" should be confined to that part of the employer's receipts which belong to him as such, that is, to his earnings or wages of management or superintendence, and should not be extended to the interest which he obtains as a capitalist for himself, or hands over to some one else from

whom he has procured a loan. This last view is held, amongst others, by the American economist, General F. A. Walker, who, together with Bagehot in England, has been specially instrumental in bringing the importance and distinctive character of the functions of the employer into due prominence. He has even adopted (*Political Economy*, pt. iv. ch. iv.) a theory which regards the profits of the employer, using the term profits in this narrow sense, as being of the nature of RENT, and depending for amount on the natural ability possessed, and the opportunity enjoyed, by different employers, in the same way as the economic rent of land depends on its fertility and situation. But among English writers, at any rate, the term profits is generally employed in the wider sense; although there is a growing tendency to regard that part of them which represents earnings or wages of management or superintendence, as governed by similar laws to those which determine the earnings of labour generally.

The employer's labour, it is held, is labour of a high, and indeed of a special class, but it is none the less labour, and it must not be confounded in any way with interest on capital (see EARNINGS AND INTEREST FUND). Bagehot has compared (*Economic Studies*, pp. 53, etc.) the modern employer to the editor of a newspaper, or the general of an army, and has remarked in a striking passage that just as the general of an army is "nowadays a man at the far end of a telegraph—a Count Moltke with his head over some papers—who sees that the proper persons are slain, and who secures the victory," so in commerce the "whole" is now "an affair of money and management—of a thinking man in a dark office computing the prices of guns or worsteds." The employer "settles what goods shall be made, and what not; what brought to market, and what not. He is the general of the army; he fixes on the plan of operations, organises its means, and superintends its execution. If he does this well, the business succeeds and continues; if he does it ill, the business fails and ceases. Everything depends on the correctness of the unseen decisions, on the secret sagacity of the determining mind." In a similar way General Walker (*Wages Question*, ch. xiv.), after remarking that the conditions of admission to the employing class are a "long self-initiation, a high premium of immediate loss, and a great degree of uncertainty as to ultimate success," quotes from M. Courcelle-Seneuil's *Opérations de Banque* (p. 392) an enumeration of the qualities which an employer should possess. They are "du jugement, du bon sens, de la fermeté, de la décision, une appréciation froide et calme, une intelligence ouverte et vigilante, peu d'imagination, beaucoup de mémoire et d'application" (judgment, good sense, firmness, decision, a calm and cool temper, an open and

alert mind, little power of imagination, great power of memory and of application). Professor and Mrs. Marshall (*Economics of Industry*, bk. iii. ch. ix. § 4, old edition) regard the work of the employer as consisting of two main varieties. "The first is that of organising the production; of determining what shall be made, and how it shall be made; and of deciding where and when to buy and sell. We may," they remark, "adopt an American term and call this *engineering* the business. The second part of his work, which may be called that of *superintendence*, consists in providing for the proper carrying out of his instructions." As the size of the business increases, the employer tends more and more to depute the duties of superintendence to subordinate managers and foremen, and to concentrate his own thought and attention on the *engineering* of the business. To some extent he becomes, as Bagehot has aptly expressed it (*Economic Studies*, p. 59), like a cabinet minister, who may be shifted from one department of state to another in successful reliance on the specialised knowledge of the subordinate permanent officials. He ceases indeed to be personally acquainted with his actual workmen, but he is able to bring his ability and experience to bear more exclusively on the work of management. "The highest class of employers," writes General Walker (*Political Economy*, pt. iv. ch. iv.) consists of those "rarely-gifted persons who, in common phrase, seem to turn everything they touch into gold; whose commercial dealings have the air of magic; who have such power of insight as almost to seem to have the power of foresight; who are so resolute and firm in temper that apprehensions and alarms, and repeated shocks of disaster, never cause them to relax their hold or change their course; who have such command over men that all with whom they have to do acquire vigour from the contact, and work for them as they would not, perhaps could not, work for others, just as great captains (see INDUSTRY, CAPTAINS OF) inspire their armies with a confidence which alone goes far to make them invincible." Below these men come a "much larger" class of a "high order of talent, though without genius or anything savouring of magic"—"men of natural mastery, sagacious, prompt, and resolute in their avocations." Then come the "men who, on the whole, do well, or pretty well, in business;" and lower down come a "multitude of men who are found in the control of business enterprises for no very good reason that can be seen by those who know them." The passages which have been quoted will sufficiently indicate the nature of the work and qualities required of a modern employer, and will explain the high remuneration which he often commands. The average earnings, indeed, of employers seem now to be falling, with the

general diffusion of education and the rapid spread of inventive discovery. But the modern world of business offers greater opportunities for exceptional talent and extraordinary luck than have perhaps ever before been afforded; and the amount of capital and of labour placed at the disposal of a single employer is frequently very considerable. The employer is in a sense the pivot on which the modern world of industry revolves, and the distinctive prominence into which he has been brought in more recent economic literature has conduced to greater definiteness in questions of distribution generally, and in particular in the consideration of three matters of the first importance. The conception that a conflict between labour and capital is involved in the relations of employers to employed is shown to be somewhat misleading; for the employer is in a sense a labourer as well as the employed, and he often does not furnish himself the whole of the capital which he uses. It may even be supplied by individuals who are themselves employed in his own or in other trades. The employer is in reality a middleman, a kind of "buffer" intervening between one set of individuals and another; and, while he may have to bear the first brunt of the conflict, he may also shift part of the burden on to others. The conflict is not then entirely, though it may be partly, between labour and capital; but it is in some degree between one class of labourers and another, who are both interested in obtaining the supply of capital on advantageous terms, and are on the other hand respectively anxious to secure for themselves the larger share of the produce remaining when the claims of capital have been met. Another question, on which considerable light is thrown by the modern analyses of distribution, is the question of co-operative production (see CO-OPERATION). This has sometimes been represented as a question of combining the functions of capital and labour in the persons of the same individuals; but in reality, as General Walker has shown (*Wages Question*, ch. xv.), it involves the elimination of the employer. The workmen wish to take the responsibilities of management upon themselves, and to secure for their own benefit the profits of the employer. They are unable to dispense with capital, even if they entertain such a wish; and they may acquire capital, and become capitalists, without co-operative production. But the object, at which they really aim, is more difficult, for the functions of the employer are very important, and they are making an attempt to undertake them themselves. A third and last question, which is affected by the distinctive importance of these functions, is that of SOCIALISM (*q.v.*) Modern socialist writers represent the products of manufacture as due entirely to the labour of the actual workmen, and therefore as belonging

of right to them. They regard the employer as an exploiter and robber of labour, and they consider profits as the outcome of the surplus value (cp. VALUE) of what the labourer produces over what is required for his subsistence. This theory of surplus value is fallacious in other respects; but part of its error may be traced to a failure to distinguish the functions of the employer as such from those of the capitalist as such, and to separate that portion of profits which forms the reward or earnings of the difficult work of management from that which is simply and solely interest on capital.

[In addition to the books mentioned above the student should consult J. S. Mill, *Political Economy*, bk. ii. ch. xv. for the older definition of profits, and the *Boston Quarterly Journal of Economics* for 1888 and 1893 for the controversy raised by General Walker's *Theory of Business Profits*. Reference should be made to Marshall's *Principles of Economics*, bk. iv. ch. xii., bk. vi. chs. vii. and viii., and Sidgwick's *Political Economy*, bk. ii. chs. i. and viii., for the disposition to regard the labour of employers as subject to the laws affecting labour generally. For the tendency to a fall in average profits Leroy-Beaulieu's "*Essai sur la répartition des richesses*, ch. xi. and the *Report of the Industrial Remuneration Conference*, 1887, pp. 4, etc. and 186, etc., should be studied. L. L. P.

EMPLOYERS' LIABILITY ACT, 1880, 43 & 44 Vict. c. 42, extends and regulates the liability of employers to make compensation for personal injuries suffered by workmen in their service. At common law the liability of an employer, with respect to persons in his employment, differed from his liability with respect to persons not in his employment (see COMMON EMPLOYMENT, DOCTRINE OF). He was not liable to his servants for the consequences of acts done by fellow-servants in the course of their service. He was, however, liable to them for injuries resulting from the negligence of himself or his partner. Thus he was bound to take reasonable care that his plant and machinery were in a safe condition, and that servants selected by him were competent to their work. But his liability to persons not in his service was far more extensive. He was liable for injuries caused to them by his servants, even when he had not been guilty of any negligence, even when he had expressly forbidden the act producing injurious consequences. The difference of the employer's liability towards his servants and towards the public might conceivably be justified by the fact that the public has no choice as to incurring the danger which may result from his undertaking, whilst a workman can choose whether or no he will take service with any particular employer. But the distinction

came to be more oppressively felt as industry was more and more concentrated in huge concerns, such as railways and factories, where the range of choice between employers is limited, and service involves co-operation with a multitude of other "hands" about whose individual care or dexterity nobody can learn much. The influence of the working class was exerted to obtain a modification of the common law, and the Employers' Liability Act embodies a compromise on the subject. It provides that in five specified cases the workman who has sustained injury through the action of a fellow-workman may bring an action for redress as though he were not in the same employment. Where the injury happens by reason of (1) any defect in the works, plant, or machinery; (2) the neglect of any person engaged in superintendence; (3) the neglect of any person to whose orders the workman was bound to conform when the injury took place; (4) the act of any fellow-servant done in obedience to the rules, by-laws, or instructions (if improper or defective) of the employer or his delegate; (5) the negligence of any signalman, pointsman, or person having charge of a locomotive on a railway, the workman is put on the same footing with the public. But for the purpose of the act "workman" is so defined as to exclude seamen, domestic servants, and any servant not employed in manual labour. When an injury has been sustained notice must be given, and the action must be brought within a limited time, and the amount of the compensation must not exceed three years' earnings of a workman in that employment. If the injury prove fatal, the right of action passes to the dead man's representative. The act was originally passed for seven years only, and since 1887 has been renewed from year to year. Parliament has not found time to place the law relating to this subject on a permanent footing. The above statement, both of the common law and of the effect of the act, must be regarded as summary and popular, not full or precise.

For the previous state of the law and the change made by the act, the reader may consult Macdonell, *The Law of Master and Servant*. For a discussion of the principles involved, see *Essays on Jurisprudence and Ethics* by Sir Frederick Pollock (essay v., "Employers' Liability.") In the present session of parliament (1893) the home secretary (Mr. Asquith) has introduced a bill putting the workman on the same footing with the public whenever he has been injured by the negligence of a person in the service of his employer. The bill applies to seamen. The person employed cannot contract himself out of his right beforehand. The Employers' Liability Act, 1880, is to be repealed. It is impossible to say at present what alterations in the law may follow from this bill.

F. C. M.

EMPLOYING CLASS. General F. A. Walker, who has contributed greatly to bring into due prominence the functions discharged by the employer (see **EMPLOYERS AND EMPLOYED**) in the modern world of industry, draws a distinction (*Wages Question*, ch. xiv.) between what he calls a "false employing class" and the "real employing class," to the latter of which alone these functions in his opinion properly belong. The "false employing class" includes, in the first place, those who hire servants who help their employers rather to consume the wealth they have previously produced than to produce fresh wealth. In the second place it includes artisans who are employers on so small a scale that they have only single apprentices; and in the third place it comprises those who are nominally employers, but practically are partners of the employed; and, fourthly and lastly, it contains those who "cling to the skirts" of the profession. The "real employing class," therefore, is the "comparatively small body of men" which is reached by eliminating these various kinds of "false" employers.

L. L. P.

EMPLOYMENT. The number of persons employed in the performance of labour in a country obviously cannot exceed the number of persons capable of labour existing in the country, and, as a matter of fact, it is never for any length of time very much below this number; in all countries the able-bodied unemployed, including not only the men "out of work," but all others who from whatever cause are not engaged in labour, are but a minute fraction of the whole able-bodied population. This is sufficient to show that, broadly speaking, the number of persons employed is regulated in the main by the number of persons seeking employment, or in other words, desirous of earning a livelihood by labour. In a small community, say of ten or twelve persons, living in entire isolation from their fellows, every one would find it easy enough to obtain employment, though he might find that a great deal of employment produced very little food. In a great community where co-operation in the production of wealth is effected by means of exchange, the fact that there is always a certain small proportion of persons seeking employment who are unable to find it is chiefly due to the circumstance that, owing to the division of employments, every kind of production comes to be carried on by people who have by training and experience acquired particular skill in that kind of production, so that when the demand for any one commodity slackens and the number of those who produce it has to be reduced, or at any rate not increased at its normal rate, the persons deprived of this employment are not immediately absorbed in other employments.

EMPTION. The right of the crown, exercised from time immemorial, to *take and buy* "at its need" or "for its use" an indefinite amount of commodities, at such price or on such terms of payment as the circumstances of the case might warrant. It was claimed by Edward I. in 1297 that the king was "free to buy and sell like another"; the advantage to the crown being that such purchases were paid for by tallies, and the amount of the maltolte deducted from the purchase-money (see MALTOLTE). Hall, *History of Custom Revenue*, vol. i. pp. 62, 64; (see also PREÉMPTION AND PURVEYANCE).

H. HA.

EMPTIO-VENDITIO. The Roman contract of sale, or of buying and selling as it is called in order to denote its bilateral character, is formed by one contracting party promising to pay a sum of money or price (*pretium*), and the other party promising to deliver a thing (*merx*) in return. The contract is binding by mere agreement between the parties, neither requiring any formality nor delivery on one side, and so belonging to the class of contracts called consensual. *Arrha* (see ARLES; EARNEST MONEY), a sum of money or other object of value frequently given by a contracting party to afford evidence of the contract, and a security for its fulfilment, is not a requisite of the contract itself. There can be no contract of *emptio-venditio* unless a determinate price, or a price which can be made so (*id certum est quod certum reddi potest*), is made part of the agreement. It was at one time a subject of dispute whether the price must necessarily be in money; thus the Sabinian school of jurists maintained that exchange was a species, and the oldest species, of sale, citing in support of their view the lines of Homer—

"Here touched Achæan barks in quest of wine,
They purchased it with copper and with steel,
With hides, with horned cattle, and with slaves."
(Poste's *Gaius*, III. § 141.)

But the view prevailed that sale was a contract distinguished from barter or exchange by the fact that it had for its object the payment of a sum of money for a thing.

When the contract of *emptio-venditio* is complete the vendor is bound to deliver the thing to the purchaser and the purchaser to pay the price of the thing, but one party cannot be compelled to perform his part if the other will not perform on his side. The obligation of the vendor is not to make the purchaser owner of the thing, but only to give him possession of it. If, however, the purchaser is evicted by a third party who has a superior title, the vendor is obliged to make good to him the loss. Ownership of the thing does not pass to the purchaser until possession of it has been de-

livered to him and he has paid the price, if it is a ready-money transaction. But though the property has not passed to the purchaser, he is subject to the risk (*periculum*) of its accidental loss, *i.e.* of loss which cannot be attributed to the negligence of the vendor from the time of entering into the contract (*resquit emptori*). This rule is only applicable where there is a specific object appropriated to the contract. If the thing is determined only by its genus or kind, the risk does not attach to the purchaser until the thing has been weighed, measured, or counted, and the purchaser has had notice of this having been done. The purchaser, on the other hand, could claim all accessions and profits of the thing bought arising between the making of the contract and the date of delivery.

The vendor is liable on account of defects in the thing sold, not only when he represents that they are absent, or fraudulently conceals their existence, but, according to the law established by the edict of the curule Ædiles, who had jurisdiction over the market, even on account of latent defects of the existence of which he was unaware. Thus in the Roman contract of sale there is an implied warranty that the thing sold is free from defects. Such, in brief outline, are the main features of the contract of *emptio-venditio*, with which those of the English contract of sale of goods may be usefully compared.

E. A. W.

EMULATION, EFFECTS OF, ON SOCIETY. The feeling of emulation may be defined as the desire to excel one's fellow-creatures in any respect whatsoever. It thus admits of infinite variations, produces the most dissimilar consequences, and gives rise to the most contradictory judgments. At its best the spirit of emulation is hardly distinguishable from the desire to achieve greatness or perfection, at its worst the spirit of emulation is hardly distinguishable from envy and uncharitableness. It is, however, an indestructible instinct, which may be schooled but cannot be extirpated, and which is most powerful in the most vigorous natures. Further, it prompts to unceasing effort because it is insatiable. The plain animal appetites may be sated; but emulation incessantly creates anew its object of desire, and, the more it has accomplished, finds the more to be done. Next to the instinct of self-preservation and the instinct of sex, the instinct of emulation has probably had greater effects than any other upon the economic history of mankind. We may consider its effects shortly under three heads: (1) *Emulation in accumulating wealth*, (2) *Emulation in expending wealth*, (3) *Emulation in other directions*.

(1) *Emulation in accumulating wealth*. The desire to be richer than one's neighbour, to excel him in the power and consideration given by wealth, has been a prime factor in accumulation. Its force has varied chiefly with two

circumstances: with the degree of desire for wealth characterising any given society, and with the proportion of persons who have had a chance of acquiring riches. As to the former circumstance, societies have differed considerably in the value which they assign to wealth in comparison with the other goods of life. The causes of this difference are too many and too subtle to be enumerated here; but among the most influential are different moral and religious ideals, different stages of political development, different degrees of command over the resources of nature. As to the latter circumstance—the proportion of persons who can indulge a spirit of emulation in the pursuit of riches is exceedingly variable. In many societies a small proportion has been above, and a large part has been below, any active emulation in wealth. Sometimes a class of nobles has owed its pre-eminence rather to birth and to military prowess than to riches, and has therefore been less emulous of riches. Often a class of slaves who were legally incompetent to hold property, or of serfs who were not adequately protected by law in the enjoyment of their property, or a class of underpaid free labourers who could barely earn their daily bread and nothing more, has found it difficult or impossible to rise into a more comfortable condition, still more to compete in a rivalry of riches. In such a case the spirit of emulation dies out, because not fed with hope. These remarks might be illustrated from the history of mediæval Europe, in which the emulation of riches appears as a great force only in certain classes and in certain places. But in such communities as our colonies and the United States of America, in which material well-being is the accepted ideal, in which every citizen has hopes of realising this ideal, and in which the command over natural resources is almost unbounded, the emulation of wealth becomes a passion as universal as it is intense, and impels to an amazing economic development.

It is conceivable, indeed, that emulation in the pursuit of wealth might become so intense as to lessen, not to augment, the wealth of society. Thus a community of men so zealous in the pursuit of wealth that they grudged time, trouble, and money for national defence, or for alleviating social evils, might end in subjection to a foreign power or in mere anarchy; and would in either case be reduced to comparative poverty. The same result might follow if emulation in the pursuit of riches led to a universal disregard of commercial integrity or to a neglect of all liberal culture. For there is no instinct which, if left to itself, will not sometimes defeat itself.

(2) Emulation in expending wealth must be taken to mean emulation in expenditure which is not directly productive. The immediate result of such emulation is to lessen wealth.

Its ultimate result will depend on many considerations. Thus the wealthy citizens of Rome rivalled each other in expenditure on public works intended for the health and recreation of the public; the burghers of mediæval Europe in building and endowing churches; the nobles of France in display at Versailles. Clearly each of these modes of emulation in expense differed from the rest in its ultimate economic effects, although each was in the first instance non-productive. Again, emulation in expense has different economic results accordingly as it is the emulation of a productive or of a non-productive class. The courtier of Versailles, when he had squandered his fortune, remained poor or had to squeeze his dependents. The American, when he has spent lavishly in Europe, goes back to his country and works yet harder to make another fortune.

(3) Emulation in other directions. Every form of emulation soon or late produces economic consequences. In all ages wealth has followed power, and has been kept by strength. Few nations have got wealth and none have kept it unless there was an emulation of public spirit and military virtue among their citizens. Intellectual emulation, emulation in knowledge and culture, has always stimulated economic and industrial development, and often most effectually when it has been most free from sordid motives. Thus the wealth of modern Germany is directly due to the intelligence of the age of Goethe and the public virtue of the age of Bismarck. Again, the economic condition of the later Roman empire and of the middle ages must have been considerably affected by the emulation of ascetic piety which withdrew so many of the strongest wills and keenest intellects from the world to the cloister. The immediate result was an economic loss, although this may have been partially counterbalanced by the civilising influence of many monastic bodies. Even emulation in mere sports and pastimes would be found to influence occasionally the economic state of society.

ENCABEZAMIENTO, a contract between the Spanish treasury and the local authorities, by which, after a preliminary estimate of the taxes to be levied, the latter engaged to collect and remit the amount. The first known *encabezamiento* goes back to 1494.

E. Ca.

ENCLOSURES. Of "enclosing," *i.e.* the fencing round of land which had previously lain open, whether as common field or as common waste, we hear but little before the 13th century, when the necessity for statutory regulation points to the existence of the custom and of differences between the lords of manors and their tenants. About the origin of those common rights of pasture which play so important a part in the history of enclosures, there has been much controversy; but there is

an increasing consensus of opinion as to the main legal points. Although in strict feudal theory the land belonged to the king as the supreme landlord, the lords of manors came in course of time to be treated as owners of the soil within the manor, who in various ways granted certain rights over it to their tenants. Land might be cultivated by the tenants for their lord or for themselves according to a common system of husbandry, upon certain terms which in many cases included certain pasture rights. These might be (1) rights over the arable land during the year, when under the three-field system it was lying fallow, or during the period between harvest and the sowing of seed; or (2) the right of herding a certain number of animals in a common close; or (3) rights over the wastes and woods belonging to the manor. Whether the lord could from the earliest times enclose at will is a matter of some controversy, but, by the statute of Merton, 1236 (20 Hen. III. c. 4), a parliamentary sanction was given to the enclosure of wastes by the lord of a manor, provided that sufficient pasture was left for the requirements of his freehold tenants; while by the Statute of Westminster, II., 1285 (13 Edw. I. c. 46), enclosure was permitted as against commoners who, without being tenants, possessed pasture rights by a special grant. Until the middle of the 14th century the enclosure of open fields in the interests of tillage continued, and many agreements were made between lords and commoners destroying the common rights over the arable land between harvest and seed-time, and sometimes involving exchange of land. Since such enclosure simply implied the rearrangement of estates, and required the same resident population as before, while the conversion from wood and waste into arable land—another feature of the time—found employment for a larger population, no grievance could arise, and the agricultural gain was great. But owing to the scarcity of labour after the ravages of the Black Death (1349), and the consequent introduction of the lease system, attention was turned to the advantages of pasture farming over tillage. When to these influences there was added, in the 15th century, a desire to promote commercial interests by increasing the supply of wool for exportation, pasture farming was still more widely introduced. Sheep could not be properly reared upon open commons, or upon the small scattered strips, and thus arose the policy of enclosing commons wherever this was possible, either by force, or by voluntary agreement; while the profits of sheep-farming led to the conversion of much arable into pasture land. Tenants were encouraged to consolidate their holdings, to exchange their strips in the open fields for separate farms, and to divide the common pasture with the lord, or in some way to make an agreement with him. The economic

advantage of enclosure for grazing purposes was doubtless great, but the social and political dangers were considerable, as was pointed out by many contemporary writers who dwelt upon the depopulation of vast tracts, the diminished sphere for employment, the increase of pauperism, the pressure of evictions, and the loss of customary rights. These evils became more apparent after the dissolution of the monasteries; the earlier agricultural system had been retained on many estates which were confiscated, and thus passed under the new system, while the customary rights of the tenants were held to be overridden by the royal grant. Various statutes were enacted throughout the 16th century for the encouragement of tillage, but it was not until its close that the danger passed away. Edward VI. issued a commission in 1548, to investigate the matter throughout the country, but it was unable to put an end to the social discontent, which found an expression in Kett's Rebellion in 1549. The subject was summarised in the charge read by John Hales at the opening of the commission, and in the *Brief Concept of English Policy* (see ed. 1893 under the title of *A Discourse of the Commonwealth of this Realm of England*, and article by Miss E. Lamond, *English Historical Review*, 1891). By the close of Elizabeth's reign complaints about enclosures in the interest of pasture farming seem to have ceased; this was partly due to the encouragement given to the growth and export of corn, a course which had a more beneficial effect in reviving tillage than the many statutes passed with that object. From this time onwards enclosure of waste and common fields alike is chiefly advocated in the interest of tillage, not of pasture. In the 17th century many writers advocated enclosures of common fields for the improvement of tillage. Steps were taken for the draining and enclosing of the fens under the direction of Cornelius Vermuyden, a Zealander, while the Earl of Bedford headed an enterprise for enclosing the level which bears his name. In each case the undertakers were rewarded with a portion of the lands thus reclaimed, and this led under the Commonwealth to serious riots on the part of the fen men, whose customary rights were thus set aside. The only other noteworthy feature in the history of 17th-century enclosing, was occasioned by the financial necessities of Charles I., which led him to institute proceedings against those who had encroached upon the royal forests. Heavy fines were imposed upon offenders who had thus enclosed, but it is doubtful whether the king derived as much profit from this source of revenue as he had anticipated.

Until the reign of Charles II. enclosures were effected by agreement between the owners of land and those who possessed rights of common, commissioners being appointed to allot the

ands; the agreement was ratified by the court of chancery, or by royal licence where crown interests were concerned, but from the reign of Charles II. a parliamentary sanction was required. This was only given after the consent of the landlord, the tithe owner, and four-fifths of the commoners had been obtained in favour of enclosure. During the first half of the 18th century enclosing continued slowly; but the rise of a moneyed class interested in agricultural improvements, the increased use of green crops, which raised the profits of tillage, but which could not be profitably worked under the open-field system, the increase of population together with the withdrawal of a large portion from agricultural labour, the difficulty of providing a sufficient food-supply and the danger of dependence upon foreign countries, together with the famine prices produced by the French wars—all these various causes combined necessitated the utmost development of natural resources, and gave an enormous impetus to enclosure both of open fields and of common wastes from about 1760 onwards. The rate of progress is most easily shown by a few figures. In the reign of Anne there were three private bills for enclosure, in that of George I. 16, and under George II. 226, a total of 245 in fifty-eight years, while the sixty years of George III.'s reign show the astounding number of 3209 private bills as well as the general enclosing act of 1801. Unlike the enclosures of Tudor times, those of the 18th century were entirely in the interests of tillage. It is hard to estimate by how much the actual area brought under tillage was extended, since a great many enclosures affected open fields already under cultivation. In 1797, when over 1720 private bills had been passed, the select committee on enclosures reported that of the 46,000,000 acres which England was supposed to contain, about 7,800,000 were uncultivated wastes, while 1,200,000 were in the state of common fields, and it has been estimated that about 4000 parishes, containing open fields, chiefly in the eastern and some of the midland counties, out of a rough total of 8500, were enclosed between 1760 and 1844. Where such enclosures took place with due regard to common rights the gain was great, as the customary course of agriculture, and the difficulty of introducing changes such as machinery or a better rotation of crops, were almost insuperable obstacles to improvement. The enclosure of the wastes was also an economic gain, for in many cases they were previously worthless, the cattle reared on them were of an inferior kind, and, as Sir John Sinclair pointed out in an address incorporated in the report of the select committee of 1795, it was found more profitable to hire land for the breeding of sheep of a more valuable sort than to turn them on to a

common for nothing. Nor must it be forgotten that though much suffering was probably inflicted, still it was a social gain to clear some districts of an idle and lawless population—the haunts of thieves who, more especially near the capital, were a public nuisance,—while the draining of vast tracts was not without beneficial effects upon the public health. In many cases the enclosures, as carried out, were hurtful to the labourers, whose cottages had been on the commons, and who had been able to keep a cow, which was no longer possible when enclosure of the open fields and of the waste deprived them of customary pasture rights—often without compensation. The expense of enclosing and the loss of pasture rights is one of the many causes which contributed to the disappearance of the yeomanry during this period. The force of the argument against enclosures lies in the fact that the poor did not in many cases receive compensation for the loss of traditional rights. The enclosure bills did indeed provide that all legal rights should be regarded, and on the whole the commissioners tried to act fairly, but the expense of enclosing was very great; much of the money compensation paid to the commoner was swallowed up in legal expenses, and the poor man was doubtless at a disadvantage in contesting the rival interests of a wealthy neighbour. After receiving reports from various select committees which had communicated with the board of agriculture, parliament in 1801 passed a general enclosing act (41 Geo. III. c. 109) with the object of cheapening and facilitating the process of enclosure, and of thus protecting the interests of the poor. By the act certain general provisions were laid down, which rendered the private acts shorter, though the expense of an application to parliament, and of referring contested cases to a parliamentary committee, still remained.

In 1836 an act (6 & 7 Will. IV. c. 115) was passed by which enclosure of common fields was facilitated. Possessors of common rights to the number and value of two-thirds might nominate commissioners to carry out enclosure of common fields, provided that these were beyond certain distances of the larger towns.

By the general enclosure act of 1845 (8 & 9 Vict. c. 118) this method was extended to the common wastes. An enclosure commission was appointed to deal with land of various kinds in England and Wales. (1) All lands held in severalty, or subject to definite common rights, could be enclosed by the authority of the commissioners without parliamentary sanction. By 15 & 16 Vict. c. 79, the commissioners were, however, forced to submit proposals dealing with land as above described to parliament. (2) All lands over which undefined rights of common existed—and all wastes within 15 miles of London, or within certain distances of other

towns. In such cases the commissioners held an inquiry, and then drew a scheme; all the schemes for the year being presented to parliament in one general act. The commissioners were thus substituted for the parliamentary committee, and it was hoped by the promoters of the measure that examination on the spot would prove a security to the poor, whose interests were directly protected by clauses empowering the commissioners to make allotments and recreation grounds. (3) Village and town greens, as well as the New Forest, and the Forest of Dean, were excluded from the operation of the act.

In 1852 parliamentary sanction was made compulsory for the enclosure of land held in severalty without definite common rights. In 1893 the statute of Merton, though not repealed, was greatly modified; and no enclosure may henceforth be made under that act without the consent of the board of agriculture, which in dealing with such proposals is instructed to carry out the requirements of the Commons Act of 1876, when considering applications for the general enclosure of a common.

ENCROACHMENT. See TRESPASS.

ENCYCLICAL. The encyclical of Pope Leo XIII. on the condition of labour, dated 15th May 1891, which is the subject of this notice, receives its name from its opening words *Rerum novarum*. Here, as in previous encyclicals, notably the one *Quod Apostolici Muneris*, issued in the first year of Leo XIII. (1878), the question of capital and labour is considered mainly in its connection with the recent advances of socialism. It offers us, as M. Charles Périn, emeritus-professor of the University of Louvain, puts it, a "synthesis of the economic order according to the divine laws which regulate human conduct," and it is important as constituting "la vérité catholique pour l'ordre économique," or, as we should put it, an authoritative statement on the part of the Roman Catholic Church on the economics of labour. Its distinguishing feature is the introduction of the principles of justice and charity in the solution of economic questions. The encyclical opens with an allusion to the "spirit of

revolutionary change," and the influence of this in the "field of practical economy"; it dwells on the danger of social agitation in the presence of real grievances such as "the misery and wretchedness which press so heavily at this moment on the larger majority of the very poor," and the isolated and defenceless condition of working men, "the callousness of employers, and the greed of unrestrained competition" (*Encyclical Letter*, official translation, p. 4). It then proceeds to examine the remedies proposed on the one hand by socialists, which it condemns, and those which are within the province of the church and state, which it recommends, dwelling in conclusion on self-help by means of association and the importance of a wider diffusion of Christian charity in all human relationships which strikes at the root of all social evils.

(1) The socialistic proposals are characterised as unjust and tending to rob lawful possessors, and putting the state into "a sphere that is not its own" (p. 5), and thus depriving the labourer of the liberty of choosing his own employer and using the proceeds of his work. Private property is defended, as against the socialistic recommendation of collective ownership as being "according to nature's law," whilst, "the authority of the divine law adds its sanction" (pp. 7, 8); and, considering the rights of the family as co-ordinate with those of the state "our first and fundamental principle, therefore, when we undertake to alleviate the condition of the masses, must be the inviolability of private property" (p. 11). The pope here falls into the common error of supposing that all private property is excluded in the schemes of modern socialism, whereas it is only instruments of production—private ownership in lands, capital, and machinery—which are to be abolished and become state property, the state directing the process of production, with the disappearance of the wages system in the socialistic state. (2) The encyclical declares inequality as in the nature of things permanent, and points out the methods of the church under these circumstances for remedying the evils arising therefrom. It is the duty of the church to teach and to train men in the principles of social ethics (pp. 18, 19), whereby the poor may learn "to suffer and endure" and to abstain from violent measures in compassing their ends, whilst the rich are taught to "religiously refrain from cutting down the workman's earnings, either by force, by fraud, or by usurious dealing" (pp. 13, 14). The church, too, in her institutions, as in the past, guards the "patrimony of the poor" by means of "deposits of piety" flowing from Christian self-sacrifice and charity. (3) The state as the organ of distributive justice protects each class with a view to the common good; all well-constituted states are bound "to provide those bodily and ex-

ternal commodities *the use of which is necessary to virtuous action.*" "It is only by the labour of the working man that states grow rich. Justice, therefore, demands that the interests of the poorer population be carefully watched over by the administration" (pp. 22, 23). Sunday rest, and the protection of health and the prevention of excessive labour of children and females being among the subjects demanding state interference, as also the restraint of the disturbers of social peace, "to save the workman from their seditious arts, and to protect lawful owners from spoliation" (p. 25). On the wages question Leo XIII. proves himself to be "le pape des prolétaires" in demanding of the state protection against unscrupulous employers, who under a semblance of free contract deprive the labourer of his due. Distinguishing between this theory and facts, between normal wages and fair wages, he points out that the working man, having nothing but his wage to fall back upon for a livelihood, is bound to come to terms with the master even to his own disadvantage, unless he is protected by the state or boards of conciliation authorised by the state to secure the rights of both parties of the contract, and this on the equitable principle that "each one has a right to procure what is required in order to live" (p. 28). (4) In the last place the pope recommends association and corporation as after the pattern of Christian confraternities under the fostering influence, though without undue controlling power, of the state as means of mutual support and protection against encroachments; but it is by a return to Christian faith and charity alone that the evils of society can be cured in the end,—so concludes the encyclical which thus becomes what Anatole Leroy-Beaulieu, in his appreciative study of *La Papauté, le Socialisme, et la Démocratie*, calls "un code de morale sociale" (see pp. 66, 67). But also, as the same writer points out, so far from coming into conflict with the principles of political economy, as now understood, the encyclical is on a line with its most recent developments (*ib.* p. 50), adding to the moral factor the religious forces without which selfishness and greed would be the only prompting motives of economic action.

[Charles Périn, *L'Économie Politique d'après l'Encyclique sur la condition des ouvriers*, Paris, 1891.—*Note sur le juste Salaire d'après l'Encyclique rerum novarum* by the same.—Henri Joly, *Le Socialisme Chrétien* under the head, *Les dernières écoles*.—Anatole Leroy-Beaulieu, *Papacy, Socialism, and Democracy*, trans. from the French by B. L. O'Donnell, Chapman and Hall, 1892, gives the text of the encyclical in an appendix.—Henry George, *On the Condition of Labour*, 1891.—Also W. T. Stead, *The Pope and the New Era*, 1890.] M. K.

ENDORSEMENT. See BILL OF EXCHANGE.

ENDOWMENTS. Adam Smith in a well-

known passage¹ has written strongly on the subject of endowments. In his eyes they tend to hinder capital and labour from taking their natural course. In certain professions, notably that of holy orders, the existence of endowments, to encourage and support those who are preparing for them, has attracted large numbers of men who would otherwise have carried their energies into different fields. Hence a depression of incomes in those professions, for the number applying for employment in them is greater than the work requires. A change in circumstances since Adam Smith wrote has robbed his particular instance of much of its force, for the endowments in question have, as a rule, been diverted, and the growth of population coupled with well-defined religious revivals has greatly increased the work of the clergy. But Adam Smith goes farther, and maintains that, tested by experience, endowments have failed to secure any good object. The universities, he says, are largely endowed, and have failed to make any great additions to the learning of the country, which is no more than might have been expected *a priori*, for the motive to exertion being removed by the certainty of income independent of it, exertion itself would tend to diminish. Dr. Johnson,² though not accepting Adam Smith's conclusions, put the same argument in a popular form when he says, "Why, sir, we would all be idle if we could."

As the growing tendency of the present time is to employ endowments for the advancement of learning or the furtherance of education, it may be worth while to examine the reasoning at greater length. The objections to endowments may be put in the form of a dilemma—either a given result is worth having, and then the public are ready to pay for it, or the public is not ready to pay for it, and then it is not worth having; in the one case endowments are superfluous and cripple energy, in the other they are wasted. It will be observed that this argument is based on the assumption that the public are the best judges in such matters. To this it is objected that although the common exchanges of life may safely be left to competition, and the public are able to judge of quality in the matter of tea, sugar, etc., the case is very different when learning and the higher forms of education are involved. The public, or at least the English public, are not qualified to discern good and bad in such matters. The demand for books and teaching in the highest subjects is never likely to be sufficient to make it worth any one's while to write upon or teach such subjects as a profession, and many persons who have the ability and the taste requisite are powerless to pursue the subjects for want of

¹ *Wealth of Nations*, bk. i. chap. x.; ep. bk. v. chap. i., art. ii.

² Boswell's *Life of Johnson*, A.D. 1776.

means. In such cases endowments, it is argued, may profitably be used to provide the means of subsistence for men who are in reality great public benefactors. Certain chairs, for instance, at the universities need endowments to support their holders in the absence of a sufficient number of students ready to pay fees to maintain their teacher. Certain forms of study and research are never likely to be sufficiently remunerative to provide those who pursue them with the means of livelihood, and must consequently be endowed. Outside these special cases it is readily granted that endowments, by making men independent of their exertions, tend to weaken their industry; but unless these particular subjects are endowed, the level of learning and of teaching is likely to be lowered, for the subjects studied and taught will be those, and those only, which bear directly on practical life. The question is not, perhaps, one which admits of a final answer. The enthusiasm which leads a man to adopt an unpopular subject may in many cases be trusted to keep him industrious, independently of reward. A certain habit of mind is observable in those who are mainly supported by endowments, a tendency to delay publication, an excessive self-criticism, a want of definiteness—all these go far to postpone, if not to destroy the realisation of the results of their work. It has been remarked that in this country a large amount of the best work has been done by men who have a regular employment, and with whom the advancement of learning is a secondary occupation. J. S. Mill, *e.g.*, wrote his principal treatises in the intervals of his work as a clerk in the India House. Grote's *History of Greece* was the work of a banker, and other instances might be quoted. In the great majority of cases a certain amount of teaching is a help and not a hindrance to research. The most successful use of endowments has, perhaps, been in cases where they have been employed to support men who have already made themselves a name in a subject, and who have been set free from the necessity of working for their daily bread at some occupation which they have hitherto practised. But the method of distributing endowments is distinct from the question of their inherent advantages or drawbacks. In German universities endowments are, as a rule, only a part of the income of a professor, the proportion that he earns by fees being greater or less as his subject is popular or the reverse.

Apart from the encouragement of research, endowments are largely used to forward the higher education of the country. The universities expend large sums annually in scholarships to attract students; and fellowships, being now largely used as prizes at the end of a university course, are additional inducements to students to undertake it. The consideration

of poverty enters but little into their distribution. Here again a question may be raised as to the wisdom of such a policy. Studies, it will be urged, which are not self-supporting in the sense of attracting students by their own charms, are not worth supporting at all. Others will hold that studies which do not bear directly on practical life (in German phrase are not "bread studies") have a value of their own, of which the public are not the best judges, but which make it worth while to support them by endowments; and that while studies which are a direct preparation for business may safely be left to themselves, it is the interest of a country to preserve others from extinction. We have in England no logical principle applied to the graduation of studies or their mutual relation; but the tendency of the present day is to use endowments largely to facilitate the passing from the lower to the higher grades. Instances are not wanting of those who by their means have risen from elementary schools to high places in the universities. In practice it must be owned that endowments often (1) cheapen education for a class who can perfectly well afford to pay for it, by providing plant, etc., for the great public schools and the universities; (2) enable poor men to live at a needlessly expensive rate, which is determined by the standard of comfort set by more wealthy companions.

Two subsidiary points may be mentioned.

1. The system of confining the advantages of endowments to certain localities is being gradually modified. It is argued that migratory habits and facilities of communication have greatly lessened the reality of local divisions; that, on the whole, every locality gains by the process; that waste is avoided, and the supply of endowments made to correspond more nearly to the number of persons qualified to make a good use of them.

2. The abolition of any poverty qualification, mentioned above, has been severely criticised. It may be defended on the ground that it is almost impossible to make such a qualification real. Poverty is difficult to define, and it is impossible to formulate any system of compensation as between ability and want of means. Moreover, on the whole, the present tendency to distribute endowments by competition, making ability and not poverty the test, tends to raise the whole level of education, and so to benefit the poor; whilst the spur of poverty is sufficient to ensure industry, and the temptations to idleness which go with wealth are, in the great majority of cases, strong enough to prevent members of the wealthy class from competing successfully.

L. R. P.

ENEMY GOODS. In early times the pro-

perty of the enemy, wherever found, was liable to capture. By custom and treaty the harshness of this rule has been modified, and the modern practice may be summed up as follows:—(1) Movable property belonging to an enemy state may be appropriated; immovable property may be occupied but not alienated. (2) Movable private property is liable to contribute to the support of the invading army, contributions and requisitions being levied for that purpose; immovable private property is exempt from appropriation. (3) Private property on the high seas is liable to capture except where it is on board a neutral vessel. (4) Private property within the jurisdiction of the belligerent is not as a rule liable to capture.

[*International Law*, by W. E. Hall, Oxford, 1890. Many writers advocate the exemption of private property at sea from capture. The United States has more than once made this proposal, and in some modern wars this principle has been followed. See De Laveleye, *Du Respect de la Propriété Privée en Temps de Guerre*.—Bluntschli, “Du droit de Butin,” *Rev. de Droit International*, tom. ix. and x., and articles in the same review by M. Vidari, tom. iii. (1871).—M. Gessner, tom. vii. (1875), and the reports presented to the Institute of International Law, tom. viii. (1875).] J. E. C. M.

ENFACED PAPER OR RUPEE PAPER.

The title applied by stock exchange custom to Indian government securities, the interest on which is payable in silver rupees. The capital also is expressed, or enfaced, on the certificate as being so many silver rupees, the value of which in the London market varies according to the value of silver in relation to gold. The word “enfaced” might almost as well be applied to any other kind of security, inasmuch as all have more or less on their face a description of the security represented. Custom, however, has lent the word simply to those Indian rupee stocks which bear interest at 4 per cent and upwards, the interest of course being payable in silver, and subject to an increase or decrease in sterling value according to the value of silver in the bullion market. The Indian government cannot borrow so easily or at so low a rate of interest in silver as it can in gold, the mass of investors having been repelled by the possibility of fluctuations in the sterling value of the interest receivable. At the same time it has been thought well by Indian statesmen to avoid accumulating a large sterling debt, lest the Indian government should some day encounter a heavy fall in the value of silver, which would compel it to tax the natives of India to the extent that more rupees would be required to provide each pound sterling.

A. E.

ENFACEMENT is the converse to endorsement (see BILL OF EXCHANGE). The word does not appear to have been in use before the year 1858, when the Indian Government de-

cided to pay the interest on the Indian home debt in London by means of drafts at sight on India, and issued the following notification:—

“When holders of notes in Calcutta desire that the interest thereon should be made payable by bills issued in London, they must present their notes at the office of the Accountant-General to the Government of India, where an enfacement will be made on each of the notes in question as follows: *Interest payable in London by draft on Calcutta* (or Madras, as the case may be).”

[Geo. Clare, “Stock Exchange Securities,” *Journal of the Institute of Bankers*, vol. xiv. p. 226.]

ENFANTIN, PROSPER, called “Le Père” (1796-1864), was born at Paris and died in the same city. Having first been, in conjunction with BAZARD (*q.v.*), a leader, he became, after Bazard retired, the sole chief of the St. Simonians, and did his utmost to promote the success of that economico-religious sect, up to the date of its fall. Commencing as a devotee of mysticism, Enfantin finally adopted the doctrine of “free love”; this brought him into trouble with most of his fellow-religionists. He was condemned on 28th August 1832 by the assize court of the department of the Seine, in company with Charles Duveyrier and Michel Chevalier, to a year’s imprisonment and a fine of 100 francs, for having assisted, without previously obtaining permission, in the formation of an association consisting of more than twenty members, and in the promulgation of articles injurious to public morality.

The penalty was before long commuted, and Enfantin made his way to Egypt, where he studied the question, now long since settled, of piercing the Isthmus of Suez.

Subsequently, after remaining for several years at Tain (Drôme), he returned to Paris, and was appointed, in 1845, a director of the first company for constructing a railway from Paris to Lyons.

After the revolution of 1848 he founded, in conjunction with Charles Duveyrier, the journal *Le Crédit*, which continued to appear till 1850. Finally Enfantin became the administrator of the second Paris, Lyons, and Mediterranean Railway Company—a post which he continued to hold till his death.

Before the fall of the St. Simonian School, Enfantin published, in conjunction with others, *Doctrines de St. Simon, Exposition*, 2 vols. 8vo, 1830-32; afterwards, in his own name, *Economie politique et Politique*, 1 vol. 8vo; *Morale*, 1 vol. 8vo, etc. After the dispersion of the St. Simonian School, Enfantin wrote a volume, *Colonisation de l’Algérie*, 1843, 8vo, in this, across a web of original ideas and among passages which show deep historical study, may be traced the opinions of the early socialists.

His works were collected by zealous disciples, and printed in 9 vols. 8vo, 1866-73. A. C. F.

ENFRANCHISEMENT, the liberation of the serf from his forced astringency to his lord's estate, and his forced labour for his lord's behoof. Though not liable, like the slave, to be sold from master to master, or to give his whole time to his master's work, the serf was still practically chained to the estate to which the right to his labour was legally appendant, and he could still be compelled to his work by whips or imprisonment at his master's will. There was a third strand in his bondage—his subjection to his lord's civil and criminal jurisdiction, which left him defenceless against arbitrary exactions, and therefore operated often quite as injuriously on his economic position as the other two, but it was not felt to involve the same personal indignity as they did, and the serf is commonly considered enfranchised when he is released from them, although he may continue subject to his lord's general authority. Enfranchisement has proceeded perhaps more generally from moral than from economic motives, but it has usually justified itself immediately, and always eventually, by bringing with it a decided economic advance. The pinch of serfdom was the forced labour; when that was commuted to a money payment the astringency to the estate fell away of itself, for want of any practical reason for enforcing it longer. But though the astringency to the spot was less grievous to individuals—except indeed among the Russian peasantry, whose chief complaint, Haxthausen tells us, always was that it restrained their idle propensity to rove—it was always most pernicious to the progress of the community, because it stopped all division of labour, limiting occupations to the little round of work in a rural village, and preventing the rise of towns, and trade, and manufactures. Russia consequently, where serfdom was only abolished in 1861, is still, in spite of the acknowledged industrial gifts of its people, little more than a vast nation of crofters, every man half indifferent agriculturist and half indifferent tradesman; and even in agriculture, though it is now one of the largest exporters of grain in the world, its system of husbandry continues almost primitive, and there has never arisen a modern farming class with the requisite skill and capital for practising improved methods. The ill effects of the forced labour were always more directly obvious. The serf who got a small holding to cultivate for his own support, but was obliged to give three days a week (the usual quota) to his lord's work, could neither do justice to his own fields nor to his lord's,—not to his own because he was called away from them precisely when he most required to be upon them, and not to his lord's because he gave his labour reluctantly, sometimes with bitter ill-will, and he had no interest except to give as little of it as he dared. His holding is sometimes called the wages for his labour, and his labour the rent for

his holding; but that was a bad form of wages because it repressed instead of encouraging the labour it was supposed to reward, and this was a bad form of rent, because it interfered with the proper cultivation of the land which was supposed to yield it. Serf labour, like all discouraged labour, was habitually indolent. Professor R. Jones was informed by the English engineer who superintended the making of the road from Hamburg to Berlin in 1830, that the Prussian free labourers he employed broke thrice as much granite in the day as the Mecklenburg serfs, and that when he tried to animate the latter by mixing them in the same gangs with the former, the experiment failed because it had exactly the contrary effect of making the free labourers slacken their exertions to the bond pace (*Distribution of Wealth*, p. 52). The peasants on Russian state lands, whose labour rents were commuted into money rents long before the universal emancipation, are much more energetic, enterprising, and prosperous than the recently emancipated serfs (Thun, *Landwirthschaft u. Gewerbe in Mittelrussland*, p. 43). Roscher quotes two authorities who made personal investigations into the relative industrial capacity of serf and free labourer in the same communities, and one—Jakob—counted two free labourers equal to three serfs, while the other—V. Flotow—counted three free labourers equal to four serfs (*System d. Volkswirthschaft*, i. 152). The difference is still more strikingly shown by Hanssen, who mentions that on the estate of Rixdorf in E. Holstein, where labour rents were commuted in 1780, it required ninety-two horses and seventy-five men to work the home farm before the commutation, and only thirty-six horses and fourteen men after it (*Aufhebung der Leibeigenschaft in Schleswig u. Holstein*, p. 39). Usually, too, though the labourers were fewer the harvest was greater. The eminent Danish statesman, Count J. H. E. von Bernstorff, finding he could not with serf labour make his property yield enough to pay the taxes, freed the serfs in 1767, paid them wages for the work they did, and obtained a net return of £150 a year (Sugenheim, *Gesch. d. Aufhebung d. Leibeigenschaft*, p. 500). Storch mentions that he nearly tripled the production of his estate by this enfranchisement, raising his product of rye in the ratio of from 3 to 8½, of barley from 4 to 9½, and of oats from 2½ to 8 (*Cours d'Economie polit.*, iv. 306).

In factory work it has been generally found impossible to employ serf labour remuneratively at all. Haxthausen found some old serf factories in Russia during his visit, but they were in a very languishing condition, and most of the Russian manufacturers, though they had generally begun with their unemployed domestic serfs, and then changed them for some of their agricultural serfs who were stronger, had all in the end to learn the same secret—that the

Russian was a bad workman when he worked on compulsion, but became an excellent workman when he worked for hire. Force extorts but the minimum of effect; it is hope that draws out the maximum. They consequently set their serfs free, imposed a small annual charge as commutation duty, and engaged them in the ordinary way for wages (*Russian Empire*, i. 110), precisely as Storch says had been done in Moscow factories as far back as 1805 (*Cours*, iv. 30).

Enfranchisement has occasionally resulted ill, but that has been due either to moral defects in the particular individuals or groups enfranchised, or to the excessive burden of the compensation dues or other conditions of the enfranchisement. Freedom necessarily contains the possibility of doing worse as well as the possibility of doing better. J. G. Kohl repeatedly came across villages in Little Russia with free peasants living on one side and serfs living on the other, and he always found that while the most prosperous inhabitants of the village were among the free peasants, so also were the most miserable (*Reisen im Innern von Russland*, ii. 300). On the Zamoiski estates in Poland, enfranchisement seems to have had a curious double action; it tripled the production on the proprietor's fields (Cox, *Travels in Poland*, i. 22), but it had a bad effect on the serfs' own, because they became drunken and neglected their work (Burnett, *Present view of Poland*, 106). The great Russian emancipation of 1861 is the most notable example of the natural and good operation of enfranchisement being vitiated by concomitant economic and social conditions. J. R.

ENFRANCHISEMENT OF LAND FROM COPYHOLD AND SIMILAR TENURES, HISTORY OF. The enfranchisement of copyhold lands in England has passed through three stages. It is necessary for the purpose of tracing its history to consider (1) enfranchisement at common law; (2) voluntary enfranchisement under the copyhold acts 1841-1887; (3) compulsory enfranchisement under the copyhold acts 1852-1887.

1. Enfranchisement at common law. Copyhold lands and lands of similar tenure must, according to the law of England, be "parcel" of a manor, or in other words, wherever lands are held by copy of court roll, the freehold in those lands is in other hands than those which hold the "copy." The process of enfranchisement unites, in the hands of the copyholder, the freehold and the copyhold interest. It is evident that nothing short of the whole freehold interest will suffice to clear the land of all its copyhold incidents, and therefore an enfranchisement at common law may be effected "by any lord entitled to the manor in fee simple, or who has a power to enfranchise or a power of sale and exchange," but it cannot be effected

by a lord with a more limited interest or less extensive powers. An enfranchisement, therefore, before the year 1841, was carried out through a conveyance of the fee simple of the copyhold in question, from the lord of the manor to the tenant for an agreed price. The fact that the tenant himself had only a limited interest in his copyhold estate did not affect the validity of the enfranchisement, which would enure for the benefit of the estates of those who succeeded him. Unless special provisions were inserted in the conveyance, three somewhat unexpected results would follow from the enfranchisement. (1) That the mines and minerals would pass from the lord to the copyholder; (2) that the copyholder's rights of common in the "waste" of the manor would be extinguished; (3) that all mortgages, or other incumbrances affecting the lord's title, would affect the enfranchised lands in the hands of the quondam copyholder. It will be readily understood that the difficulties attending enfranchisement, under such conditions, rendered the conversion of copyholds into freeholds a cumbrous and costly process.

In 1802 we find, in the Land Tax Redemption Act, provisions which enable owners of limited estates in manors to make enfranchisements for the purpose of obtaining money for redeeming the land tax. This appears to be the first indication of the principle subsequently worked out in the copyhold acts.

2. In the year 1841 was passed the first of the acts which "provide the means for an adequate compensation for the rents, fines, and heriots payable to the lords of manors, in respect of lands of copyhold and customary tenure, and for facilitating the voluntary enfranchisement of such lands, and for improving such tenure." This act created a body of commissioners called the copyhold commissioners, now the land commissioners, whose consent and approval must be obtained to enfranchisements made under the act. Under this protection the legislature felt itself enabled to give authority to the lord of any manor, "whatever may be his estate or interests therein," to enfranchise "all or any of the lands holden of his manor," and to any tenant, "whatever may be his estate and interest," to accept such enfranchisement. The consideration was payable in money, but by agreement such money might be made payable at a future time. Whenever the lord who enfranchised had a limited interest only, the money, so soon as it was paid over, was to be invested, and to be subject to the same trusts as those affecting the manor to which the enfranchised copyhold had previously belonged. It was now enacted that any rights of common belonging to the land enfranchised should continue to be attached thereto after it had become freehold, and that the lord's right to

mines and minerals, under the enfranchised land, should not pass upon the enfranchisement unless expressly commuted. Upon payment of the sum payable for enfranchisement, the tenant was authorised to charge it upon the lands enfranchised, with all the powers and rights of a first mortgagee. Finally, the title to the enfranchised copyholds was to be separated for ever from the title to the manor.

By this act, therefore, three of the main impediments to general enfranchisement were done away with; for (1) it was no longer necessary to obtain the conveyance from an absolute owner; (2) it was no longer necessary expressly to reserve the lord's mines and minerals and the tenant's rights of common; and (3) the enfranchised copyholder had nothing to fear from any encumbrances clogging the estate of his former lord. But enfranchisement still remained a matter of agreement, and could not be forced upon an unwilling lord. Amending acts are a sure sign that a statute is not a dead letter, and the Copyhold Act of 1841 was followed by those of 1843 and 1844. The act of 1843 provided that the consideration for enfranchisement, which under the act of 1841 was a lump sum of money, might in future be paid wholly or in part by an annual rent charge, or might take the shape of a conveyance of lands forming part of the manor to which the enfranchised lands had previously belonged. The act of 1844 extended the last-mentioned provision to any lands which, in the opinion of the copyhold commissioners, could be conveniently held with the manor to which the enfranchised lands had previously belonged, although themselves not belonging to such manor.

These three acts of 1841, 1843, and 1844, constituted a short code under which voluntary enfranchisement could be satisfactorily carried through. But it was not until 1852 that compulsory enfranchisement became possible for either lord or tenant.

3. The system of compulsory enfranchisement, which was inaugurated by the Copyhold Act of 1852, was applied in the first instance to those copyholds only to which a new tenant was admitted on or after 1st July 1853, or in other words, so long as an existing estate in the copyhold continued to subsist, neither lord nor tenant could force an enfranchisement upon tenant or lord. But six years' experience of the act of 1852 enabled the legislature to extend its provisions to all copyholds whenever the last admission had been made to them.

The key-note to the system of compulsory enfranchisement is valuation of the lord's interest by independent valuers, under the supervision of the copyhold commissioners. The difficulty which compulsory enfranchisement had to deal with was the amount of

compensation to be paid to the lord in respect of fines and other sources of profit to which, if the copyhold interest continued, he would become entitled at uncertain intervals, and which, upon enfranchisement, required to be turned into money once and for all. Without going into the meaning as to "the lord's fine," it may be sufficient to say that such fines are payable when a new tenant is admitted, that is, entered upon the court rolls as the person holding the copyhold tenement "according to the custom of the manor." Originally the price given to induce the lord to accept the new tenant, the fine, was in its nature arbitrary and uncertain, and depended in each manor upon the custom of that particular manor. But the courts of the king had, at an early date, established that the courts of the manorial lords could not by custom give efficacy to unreasonable fines, and in course of time developed the working rule that "two years' improved value of the land, after deducting quit-rents," was the maximum amount which the lord of a manor should be entitled to receive upon the admission of a new tenant.

How then does the act of 1852 meet this problem? In the first place all fines and other manorial dues, payable upon the admission, which under that act supplies the opportunity for enfranchisement, are to be discharged before any further step is taken. Then the valuers, or their umpire, or the single valuer agreed upon by lord and tenant, must ascertain the value of the manorial rights now exercised for the last time. The valuation, when made, must take the form of an award, must be confirmed by the copyhold commissioners, must be registered at the office of the commissioners, and must be entered upon the court rolls. The amount of the valuation, failing agreement, is to be paid by the tenant in a lump sum, if he has claimed the enfranchisement; but if the lord has insisted on the change of tenure, the compensation will, in the absence of express agreement, take the form of an annual rent-charge. In either case the "enfranchisement consideration" is a first charge upon the lands enfranchised.

Two provisions of this act are noteworthy, as showing the caution with which the legislature introduced compulsory enfranchisement. Firstly, power is given to the lord to buy out the copyholder compulsorily if he can show, to the satisfaction of the commissioners, that his "mansion-house, park, garden, or pleasure grounds," may suffer from the tenant's enlarged powers of dealing with the lands which are ceasing to be copyhold. Such a power might well be granted to the lord if the tenant threatened to open a marl pit or cut down standing timber upon land with which he could not so deal whilst still a copyholder. Secondly, if it be found at any time that the person who

supported to enfranchise was not the lord at all, it is provided that the true lord is to recover the consideration for the enfranchisement from the person who wrongfully received it, instead of forcing the tenant to pay the money again and look to the wrong-doer for compensation.

Valuers acting under the Copyhold Act 1852 must take into consideration "facilities for improvement," as, for example, the possibility that the land may become building land, and the hindrances to such improvement, as, for example, the probability that it will not become building land for some years.

The Copyhold Act 1858 is to the Copyhold Act 1852 what the Copyhold Acts 1843 and 1844 are to the Copyhold Act 1841. It contains such improvements as the working of the principal act had suggested. Thus for the deed of enfranchisement specified by the act of 1852, which the parties would execute, was substituted an award of enfranchisement to be made by the copyhold commissioners; owners of at least two-thirds of the value of copyholds held in undivided shares, obtained the power to insist on an enfranchisement whatever their co-tenants might desire; and one form of certificate of charge was provided for securing the payment of consideration money, compensation money, and expenses of enfranchisement, as the case might be.

Speaking generally, the costs of a voluntary enfranchisement are paid in manner agreed by the parties, or, failing agreement, are paid as directed by the commissioners; while the costs of a compulsory enfranchisement are to be paid by the party who has insisted upon abolishing the copyhold tenure.

In 1887, after an interval of thirty years, an act was passed "to make further provisions for enfranchisement" of copyhold lands. An important provision of this act is that the steward of any manor, when a new tenant comes for admission to a copyhold, must hand to such tenant a notice stating that he is entitled, if he desires, to enfranchise the copyhold. A further provision of great importance prevents the lords of manors from making grants of portions of the "waste" of their manors. Again, the tenant may, under the act of 1887, pay the compensation for an enfranchisement on which he has insisted by means of a rent-charge of 4 per cent of the amount of compensation. Finally, the compensation to the steward of the manor is fixed by a schedule to the act, and the land commissioners are directed to "frame a scale of compensation" such as "will be fair and just, and will facilitate enfranchisement."

The scale published by the land commissioners in conformity with this act comprises a table in which is calculated the number of years' annual value payable to the lord, accord-

ing to the age of the tenant, as compensation for the loss of future fines. This table ranges from the case of a tenant of five years or under, who should pay 2·29 years' purchase, to the case of a tenant of 100 years or upwards, who should pay 5·16 years' purchase. Quit-rents are calculated at twenty-five years' purchase; timber at full value if the lord had the right to enter and cut; at half value if the lord could not enter to cut without the tenant's consent.

Enfranchisements on crown lands, church-lands, and university and college lands, are the subject of special statutes which are not of general importance.

[Brown, *Copyhold Enfranchisement Acts*, 1888. —Scriven, *On Copyholds*, 6th edition, 1882.]

ENGLISH EARLY ECONOMIC HISTORY.

In the present state of historical investigation, it is difficult to give a complete and exhaustive account of the development of political economy in England. Although many writers have devoted attention to the subject, and have reached important conclusions, comparatively little use has been made of the vast stores of material relating to the later middle ages, and the rise and fall of the mercantile system. Particular movements have indeed been carefully investigated, and we are not without indications of the general course of development. To borrow an illustration from mathematics, certain points on the curve of development have been fully ascertained; we have some notion of its shape; we know also that the English curve is only one of a large family of curves, other members of which may be found on the continent. But of its direction between the points already ascertained, and of the differences between it and others of the same class, we know little.

The subject may be best approached by considering the influence of the mediæval church. Before the conversion of the Anglo-Saxons to Christianity there was little or no commerce, although Christian merchants resorted to England while the inhabitants were still pagans, and so brought them into contact with a more highly developed economy than their own. Many of the principles which we find in mediæval economic teaching may probably be traced back to this or an earlier period. The idea, for example, of money as a *pledge*, which exercised an important influence on economic doctrine in England far into the 17th century, was derived from pre-Christian times. Neither the condemnation of avarice nor hostility to usury was peculiar to Christianity. The social system of the middle ages, greatly modified as it was by Christian teaching, had its foundations in a pre-Christian state of society. But making every allowance for the influence of ideas and

customs derived from earlier times, the fact that the new religion obtained a firm hold on the population while industry and commerce were still in their infancy, is of primary importance in tracing the development of political economy. Early economic institutions and laws are stamped with the teaching of the church. Subsequent modifications of doctrine are largely the outcome of the struggle, on the part of the church, to guide or control new economic forces as they gradually came into operation. To follow rightly the course of development it is first of all necessary to understand the position of the church with regard to trade and industry.

From the earliest times the church had had forced upon it the duty of applying the principles of Christianity to social life. Outside Palestine the earliest converts were found in the busy trading centres of Asia Minor; and the first persecutions were probably due to the fact that the new religion threatened various trading interests, and tended to the overthrow of the existing social system (Ramsay's *Church in the Roman Empire*, pp. 12, 199, 200, etc.). But the church was hostile to the ordinary usages of the world only in so far as they were in conflict with the ideal of Christianity, which supplied a standard by which all actions in the economic sphere could be tested. Everything inconsistent with the profession of Christianity was condemned, and uncompromising obedience to its precepts was enjoined. The process of applying Christianity, in changing or widely differing social conditions, went on in the earlier centuries of the Christian era and throughout the middle ages. The work of the church was not so much to introduce new principles of action as to test those already known, assimilating those which were not hostile to Christianity, and giving them new significance when considered in the light of the Christian faith.

The pursuit of gain as an end in itself was obviously inconsistent with Christianity, and the condemnation of avarice in every form is one of the most striking characteristics of the teaching of the church. This may be regarded as the fundamental principle of mediæval economics. Its different parts are so closely interwoven with each other that we can without much difficulty reconstruct the whole system from any one of its elements. Closely bound up with the condemnation of avarice was hostility to many methods of acquiring wealth which have since been adopted by civilised communities, and chief amongst those forbidden methods was USURY (*q.v.*), the objection to which extended to all forms of investment for the sake of gain. But the general teaching of the church would have had comparatively little influence but for its wide and far-reaching application of the principle of association. The interests of the individual were subordinated to those of the

community. The duty of helping those in need, and the brotherhood of all Christians, were insisted on. It was this side of the teaching of the church (see CHURCH, THE MEDIÆVAL, ECONOMIC INFLUENCE OF) which accelerated, if it did not initiate, the formation of guilds and other associations, and ultimately led to the creation of the elaborate system of the middle ages for the regulation of trade and the restraint of competition. Insistence also on a just or reasonable price for commodities, the approximate determination of which was easier in this early stage of industrial development than it would be in modern times, led to numerous laws framed with a view to realising that object. It may be noticed as evidence of the hold which mediæval doctrines obtained, that the expression "just price" (*JUSTUM PRETIUM*), interpreted to mean that price which most closely approximated to cost of production, was used as a synonym for "cost price" as late as the end of the 16th century.

(*Vide* R. RECORDE'S *Grounde of Artes*, 1543, frequently reprinted and edited by Dr. Dee, John Mellis, Robert Norton, and others.)

The early hostility of the church to usury was based on the biblical records and on the authoritative declarations of the Christian fathers and the councils. Had the church maintained its original attitude there can be no doubt that its influence would have seriously hampered economic development. It became impossible, however, to regard with hostility many of the new methods of acquiring wealth which appeared with the extension of trade and commerce, and thus began one of the most interesting movements of thought of the middle ages, viz. the adaptation of the principles of Christian teaching on the subject of lending and borrowing to the needs of a changing environment. This process begins about the twelfth century. The canonist writers, on the one hand, endeavoured to separate the essential from the non-essential elements of the doctrine of usury, and to apply it to mercantile transactions, strengthening their position by appeals to ARISTOTLE'S doctrine of the barrenness of money, the conception of *natural law*, and other arguments; while, on the other hand, merchants and traders, anxious to escape the "censure of usury," appear to have been not unwilling to submit to decisions which, on the whole, did not seriously hamper freedom of investment. *Bonâ fide* credit agencies, bills of exchange, loans for trading purposes, the payment of interest whenever the lender could show that the loan would result in "certain gain lost" or "actual loss incurred," rent charges, partnership, loans on bottomry, and other expedients for securing a return for the investment of capital, were gradually approved by the canonist writers, and the outcome of the movement was that the doctrine of usury was stripped

f everything likely to prove an obstacle to the practice of ordinary business methods.

Such was the course of movement on the continent. But for the present we are only entitled to say that there was a general similarity between English and continental opinion during this period. No doubt many passages may be quoted from English statutes which appear to be suggested by the canon law. The influence of the church was great, and the trading classes would not lightly risk excommunication for the sake of gain. "Goods lost, nothing lost; credit lost, much lost; soul lost, all lost," is an old proverb; and even as late as 1486 Pope Sixtus IV. thought it worth while granting to the inhabitants of the Channel Islands "the help and authority of the church by interdict, anathema, and other forms of censure, for the repression of piracy, robbery, and violence" (*Materials for history of the reign of Henry VII.* (Rolls series) i. 280). The ordinary teaching of the church, whatever may have been its practice, was hostile to avarice and covetousness (*vide*, for example, the homily in *Ashm. MSS.* 750), and occasionally the influence of the GILDS (*q.v.*) may have been favourable to the rule of the CANON LAW (*q.v.*) [*Ordinances of the Gild of St. Leonard, Lynn*, Toulmin Smith's collection, p. 50]. The usury laws also were enforced and had the support of the trading classes (*Liber Albus*, ed. 1861, 318, 319, 339). But such evidence enables us to say only that there was a general similarity, which indeed we should expect, between England and the continent; and in the development of economic doctrine the points of difference are of equal if not of greater importance. The backwardness of investigation prevents us from dealing with the latter with any completeness of detail. The following, however, may be noted. Neither the canon law nor the civil law was received in England as authoritative "except educationally, and as furnishing scientific confirmation for empiric argument." (Stubbs, *Lectures on Medieval and Modern History*, 307.) The canonists, however, claimed that "a suit might be brought in the ecclesiastical courts for every matter which was not cognisable in the courts of secular law, and for a great many matters which were so cognisable" (*ib.* 316), and there was a long conflict on the subject. The system of rent charges was not generally prevalent in England, and *montes pietatis* were never established (see MONT DE PIÉTÉ). An attempt to introduce the latter was made without success, by Gerard MALYNES, early in the 17th century (*Lex Mercatoria*, 1622). The economic legislation of the 14th and 15th centuries was largely empirical. In the regulation of foreign trade especially, and in the organisation of the customs, the measures adopted were mainly determined by the fiscal necessities of the government, and we can see very early the tendency to subordinate trade to the exigencies of foreign

diplomacy (*e.g.* in the relations between England and Flanders) which became so prominent a feature of later commercial development. Councils of merchants were summoned by Edward I. and Edward III. to advise with them on questions of trade (see Rymer, *Foedera* (1821) vol. ii. pt. v. 1057). The general impression we get from a study of the legislation of this period and from such arguments as are recorded in the Rolls of Parliament, is that many of the measures adopted were tentative and experimental. To understand therefore the economic ideas of the time we must examine closely the statutes and institutions in which they were embodied. Such were the statutes regulating wages and prices, the organisation of the crafts, the staple system, restraints on the exportation of bullion, statutes of employment, and usury laws. We may notice the following points: (1) The movement of thought on the subject of usury was slower in England than on the continent. (2) Financial methods well known on the continent were not introduced into England until comparatively recent times. The discussion, therefore, of various credit agencies which did so much to modify continental opinion was scarcely possible in England. (3) The impression prevailed—with what reason it is unnecessary here to discuss—that the staple system, while imposing certain regulations on all merchants alike, was not unfavourable to freedom of enterprise. (4) Money, so far from being subject to the same laws as other commodities, was supposed to be essentially different from them. It was, in fact, not a commodity at all, but a *pledge*, a *medium of exchange*, circulating under the authority of the prince or commonwealth, its value determined solely by that authority. The first appearance of those forces which were destined to break up the mediæval system should be noted. In the reign of Richard II. we have the first navigation act; then the beginning of various trading companies, especially that of the merchant adventurers (see ADVENTURERS, MERCHANTS; NAVIGATION ACT).

We are now in a position to trace the subsequent development of economic doctrine in England. The reign of Henry VII. was of great importance in the economic history of the country, and its industrial and commercial progress very soon brought about far-reaching changes in economic ideas. From the middle of the 16th century onwards there were few years in which some book or pamphlet was not published on subjects of economic interest, and such works may be reckoned by thousands. It is difficult to draw a sharp line of division between economic and non-economic publications. We shall, however, keep as closely as possible to the main line of development of doctrine, and in a later section indicate the relation to it of other currents of thought.

English statesmen and writers in the middle

of the 16th century had to face the most difficult economic problems which could possibly be submitted to them. The mediæval system for the municipal control of trade was unsuitable for the regulation of the new economic forces which the extension of the domestic system, especially in the woollen industry, brought into operation. The decay of tillage, and the growth of enclosures, appeared to threaten the country with the evils of depopulation, as well as a great increase in poverty. The social changes induced by the reformation seemed to be equally momentous. In relation to foreign trade, the loss of Calais inflicted a death-blow on the staple system, and the withdrawal of the privileges of the Hanse merchants injured the interests of a section of English merchants, although it left the way clear for the development of a national foreign trade by the merchant adventurers. In the growth of industry and commerce these difficulties were inevitable. There must have been great disturbance and loss to some classes, but in time the country would have settled down to the new conditions. The evils, however, of the period of transition were aggravated by a currency problem of the first magnitude. The debasement of the coinage under Henry VIII. and Edward VI., coupled later on with the influx of the new silver from the American mines, led to a rise of prices without parallel in the history of the country. The evils of the debasement were felt especially by the landed interest, the government, and the working classes. It is important to keep these facts in mind, for they formed the subject-matter of the earliest economic literature. One treatise—the *Briefve Conceit of English Policy*, attributed to William Stafford, and published in 1581, but really written by John HALES about 1549 (*Eng. Hist. Review*, vi. 284)—deals with these questions as a whole, and sums up the aims of the government at this time. The writer shows a clear insight into the causes of the high prices; his work is invaluable as a storehouse of information, and in it we have a broad outline of the theory of the balance of trade, which was elaborated in the following years. The *Briefve Conceit*, however, scarcely enables us to trace distinctly the relation between the opinions which have already been described, and later economic doctrine. To do that we must go to the history of the merchant adventurers.

With the growth of their trade, the merchant adventurers naturally adopted means of avoiding the transmission of bullion, such as bills of exchange, which had long been in use for certain transactions. Until the middle of the 16th century all went well, but then the fluctuations in the ratio of exchange between London and Antwerp, and other places, brought into prominence the usurious aspects of bill discounting, and the opponents of the merchant adventurers attributed the rise in prices to their practices.

It was commonly believed that it was within the power and the exclusive right of the government to fix the rate of exchange, and thus determine the prices of commodities. We cannot here detail the circumstances which gave rise to this theory. It must suffice to say that when it arose it was not altogether absurd; there was much in the ordinary practice of merchants to give some show of truth to the theory; and it was closely bound up with the doctrine of usury. From the middle of the 16th century until late in the 17th it was advocated in pamphlets, and pressed upon the attention of the government, which was really uncertain how to act. It was the basis of the charge of usury, which was one of the most usual arguments against the merchant adventurers (*vide the Treatise on Exchange*, 1564, printed in Milles's *Customers Replie*, 1604), and the economic world was divided into two opposite camps—the bullionists, represented by the advocates of the STAPLE SYSTEM (*q.v.*), and the newer mercantile school represented by the merchant adventurers and their supporters. In his economic works, nine in number, though only five survive, Thomas MILLES, head customer of Sandwich, undertook the defence of the staple system, and denounced the monopolising tendency of the merchant adventurers. In his *Customers Apology* (1601), we have a curious anticipation of Adam Smith's canons of taxation, and one of the earliest instances of the claim for free trade based upon the theory of natural rights (cp. Report from the Committee on the Free Trade Bills, 1604, *Journals of the House of Commons*, ii. 218-221. The monopoly of the merchant adventurers was "against the natural right and liberty of the subjects of England.") The attacks on the company called forth John Wheeler's *Treatise of Commerce* (1601). WHEELER was secretary to the merchant adventurers, and his statements are not free from bias and inaccuracy, but his book is a good defence of their policy and aims. Wheeler's reply to Milles provoked another attack from the latter, in the *Customers Replie* (1604), in which he added to the force of his own arguments by reprinting the *Treatise on Exchange in Merchandise and Merchandising Exchange* mentioned above. We need not, however, follow him through his other works. His mantle fell on Gerard Malynes, who was more moderate in his views, and had more knowledge and experience than Milles. Meanwhile, the East India Company had obtained their charter, and in it a clause allowing them to export bullion. In consequence of this, the controversy on the foreign exchanges, the brunt of which had been borne by the merchant adventurers, was turned against the East India Company. Matters were also complicated by the introduction of a new element into the discussion, viz. the relative advantages of joint-stock and regulated companies for

carrying on distant trade, the East India Company being an example of the former, and the merchant adventurers of the latter. It must also be pointed out that the state of trade in the reign of James I. caused, reasonably or unreasonably, much anxiety; and the currency, the privileges of the trading companies, the price of wool, the navigation acts, etc., formed from time to time the subject of government inquiry. We shall deal with these issues later on; they are mentioned now to show how impossible it becomes with the growing complexity of economic questions to separate the writers of this period into well-defined groups. Early in the reign of James I. there was some possibility of the revival of the old machinery for the regulation of the foreign exchanges. The controversy burst into new life in 1622. To meet the charges brought against the East India Company, Thomas MUN published, in 1621, his *Discourse of Trade from England to the East Indies*, which was devoted partly to showing the advantages of the exportation of bullion. It is interesting to notice, however, that as yet Mun had not entirely broken away from the old school, for in this work he approved of the statutes of employment. EDWARD MISSELDEN, for some time deputy governor of the merchant adventurers at Delft, had long devoted attention to the woollen trade, and in 1622 he published his *Free Trade, or the means to make Trade flourish*. In this work he discusses the reasons for the backwardness of the English cloth trade, and defends the company organisation. But for some cause he appears to have been not unwilling to disarm the opposition to the merchant adventurers and to turn it against the East India Company; and amongst the causes of the decay of trade he enumerates the exportation of bullion by the latter.

Now Malynes had already, in his earlier pamphlets, found a sufficient cause not only for depression of trade, but for all social evils, in the theory of the foreign exchanges which we have already noticed. To his mind the only remedy likely to prove efficacious was the revival of the staple system. Naturally, therefore, he thought Misselden completely mistaken in the causes to which he attributed the supposed decay of trade, and he approved of a joint-stock company for the East India trade. He therefore replied to Misselden in his *Maintenance of Free Trade* (1622), in which he reiterated his theory of the foreign exchanges. This pamphlet was almost immediately followed by his great folio *Lex Mercatoria*, in which he expressed the same views.

We may digress for a moment to point out that we probably owe to Malynes the introduction of the word "capital" into England. At the beginning of the 17th century this word was unknown, or at any rate not in use in England. In his *Lex Mercatoria*, Malynes endeavours to

popularise the Italian and Dutch method of keeping accounts, and he describes the *capital* or *stock* of a merchant as consisting of the goods in his warehouse, his ready money, debts due to him, houses and lands in his possession, and his "plate, apparell, and household stuff." "Capital," as used by Malynes, was derived from *capitale*, very numerous instances of which may be given from continental treatises on mercantile law.

To return to the controversy of 1622, Malynes's work was not allowed to pass unquestioned. In 1623, Misselden replied in his *Circle of Commerce, or the Ballance of Trade*, in which he completely refuted Malynes's theory of the foreign exchanges, and, taking up the defence of the East India Company, pointed out the advantages of the exportation of bullion, and sketched the theory of the balance of trade. Malynes again replied, but his theory had been completely demolished. Thus the mercantilists not only arrived at a truer doctrine of international trade, but in doing so destroyed a theory with which the old views with regard to usury were closely bound up. In 1628 Thomas Mun further developed the argument for the exportation of bullion in the *Petition and Remonstrance of the East India Company*, which was republished in 1641. Meanwhile, Sir Ralph MADDISON had been devoting attention to the subject. He had sat, with Mun and others, on the royal commission of 1622, though for some reason his name was omitted on the reappointment of the commission in 1625. Under the commonwealth and the protectorate he was regarded as a great authority on currency questions. He gave a clear statement of the theory of the balance of trade in *England's looking in and out*, 1640, a work which was reprinted in 1641, and again, with a few verbal changes and additions, in 1655 under the title of *Great Britain's Remembrancer*. Maddison, however, holds a middle position between Malynes and Mun, for his views on currency and the foreign exchanges appear to be based upon the works of the former. Mun incorporated the arguments of the *Petition and Remonstrance in England's Treasure by Foreign Trade*, published in 1664, some years after his death, and this work became the chief bulwark of the mercantile system in England. It passed through many editions and exercised an influence almost incredible at the present time. Thus the great system of which we find the general outline in the *Briefe Conceit of English Policy* was furnished with an economic basis. But before we describe the principal characteristics of Mun's work, it is desirable to trace the development of the other lines of thought which his book brought to a focus.

The economic writers of the 16th and the 17th centuries agreed in maintaining that the unrestricted operation of the motive of self-

interest led to disorders in the state, and that an efficient system of industrial and trade organisation was necessary to direct the economic activities of the country into the right channels. They set before themselves a definite object, the "public good," by which they meant the creation of a "commonwealth," in which the various trading interests should be so balanced as to secure the greatest economic efficiency of the various elements consistent with the self-sufficiency of the nation as a whole; and considerable prominence is given to this idea as an "economic motive" in the works of the best writers. Thus Mun distinguishes between three sorts of gain, (i) that of the commonwealth, which was sometimes the merchant's loss; (ii) that of the merchant, "which he doth sometimes justly and worthily effect, although the commonwealth be a loser"; and (iii) that of the king, "whereof he is ever certain" (*England's Treasure*, etc., p. 64), but he had previously stated the rule that, in commerce, "private gain was ever to accompany the publique good" (*ib.* p. 3). The pursuit of the public good, interpreted in the sense given to it above, was a real force in the economic world, and the suppression of a trade "hurtful to the commonwealth" was generally approved. Taking the mercantile system at its best, it shows a distinct advance on mediæval ideas in the substitution of the wider interests of the nation for those of the craft or the municipality. On the other hand, it must be admitted that the majority of the writers show little or no consciousness of a high national aim. The "hurtful" trade generally happened to be that of a rival company, a dependency, or a neighbouring nation. The mercantilists differed too from the *laissez faire* school in the views they held on the relation of economic questions to religion, politics, and other subjects. Economic interests could not be isolated. Prosperity was the result of various economic, political, and religious forces mutually interdependent. Thus Sir William TEMPLE remarks of Holland: "The trade of this country is discovered to be no effect of common contrivances, of natural dispositions or situation, or of trivial accidents, but of a great concurrence of circumstances," amongst which he enumerates the immigration of aliens, the constitution and credit of the government, liberty of conscience, security of life and property, and the interest of the people in their government, as well as causes of a more strictly economic character (*Observations upon the United Provinces*, Collected Works, 1723, i. 65). One of the mercantilist tests of economic prosperity separates them so sharply from more modern schools, that it deserves to rank as a fundamental principle of their teaching. This was the quantity of the precious metals which the country contained. A thorough examination of mercantile doctrines in relation to the circumstances of the time does not exoner-

ate the writers from the charge of confusion of thought on this subject. There is no evidence that this led to any evils in the ordinary economic life of the community. But on foreign trade as a whole, and on the popular estimation in which different branches of foreign trade were held, it had enormous influence: "The ordinary means to increase our wealth and treasure," says Mun, "is by Forraign Trade, wherein we must ever observe this rule: to sell more to strangers yearly than we consume of theirs in value." The economic pamphlets of the period abound with similar statements. They certainly mean that the benefit of foreign trade is measured by the excess in value of exports over imports, and that branches of commerce which can not bear this test should be discouraged, or even suppressed altogether. Although there is no "historical justification" for this doctrine, we can see how it arose. We may dismiss the idea that the mercantilists thought "wealth" and "money" identical. No man could believe more firmly than Gerard Malynes in the necessity of securing a constant influx of bullion, yet we owe to him the first clear definition of capital in the English language. His book, bound up with Dafforne's *Merchants' Mirrour*, one of the most complete works on book-keeping then in existence, was very generally used as the chief authority on mercantile affairs. The strongest advocates of the theory of the balance of trade were successful business men. Mun was one of the ablest East India merchants of his time. There is no trace of any confusion of wealth with money in their business transactions, and they exported bullion like any other commodity. We must therefore seek some other explanation of the fallacy. Although the old bullionist theory of the foreign exchanges had been refuted, the writers of the 17th century could not free themselves from the conceptions on which it was based, and such works as Roberts's *Mappe of Commerce* (1638), or even Alexander JUSTICE's *General Treatise of Monies and Exchanges* (1707), in which the ratios and methods of exchange between London and other trading centres are given in great detail, show that international transactions were still carried on in much the same manner as under the staple system. The king's EXCHANGER (*q.v.*) had disappeared, but the cambists and goldsmiths performed his functions with great profit to themselves. Communication between one country and another was slow and difficult; credit agencies were little developed; and in such circumstances the old view of the precious metals was not easily eradicated. It remained firmly fixed in the popular mind. It was more natural to regard the changes which lapse of time, expanding commerce, and the rise in prices had brought about, as modifications of an old theory, than to invent a new

and more accurate one. The strict analogy drawn by the writers of this period between the business transactions of an individual and the foreign commerce of the nation as a whole gave to the old theory a greater persistence. The fact that during the 17th century imports and exports were a fairly good test of international indebtedness had the same influence. It may also be pointed out that English imports consisted of a greater proportion of luxuries, such as spices, wines, silks, and fine linen, and a smaller proportion of necessities and raw materials than at the present day, while bullion was indispensable for trade with the east, in the then backward state of English manufactures. So the mercantilists tried to keep down the importation of commodities which in their opinion sapped the vitality of the nation, and to secure the bullion which they required (see MERCANTILE SYSTEM).

We are now in a position to understand the attitude of the school of which Mun was the typical representative to the economic questions of the 16th and the 17th centuries. It is obvious that the mercantilists were not likely to take much theoretical interest in the finely-drawn distinctions of the canonist writers on the subject of usury. Theological influences were not strong in this country; and true to the English tradition, the mercantilists preferred expediency to metaphysics. It is probable that the views of the later canonists were never thoroughly popularised in England. During the reformation period there was much controversy, and towards the end of the 16th century many pamphlets were written, amongst which we may mention Nicholas SANDER'S *Briefe Treatise of Usury* (1568), Thomas WILSON'S *Discourse of Usurie* (1569), Rogers's translations of the works of M. P. Cæsar and N. Hemming (1578), H. SMITH'S *Examination of Usury* (1592), and Miles MOSSE'S *Arraignment and Conviction of Usury* (1595). But the development of trade and commerce, which at an earlier period might have imparted great vitality to such discussions, took place subsequent to the reformation, and though the influence of the contending schools may be traced in the legislation of the period, English writers appear to have regarded the subject mainly as one of practical expediency. Malynes was indebted to Wilson's *Discourse* for some of his arguments and illustrations, but even those who were willing to prejudice the merchant adventurers by attributing their "usurious" practices to the influence of Rome, were on the whole hostile to the prohibition of usury. The doctrine was important only as a support to an erroneous theory of the foreign exchanges, and, with the refutation of the latter, interest in the former disappeared. The CULPEPERS, father and son, Thomas Manley, and other writers from time to time engaged in the controversy. The average English position is

stated in Sir J. CHILD'S *Brief observations concerning Trade and the interest of Money* (1668). In *The Interest of Money mistaken, or a treatise proving that the Abatement of Interest is the Effect and not the Cause of the Riches of a Nation*, published in the same year, an attempt is made to correct a current popular fallacy. Mun's view was the ordinary view of the time; favourable to usury, he held that "this course in the rich giveth opportunity presently to the younger and poorer merchants to rise in the world, and to enlarge their dealings; to the performance whereof, if they want means of their own, they may and do take it up at interest: so that our money lies not dead; it is still traded" . . . "usury and trade rise and fall together" (*England's Treasure*, etc. 144, 146). With the views of LOCKE and the other writers of the end of the 17th century we shall deal in a later section.

While the theoretical discussion of interest and usury attracted few writers, the constitution of the trading companies assumed great importance in economic controversy. This was inevitable, for at the beginning of the reign of James I. the whole of the foreign trade of the country except that carried on with France was monopolised by one or another of the companies, and they were one of the most important factors in economic development from the beginning of the 16th to the middle of the 18th century. During the period which we are now considering, viz. from the beginning of the 16th century until the publication of Mun's work (1664), there were, roughly speaking, two stages in the controversy on this subject. In the first stage the Merchant Adventurers Company was the most powerful of the associations then in existence. The controversy naturally took the form of a struggle between the merchant adventurers and those who looked for a solution of the great problem of the organisation of foreign commerce to a revival in some form of the staple system. The first stage may be said to terminate with the free-trade bills of 1604, to which reference has already been made. After the failure of these bills the position of the companies was assured, although hostility to them in one form or another is a most marked feature of 17th century history, and Cromwell tried the experiment of a free and open trade with the East Indies in 1653. The case for the merchant adventurers is stated with great moderation in an anonymous treatise, *Touchinge the Multitude of Marchantes for ventinge of Eng. clothes* (Rawl. MSS., D. 23). After pointing out that the government should provide for only so many merchants "as have acquaintance, and as have policy and understanding to trade together to buy up all clothes vendible for marchant venturers, and to carry them together, by one consort of Marchants, unto one certain marte," the writer goes on to say:

"I do also suppose yt it is not profytable for the realme to have a multytude of Marchante Venterers, yt have but small stockes, and thereby they have but small credytt, and suche marchantes can not conveniently tary for theyre sales, nor yet keepe necessarye order." The opponents of the companies, as we have seen, claimed free trade as their natural right and inheritance, but "this generall lybertye . . . would cause a greate confusion, and a greate dysorder to growe in the ventyng of Englyshe clothes, whereby would follow yt or Englyshe clothes would be soulded at a lower pryce, then is fytted for the benefytte of or realme, and strange wares for England would be boughte at a dearer pryce than is conveyent for our commonweale of Englande." On the other side the arguments, in addition to the one mentioned above, were very strong. It was urged that freedom of trade would lead to the increase of wealth and shipping, the more equal distribution of wealth, and the increase of revenue. It was further maintained that the company organisation was no longer necessary, and that if trade were free, commerce might be extended beyond its present limits.

The growth of the East India Company, which was incorporated on the last day of the 16th century, led to the second stage of the controversy. The merchant adventurers were what was called a regulated company; the EAST INDIA COMPANY was organised on the joint-stock principle (*vide* COMPANIES). Now many people who objected to monopoly in every form were of opinion that the former was less injurious to trade than the latter, and the East India Company had a long and arduous struggle before it won the victory. The conflict had to be waged with the TURKEY COMPANY, whose trade in raw silk was ruined by the enterprise of the East India merchants, with those who were alarmed at the exportation of bullion, with the free traders and interlopers, and with those who thought the East India trade disastrous to the growth of the navy. The last-mentioned cause of hostility gave rise to a sharp controversy between Sir Dudley DIGGES and an anonymous writer, J. R., in 1615. "The East India men," says the latter, "not able to furnish those places they resort to, keep out others from coming amongst them. . . Besides, how tedious and costly they, and all other companies, make it to their own associates, whereas out of orders, and cause of upholding their trade, men can neither dispose of their own as they would nor have the benefit under a long time? How private do they and other companies make it when . . . how plentifully soever the commodities are brought in and at what advantage soever they buy them, they will be sure to keep up the price, either by sending most part of the commodities abroad, or else by buying all others into their hands?"

Digges's reply, *The Defence of Trade*, on behalf of the company, probably derived more force from the position of the author than from the arguments he employed. The company of course could point to the fact that the prices of eastern produce had fallen since their incorporation, and they made as much as possible of this argument, which was further elaborated by Mun in his *Discourse of Trade to the East Indies* (2nd ed. 1623). The company and its advocates, however, appear to have evaded rather than answered the objections of their opponents. No one during the 17th century wanted freedom of trade in the modern sense of the words. It was universally recognised that some form of regulation was necessary, and most people would have chosen the company organisation. The object of the free-trade bills (1604) was not to break down all restraints on free competition, but to throw the companies open to all who cared to join them, imposing by government authority such charges as were necessary to keep up their official establishments in foreign ports. It was the monopoly of the companies which roused the hostility of the outsiders. The companies seem to have imagined that when they had shown the advantages of the trades they monopolised, and proved the necessity for regulation, they had answered their opponents. Mun wrote *England's Treasure* long before the end of the struggle. But his book did good service to the company. Their exportation of bullion could no longer be urged as a reasonable ground of objection, and the East India trade had been proved to be favourable to the growth of the navy.

It has become a commonplace to regard the navigation acts as the natural outcome of mercantile doctrine. The political circumstances of the time, the growth of foreign commerce, and along with it the necessity of providing adequate means for its defence, and the foundation of colonies, showed the great importance of a powerful navy. The economic writers of the period were naturally influenced by the general movement, and they urged the encouragement of trades, especially the fisheries, which were favourable to the growth of the navy. The vast increase in the wealth of the country, and the greater ease with which large sums can be raised by taxation, have made inapplicable to the present age the practical suggestions of the mercantilist writers. But the importance of a mercantile marine as a naval reserve is felt as keenly now, especially in times of danger, as in the period under discussion. The economic arguments, however, by which the navigation acts were defended, give to those measures a peculiar character. There were navigation acts in the reign of Richard II. Those, however, we need not discuss. It is the series of acts commencing in the reign of Elizabeth, and culminating in the great act of

the Long Parliament (1651), re-enacted at the Restoration, to which we shall devote our attention (*vide* NAVIGATION ACTS). The Merchant Adventurers Company, which as we have seen played such an important part in the development of the mercantile system, early associated itself with this naval policy. Thus we find them advocating it in 1551. One of their *Articles and Allegations . . . against the Hanse Merchants* (*Rawl. MSS. C. 394, ff. 37, 38*) was to the effect that whereas they "have and by all waies do indevoure themself to supporte and maignteigne to their power, the whole Navie of this your Ma^{tes} realme, by freightinge and ladinge of the same and to contynue a greate number of your Ma^{tes} subjects in maroners crafte: the said Esterlinges to the intollerable decay therof, both inwardes and also outwardes do contynnually lade, freight and shippe their goodes, wares and marchandises in foreyne and strange bottomes, and vessells." They then point out the loss to the country of the money paid for freight and insurance. This is an argument which recurs over and over again, and it is evident that the writers of the period attached great importance to it. Mun argues that we must "use our own shipping and so get the merchant's gains, insurance and freight," though generally speaking "commerce should be free to strangers to bring in and carry out at their pleasure" (*England's Treasure*, p. 22). The influence of the navigation acts was made the subject of government inquiry, and much attention was given to the subject throughout the 17th century. *The Advocate* (1651), which was published to allay the discontent caused amongst some classes by the act of 1651, and which we find reflected later on in the writings of Roger COKE, shows how these acts were regarded as part of a general scheme of economic policy. This work points out that it was the design of the Dutch "to engross universal trade that so they might poize the affairs of any other state about them and make their own considerable." The advantages which Holland has over England are then enumerated. Their ships are built, provisioned, and convoyed at less cost than those of England. Their "cheapness of freight," which is an advantage of 20, 15, and 10 per cent over England, has forced English merchants to hire and freight Dutch ships. They employ a "great stock"; give "prudent care to their manufactures"; make the negotiation of commercial treaties their "interest of state"; impose small customs; encourage inventions; have a low rate of interest; facilitate their trade by a bank; and pursue an enlightened land policy. Some "unalterable laws in manufactures" are enunciated. (1) There is no manufacture or artificial commodity which cannot be transplanted into any country. (2) All manufactures, if they are of a certain

goodness, are of a certain value and price also. (3) Two persons selling or making commodities of a like goodness, he shall have the preference of the market that will sell them the cheapest. And so in international trade. (4) The cheapness of manufactures and artificial commodities depends upon the plenty and cheapness of the raw material, and upon the price of labour. The price of labour depends upon the price of victuals, house-rent, and other things necessary. The Dutch have no extraordinary advantages over England. Such as they are, they are due to the carelessness of England. By trade alone can wealth and shipping be increased, and so the power of any nation sustained. A commonwealth can only be enriched by reducing into general practice the courses used by private men for that purpose. Hence England should encourage native manufactures; and weaken Dutch shipping. Commodities must be imported from the immediate places of their production or growth, or as near as conveniently may be. Exports, native or other commodities, must be sent to the farthest market, where they will yield the greatest price and have the quickest sale. After these reasons, it is hoped that little or no dissatisfaction with the navigation acts will remain.

The examples we have given show the manner in which the mercantilists approached the questions of their time, and it is unnecessary to trace in detail the economic policy which found expression in the corn laws and bounties, in the commercial treaties, and the foundation of colonies. We have said "policy," for the mercantile system was a collection of practical expedients, based indeed on the fundamental principles we have noticed, but never elaborated into a scientific economic system. Such was the state of economic thought when Mun's book was published, and we can now understand the popularity with which it was received. As a scientific work it has no merit whatever. But it appealed to a very strong and growing sentiment, and put into words what most people believed at the time of its publication. Mun's work, with its sequel the *British Merchant*, the name given to the series of papers written in opposition to DE FOE's *Mercator*, during the controversy on the free-trade clauses of the Treaty of Utrecht (1713), gives the best idea of mercantilism as an economic system. But before the time of its greatest influence forces had been set in operation which ultimately overthrew it, and we must now briefly sketch this movement.

We have already seen the character of the early opposition to the trading companies, and the appeals to natural right as the basis of free trade. The companies won the victory, for in the relation of the government to trade, and the unsettled state of the countries to which the companies traded, their organisation was neces-

sary, and they included amongst their numbers the wealthiest and most influential of the merchants. The outsiders on the other hand were weak and disunited. But with the extension of commerce the number and influence of the latter grew; and it became clear that the exclusive privileges of the companies were an anomaly. The great statute of monopolies (1625) was a step towards freedom of trade; for although many of the evils complained of remained unchecked, it established the principle that none should monopolise for private gain what was the equal right of all English citizens; and it restricted the royal prerogative in the regulation of trade. The agitation against the trading companies was not without important results, for the most powerful of them, the East India Company, was reorganised on a broad national basis (1692-1702). In the 18th century we find little discussion of a subject which had been of such importance in the century before, and Tucker's pamphlet on the Turkey Company (*Reflections on the expediency of opening the trade to Turkey*, 1753) only expressed what was true of all the companies then in existence. It is doubtful whether at this time they were a serious restriction on trade, but they had performed the useful functions they once had, and it was absurd to continue their privileges. In other directions also, e.g. in Walpole's colonial policy, and the decay of the Elizabethan system for the regulation of wages and industry, we can see a movement towards free trade.

Meanwhile the theory of natural right was shattering the philosophical basis on which the mercantile system rested. The instances we have given from the history of the trading companies may probably be referred to popular sentiment, or to conceptions derived from English common law. At any rate, the latter was appealed to in the Commons debates of 1601 (Townshend's *Historical Memorials*; D'Ewes's *Journals*.) But the theory grew in influence and the range of subjects to which it was applied; and the levellers claimed universal suffrage and other measures as the natural right of all men (*Clarke Papers*, edited by C. H. Firth for the Camden Society, Introduction). Economic and popular sentiment coalesced with the philosophical movement, and with the development of the theory of the social contract the way was paved for an individualist system of political economy. Philosophical conceptions, however, derived from this source, had little or no influence on economic theory until the time of HUME. HOBBS and LOCKE took the economic ideas of their age as they found them ready made by the pamphleteers of the 17th century, and merely stated them with greater clearness. During the period with which we have to deal, the economic is of greater importance than the philosophical movement. The attempt to deal with the practical difficulties of the 17th and

the 18th centuries supplied those fundamental economic conceptions without which the science could have made no progress.

We have seen that one of the chief sources of error in the works of the mercantilist writers was their confusion of thought on the nature and functions of money. The foundation of the Bank of England (1694) and the recoinage (1696) called forth an immense number of pamphlets dealing directly or indirectly with this subject. It is from this period that we can date the theoretical discussion of economic questions, and the attempt to work out a scientific system. English writers had discussed continental banks many years before the foundation of the Bank of England. We may mention, for example, the *Treatise on Exchange* (1564), to which reference has already been made. In works intended for the guidance of merchants, such as Malynes's *Lex Mercatoria* (1622) and Lewis Roberts' *Merchants Mappe of Commerce* (1638), it was natural that the writers should explain so important a feature of continental practice. The superiority of the Dutch was, as we have seen, partly attributed to their banking system, and during the 17th century the advisability of adopting it in England was frequently urged upon the government (e.g. Hugh Morrell to William Lenthall, ii. Jan. 1646-47, *Portland MSS.*, vol. i. p. 405). Generally the establishment of a bank was advocated in pamphlets in which its advantages were discussed. Amongst these we may mention Thomas Violet's *Advancement of Merchandise*, 1651; Sir Ralph Maddison's *Great Britain's Remembrancer*, 1655; Samuel LAMBE's *Seasonable Observations*, 1657; W. POTTER's *Tradesman's Jewel*, 1659; Francis CRADOCKE's *Wealth Discovered*, 1661; Sir Edward FORD's *Experimental Proposals*, etc. 1666, etc., which show that for some years before the great experiment people's minds were much occupied with the subject. As these proposals took a more definite shape the number of books published became larger. The banking question was associated with the coinage, the public debt, and general questions of trade and commerce. Sir Dudley NORTH, Sir William PETTY, John LOCKE, Nicholas BARBON, Michael GODFREY, William LOWNDES, William PATERSON, Robert MURRAY, John ASGILL, Simon CLEMENT, are some among the many names which may be found in English controversy during these years. One pamphlet followed another with such rapidity, and discussion was so general, that it is difficult to single out any one author as the representative of the others. North's *Discourses* (1691), however, should be noticed, and the works of N. BARBON show a deeper insight into economics than those of his contemporaries. Locke's *Considerations of the Lowering of Interest and Raising the Value of Money* (1691), followed by his *Further Con-*

iderations (1695), not only refuted the arguments advanced by William Lowndes and others, in favour of his scheme for restoring the coinage, and so saved the country from a great disaster, but contributed much that was of permanent value in economic science. In spite of these merits, however, Locke was strongly under the influence of the mercantile doctrine. The great controversy of 1691 to 1696 finally disposed of the theory of money which underlaid the mercantile system, and the relaxation of its influence was now only a question of time. The persistence of an old theory, long after its refutation, is a common phenomenon in the history of human thought. While the discussion of currency, banking, and credit undermined the theoretical framework of the mercantile system, and the growth of statistics threw doubt upon the balance of trade as a test of economic prosperity, the accumulation of capital and the development of commerce were removing the conditions of which the mercantile system was partly the reflex. During the first fifty years of the 18th century economic progress was slow. Defoe indeed in his *Mercator* had urged a principle which would have led to important results if it had been acted upon. He recommended no less than the *isolation* of economic questions. "Gain is the desire of merchandise: trade is a commutation of merchantable commodities between one country and another, and for the mutual profit of the traders. The language of nations one to another is, *I let thee gain by me, that I may gain by thee* . . . Trading is a matter entirely independent in its nature, and neither consults other interests, nor depends on any interests, but what relate to itself" (*Mercator*, No. 21). But it was the *British Merchant* and not *Mercator* that was sent to every parliamentary borough for the use of the inhabitants.

Why is it, we may ask, that for so great a length of time little progress in economic science has to be recorded? Certainly it was not due to lack of interest in economic subjects. There seems to have been no difficulty in obtaining a hearing. There are literally hundreds of economic writers in England between 1500 and 1752, and every trade crisis or controversy produced its score or so of pamphlets. The reasons for the slow growth of the science seem to have been as follows:—(1) With few exceptions the economic works of this period were written merely to advocate some definite object,—to urge the adoption of some scheme for the improvement of trade, to defend those whose interests were threatened by new developments, e.g. the numerous pamphlets on the East India Company, and their relations with the Levant Company, or to protest against some abuse and to suggest a remedy, e.g. the pamphlets on the poor laws, the coinage, public credit, etc. This close relation between economic

literature and the practical life of the nation was unfavourable to the development of a system of economic doctrine. Mun (*England's Treasure by Foreign Trade*, 1664) expressly states that his work was not intended as an exhaustive and systematic treatise on the economics of the 17th century. He proposed to discuss only "so much of the merchant's practice as concerned the bringing of treasure into the kingdom." (2) Such being the objects of the writers, there is a strong bias in most of them in favour of the organisation or project with which they happened to be identified. The biographies of the earlier writers are therefore of importance, for their personal relations with hostile organisations or individuals, and events in their lives, affected their views to a great extent. (3) When once a controversy was concluded, no one endeavoured to develop and apply the general principles which may have been stated in the course of it. Thus the currency controversy in 1694, and the defence of the East India Company, led to a statement of the main outlines of the principle of the division of labour (SIMON CLEMENT; *Discourse of General Notions*, etc., 1695; *Considerations on the East India Company*, etc.). Other writers such as Petty, Berkeley, Addison, etc., also enunciate this principle. But it lay unregarded until Adam Smith made it one of the fundamental principles of the *Wealth of Nations*. (4) The early writers had to depend, for the most part, on their own knowledge and experience to suggest or illustrate their arguments; trustworthy information on economic subjects was neither so copious nor so widely diffused as it is at the present time. Sir William Petty, John GRAUNT, Gregory KING, and Charles DAVENANT, who laid the foundations of statistical science, all lived in the latter half of the 17th century. So late as 1699 Davenant complains (*Essays on Trade*), that "the aids and lights which might be gathered from the public accounts and offices have been industriously withheld from all who are not servile applauders of the wild and destructive conduct . . . of some persons of no small power in the management of affairs." He and Gregory King are "beginners of an art not yet polished, and which time may bring to more perfection." (5) The early writers employed in their works the language of ordinary business. They had no scientific terminology. Now the language of the market-place is not characterised by scientific precision, and their looseness of phrase gave rise to endless misunderstanding.

The point of view from which early economic literature should be regarded becomes therefore quite clear. It must be studied along with the history of the times at which it was written. This must be carefully borne in mind, or we shall form an erroneous estimate of the value of these early works and the ability of the writers.

We must not expect a uniformity, consistency, and completeness of doctrine and practice which are not to be found. Nothing could be more fatal to the right appreciation of this period than to investigate it with the idea that we shall find in it only illustrations of a well-rounded set of general propositions.

[Much has been written on the history of economics. *Vide* especially Ashley, *Economic History*, vol. i. pts. i. and ii.—Cunningham, *English Industry and Commerce*.—Endemann, *Die Nationalökonomischen Grundsätze der Canonistischen Lehre*.—Hewins, *English Trade and Finance*.—Heyking, *Handelsbilanztheorie*.—Knies, *Politische Ökonomie*.—Roscher, *Geschichte der Nationalökonomik in Deutschland*.—*Political Economy* (trans. Lalor), *Geschichte der englischen Volkswirtschaftslehre*.—Schanz, *Englische Handelspolitik*.] W. A. S. H.

ENGLISH SCHOOL OF POLITICAL ECONOMY.

Before Adam Smith, p. 730; Modern Economics, p. 733.

BEFORE ADAM SMITH.—The English writers on political economy before Adam Smith do not at any time present the marks of a "school," properly so called. The nearest approach to a "school," so far as community of doctrine is concerned, is found among the mercantilists; but even these writers owe no allegiance to any personal authority. Their views are individual and independent; and it is only with Adam Smith that the English school *par excellence* begins. The rise of that school was affected by many influences, English and foreign. Of these the genesis of economic theory in England must be sought chiefly through the writings of the authors whose names are mentioned in the rapidly-connected sketch which follows.

There is much that is of interest not only to the economic historian but also to the student of economic theory in the early statutes and the records of the social history of England, but few English writers earlier than the 17th century call for special mention in this article. Langland, in his *Visions of Piers the Plowman* (14th century), and the writer of the *Libell of Englyshe Policye* (15th century) incidentally supply some interesting illustrations of the course of life in England during those periods. The writings of WALTER OF HENLEY (13th century), FITZ-HERBERT (16th century), and TUSSEY'S *Five hundred pointes of good husbandrie* (Tottel's edition, 1573), throw light on the state of agriculture and the condition of the people. "W.S." (see HALLS, JOHN) in his *Discourse of the Common Weal of this Realm of England* (written 1549, printed 1581), acutely discusses the contemporary depression of agriculture and industry. His attempts to show that the "alteration of the coyne is the cheifest and principall cause of this universall dearthe" are highly interesting examples of early economic argument and analysis. More's *Utopia*, 1518, imbued as it is with the ideas of classical anti-

quity, has more affinity with the *Republic* of Plato than with the industrial utopias of later writers. The chief impetus to the publication of *Discourses upon Trade*, was afforded by the problems of policy in colonial trade by which the commercial activity of the English people following upon the enterprise of navigators and adventurers, found itself confronted. This is noticeable as early as the essays of BACON, 1597 ("Of Plantations"), and the writings of RALEIGH. From the incorporation of the East India Company, 1600, there is a continuous succession of writers on the theory of foreign trade which formed the kernel of the old MERCANTILE SYSTEM. The mercantile school may indeed be said to continue its existence in quite different forms from this time to the days of STEUART. The traffic in the precious metals naturally attracted the attention of statesmen and merchants alike; and from the reign of Edward III. onward, attempts were made to regulate its exchange for imported commodities. The inevitable export of bullion for the East India trade found an ingenious apologist in MUN who, in his *Discourse of Trade from England into the East Indies*, 1621, and *England's Treasure by Foreign Trade*, published 1664, shifted the ground of the BALANCE OF TRADE from the position which it holds in the writings of ARMSTRONG (1530) and MALYNES (1601). He argued that this export, like the seed carried away by the husbandman, was in the long run amply repaid in kind, and that the raw materials which the precious metals purchased, when worked up and sold to foreign countries, caused the national stock of bullion to be increased and not diminished. "The title of Mun's book *England's Treasure in Foreign Trade*, became a fundamental maxim in the political economy not of England only, but of all other commercial countries" (*Wealth of Nations*, bk. iv. ch. i. Malynes, *The Canker of England's Commonwealth*, 1601, and *Lex Mercatoria*, 1622, describes the Ancient Law Merchant as well as the contemporary habits and institutions of trade; and LEWES ROBERTS, *Merchants Map of Commerce*, 1638, *Treasure of Trafficke*, 1641 explains the operations of commerce, and recommends practical measures, —e.g. free export of gold and silver, and low customs,—for its promotion. His *Mappe of Commerce* is a mercantile geography, showing the situation, exchanges, and commodities of trade of different places. MISSELDEN (*Free Trade*, 1622, *Circumstances of Commerce*, 1623) exhibits the Spaniards' warnings, the Dutch as models in mercantile policy, and disputes with Malynes the cause and consequences of an unfavourable balance of trade. The example of the low rate of interest in Holland further stimulated the CULPEPERES, father and son, to urge the reduction by parliament of the legal rate of interest—a demand supported with much weight by

CHILD (1668), whose business instincts, superior to his scientific theory, were probably not at fault when he supposed such a measure would redound to the encouragement of English commerce. The unsoundness of some of the arguments which he employs was pointed out in *The Interest of Money Mistaken*, 1668.

Passing by the utopia of HARRINGTON (*Oceana*, 1658), and such agricultural writings as those of Blith, *The English Improver Improved*, 1652, HARTLIB, *Legacy of Husbandry*, 1655, WORLIDGE, *Systema Agriculturae*, 1668, and John SMITH, *England's Improvement Reviv'd*, 1670, we come to the speculations of HOBBS, 1670, and ASGILL, 1696, on the nature and causes of wealth. Particular recommendations for the improvement of trade by the naturalisation of aliens, and in favour of the policy of enclosures, are found in FORTREY, *England's Interest and Improvement*, 1663, and COKE, 1671. Fortrey's statement that the country "lost" £1,600,000 a year by its trade with France, long had a discouraging effect. The despondent tone of most writers of this time is echoed in the title of *Britannia Longuans*, 1680, and in the arguments of its pseudonymous author (Philanglus), that the importation of foreign luxuries was a "consumptive trade" which threatened to bring about the decay of the nation while money was exported for them. The same writer urges the "legal regulation" of trade, to prevent its destruction by "private interest" and by the "clogs" of navigation acts, companies, monopolies, etc. Similar views with regard to the eastern trade are found in POLLEXFEN'S *England and East India Inconsistent in their Manufactures*, 1697—a reply to DAVENANT'S *Essay on the East Indian Trade*, 1696-97. A more hopeful note is struck in *England's Great Happiness: wherein it is demonstrated that a great part of our Complaints are Causeless*, 1677, and in the optimistic preface of PETTY'S *Political Arithmetic*, 1682, which opposed to vain imaginings and timid surmises the positive conclusions of comparative statistics, and drily observed that the price of food was "so reasonable, as that men refuse to have it cheaper, by admitting of Irish cattle." The best thought of the time had now for many years been directed into the channels of trade, and produced, as was natural, an abundant crop of pamphlet literature on all questions connected with "the Science of the Great Commerce." Comparative study of other nations, especially of France, Holland, and Spain, was one main source of the inspiration of these writings, and numerous proposals sprung up for establishing banks (see ASGILL, BRISCOE, CARY, CHAMBERLAIN, CRADOCKE, LEWIS, MURRAY, PATERSON) and for emulating Holland in other matters. This spirit is shown in YARRANTON'S *England's Improvement by Sea and Land: To outdo the Dutch without fighting*, etc. (pt. i. 1677; pt. ii. 1681), in Sir Wm. TEMPLE'S *Observations*

on the Netherlands, 1693, and in the popularity of the translations of "John de WIT's" *True Interest and Political Maxims of Holland*, 1702, etc. (see DUTCH SCHOOL).

An important epoch is marked by GRAUNT'S *Natural and Political Observations upon the Bills of Mortality*, 1662, with which begins the science of DEMOGRAPHY, as statistics, and the theory of taxation may be said to commence with Graunt's more famous friend Sir Wm. Petty, whose remarkable treatises on *Taxes and Contributions*, 1662, *Political Arithmetic*, 1682, and the *Political Anatomy of Ireland*, 1691, exhibit an ingenuity of method and grasp of principle rarely if ever shown by his predecessors. The first table of mortality was published by HALLEY in 1693. DAVENANT (1699) and GREGORY KING (in 1696) continued the work of statistics (see ARITHMETIC, POLITICAL); while the current views on the balance of trade found an able opponent in BARBON (1690), who was soon to cross swords with LOCKE on the subject of money.

The proposals of LOWNDES, then secretary to the treasury (1695), to coin the new (silver) money lighter, provoked the opposition of Locke, whose able writings on money at this critical period of the great recoinage (see RECOINAGES) are still appealed to in controversies of to-day upon the history of the currency. The earlier work of VAUGHAN, *Discourse of Coin and Coinage*, 1675, should also be mentioned here. Mingled with the discussions of semi-political questions by earlier authors are many glimpses of a broader consistent theory, general principles of which now begin more clearly to emerge. The close of the 17th century is indeed a time conspicuous for the ability of English economic writers. Barbon's *Discourse of Trade*, 1690, contains some striking analyses of value, price, interest, and rent. NORTH'S *Discourse of Trade*, 1691, is an admirable exposition of the merits of free exchange. FLEETWOOD'S *Sermons against Clipping and Sweating of the Precious Metals*, 1694, precede by thirteen years his *Chronicon Preciosum* or history of prices, familiar to students of Adam Smith. The problem of the conditions of the poor which had fitfully occupied statesmen since the date of Richard II., in whose reign the earliest legislation for dealing with impotent beggars took place, seriously engaged the attention of FIRMIN (1678), HALE (1683), Child (who proposed the appointment of poor-law guardians or "fathers of the poor"), CARY (1695) and BELLERS, *Proposals for Raising a Colledge of Industry of all Useful Trades*, etc. 1695-1696. From DEFOE'S lively and prolific pen came, in 1704, the vigorous essay, *Giving Alms no Charity and Employing the Poor a Grievance to the Nation*, in which it was contended that work-house labour should not be employed in competition with outside industry. The same writer's *Compleat English Tradesman*, 1725-27,

and *Plan of the English Commerce*, 1728, are the chief of his other numerous works on subjects relating to trade. JOHN HOUGHTON, F.R.S., *Collection for the Improvement of Husbandry and Trade*, 1692-1703 (particulars of prices of corn, cattle, coal, hops, wool, etc.); *The British Merchant; or Commerce Preserved*, 1713 (papers collected and published by Charles KING, 1721); and Defoe's *Mercator, or Commerce Revived*, 1713, 1714 (an opposition paper to *The British Merchant*), afford useful details for the history of commerce.

LAW's *Money and Trade considered*, 1705, exhibits at once the power and the defects of his erratic genius; original, daring, and acute, he admits no limit to the bounds of credit, and has little thought of its contraction. His book marks, however, a real advance in the study of money and credit. WOOD's *Survey of Trade*, 1718, also deals with money and bullion. MADOX is an invaluable source of information for the economic historian in his *Antiquities of the Exchequer*, 1711, and *Firma Burgi*, 1726. In Ireland appeared about the same time the well-known *Drapier's Letters*, 1725, in which SWIFT inflamed the anger of his countrymen against Wood's copper halfpence; DOBBS' essay on "The Trade and Improvement of Ireland," 1729-31; and BERKELEY's *Querist*, 1735, a collection of searching and suggestive inquiries in economics, revealing at once the author's mind and the degree of development which the science had then attained. Swift's *Modest Proposal for preventing the Children of Poor People from being a burden to their Parents or the Country*, 1730, is an elaborate joke framed in a tone of ironical and pseudo-economic savagery. GEE's *Trade and Navigation of Great Britain considered*, 1729, is a despondent treatise of mercantilism, affecting to show "that the surest way for a nation to increase in riches is to prevent the importation of such foreign commodities as may be raised at home." VANDERLINT's *Money Answers all Things*, 1734, on the other hand ably argues for free trade, while MANDEVILLE's *Fable of the Bees, or Private Vices, Publick Benefits*, 1706, 1714, 1723, etc., urges the social advantages of individual liberty. Both books mark a movement in the direction of LAISSEZ-FAIRE. DECKER's *Proposals*, 1743, for raising the whole revenue by a single tax on houses, and the *Essay on the Causes of the Decline of the Foreign Trade*, 1744, show much ingenuity in the study of taxation. JOHN SMITH's *Chronicon Rusticum Commerciale, or Memoirs on Wool*, 1747, is an industrious compilation of standard value upon this great branch in the history of English trade. Equally laborious but less praiseworthy are the *Dictionaries of Trade and Commerce* of POSTLETHWAYT (1751), ROLT (1761), and MORTIMER (1766). Postlethwayt's, the best of the three, was founded mainly upon the French dictionary of SAVARY. In 1751 and

1753 appeared translations from the Spanish of USTARITZ and ULLOA of the history of trade in Spain, and in 1753 a translation from the German of MAGENS' *Universal Merchant* (postscript 1756). The last two writers are mentioned by Adam Smith. FRANKLIN's *Observations concerning the Increase of Mankind*, 1751; HUME's essay of "The Populousness of Ancient Nations" in his *Political Essays*, 1752; and WALLACE's *Dissertation on the Numbers of Mankind in Ancient and Modern Times*, 1753, show an interest in the progress of population, its causes and limits, nearly half a century before MALTHUS. The middle of the 18th century recalls the end of the 17th by the fertile ability of its economic writers. Hume's *Essays* contributed powerfully to the development of sounder views on money and the balance of trade. Wallace, in his *Characteristics*, 1758, discusses the functions of paper money and credit. The essays of Patrick Lord ELIANK, on *The Public Debt* were published in the same year (1758) as FIELDING's *Proposal for making an Effectual Provision for the Poor*. The most important writings appearing at this time were, however, those of CANTILLON, MASSIE, and TUCKER.

Cantillon's posthumous *Essai* (published 1755) is the earliest approach to a complete presentation of economic principles, tracing the distribution of wealth by the guiding thread of a central theory of value. Its influence was greatly felt in the FRENCH SCHOOL, but is also clearly seen in the *Essay on Money and Coins* of HARRIS (1755-58). Massie (see *infra*), though best known by his criticisms of Decker's and FAUQUIER's proposals in taxation and by his *Essay on the Governing Causes of the Natural Rate of Interest* (1750), has been shown by Dr. Cunningham to have left a bibliography of economic literature of the highest value (*Economic Journal*, vol. i. No. 1). Tucker (see *infra*), dean of Gloucester, is remarkable for the breadth and liberality of view with which he regards the economic aspect of colonial and foreign politics. Tucker accepted with pride the sarcasm of Warburton, that he made a religion of trade as other ecclesiastics had been known to make a trade of religion. The dignity of economic study did not much longer need vindication. His *Reflections on the Expediency of a Law for the Naturalisation of Foreign Protestants*, 1751, were translated into French by Turgot (1755). His *Brief Essay on the Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750, is said by BLANQUI to show the influence upon Tucker of the French economists with whom he was in close correspondence. But there can be little doubt that in their relations with Tucker at this time they were rather disciples than masters.

The high esteem in which the early English writings were held abroad was no doubt largely

due to the superiority of English commerce which gave them birth. It was felt with justice that a nation of successful merchants were worth listening to on matters of trade. The French in particular richly repaid their debt to us through Adam SMITH, upon whose mind they impressed their systematic and logical views; but it should not be forgotten that those views were largely founded on the practical judgments of English writers. Nor can the diligent student of the *Wealth of Nations* fail to be struck by the extent to which that work is rooted upon the earlier English writings. And though in the crucible of Adam Smith's mind the materials of his predecessors are often refined, they still do not defy recognition, but testify to the close continuity of the English school.

It has not been possible in this slight account to do more than enumerate some of the writers who preceded Adam Smith. For fuller notices the student is referred to the separate articles under the names of the authors. Contemporaries of Adam Smith are dealt with in a later portion of this article. It is only necessary to mention as appearing before 1776, the *Three Tracts on the Corn Trade and Corn Laws*, 1758, by Charles SMITH, whom Adam Smith has described as "ingenious and well-informed"; the important *Inquiry into the Principles of Political Economy* of STEUART, 1767 (see *infra*); ANDERSON's *History of Commerce*, 1764; FERGUSON's *History of Civil Society*, 1767; PRICE on *Reversionary Payments*, 1769, and on the *National Debt*, 1774; and Arthur YOUNG's *Farmer's Letters*, 1771, *Rural Economy*, 1773, and *Political Arithmetic*, 1774, with some of his earlier *Tours* in the English counties. H. H.

MODERN ECONOMICS. PERIOD I. ADAM SMITH.—After the Union of 1707, Scotland began to play a part in English economic study. Francis HUTCHESON (professor of moral philosophy at Glasgow, died 1747) turned the attention of Scottish philosophers to economic questions, on which he himself touches, though briefly, in his published works (*e.g.* in his *Inquiry into the Original of our Ideas of Beauty and Virtue*, etc., 1st ed. 1725). The notion of the "greatest happiness of the greatest number" appears in Hutcheson, and he also lays stress on the connection between industry and self-interest, industry and property, thus carrying on the discussion raised by Mandeville (*Fable of the Bees*, etc., 1706, and later eds.), on the nature of the motives to economic action. The activity of the Scotch press (Foulis, Urie, etc.) in the publication and reprinting of economic treatises becomes noticeable about this time (say 1750 to 1770). Adam FERGUSON in the 4th ed. of his *History of Civil Society* (1773), announced the forthcoming work of Adam Smith, which was to be "a complete theory of national oeconomy"; but Ferguson's own economical views (*e.g.* on division of labour) are given incidentally along with

his political philosophy, and not in a separate treatise. In his *Institutes of Moral Philosophy* (1769), where he treats of economical questions, he borrows to some extent from Joseph HARRIS (*Essay on Money and Coins*, 1757). To much greater effect David HUME, who had learned from Hutcheson, had prepared the way for his friend Adam Smith by his keen criticism of the current views of the balance of trade, to say nothing of his pregnant remarks on the other subjects embraced by the "Mercantile Theory" (*Essays on Commerce, Money, Interest*, etc., 1752). Economical subjects receive separate consideration, and Hume's reasonings upon currency, credit, and population were of special influence. In the controversy as to the populousness of ancient nations he took the side of the moderns. In the matter of public credit, or national debts, he took the view that national debt would eventually prove the ruin of modern nations. He points out that the quantity of metallic money in a country does not determine the rate of interest, also that a time of increasing currency is a time of lively trade. He thinks that commercial jealousy rests on a false idea that one party must always be the loser, in a bargain. He goes, if not as far as Adam Smith, nearly as far as Josiah TUCKER (*Advantages and Disadvantages which respectively attend France and Great Britain with regard to Trade*, 1750). But it was left to Sir James Steuart and Adam Smith to recognise for their own country what had already been made good by the physiocrats in France (see PHYSIOCRATS and FRENCH SCHOOL), that economical subjects must be a study by themselves. Sir James Steuart's book (*An Inquiry into the Principles of Political Economy, being an Essay on the Science of Domestic Policy in Free Nations*), written in exile in Germany, and first published (in Edinburgh) in 1767, made no impression on the public to be compared with that of Adam Smith's *Inquiry into the Nature and Causes of the Wealth of Nations* (1776); and was rather a revised edition of the mercantile theory than a new departure. The immediate popularity of Adam Smith's work, on the other hand, was largely due to its crushing criticisms (especially in bk. iv.) of the "commercial system," which was tracked out and destroyed in all its logical ramifications, however tenaciously it might afterwards survive in political practice. The idea of "natural liberty" organising industry, and transforming society "of its own accord," was stated by Adam Smith even more boldly than by the French economists, and he avoided their mistake of restricting productiveness to agriculture (bks. iv. ix.). In his chapters "On the Revenue of the Sovereign or Commonwealth" (bk. v.), he came out as "the greatest of theorists on finance" (Bastable); and no economical treatise ever exerted greater political influence.

On economic theory its influence has been also very great, though it was not so immediately visible, and is now partly spent. The definition of wealth, the discussions on labour, wages, rent, interest, and the short remarks on value, served as starting-points for more thorough and satisfactory consideration of these matters. Adam Smith's method of reasoning, though frequently deductive, involves so full an illustration from facts and statistics, where such were accessible, that he has often been claimed as an inductive economist. The industrial changes then taking place in England gave his treatise a peculiar historical importance, if they were not indeed responsible for its creation. Similarly, if we pass by Bentham's correction of one false concession in "the Wealth of Nations" (see BENTHAM), the next contribution to English political economy was largely occasioned by a change in the condition of the people.

PERIOD II. MALTHUS AND RICARDO.—The poor law of W. PITT, proposing a bounty on large families, and the popularity of Godwin's political theories, led MALTHUS to bring forward in his *Essay on Population*, 1798, a clear-cut theory of "the principle of population." He inquired into the nature and causes of poverty, as Adam Smith into those of wealth. The tendency of population to increase up to the limits of the means of subsistence was brought out more strongly than the checks on this tendency, which were not adequately stated till the book had emerged from the floods of criticism into a second edition (1803). The views of Malthus on general economic theory were not elaborated with such perfect lucidity as his doctrine of population; he tended either to fall back on physiocratic views, or to theorise, as on the measure of value and the corn laws, with a subtlety inconsistent with clearness. He maintained views on over-production which brought on him the damaging criticisms of J. B. SAY. On the other hand, he shares with JAMES ANDERSON, and Sir E. WEST, the credit of first stating what is usually called the Ricardian theory of agricultural rent, that rent is the effect not the cause of price, and that it depends on the graduated fertility of lands. RICARDO, who first obtained fame by his *Letters on the High Price of Gold Bullion* (1809), and made an enduring mark on the theory of currency, owes his prominence in economic literature to his *Principles of Political Economy and Taxation* (1817). In this book he pushed the theory of rent farther than its discoverers, and made it, together with a new theory of value, the centre of a theory of the distribution of wealth between the three parties concerned in its production—the labourers, the employers, and the landlords. The value of manufactured articles is determined mainly by the quantity of labour necessary to the production of them, and of agricultural products by the quantity of labour

necessary to the cultivation of the worst land actually cultivated. The height of this "margin," to use the phrase of Dr. CHALMERS, determines the amount of profits to the employers, and the amount of rent to the owners of all land above the worst. Ricardo's qualifications of this theory were neither numerous enough nor clearly enough stated; and, even if the theory had not been reproduced, as by M'CULLOCH, without the qualifications, a reaction against Ricardian political economy could be only a matter of time. But it held the field for nearly a generation after the publication of the *Principles*. It found popularisers both humble and eminent (Mrs. MARCET and DE QUINCEY): James MILL followed it wholly, and SENIOR with reservations that seemed in those days unimportant, though in after times the acuteness of Senior has been better recognised. TORRENS did not succeed in establishing his claims to independent authority, nor did Chalmers restore the authority of Malthus. WHATELY, LONGFIELD, LAWSON wrote clearly but without making any decidedly new departure. Professor Richard JONES, in appealing against Ricardo to the history of India, was before his time. The minor writers (see below) left fruitful hints, but made few converts among students of the subject. Robert OWEN and his followers gained little hearing in the world of letters. The victory of FREE TRADE (1846), the passing of the early FACTORY ACTS, the rise of CHARTISM, and the regulation of the paper currency (see BANKING), affected the course of economic discussions; and the French Revolution of 1848 played a part in England as well as on the Continent. French and German writers began to acquire greater influence than ever before.

PERIOD III. JOHN STUART MILL.—Their influence was shown in John Stuart Mill's *Political Economy* (1848). This book was an attempt to combine abstract economical theory with the modifications necessary for its application in the concrete, and to view the whole of economics in relation to other parts of the philosophy of society. As Mill went beyond Bentham in his ethics, he went beyond Ricardo in his economics. Long before this time Mill had, like SENIOR, given attention to the question of method, which was afterwards to become an object of lively discussion.

The study of COMTE and other foreign writers had led Mill to doubt whether abstract theory was allowable at all in social inquiry. He retained it, however, for political economy; and in his chief economic book the abstract theory is presented, along with the modifications, being little more than a careful re-statement of Ricardian principles. He had wished to do for his own day what Adam Smith had done for his (see preface to Mill's *Political Economy*); and the influence of his book was so great that it seemed as if a new departure had

been taken and a new era begun. But Mill was so far from overthrowing the old doctrines that he really strengthened their hold at a time when it had been loosened. Yet, by his emphasis on the relativity of abstract economics to particular societies, and on the possibility of far-reaching changes in the social system, he showed an affinity with "historical economists," and "scientific socialists." The former found their earliest representatives in Cliffe LESLIE and Thorold ROGERS; and their views are now energetically advocated by Ingram, Cunningham, and Ashley. The CHRISTIAN SOCIALISM (of MAURICE, KINGSLEY, LUTLOW, NEALE, Hughes) grew out of Owen and Chartistism; and its upholders, in advocating co-operative production, appealed rather to philanthropy and human brotherhood than to cool economic theory. The scientific socialism of MARX, avowedly based on the Ricardian theory of value, can hardly be said to have representatives in this country among professed economists. In his views of Land Reform, Mill (like his father), approached very near to socialism; but his attitude to socialism as a general policy is quite as truly critical as sympathetic.

PERIOD IV. W. S. JEVONS.—This cool reception of scientific socialism is mainly due to the rejection, by Jevons and his closest followers, or the serious modification, by Marshall and Sidgwick, of the Ricardian theory of value. The ideas of Jevons have had greater power since his death than during his life. He was too impatient at the almost universal submission to Mill's authority to do Mill complete justice. But he was one of the first critics of Mill who attracted general attention at all; and, since his time, there has been less submission to authority of any kind. There has no doubt been a line of writers who follow the older school very straitly (FAWCETT, CAIRNES, MALLER) as among statesmen there has been a line of supporters of the old economic policy identified with BRIGHT and CORDEN. But changed conditions have forced most leading statesmen to go beyond *laissez-faire*; and new aspects of old problems have led theoretical economists into deeper study of particular questions (e.g. CONSUMPTION) than before. The mathematical treatment of economical data has practically fallen into the hands of a wing of the school of final utility, which is often spoken of as a school by itself, the mathematical school (Edgeworth, Wicksteed). Amongst the many writers who have taken part in discussions on currency and banking, Mr. H. D. Macleod has fallen back on WHATELY's view that economics is simply catallactics, Bonamy PRICE has professed to represent unaided common sense, BAGEHOT has insisted on the need of formulating deductive economics for "advanced" nations, and on the impossibility of doing so for uncivilised peoples. Bagehot's lucid writings on banking

and depreciation helped to keep these questions before the minds of economists; and the fall of silver since 1870 has made bimetalism versus monometallism an object of lively debate. The dominant view among professed economists after Jevons seems to be that bimetalism under certain conditions is possible, but that the conditions are difficult of fulfilment. The question has been discussed in close connection with the subject of the metallic reserves of our English banks, and, in this as well as other connections, the wisdom of the Bank Charter Act of 1844 is not now upheld by the majority of economists. A large part of the recent work of economists in England has been the re-statement of the older doctrines, with the fresh light afforded by the theory of value laid down in 1871 by Jevons in this country, and substantially one with the theory of the AUSTRIAN SCHOOL OF ECONOMISTS. In connection with this, there has been practically a new theory of wages and profits, towards which not only Jevons but Walker has contributed very essentially. The idea of a wages fund, as held by Ricardo's immediate successors, and till 1869 by J. S. Mill, has been abandoned as Longe and W. T. THORNTON had foretold. The distinction of interest from profits—capitalist from employer, has been better kept in view—largely owing to the writings of Walker. The application to wages, interest, profits, and even taxation, of the idea of final utility has been pursued vigorously. Probably at no time have questions of economic theory ever been more ardently discussed in England than at present; and these discussions have hope of greater fruitfulness than before, because conducted now (a) with a much more adequate knowledge of what is written and said, about the subjects concerned, on the Continent of Europe, and in the United States of America, and (b) with a closer regard to the facts of everyday life, as the touchstone of all theories. Economists are more conscious than at any previous time of the importance of statistics for the understanding of the phenomena of society. They are also more keenly aware, partly from the influence of CARLYLE and Ruskin, of their need of contact and sympathy with men and associations of men in the surrounding world, though they keep in mind the distinction of an economic theory from a mere record of facts or a mere utterance of philanthropic aspiration.

Even in this short sketch it would be wrong to omit mention of the minor writers and amateur economists. Every great industrial or financial change, besides awaking a corresponding movement of speculation among professed economists, has been reflected in the fugitive literature of the day; and there has often been a subordinate movement of social, political, and economic theory, apparently quite aside from the path of the classical economists. The

writings of the agriculturist, Arthur YOUNG, and the financier and politician, Richard PRICE, had a certain influence on economical study. In the dark days of the French War the writings of William GODWIN may be said to have given the first impulse to the socialistic speculations afterwards carried out by Charles HALL, Robert OWEN, EDMONDS, GRAY, J. F. BRAY, and William THOMPSON. With Thomas SPENCE begins the movement for the nationalising of the land, countenanced in theory at least by James Mill, and advocated in later times by DOVE, George, and A. R. Wallace. The books of PAINE include not only deistic and political utterances, but useful admonitions in regard to paper currency in the early days of the suspension of cash payments. LD. LIVERPOOL's *Coins of the Realm* (1805), with the mass of pamphlets (see e.g. H. THORNTON, Lord KING, Boyd, BARING, BOSANQUET, HUSKISSON, TROTTER) called forth by suspension and by the Bullion report, form a considerable literature, in the face of which (and often by the aid of it) the theories of economists like Ricardo shaped themselves. Such books as Thomas TOOKE's *History of Prices*, ably continued by NEWMARCH, and in a less degree COLQUHOUN's book on the *Resources of the British Empire*, and (later) PORTER's on the *Progress of the Nation*, helped to point economists to the more ample use of statistics; and this service is now rendered by writers like Guy, Rawson, Palgrave, Booth, Giffen, and others in the journal of the "Royal Statistical Society" (founded 1834).

The "refutations" of Malthus on population proceeded from all sorts and conditions of men. Many men of the stamp of COBBETT and Peronet THOMPSON took up every economic controversy that had a conspicuous political side. The new Corn Law of 1815 gave birth to a multitude of pamphlets and books on the corn laws, and eventually, after HUSKISSON's reforms, to the movement that took shape in the ANTI-CORN LAW LEAGUE, and was kept up vigorously by the MANCHESTER SCHOOL of Free Traders. Concurrently with this movement and later in its political victory came the agitation for extension of the FACTORY ACTS, with a literature of its own. The discussions in regard to emigration (see SELKIRK) and (later) colonisation (see TORRENS, WAKEFIELD, and HILL-BURTON) as well as in regard to the reform of the poor law, produced not only small tracts but large volumes in which economists still find useful materials. The value of English blue books on such topics can hardly be over-estimated, and since the establishment of a labour department (1893) their usefulness in this particular field may be expected to increase. Where economic policy has touched closely the business of the City, as in the Bank Charter Act, the repeal of protective duties, and the repeal of the navigation act, commercial men have taken the lead in the composition of pamphlets contending for or against particular

measures by the aid, as a rule, of a popular political economy. Yet on such matters as banking and the foreign exchanges such pamphlets have not unfrequently achieved a permanent place in classical economic literature.

The great development in the last half century of organisation among the working classes has led to considerable modifications of economic theory (see WAGES FUND). This organisation has shown itself most notably: (1) in trades unions and other benefit societies among skilled labourers; (2) in co-operative societies for sale of goods. The former are federated somewhat loosely in the trades union congress, the latter very compactly in the co-operative union. Hitherto co-operative production in the sense of partnerships of workmen has not advanced rapidly. The latest phases of the organisation of the working classes are: (1) the growth of trades societies among women, and especially (2) the "new unionism," which has two chief features (a) the organisation of unskilled labourers, (b) the policy of united action by all the organised groups when the interest of perhaps only one is at stake. These movements have undoubtedly influenced politics in the direction of greater interference by the state than was contemplated by our forefathers.

Indications that political economy has not lost its attractiveness for the English mind may be seen in the foundation of the British Economic Association (1890), its organ the *Econ. Journal* (1891), and indeed in the present *Dictionary*. The *Econ. Review* (1891) covers partly the same ground, though not so strictly economic as the *Econ. Journal*. The Cobden Club is still on the watch against protection and over-interference of the state. The Statistical Society has a journal coeval with the society, embodying its transactions, with much other valuable matter. The *Economist*, under the editorship of such men as Wilson, Bagehot, and Palgrave, has done valuable service in presenting clear, vigorous, and solid economic argument on questions of the day. With the *Statist* it represents on the whole the views of the economists of the City. The *Banker's Magazine* does the same for the world of bankers. Many papers of a strictly economical character (especially those of Jevons and Giffen) have been published in journals like the *Contemporary Review*, not addressed to professional economists but to the educated public generally. It is to be regretted that fugitive economic literature, whether in pamphlets or articles, has not yet found its historian; J. R. McCulloch attempted the work in his *Literature of Political Economy* (1845), with a fair measure of success.

The series of volumes edited by McCulloch (printed for the Political Economy Club and Lord Overstone), in some degree supplement his work, at least for the early part of the period above treated; their titles are: *A Select Collection of Scarce and Valuable Tracts on Money*, London, printed for the Political Economy Club, 1856.—*A Select Collection of Early English Tracts on Commerce*, London, printed for the Political Economy Club, 1856.—*A Select Collection of Scarce and Valuable*

Tracts and other Publications on Paper Currency and Banking, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts and other Publications on the National Debt and the Sinking Fund*, printed by Lord Overstone, London, 1857.—*A Select Collection of Scarce and Valuable Tracts on Commerce*, printed by Lord Overstone, London, 1859.—*A Select Collection of Scarce and Valuable Economical Tracts*, printed by Lord Overstone, London, 1859.—*The Evidence given by Lord Overstone before the Select Committee of the House of Commons of 1857 on Bank Acts*, London, Longman, Brown and Co., 1857.—*Tracts and other Publications on Metallic and Paper Currency*, by the Right Hon. Lord Overstone, London, Longman, Brown and Co., 1858.

ENGROSSING. See **FORESTALLERS** and **REGISTRARS**.

ENREGISTREMENT, Fr. One of the principal divisions of the French finances, consisting of a registration duty on all deeds and documents, including notarial acts, judgments, contracts, sales, leases, indentures, wills, insurance policies, loans, articles of association, successions, transfers of property by gift or sale, etc. The duties are fixed or proportional—fixed for deeds not involving any pecuniary obligation; proportional when applied to acts stipulating a money consideration or a mutation of property. The registration dues produced in 1891 £27,600,000 independently of £6,640,000 for stamp duty. The proportional duty ranges

VI.

from 12½ centimes to 10f. 80c. per 100 fr., the highest rate being for legacies or gifts from strangers in blood. The registration dues have been frequently criticised for their exaggeration. M. Leroy Beaulieu describes them in his *Traité de la Science des Finances*, with the stamp duty superadded, as frequently occurs, as a fiscal brigandage. He admits the utility of registration as a record of transactions in case of loss of the original deeds, but adds that the tax is only justifiable provided that it is of moderate amount, whereas as it is established in France it frequently becomes a confiscation of private fortunes by the state. The duty for gifts *inter vivos* is substantially the same as for successions after decease; that on sales of real estate is 6f. 60c. per 100 fr., and the effect of this heavy charge is to restrict the free circulation of such property. T. L.

[*Code annoté de l'enregistrement et du timbre*, par Dalloz et Vergé, Paris, 1878.—*Annuaire de l'administration de l'enregistrement*, P. Dupont.]

ENSENADA, ZENON DE SOMODEVILLA Y BENGOCHEA, Marquis de la (1702-1782), died in Medina del Campo. Belonging to a noble but poor family, he joined the naval service as commissary at the age of eighteen, and through his personal merit rapidly rose to the highest rank; he made an immense fortune and received his title of marquis in 1736 from the Infante Don Carlos, afterwards Charles III. of Spain, then king of the two Sicilies.

In 1743 he was appointed at the same time secretary of state for the navy, war, the Indies, and finance, although he expressly declared that "he did not know one word of the latter subject." He remained in power until his fall in 1754.

Ensenada was one of the most efficient finance ministers of Spain, and in 1751 he informed the king that "all the requirements of the state were met," an assertion which no Spanish minister had been able to make since the accession of the house of Austria in the 16th century. Under his enlightened administration, the ordinary revenue rose in a few years from 211 to 360 millions of *reales* (say from 21 to 36 millions sterling), although he contrived to alleviate the pressure of the enormous and vexatious taxation which oppressed the lower classes of the population. He put an end to the scandalous exactions of the farmers of the *rentas reales* (royal taxes), and he deprived them completely of collecting the *rentas provinciales*, which he put under the direct administration of the crown. Looking on precious metals as ordinary commodities, he allowed the exportation of silver, subject to a duty of 3½ per cent when drawn from Spain and of 6 per cent when drawn from America. He established *registros* or register ships, which were allowed to trade with America, independently of the *flota* and galleons. The *flota* was the annual fleet between Spain and her American colonies, the galleons were the

3 B

trading vessels escorted by the fleet. He formed the design of doing away with the *millones* or numerous minor excise taxes and tolls which weighed on every transaction of daily life, and of compensating the resulting deficiency by a better management of the customs and of the excise on salt and tobacco, and by establishing in Castile the *unica contribucion* or single tax, which was to be of 4 per cent on every species of income and property. It had been suggested for more than a century by the majority of Spanish economic writers and introduced into Catalonia in 1729. The preliminary survey or *catastro* was begun under his direction. Ensenada also abolished the internal duties, which interfered with the transport of corn from one province to another, and improved the means of internal communication. The royal navy, military ports, and arsenals were the object of his incessant and successful exertions, which were extended to almost every branch of government.

Ensenada's views and plans are explained in clear and straightforward language in the *Representaciones*, which he submitted to King Ferdinand VI., and which have been given in full for the first time in Don Antonio Villa's excellent biographical essay (*El Marques de Ensenada*, Madrid, 1878). One of them, written in 1751, will be found, although not quite complete, in the *Semanario Erudito* of Valladares (Madrid, 1788, vol. xii. p. 260), and in French in the French translation of Coxe's *Memoirs of Spain under the Bourbon Kings*, published by Andres Muriel in Paris in 1827 (*L'Espagne sous les rois de la Maison de Bourbon*, vol. iv. p. 282). Coxe gives a very favourable account of the internal administration of Ensenada (ch. liv.); which will be discussed in a special notice by Count Fernan Nuñez in his *Vida de Carlos III.*, now (1892) in the press. E. ca.

ENTAIL, LAW OF. An entail is defined by Wharton (*Law Lexicon*) as "an estate settled with regard to the rule of its descent." The object of legislators in recognising entails has been to preserve estates undiminished in the hands of successive generations of the same family. This fixity of landed property was essential to feudalism, which based the political rights and duties as well as the social consideration of each individual on his relation to the land. Feudal law, therefore, regulated the disposition and devolution of land less with reference to the wishes of the owner or to the increase of the riches of the community, than with reference to the permanence and efficiency of the feudal organisation. Feelings of family pride deepened by feudal ideas contributed in turn to perpetuate the system of entails which had fostered them. But in the main the system of entails is a political institution.

In one form or another the system of entails

may be traced in every country where feudalism established itself. In many of those countries it disappeared in the series of political changes which opened with the French Revolution. In England, however, it has survived, but with many modifications which have almost destroyed its identity. The English law relating to entails may be considered under three heads:

I. The doctrine of "estates" in land; II. the practice of making settlements of land; III. the modifications recently made in the law relating to land.

I. The unity of ownership, so prominent in Roman law, is almost lost in the feudal land law. In England land is not technically an object of private ownership, since the crown is supreme lord of all the land of England. Private persons can only have *estates*, *i.e.* interests more or less extensive in land. Many different persons may have estates or interests in the same piece of land. In freehold land there are three different estates: (a) estate in fee simple, (b) estate tail, (c) estate for life. Estate in fee simple or an estate to a man and his heirs is practically, although not technically, the same thing as full ownership. The tenant in fee simple has the fullest power of enjoying and disposing of the land. An estate tail is an estate to a man and the heirs of his body, *i.e.* to a man and his descendants. It may be an estate in tail male, *i.e.* descending only to male offspring, or an estate in tail female, *i.e.* descending only to female offspring, or an estate in tail special, *i.e.* descending only to offspring by a particular wife. But estates in tail special, are, in practice, very uncommon. When the offspring of the tenant in tail are all deceased, the estate tail is at an end and the land reverts to the grantor of the estate tail or to his representative. Thus an estate tail is a smaller interest in the land carved out of the fee simple estate. When there is an estate tail in one party there must be a reversion in fee in another party. An estate given to a man and the heirs of his body was at first regarded as a fee simple estate given conditionally upon the birth of issue. When the tenant had issue he acquired the right of alienating so as to defeat the rights of his heirs and also of the reversioner. By the statute *De Donis Conditionalibus* (13 Ed. I. c. 1), the power of alienation was entirely taken away. But within two centuries the lawyers invented methods of evading the statute, namely, the collusive actions known as *Fines* or *Recoveries*, whereby the tenant in tail could once more alienate his land, and defeat the rights of heirs and reversioners. By the Act for the Abolition of Fines and Recoveries (3 & 4 Will. IV. c. 74), these actions were superseded and the tenant in tail was enabled to attain the same object by simply executing a deed to that effect and having it enrolled in

a public office. Thus a tenant in tail can turn his estate tail into an estate in fee simple, and acquire virtually unrestricted ownership. An estate for life does not descend to offspring of the tenant, and cannot be enlarged so as to extinguish the rights of the reversioner. The position of the tenant for life at common law, and previously to certain modern statutes, was that of a usufructuary, who might enjoy the income, but might not change the character, much less impair the capital value, of the property. Thus he could not open mines, fell timber, or plough up old meadow land. Nor could he dispose of the land by way of gift, sale, or exchange, or lease it for more than a very limited period. He has been recently invested with very wide powers which will be explained later on.

II. The settlements of real estate in use date from the 17th century. When a landowner executes a settlement, he usually reserves a life estate to himself and gives an estate in tail to his eldest son with remainders in tail to his other sons. The eldest son, when born, acquires an estate in tail to take effect after his father's death. Such a future estate in tail cannot be barred without the consent of the tenant for life, who is called the protector. If the son held out till his father's death, he would become tenant in tail in possession, and then could bar the entail and get an estate in fee simple. But whilst his father lives he has nothing. Therefore, when he wants an establishment of his own, he has every reason to join with his father in making a new settlement similar to the old one. Thus the perpetuation of an estate in the same family is ensured. But the powers of a tenant for life at common law were not enough even for the proper management of an estate. In every well-drawn settlement there were appointed trustees, invested with powers of selling, exchanging, or leasing parts of the estate and of executing permanent improvements and charging the estate with the cost thereof. These powers the trustees were to exercise only with the consent of the tenant for life and with a view to the interest of all persons entitled under the settlement.

III. The modifications recently made in the law amount to bestowing upon the tenant for life powers similar to those bestowed upon the trustees by the settlement. A series of statutes of the present reign ending with the Settled Land Act of 1882 has annexed to the character of tenant for life the fullest powers of alienating the whole or parts of the estate, and of employing the proceeds either to buy other land or to pay off encumbrances on the fee simple, or to make permanent improvements, or to invest in certain specified securities. The tenant for life now combines two totally distinct characters: his former character of

usufructuary, and his new character of trustee for all parties (himself included) who have an interest under the settlement. The settled estate is now to be regarded not so much as land, but as capital which happens to be invested in land, but may be invested otherwise at the discretion of the tenant for life. It remains to notice the objections made by economists against systems of entail generally, and to consider how far they are applicable to the system of entails now existing in England. These objections are principally two: I. entails check the improvement of land; II. entails restrict the transfer of land.

I. Entails check the improvement of land, and so lessen the wealth of the community; because the limited owner, as compared with the absolute owner, has (a) less motive to improve and (b) less power of improving. (a) The limited owner has less motive to improve his land, because he cannot dispose of it by sale or testament, and because the property will all go to one son, without affording a provision for the other children. Hence the limited owner is exposed to the temptation of desiring to apply the whole income of the land, either to his own purposes or to making a provision for daughters and younger sons. The English tenant for life cannot now be deprived of the power of selling his land, but he can touch only the income of the proceeds. This objection, therefore, is lessened rather than removed by recent legislation. (b) The limited owner lacks power to improve the land, because (i) his freedom of action has been narrowly regulated by law. (ii) His land may have been encumbered with charges created in favour of other members of his family, which lessen the net income; (iii) he has to make provision for children other than the heir, and is thus further straitened.

(i) The English tenant for life (see Settled Land Act, 1882), has now the legal right to do almost anything which the tenant in fee simple could do. His means for permanent improvement are now much greater than they were formerly, since he can sell part of his land in order to raise capital for improving the rest. He can do this without impoverishing his younger children, as the land which he sells would under the settlement have gone to the eldest son. (ii) The charges on the land to provide a jointure for the widow of the late tenant for life, and portions for the younger brothers and the sisters, are not affected by recent legislation. They form deductions from the gross income of the tenant for life, and lessen his means of improvement. (iii) The tenant for life still has to provide for his younger children, and may thus be tempted to set apart for them money which might with advantage be spent on improving the land. Recent legislation, therefore, whilst much enlarging the powers of improvement possessed by a tenant for life, has

not put him upon an equality in this respect with the tenant in fee simple.

II. It is said that a system of entail deprives landowners of (a) the power, (b) the motive to sell their land, and thus produces the following evils:—(i) the retention of land in the hands of persons who may be too impoverished to improve it; (ii) the exclusion of capital from being employed in the improvement of land which under a system of free sale would be purchased by capitalists; (iii) a restriction in the number of landowners, which diminishes the stability of society; and (iv) the removal of a strong motive to industry and economy in the labouring class, namely, the hope of becoming the owner of a piece of land.

That the power to sell is wanting, under a complete system of entail, is clear. That it is not wanting under the modified system of entail now existing in England is also clear. The motive to sell is still wanting to the tenant for life, in so far as he cannot appropriate the capital sum paid by the purchaser. But, since his income is much reduced by prior charges, and by the necessity of saving for children other than the heir, he has the strongest inducement to exchange an investment like land, which at the present day rarely pays more than 2 per cent, for investments like railway debentures, which pay 3 per cent. For the increase of return all goes to swell his income, the charges upon it remaining the same.

Under the Settled Land Act, a good deal of land has been sold in England. But hitherto land has been offered for sale mostly in large masses. For this there are several reasons:—(i) the influence of habit upon those who conduct the sale of land; (ii) the extravagant expenses connected with making out a title, which may be as heavy for a small piece of ground as for a large estate, and so act as a prohibitory tax on sales of small parcels; (iii) the present condition of the market for agricultural produce which represses any strong desire, in the English middle or lower class, to become freeholders. Energetic persons engaged in agriculture prefer to employ their capital in working a large farm rather than in buying a small one. Other small capitalists dislike so risky and unproductive an investment as land is at the present time. For all these reasons the estates which have come into the market have generally been bought undivided by wealthy men who can afford to place great sums in a sort of property which gives social consideration and out-of-door amusement, but yields only a paltry return in money. Thus the sales which have taken place in England are not believed to have much increased the number of landowners. In Wales, the tenants sometimes buy their farms when offered for sale. In Ireland the tenants are almost the only purchasers. In those countries the number

of landowners is thus increasing. Moreover, as small owners rarely make family settlements, an increasing part of the land in Wales and Ireland is no longer subject to a system of entails, but is held by tenants in fee simple.

[For the legal learning of entails, the reader may consult Kenelm Digby's *History of the English Law of Real Property*.—Williams' *Law of Real Property*.—Goodeve, *Modern Law of Real Property*.—*The Land Laws*, by Sir Frederick Pollock (English Citizen Series), and many other text-books, together with the statutes and leading cases to which they make reference. Some interesting observations upon the rise of feudal systems of tenure, upon entails and primogeniture, will be found in Maine's *Ancient Law*, ch. vii., and *Early Law and Custom*, ch. ix.

Of the writers who have considered entails in their economic aspect, only a few can be mentioned here: Adam Smith, *Wealth of Nations*, bk. iii. ch. ii., who dwells on the injustice to younger children caused by entails, and asserts in terms much too absolute the improbability of a great proprietor executing great improvements.—M'Culloch, *Principles of Political Economy*, who justifies primogeniture by its effect in raising the fashionable standard of living, and so giving an impetus to the pursuit of wealth.—Mill, *Principles of Political Economy*, bk. v. ch. ix., who condemns entails partly as encouraging idleness and extravagance, partly on the grounds above explained at length.—Boyd-Kinney, *Principles of Property in Land*.—Cliffe Leslie, *Land Systems and Industrial Economy*.—A volume of the Cobden Club Essays, entitled *Systems of Land Tenure in various Countries*.—George Brodrick, *English Land and Landlords* (also included in the Cobden Club Essays).—Shaw Lefevre, *English and Irish Land Questions*.—Arthur Arnold, *Free Land*.—Kay, *Free Trade in Land*, etc. None of these writers can be said to have fully considered the latest stage of the English law relating to this subject, and therefore many of their criticisms are partially obsolete.] F. C. M.

[Refer for other sides of the question to BEQUEST, POWER OF; MORCELLEMENT.]

ENTAIL (SCOTLAND) anciently and still sometimes called tailzie, from Lat. *talliatum*, cut off; any deed by which the ordinary legal course of succession is cut off and a fresh one substituted. The power to create an entail, previously doubtful in Scotland, was definitely given by the act 1685 c. 22. Every proprietor in fee since that date may grant a simple destination which merely names a succession of heirs, each one of whom may dispose of the estate as he pleases, and whose successor in the destination merely takes in default of such disposition, or he may protect the succession he prescribes by restrictive clauses forbidding any interference with the succession by selling, alienating, or disposing of the lands, contracting debt, or doing any deed whereby the succession might be frustrated. These clauses must be inserted in all title-deeds, and the entail with the judicial authority of the court of session

must be recorded. Every act or deed contravening these restrictions was declared null, and the real heir might, on contravention, take up the estate. In 1770 the heir in possession of entailed lands was allowed a modified power of leasing, and of charging against future heirs a proportion of the expense of improvements on the property by the Montgomery Act, 10 Geo. III. c. 51. Further relaxations were granted in 1824 by the Aberdeen Act, 5 Geo. IV. c. 87, enabling an heir of entail in possession to make limited provisions in favour of a husband or wife or children, which were payable by the successors out of the yearly rents or proceeds, but did not affect the fee of the entailed estates; by the Rutherford Act 1848 the fee may now be charged in favour of younger children. But no powers either under the Montgomery Act or the Aberdeen Act could be exercised so as to deprive the successors of more than two-thirds of the free yearly rents. In 1836 the Rosebery Act, 6 & 7 Will. IV. c. 42, gave the heir in possession a limited power to sell parts of the estate for the entail's debts under the authority of the court of session. In 1848 the Rutherford Act, 11 & 12 Vict. c. 36, first conferred on an heir of entail in possession the power to disentail. Elaborate and intricate provisions were made by the Rutherford Act distinguishing between entails made before and after its date, and heirs in possession who were born before or after that date, with regard to the consents required to disentail. Broadly speaking, if the heir in possession was born before the act and the entail was made before the act, he requires the consent of all the heirs if less than three, or of the next three heirs, or of the heir apparent and two of the heirs who would, including the heir apparent, be successively heirs apparent, provided the nearest heir be twenty-one years old; or if such consents be refused by any heir, even, since 1882, the nearest heir for the time, the court may assess the value of the heir's interest and dispense with his consent on the payment to him of the value of his interest, or sufficient security for such payment. The next heir in succession thus receives a lump sum for his expectancy instead of getting, as in England, the interest of the purchase money if and when he succeeds in lieu of his interest in the land. The distinction between old and new entails is now removed. Other powers now possessed by heirs in possession of entailed estates are—to sell under the same conditions as those of disentailing, to excamb, or exchange, any portion of the entailed estate for an equivalent in contiguous lands, without any consent, taking or giving not more than £200 for equality of exchange, to grant feus and leases, to charge improvements, and to charge family provisions in favour of the wives, husbands, or children of heirs of entail in possession.

[Rankine, *Land Ownership*, chap. xxxiv.—Bell's

Principles, § 1716, *et seq.*—Duff on *Entails*.—Duncan on *Entail Procedure*.] J. W. B. I.

ENTREPÔTS. A term applied in France and other countries to places of deposit for goods, analogous to the bonded warehouses in the ports and trade centres of the British Empire. In them articles subject to custom or excise duties may be placed, until time of payment of the imposts to which they are liable on delivery for consumption, or until removal for the convenience of trade, or exportation to foreign countries. In the latter case the importers are relieved altogether from the necessity of the revenue payments, and in the others this outlay need not be incurred until such time as the consumers are ready for their use. In this country, where an immense transit trade centralises, where the operations are often of great magnitude, and the few duties retained are great in proportion to the prime cost of the articles, the facilities afforded by this system permit of much trade being carried on which would otherwise be cramped or altogether prevented. The use of capital is economised, and excessive fluctuations in price are checked by the large stocks it is possible to retain on hand, as well as the speed with which supplies may be transferred to the consumers, at a lessened cost for time and money expended. On the other hand, the care bestowed upon their safe custody, and the supervision of the necessary operations, such as sorting, vattling, and other processes, constitutes a charge upon the revenue for the benefit of the consumer or trader.

These observations apply with much greater force to the "entrepôts" established in France and elsewhere, because of the multitude of articles which have, for the security of the revenue, to be taken in charge, at a considerable cost if the supervision be effectual, or of risk if it be insufficient. There, too, it is not only the national revenue which, as here, has to be safeguarded, but also the municipal tolls in the shape of *octroi*. It is mainly this which has led to the division of these *entrepôts* into "*réels*" where the goods are actually kept in custody, and "*fictifs*," nominal or conventional, where the owner has them in his own charge, but is answerable for the payment of the duties to which they are liable. See also BONDED WAREHOUSES.

[*Nouveau Dictionnaire d'Économie Politique*, 1891, vol. i. p. 898; and *Dictionnaire des Finances*, 1889, vol. ii. p. 118.] S. BO.

ENTREPRENEUR. An alternative name for the employer (see EMPLOYERS and EMPLOYED). Adam Smith (*Wealth of Nations*, bk. i. ch. vi.) used the term "undertaker," and J. S. Mill (*Political Economy*, bk. ii. ch. xv. § 1 footnote), expresses his regret that "this word, in this sense, is not familiar to an English ear." He adds that "French political economists enjoy a great advantage in being able to

speak currently of 'les profits de l'entrepreneur'; and it seems that, partly perhaps in consequence of this, political economy has in France avoided the mistake committed by some of the older English economists in failing to distinguish the functions of the employer and his share in the produce of industry as such from the functions and share of the capitalist as such. General F. A. Walker (*Wages Question*, ch. xiv.) echoes Mill's regret that "we have not a single English word which exactly fits the person who performs" the office of the employer in modern industry. "The word undertaker," he remarks, "at one time had very much this extent," and so had the word "adventurer." But they have since acquired other senses. The "French word entrepreneur," however, he adds, "has very nearly the desired significance, and it may be that the exigencies of politico-economical reasoning will yet lead to its being naturalised among us." L. L. P.

[See also FRENCH SCHOOL.]

ENTRY, BILL OF. The name given to an office within the custom house at London, and other ports of the United Kingdom, from which there issue daily lists of ships arriving and sailing, with accounts of their cargoes, deliveries from bonded warehouses, and other particulars of considerable interest to the mercantile community. In addition to these printed publications, manuscript accounts are rendered to those who may desire such special information as can be gleaned from the customs records, or may be compiled from the various documents and forms supplied for customs purposes. The printed lists are sold to subscribers, and the special returns are paid for in proportion to their length or the trouble involved in their preparation, for the exclusive use of those at whose expense they are compiled.

The history of this arrangement is somewhat peculiar; it is, or was until recently, a remnant of the old times when special privileges were conferred on favoured individuals for their pecuniary advantage, or in return for payments made by them. One of these acquired, in 1660, by letters patent, the exclusive right of access to all official documents connected with the customs reports and entries, and of obtaining and publishing any portion of the information they furnished. Ultimately, in 1817, this right became vested in the Customs Annuity and Benevolent Fund—a mutual insurance fund supported by payments of the officers themselves, supplemented by the profits of the bill of entry, and devoted to the sole benefit of their widows and orphans. Through the energy and wisdom of the directors this had grown to be a valuable business, which, at the expiration of the crown patent, in 1880, the treasury appropriated to its own benefit, and it is now profitably carried on by the commissioners of customs. The public funds thus

became possessors of a private property created by independent exertions on behalf of a charitable purpose.

The existence of such a source of information is of great advantage to merchants, statisticians, traders, and shipowners, by enabling them to obtain correct knowledge on points too minute, too varied, and too numerous to be set forth in the periodical returns of trade and navigation laid before parliament.

[*Reports of Commissioners of Customs.—Bill of Entry*, Journals A and B.—Bourne, *Royal Statistical Society's Journal*, vol. xxxv. pp. 214-215, 1872.] S. B. O.

ENTRY, RIGHT OF. The payment of the rent, and the performance of the covenants in a lease, are usually secured by a "condition or proviso for re-entry," which enables the landlord on non-payment of the rent or non-performance of the covenants, to take possession of the premises let, as if no lease had been made. The courts of equity and the legislature have, in a certain measure, succeeded in preventing landlords from making any oppressive use of this power. Thus a tenant who has been ejected in consequence of the non-payment of rent may be reinstated if he pays the rent and costs within six months after the execution of the judgment. As regards the non-performance of covenants, not relating to the payment of rent, and not belonging to one of the excepted classes referred to below, a right of re-entry or forfeiture is not enforceable unless the tenant has failed to comply with the terms of a notice specifying the breach and requiring him to remedy it and to pay compensation in money in respect of it (Conveyancing Act, 1881, § 14). In such cases forfeiture is therefore impossible, except when the breach is wilful and persistent. The rule just mentioned does not, however, extend to covenants against assigning and underletting, and the omission to obtain the landlord's consent to an assignment or underlease of the premises may lead to the forfeiture of the lease although it was due to forgetfulness on the part of the tenant's solicitor, and although the landlord would not, under the circumstances, have withheld his consent if asked for (*Barrow v. Isaacs* [1891], i.; *Queen's Bench*, 417). The attempts to induce the legislature to enact some provisions more favourable to tenants in respect of such covenants have proved abortive, and their only result has been § 3 of the Conveyancing Act of 1892, which provides that in the absence of an express agreement to the contrary, a landlord shall not make his consent to an assignment or underletting dependent on the payment of a sum of money beyond a reasonable amount in respect of expenses. Conditions for forfeiture on the bankruptcy of the tenant, or on the taking in execution of the tenant's interest, were also originally excepted from the rule granting relief

as stated above ; but it is now provided by §§ 2 and 3 of the Conveyancing Act of 1892 that, subject to certain exceptions, a lease is not to be forfeited in such a case, unless the tenant's interest remains unsold within a year after the date of the bankruptcy or of the taking in execution. The practical importance of the exception is materially reduced by this alteration. E. S.

ENUMERATED COMMODITIES. This term has two distinct meanings, according as it is applied : (1) to the European trade of England ; (2) to the colonial trade of England. In both cases it refers to commodities which were originally enumerated in the Navigation Act of 1660, but which were altered from time to time by subsequent legislation.

(1) With regard to the European trade, the first Navigation Act in 1651 forbade the importation of European products except in British ships, or ships of the country where the goods were produced, or from which they could only be, or most usually were, exported. The second Navigation Act in 1660, while adopting most of the provisions of 1651, modified this particular article. It renewed the restriction about importation to (1) all Russian and Turkish products, and (2) certain enumerated commodities : viz. timber, salt, pitch, tar, rosin, hemp and flax, raisins, figs, prunes, olive oils, all kinds of corn or grain, sugar or potashes, wines, vinegar and spirits (12 Car. II. c. 18, § 8). All other European goods could be imported in any vessel. Two years later a further restriction was made, and it was provided that certain goods should not be imported into England in any ship whatever from Germany, Holland, and the Spanish Netherlands. This second list of enumerated commodities included all wines other than Rhenish, spices, grocery, tobacco, potashes, pitch, tar, salt, resin, timber, and olive oil (13 & 14 Car. II. c. 11, § 23). Changes in the enumeration were made at intervals in obedience to momentary pressure or changing interests. But no great relaxation of the system of 1660 and 1662 was made till 1822, when the importation of enumerated goods was extended to ships of the country or place from which they were imported ; and at the same time the exceptional restrictions upon trade with Germany, the Netherlands, Russia, and Turkey, were abolished (3 Geo. IV. c. 43, § 6). The distinction between enumerated and non-enumerated commodities disappears altogether after the repeal of the Navigation Act in 1849.

(2) As applied to the colonial trade, the term enumerated commodities had an equally important significance. The act of 1660 limited all trade, both of export and import, with British plantations in Asia, Africa, or America to British ships. But it added a distinction between those colonial products which could only be carried to England and those

which might be carried, still in British ships, to countries other than England. The former, which are the enumerated commodities in this connection, naturally included all those commodities which England did not produce herself, or did not produce in sufficient quantity for her needs. The non-enumerated commodities, which included all those goods in which the home producers dreaded colonial rivalry, were originally allowed to choose any market outside England, but were ultimately limited to countries south of Cape Finisterre. The motive for this restriction was to prevent the manufacturing rivals of England from obtaining raw materials from our colonies. These and other oppressive regulations with regard to colonial trade were undoubtedly a chief cause of the revolt in 1774 of the American colonies, whose success dealt a fatal blow at the policy of the navigation acts, and in 1796 the United States were allowed to carry their goods in their own ships to Great Britain. In 1822, the distinction of enumerated commodities among colonial products became obsolete, and the colonies were allowed to export not only their own produce, but their imports from other countries, to any place in Europe, Africa, or America, either in British ships or in ships of the country to which they were exported (3 Geo. IV. c. 44, § 4, and c. 45, § 2).

[M'Culloch's edition of Adam Smith, note xi., and Leone Levi, *History of British Commerce*, pt. iii. ch. ii., give a clear account of the enumerated commodities in European trade. For the term as applied to colonial products see Adam Smith, *Wealth of Nations*, bk. iv. ch. vii. pt. 2.] R. L.

ÉPHÉMÉRIDES. About the middle of the 18th century proposals for reform both in finance and agriculture began to interest the French public. In 1751 a special review, the *Journal économique ou Mémoires, Notes et Avis sur l'agriculture, les arts, et le commerce*, was established in order to deal with these subjects. This journal contained essays both on practical and theoretical questions ; the latter presenting restrictive as well as liberal views. Recommendations of free-trade in corn, and translations of the works of English economists, such as TUCKER and HUME, strengthened the position of the French school of free trade who became afterwards the physiocrats. The *Gazette du Commerce*, established in April 1763, admitted the contributions of Le Trosne and St. Péravy as well as those of their opponents. The government, favouring these discussions on the corn policy, bought up this newspaper and connected with the *Gazette du Commerce* a special review, the *Journal de l'Agriculture, du Commerce, et des Finances* (1764). This *Journal* soon passed into the sole possession of the physiocrats and was their organ from September 1765 to November 1766. It ceased to appear in 1783.

Among the periodicals treating on subjects akin to those dealt with by the *Journal de l'Agriculture* was a weekly paper, the *Éphémérides du Citoyen ou chronique de l'esprit national* (6 vols. 12mo), established in December 1765, after the model of Addison's *Spectator*, by the Abbé Baudeau. He intended through its means to defend the interests of "humanism" by pleading for the abolition of slavery in the colonies. He, however, employed his organ to attack the Economists, professing for his own part mercantilist views and a detestation of free-trade. Le Trosne replied in the *Journal de l'Agriculture* of March 1766 to Baudeau; the latter answered, but soon desisted, for, after reading but half a page of Le Trosne's private observations on the futility of the "balance of trade," he abandoned his intention of continuing these polemics. Shortly after this the Marquis of Mirabeau brought Baudeau fully to agree with the physiocratic school. This event, *le saut de la science*, proved very important for the progress of the Economists. For the *Éphémérides* was ready to receive their contributions just at the time that the editor of the *Journal de l'Agriculture* put difficulties in their way (December 1766). After January 1767 the new organ appeared as a monthly review under the title *Éphémérides du Citoyen, ou Bibliothèque raisonnée des Sciences morales et politiques*. Baudeau remained its editor till May 1768, when his place was taken by Du Pont de Nemours. The most eminent writers of the physiocratic school contributed to this journal. Among the most interesting articles are the following:—Quesnay's "Essays on the Government of Peru" (1767, t. i.); he declares that the system of tithes in Peru proves its ancient government to have been the most prosperous and the fairest in the world.—On "Despotism in China" signed M.A. (1767, t. iii., iv., v., vi.), in which he describes Chinese political institutions as exhibiting "an order of essential stability," besides minor articles (1767, t. x., 1768, t. ii.); cp. Oncken's edition of Quesnay's *Œuvres*, pp. 660-692.—Mirabeau's "Letters on the Legal Order." In these he undertakes to give an historical account of the causes of economic legislation, and the study of the "physical" causes leading towards its reform (1767, t. ix., x., xi., xii.; 1768, t. i. to vi., viii. to xii.; 1769, t. i. to iii., v.).—On the economic education of girls; insisting upon the necessity of instructing them in the science of the natural social order (1768, t. iii.).—Dialogues between a child and its teacher, on the use of science to princes (1769, t. vi. to ix.).—Historical eulogies on Sully, whose merits as statesman and as a predecessor of the physiocratic school are dilated on (1770, t. iii. to xii.; 1771, t. i. to xi.).—Baudeau wrote "Avis au peuple sur son premier besoin," treating of a free trade in corn, the best manner of baking bread, and on its price (1768, t. i.,

ii., iv., v.). "Avis aux honnêtes gens, qui veulent bien faire," dealing with the effects of the bad harvest of 1769, and the methods pursued to cheapen the price of bread (1768, t. x., xi.; 1769, t. x.). An Explanation of the *Tableau Économique* to Madame de—("political economy made easy") (1767, t. xi., xii.; 1768, t. viii.; 1770, t. ii.). On luxury, its destructive effects on agriculture (1767, t. i. to iii.). "On the actual state of Poland," on the causes leading to its destruction by the Moscow policy (1770, t. ii. to iv., xi.; 1771, t. i., iii. to v.).—There are also some observations by Butré respecting agriculture on a large and a small scale, illustrated by accounts of farms and estates cultivated on the Métayer principle, and proving the unprofitable character of the latter (1767, t. ix., xi., xii.).—Among Du Pont's contributions his "Notice abrégée" containing the first sketch of a history of economics, particularly deserves mention (1769, t. i. to iv., vi., ix.; 1770, t. i. *avertissement*).—Among the latest important articles were Turgot's "Réflexions sur la formation et la distribution des richesses" (published in 1769, t. xi., xii., and 1770, t. i., but written in November 1766) and the "Abrégé de l'économie politique" by the Margrave of Baden-Durlach (1772, t. i.).—Minor articles were written by Roubaud, St. Pérary, Le Trosne, Morellet, Franklin.—Criticisms are also included directed against Linguet (1767, t. iii.; 1770, t. i.), who, in his *Théorie des lois civiles*, 1767, had taken no notice of the physiocratic conception of natural law, and in accordance with Hobbeism had declared that "l'esprit des lois—c'est la propriété"; Forbonnais, who is censured on account of his attacks against the physiocratic theory that trade was a simple exchange and not affording a "produit net" (1767, t. vi., ix.);—against the attempted refutation of their doctrine by Graslin, the author of an *Essai sur la Richesse et sur l'Impôt* (1768, vol. ii., iii., x.);—against the *Doutes adressés aux philosophes économistes* by Mably, who had from the communistic standpoint attacked the foundation of this system, the right of private property (1768, t. ii., iii., v. to viii.; 1769, t. v.).—The *Éléments généraux de Police* of Justi (1769, French edition), is shown to be a work of very shallow and contradictory views, which maintains the wisdom of grandmotherly regulations (1769, t. ii., iii.); Galiani's *Dialogues sur le Commerce des Bleds*, one of the wittiest productions of economic literature, is described as "un ouvrage charmant, qui renferme les plus jolis lazzi du monde" (1769, t. xi., xii.); Baudeau also criticised Beardé de L'Abbaye's *Recherches sur les moyens de supprimer les impôts, précédées de l'examen de la nouvelle Science*, 1770, a criticism directed against the single-tax theory (1770, t. vii.); and Pinto the mercantilist "Pindar of the stock exchange" (*Traité de la circulation et du*

crédit, 1771), (1771, t. x.). Besides these articles the review contained a chronicle of public events considered to be symptoms of the progress of the doctrine of the physiocrats: this includes the utterances of the French *parlements* in the provinces on the corn-trade; the emancipation of serfs in Denmark; the encouragement given publicly to agriculture by the heir-apparent of the crown (Louis XV. being king), the Dauphin Louis, who on the 15th June 1768 himself held the plough at Versailles (1768, t. vii.; 1769, t. viii.). Louis was followed in this by the Emperor Joseph II., who drove a peasant's plough, the 19th August 1769, at Slavikovitz in Moravia (1770, t. xii.). These events have been commented on by Diderot in a review which he wrote about the *Éphémérides*, in the following words: "Plough, plough as much as you will; I promise you that as long as matters stand on their present footing, the wheatseaf growing under your royal hands will not nourish your peasants" (*Œuvres*, t. iv. p. 85). An account is given of an experiment made by the Marquis de Mirabeau and his son at Aigueperce in Limousin, to form a *bureau de conciliation*, composed of prud'hommes elected by the parishes, in order to avoid the frequency of lawsuits. The experiment was imitated by the Marquis de Sérent at Malestroit in Bretagne; it was a precursor of the modern boards of conciliation (1771, t. iii. p. 110-194; t. vii. p. 183, cp. Loménie, *Les Mirabeau*, t. ii. p. 79; t. iii. p. 59). This part of the *Éphémérides* contains some statements about financial reforms in foreign countries, especially of the experiment of a "single tax" on land (*impôt unique*) in Baden (1771, t. iv., v., vi., vii.), with the performance of which Schlettwein was entrusted in the village of Dietlingen (1770) (see *IMPÔT UNIQUE*).

The *Éphémérides* was suppressed by the Controller-Général, the Abbé Terray, in November 1772 (t. iii. is the last of the sixty-three volumes of this series). The editors sought in vain to connect themselves with other journals. It is characteristic of him that, after being forbidden to publish the *Éphémérides* in 1772, Du Pont continued to work in their line by issuing a fortnightly *Correspondance littéraire et politique* in MS., and to send transcripts to the monarchs interested in the physiocratic doctrines (cp. *Carl Friedrichs von Baden brieflicher Verkehr mit Mirabeau und Du Pont*, edited by Carl Knies, Heidelberg, 1892, vol. i. p. 151-152; cp. also vol. i. pp. 21, 56, 57, 61; vol. ii. p. 109 seq., 197). After a three years' silence Turgot, who had become minister, enabled the Abbé Baudeau to resuscitate the review. It thus became almost an official organ intended to explain and justify Turgot's politics. In December 1774 appeared the first part of these *Nouvelles Éphémérides Économiques, ou Bibliothèque raisonnée de l'Histoire et de la Politique*

(18 vols., 12 in 1775, 6 in 1776). The *Journal de l'Agriculture* too became again an organ of the physiocratic school under the direction of Abbé Roubaud. Among the contents of the *Nouvelles Éphémérides*, the following are remarkable: "Letters and Memoirs written to a Magistrate of the Paris Parliament on the Arrêt of September 13th, 1774," by Baudeau (1775, t. i.) This is an historical and theoretical interpretation of the causes which lead on to Turgot's celebrated ordinance, by which the free circulation of corn in the provinces of France was established and its free exportation abroad was made the object of future decisions of the government (see Turgot, *Œuvres*, 1844, t. ii. p. 169).—Bigot de Ste. Croix's posthumous *Essay on the Abuse of Exclusive Privileges, on the Freedom of Trade and Industry* (1775, t. i. iii.), is a literary forerunner of the abolition of corporations by Turgot.—The third part of vol. i. (1775) opens with an *Éloge funèbre de M. François Quesnay*, delivered by the Marquis de Mirabeau four days after the master's death, the 20th December 1774. T. v. of the same year contains an historical eulogium of Quesnay by the Count d'Albon.—Baudeau again contributes inquiries and historical memoirs on the finances of France from Louis XII. to Louis XV. (1775, t. ii., iii.), and a refutation of an author who had written in defence of the Corvée system.—The Marquis de Pezay writes an essay on *The Fortification of the Military Frontiers of Alsace*.—Fréville inserts a translation of extracts from A. Young's *Eastern Tour through England* (1775, t. ii. iii.), and *On the Present State of British Commerce* (1775, t. viii.) Turgot's ordinance, which allows again leases of twenty-nine years' duration (January 2, 1775) is published as a memorable event (t. ii.).—The general aspects of the school are dealt with in a *Letter on the Economists* (1775, t. iii.); in this the contrast between formal liberty, adhered to by the economists, is contrasted with the postulate of economic equality and the latter declared unnatural. Still the fundamental principle of the economists is declared to be the truth, that "the particular happiness of individuals can only be reasonably and firmly established upon the basis of the general happiness of the whole race" (1775, t. iii. p. 59). The philosophical and political ideas of the physiocratic school are embodied in a *Memoir on Public Instruction* by Mercier de la Rivière (1775, t. ix. x.), and in Roubaud's *Political Reflections on America* (1776, t. iii.), which are full of sympathy for separation of the colonies from England.—Finances are dealt with in *Reflections of a Citizen on the financial administration of great cities, and especially of the City of Lyons* (t. iv.), written to oppose indirect local taxation; they exhibit the destructive tendency of the physiocratic doctrine for local life by subjecting it to central government. An essay

is directed against the heavy taxation of tanneries after 1759 (1775, t. iv., also 1776, t. iv.), and of salt, spirituous liquors and tobacco; this essay, *Le Profit du Peuple et le Profit du Roi*, had been previously written in 1769 by Baudeau, and twelve copies only printed, 1775, t. iv.; cp. a letter to Baudeau on that subject in 1775, t. x., extracted from *Nouvelles de la République des Lettres* (Lausanne, vol. i. 1775); cp. also the criticisms on Baudeau's essay contained in *Nouv. Eph.*, 1776, t. ii. p. 70, taken from the *Journal Encyclopédique* of 1775, vol. viii. Other articles deal with the suppression of the duty on fish coming to Paris during Easter-time (1776, t. iv., and Turgot, *Œuvres*, ed. Daire, vol. ii. p. 402), and the suppression of a series of duties in Russia by Catherine II. (17th (28th) March 1775, t. vii.). Historical details are given relative to duties laid on eggs, butter, cheese (1776, t. i.), on wines coming to Paris (1775, t. v.), and likewise on such imports within Champagne (1776, t. iii.). A new method of levying the duty on brandy is described, and the weight of the impost of 1771 on the manufacture of paper, 33 per cent on the cheapest sorts, is complained of (1776, t. v.). A document, proving the antiquity of complaints on French finances, from the year 1415, is published in 1775, t. xi. An essay of Baudeau, written in 1768 was published for the first time in 1776, t. i., on the occasion of the abolition of the "Caisse de Poissy" on the 9th February 1776 (see Turgot, *Œuvres*, vol. ii. p. 316); this institution since 1743 had farmed the exclusive market right of meat for Paris to a company, which was entitled by it to take a duty of 6 per cent upon all sales of meat at Sceaux and at Poissy. Baudeau's article produced great irritation among the partners in the company, who brought an action against its author; the text of the latter is inserted in *Nouv. Eph.*, 1776, t. vi. This volume also contains a "memoir on the taxes raised in unforeseen cases ('affaires extraordinaires') in France during the war of 1756-1763." They amounted to no less than 1,105,227,761 livres.

The free-trade movement is represented by a memoir written by M. Belly on the decline of the trade of Leghorn in consequence of the number of charges (1775, t. vi.); the same author contributes an essay on the state of commerce and manufactures in Italy (t. vii.) The obstacles to the shipping trade in the Rhone (1775, t. ix., t. xi.), and to the exportation of iron (1776, t. iv.), are complained of, and a petition of the Guyenne chamber of commerce for free trade to the East Indies is published (1776, t. iv.).

Among the events favourable to the economists the following are worth mention:—The correspondence of King Gustavus of Sweden (when a youth) with Count Tessein and Scheffer, published by Col. St. Maurice de

St. Leu (1775, t. iv., 1776, t. ii.); the foundation of a "Société d'émulation" in Paris after the model of the London "Society for encouraging arts and manufactures," the rules of which are contained in 1775, t. ix. The economic reforms introduced in Tuscany by the Grand-duke Leopold, and enumerated in *Saggi di Agricoltura; di un Paroco Siamminiatense*, Florence 1775, are favourably reported on. Among these the erection of a kind of co-operative store at Florence for the sale of all sorts of goods deserves mention; upon the abolition of corporations it was imitated at Paris by the Bureau de Correspondance Générale, March 1776 (*N. Eph.* 1776, t. iii. p. 177). The publication of *Ephemeriden der Menschheit* by Isaac ISELIN at Basel is chronicled with enthusiasm by Baudeau.

The literary movement is represented by a lengthy criticism of Necker's book, *Sur le Commerce et la Législation des Grains*. It marks the distinct contrast between social protectionism and the spirit of individual property; the contrast between landed and moneyed "capitalism." (*Eclaircissements demandés à M. N.—, au nom des Propriétaires Fonciers et des Cultivateurs français* 1775, t. v. 65-168, t. vii. 89-167, t. viii. 93-139, and Baudeau's letters to M. N. on his "Eloge de Colbert," held at the French academy in 1774, t. ix. pp. 44-106). A letter directed against the free-trade theory of the economists by the Count de Magnières (t. xii.) is refuted by M. de R.—(?) in 1776, t. ii.—A review of the book of Condillac, *Sur le Commerce et le Gouvernement* (1776, t. iv. pp. 109-130, t. v. pp. 131-147), written by Baudeau, treats this author as a heretic from the orthodox school. "The true economists are easy to characterise by one feature which everybody understands. They recognise one master (the doctor Quesnay), one doctrine (that contained in the *Philosophie rurale* and the *Analyse Économique*), classical text-books (the *Physiocratie*), and technical terms . . . precisely like the old scholars of China" (p. iii.).

The *Nouvelles Éphémérides* ceased in June 1776, on the dismissal of Turgot from the ministry (12th May 1776), after which date the only organ of the physiocrats was the *Journal de l'Agriculture*, which Roubaud had reconstituted in 1775; but this periodical also came to an end in 1783. Baudeau made a last effort to re-establish his former review, for there are at the Bibliothèque Nationale at Paris three volumes of *Nouvelles Éphémérides économiques* of 1788 (Paris, Onfroi et Royer) extant. These contain attacks against Colbert and Necker, historical remarks on Sully; fundamental questions of economics, inquiries into the origin of taxation among the Greeks and Romans, and on the influence of morals on agriculture by the Marquis de P.—(?).

In 1789 appeared *Éphémérides de l'Humanité ou bibliothèque raisonnée des sciences morales*. Tome premier (and last), aux dépens de la Société. This is probably the last utterance of this kind made by the Économistes, and is entirely written by A. F. J. Fréville. It begins with a lengthy exposition of their doctrines (pp. 1-68), contains articles on the principles of taxation (pp. 108-132), and their application to the Austro-Belgian provinces (pp. 337-394); others against Necker's theory of the circulation of riches, as enunciated in his book, *De l'administration des finances en France*, t. iii. ch. xxi. (pp. 284-336). The greater part of the volume deals, however, with political questions; it is filled up with polemics against the champions of absolutism, such as Count Windischgraetz (pp. 68-108, 133-158, 265-284), and with observations on the convocation of the *États généraux* (pp. 159-264). It closes with a philosophical letter on Montesquieu's *Esprit des lois* (pp. 335-400). Constitutional questions being at this time the most prominent ones, and economic problems standing more in the background, this publication ceased with its first volume. The *Journal d'Economie publique, de Morale et de Politique*, edited by Roederer and Morellet appeared August 1796.

The *Éphémérides* thus played an important part in the literary life of economics during the 18th century. As an example it may be mentioned that Lavoisier, in his introductory remarks to his statistics *De la Richesse territoriale du Royaume de France*, printed by order of the national assembly in 1791, and reprinted in 1797 in the *Journal d'Economie publique*, edited by Roederer, mentions Quesnay as having reached the same conclusions as himself, and notes the fact that Quesnay's statistics were the occasion of Voltaire's *L'Homme aux quarante écus*. The *Éphémérides* formed a scientific economic review written with a distinct practical tendency, namely, to struggle for free trade, free enterprise, and equal taxation; to combat the crushing burdens imposed by commercial restraints, industrial monopoly, arbitrary assessment, and lavish public expenditure. Being in the exclusive possession of a "school," they preserved, in spite of the variety of their contents, a systematic uniformity in method and policy. Besides exhibiting the first example of journalism made subservient to social science, they are the richest source for the history of contemporary economic life, and the growth of modern ideas, not only in France but even in eastern Europe.

Their immediate influence in France was rather short-lived, and after the outbreak of the Revolution they became so entirely forgotten as to enable the tale to be spread that they had been written in order to help Voltaire, Servan, and Bovier to establish a democratic revolution (Abbé Barruel, *Mémoires pour servir à l'histoire du Jacobinisme*, Londres

1797, 2nd pt. pp. 210-215). The interest, however, which the *Éphémérides* excited abroad was a far-reaching one; and by inducing monarchs, statesmen, and landlords to introduce agricultural and financial reforms, to alleviate feudal burdens and commercial restraints, they benefited even the lower classes in Sweden, Denmark, Baden, Austria, and Tuscany. Thus they helped towards transplanting economic progress eastwards both in thought and practice.

[An account of the origin of this review is given in the *Journal de l'Agriculture*, March 1766; in the *Éphémérides*, 1769, t. iv., v.; in the *Dictionnaire de l'Economie Politique*, under the heading "Éphémérides du Citoyen"; in the *Nouveau Dictionnaire d'Economie Politique* the information will be found under the heading "Baudéau." See also Loménie, *Les Mirabeau*, 1879, t. ii. p. 251. Levallois, *Rousseau, ses amis et ses ennemis*, 1865, t. ii. p. 385.—G. Schelle, *Du Pont de Nemours et l'école physiocratique*, 1888, pp. 43, 99, 125, 144, 211, 408. In Germany Mauvillon complained in 1775 of the want of a German economic review of the value of the *Éphémérides* (*Untersuchungen über die Natur und den Ursprung der Reichthümer und ihrer Vertheilung*, a translation of Turgot); only the next year they were imitated by Isaac Iselin, the editor of *Ephemeriden der Menschheit oder Bibliothek der Sittenlehre und der Politik*, Leipzig, 1776-1782. The only known complete set of the *Nouvelles Éphémérides* belongs to the Giessen University Library (pressmark B. 800),—the use of it was most liberally allowed to the writer of this article, in order to enable him to draw up the above statement.] S. B.

ÉPICES. The French judges down to the revolution were paid partly by salaries (*gages*), and partly by the payments of suitors (*épices*). The latter were originally voluntary presents in kind, and several of the early kings tried to limit their amount. But in the 15th century the *épices* gradually became compulsory and were paid in money. These payments for justice constituted a considerable indirect tax upon the people, and gave rise to many abuses. It was the interest of the judges to spin out cases so as to increase the charges upon suitors, and thus justice became dilatory as well as expensive. On several occasions the states-general, and even the parliament itself, petitioned for the increase of the judges' salaries, in order that the *épices* might be abolished or at least diminished. But the French treasury was never in a condition to adopt this very simple remedy, and the abuse of *épices* lasted till the constituent assembly abolished the old parliaments, and made justice gratuitous.

[Adam Smith, *Wealth of Nations*, bk. v. ch. ii. pt. 2.] R. L.

EQUALISATION OF INTERNATIONAL DEMAND. The equation of international demand is a particular case "of the more general

law of VALUE (*q.v.*) . . . called the equation of supply and demand," but presents some peculiarities which almost justify Mill (*Principles of Political Economy*, bk. iii. ch. 18, § 4), in describing it as "an extension" of that law. These are: the absence of (1) a single market—which allows the substitution of price for value in discussing domestic trade, and (2) of the regulator given by cost of production (see INTERNATIONAL TRADE). An analysis of the forces tending to bring about equilibrium of supply and demand, always important, is here essential.

On the simplest supposition—that of two countries trading in two commodities—each article is necessarily the price of the other, and the equation of reciprocal demand is the evident outcome of the bargaining on each side, carried to the point at which no additional advantage can be gained. When several commodities enter into foreign trade the equation is established in substantially the same way. Values are so arranged that the sum of exports is equivalent to that of imports, since, were it otherwise, readjustment of quantities, of values, or of both, would be necessary. In the actual complications of foreign trade carried on between many countries the law takes a somewhat different form. "It may be concisely stated as follows. The produce of a country exchanges for the produce of other countries at such values as are required, in order that the whole of her exports may exactly pay for the whole of her imports" (Mill, *Principles*, bk. iii. ch. 18, § 4). Though each country must export to an amount equal to what it imports, its trade with any one country may mainly or even exclusively be import or export, an excess on either side being compensated by a corresponding deficit in the trade with other countries.

The statement of the equation of international demand has to be further modified so as to include the effect of the various elements of indebtedness. All debts due to a country act like an effectual demand created by the same value of exports. The principal heads are: (1) interest on foreign loans or on capital invested abroad; (2) freightage for shipping services; (3) such items as (*a*) tribute due by foreign states; (*b*) earnings of citizens abroad; (*c*) expenditure of foreigners travelling in the country. Accordingly, the final result is that "the state of international demand which results in commercial equilibrium is realised when the reciprocal demand of trading countries produces such a relation of imports and exports amongst them as enables each country, by means of her exports, to discharge all her foreign liabilities" (Cairnes, *Leading Principles*, bk. iii. ch. 18, § 5). In the most complicated as in the simplest case, the force producing equilibrium is the action of self-interest, causing the supply of commodities for exchange at such terms as will afford the maximum advantage to the

trading countries (see GIFFEN, *Essays in Finance*).

The mechanism of PRICE (*q.v.*) enables the complex adjustments of value which are requisite to be easily carried out (see INTERNATIONAL TRADE).

As to the difficult question whether the equation of international demand can be consciously altered to the advantage of one of the parties, see Mill, *Principles*, v. ch. iv. § 6; Cournot, *Principes Mathématiques de la Théorie des Richesses*; *Théorie des Richesses*, bk. iii. ch. iv.; Sidgwick, bk. iii. ch. v., who maintain that it can; also Torrens, the *Budget*. See *contra*, Jevons, *Theory*, pp. 157, 158.

[See references under INTERNATIONAL TRADE and INTERNATIONAL VALUE, more especially those to Mill, Cairnes, and Mangoldt.] C. F. B.

EQUALITY. The claim for equality may mean in politics (1) simply a claim for just and impartial administration of the laws; or (2) a claim that the laws themselves should not favour one class, still less one individual, at the expense of another; or (3) a claim for equal division of the comforts and discomforts of life. In the economic as distinguished from political doctrine, the claim of equality appears as the basis of the theory of free competition, and takes a form not precisely identical with any one of the three described. Economic reasoning, so far as it is quantitative, must assume a similarity of units. There might be a "free competition" within certain classes of the community only; and thus only the first kind of equality might be secured. An economic theory of the probable effects of such a competition would be perfectly possible. The most striking modern instance is perhaps the industrial system of the southern states of America before the emancipation of the slaves. Where the laws were clearly defined and fairly carried out, the task of the deductive economist would be comparatively easy. He would need indeed to postulate that they were so, before he could draw his theoretical conclusions; and he would then be postulating equality in the first sense, impartial administration. There might also be a state of things in which legislation was professedly indifferent to the privileges of particular classes, and all men were left free so far as legal hindrances were concerned, to seek their fortunes in the same ways. Economic theory would assume in this case that there was equality not only in the first sense, but in the second; and this has been perhaps the commonest assumption of modern economists. It was made by Adam Smith with full consciousness of its utopian character; indeed he could not conceive the possibility of so close an approach to it as has now been made by free-trading England. The full attainment of it is, however, impossible in a community of human beings, so long as they are divided by physical, social, and other

causes, into classes respectively weaker and stronger. The effort of legislation has been to redress such inequality by means of special protection and assistance. The result, though for every other reason desirable, is unfavourable to economic theory, so far as it makes the assumption of legal equality, in the second as well as the first sense, farther removed from the reality. It is no doubt possible to conceive the patronage of the laws as simply an attempt to secure to every one that equality of *opportunities*, of which the reinforcement by the laws of the inequalities of wealth would deprive the poorer members of society. From this point of view an economic theory of free competition could be worked out for competing citizens, supposed equally strong and fit for the race for wealth. But the inequalities left out seem too great for the equality assumed. Even if we neglected other causes of difference, opportunities would never be perfectly equal till human beings were physically and intellectually identical one with another.

On the other hand the effort after an equality of opportunities seems to carry society a step nearer perfection than the effort after justice and legal equality in the senses described. The opportunities may be conceived to be not of making money but of developing the faculties and doing the best work for which a man has the capacities. In all the noblest of the founders of socialistic and communistic schemes, such as aimed at equality in the distribution of wealth, equality of opportunities for the development of human individuality has been the real aim, more or less clearly understood. [See also ARISTOCRACY, COMMUNISM, TAXATION (equality of burdens).]

EQUATION OF SUPPLY AND DEMAND. (See DEMAND.)

EQUILIBRIUM is discerned by Jevons (*Theory of Political Economy*, ch. iv.) to be a cardinal conception in the abstract science which he elsewhere calls the MECHANICS OF INDUSTRY (*q.v.*). So Professor Marshall, indicating in the preface to his *Principles of Economics* the leading ideas by which he was inspired, says, "the demand for a thing is a continuous function, of which the 'marginal' increment is in stable equilibrium balanced against the corresponding increment of its cost of production." Professor Marshall employs the term *equilibrium amount* as the amount of any commodity produced in a unit of time when the demand for and supply of that com-

modity are in equilibrium, and when there is therefore no tendency in the quantity produced in a particular time to increase or diminish. The term equilibrium price is similarly used to denote the price of the equilibrium amount in the same circumstances.

M. G. D.

EQUITABLE ASSETS. Assets that could be made available for the payment of debts only through a decree or order of a court of equity. Such assets were always treated as a trust fund, and were therefore divided amongst creditors *pari passu* without any regard to the priority of one debt over another. The chief equitable assets are the proceeds arising from the sale of lands devised in trust to pay or charged with the payment of debts.

[Williams on *Executors and Administrators*, pt. iv. bk. i. ch. i., London, 1879.—*The Administration of Assets*, by A. S. Eddis, London, 1880.]

J. E. C. M.

EQUITABLE ESTATE. An estate in land that formerly was recognised in a court of equity only. The principal equitable estates are the estate taken by a person entitled to the benefit of land given in trust, equities of redemption (see EQUITY OF REDEMPTION), and equitable charges.

[*Principles of Equity*, by E. H. T. Snell, London, 1892.]

J. E. C. M.

EQUITABLE EXECUTION. The method by which a judgment creditor obtains payment by the appointment of a receiver of the rents and profits of the lands of the debtor. At common law certain forms of property, such as the interest of a mortgagor in the mortgaged premises, or the right to an unascertained sum of money, could not be reached by any ordinary writ. When the creditor had exhausted every method of obtaining payment he could resort to the Court of Chancery, who would appoint a receiver. Now the High Court of Justice can appoint a receiver in all cases where it is just and convenient that such appointment should be made.

[*The Law of Execution*, by T. K. Anderson, London, 1889.]

J. E. C. M.

EQUITABLE MORTGAGE. A contract for a mortgage that previous to the Judicature Acts could be enforced only in a court of equity. The most usual case in which it arises is where a person deposits the title deeds of property with a creditor as security for a debt. But a mortgage is also "equitable" if the subject matter is trust or equitable property, such as an equity of redemption, or where there is a written agreement to make a mortgage. The mortgagee in every case may either call on the mortgagor to make a legal mortgage or may take proceedings to enforce a foreclosure or a sale.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.]

J. E. C. M.

EQUITABLE WASTE. Waste in the nature of acts of spoliation, that a court will restrain a tenant for life from committing, though his estate was granted to him with liberty to commit waste, such as pulling down the family mansion or cutting down ornamental timber.

[Goodeve, *Law of Real Property*, London, 1891.] J. E. C. M.

EQUITY is the name applied to a number of legal rules, which formerly were administered by the court of chancery. The chancellor was originally the king's secretary, and as such he had to advise the king in "matters of grace and favour"; viz. in matters in which the king's intercession was invoked for the sake of mitigating the strict rules of the common law. "When early in the reign of Edward III. the chancellor ceased to be a part of the king's personal retinue, and to follow the court, his tribunal acquired a more distinct and substantive character . . . ; petitions for grace and favour began to be addressed primarily to him, instead of being simply referred to him by the king, or passed on through his hands. In the twenty-second year of that king such transactions were recognised as the proper province of the chancellor, and from that time his separate and independent equitable jurisdiction began to grow into the possession of that powerful and complicated machinery which belongs to later history" (Stubbs's *Const. History*, ii. 269). One of the most important stages in that growth was reached when, in the reign of Richard II., the "writ of subpoena" was introduced, which enabled the chancellor to enforce obedience to his decrees by the threat of imprisonment. One of the most important matters which came under the chancellor's jurisdiction was the protection of the rights of persons possessed of "uses" in land. For several reasons it had become convenient to sever the legal ownership of land from the beneficial ownership, and with that object it became customary on a transfer of ownership to enfeoff one person "to the use" of another. The first-named person was called the "feoffee to the use," and he was the only person whom the ordinary courts recognised; but as he was in duty and conscience bound to allow the rights of beneficial ownership to the second-named person, known by the technical name of "cestui que use," the chancellor in the exercise of his equitable jurisdiction compelled him to do so, if he wished to take advantage of his formal right. The practice in matters of this nature developed into a regular system called "equity," to distinguish it from the "common law" administered by the other courts. That system was characterised—(1) by the recognition of rights which the other courts refused to enforce (so-called "equitable rights"); (2) by legal doctrines differing in substance from the doctrines of common law;

(3) by a special procedure; (4) by special kinds of relief.

(1) The most conspicuous among equitable rights are the rights derived from trusts. Trusts are the modern successors of "uses," but are used on a much larger scale, and also in the case of personal property; the most familiar instances being the trusts created by wills and settlements, by which the control of certain land or certain funds is given to one or more persons for the benefit of another person or other persons. Another instance of an equitable right is the right of the mortgagor to redeem the mortgaged property, the legal right to which is vested in the mortgagee.

(2) Amongst doctrines specially belonging to the sphere of equity may be mentioned the rule that a debt may be assigned; that, in the absence of an express stipulation or necessary implication, time is not considered as of the essence of a contract, that penalties named in contracts cannot be enforced unless they partake of the nature of liquidated damages, etc.

(3) The administration of trusts and of the estates of deceased persons involves protracted inquiries and the taking of accounts, etc.; for this purpose a special procedure and a special machinery has been developed in the courts of equity, which were the only courts which had to deal with matters of this nature.

(4) Among the special kinds of relief which could be obtained with the assistance of the courts of equity, the right to claim specific performance of contracts for the sale of land, and the right to claim injunctions, *i.e.* orders restraining the opposite party from doing certain acts injuring the rights of the plaintiff, are the most important. The courts of equity, in granting relief of this kind, were supplying a material defect in the administration of justice, as in the courts of common law; the only remedy in the case of breach of contract or injurious acts consisted in pecuniary damages, which in many cases did not adequately compensate the injured party. The power of the courts of equity to enforce their decrees by the imprisonment of disobedient parties materially helped them in the exercise of this jurisdiction.

The Judicature Act of 1873 has merged the equity courts and the courts of common law into one high court, and the rules of equity are now administered in all courts; but as they are derived from a different source from the common law rules, and have always been treated as a separate system, the distinction is still kept up, though it has no longer any practical meaning. The matters which are specially fitted for the procedure of the chancery court, have, however, been assigned to a special chancery division which is organised in a manner appropriate to the proceedings required with regard to them.

[Spence, *Equitable Jurisdiction*.—H. A. Smith,

Principles of Equity. For the place of equity in systems of law generally, and its importance in the evolution of society, see Maine, *Ancient Law*.] E. S.

EQUITY OF REDEMPTION. The right that a mortgagor has to recover, on payment of principal, interest, and costs, a mortgaged estate which has under the mortgage deed become the property of the mortgagee owing to the failure of the mortgagor to pay the principal and interest at the time agreed on. The right resembles real estate inasmuch as it will descend to the mortgagor's heirs. It is alienable, and may itself be mortgaged.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

EQUITY TO A SETTLEMENT. When a husband had to resort to a court of equity in order to reduce into possession property of his wife, the court compelled him to make a settlement of a portion, usually one half, of such property on the wife and children.

[*The Principles of Equity*, by E. H. T. Snell, London, 1892.] J. E. C. M.

ERROR EXCEPTED. These words are frequently inserted at the end of a statement of account, and are intended to show that the accounting party wishes to reserve the right to make further claims in case any error should subsequently be discovered in the account.

E. S.

ERROR, LAW OF. When an average of a set of statistics is taken, the deviation of any one of them from the average is sometimes called an *error*; and the arrangement of the group about its mean, a *law of error*. A particular arrangement, which under certain frequently-realised conditions arises, is designated as the law of error. According to this law the figure which is likely to occur most frequently is the one which forms the average; the others are grouped symmetrically above and below the average; becoming less frequent as they are more distant from that central magnitude. In the exact language of symbols, if x_1, x_2 , etc., are the quantities averaged, and X the average, the number of quantities comprised between x and a neighbouring value $x + \Delta x$ is approximately =

$n \Delta x \frac{1}{\sqrt{\pi}c} e^{-\frac{(X-x)^2}{c^2}}$; where π and c are the well-

known constants 3.1415 . . . , 2.718 . . . ; and c is a constant proper to the group under consideration. This arrangement is represented

by the curve $Y = \frac{n}{\sqrt{\pi}c} e^{-\frac{(X-x)^2}{c^2}}$; the number

of observations in the neighbourhood of any point in the axis of x being proportioned to the ordinate at that point; and the number of observations comprised between two values of x being equal to the area intercepted by the ordinates at those two points, the curve, and

the axis x . Two illustrations of this curve are given in the annexed diagrams. The curve is spread out, as in Fig. 1, when the constant c is

Fig. 1.

large; it is gathered in, as in Fig. 2, when the

Fig. 2.

constant c is small. The constant c being ascertained for any group of statistics, we are able to predict what proportion of the group will probably be comprised between limits defined in terms of that constant. Thus half of the group is likely to be comprised between the limits $X - .4769 \dots c$ and $X + .4769 \dots c$; or, in other words, it is as likely as not that an observation taken at random will be distant from the average X by an interval greater than $.4769 \dots c$; which multiple of c is accordingly called the *probable error*. Again the greater part of the group is comprised between the limits $X - 2c$, $X + 2c$; the odds are more than 200 to 1 against any observation being at a distance greater than $2c$ from the average. The odds are 50,000 to 1 against the distance of any observation from the average being greater than $3c$. The points P and Q (P' and Q') in the figures are intended to represent the "probable" and what may be called the *improbable error* ($2c$ or more).

The condition under which the law of error is fulfilled is that each of the things averaged is dependent in the same way upon (the same function of) a great number of independently variable elements. For example add together ten or more digits obtained thus: the first is the *first* decimal place in any constant, e.g. π , the second addendum is the first digit in any other constant, e.g. e , and the remaining eight constituents of the sum are the *first* digits in almost any other unconnected constants. Form another

sum of ten digits by taking the *second* decimal place in each of the ten constants; and so on. The set of sums thus formed will group themselves according to the law of error; the average being 45, and the constant c being $\sqrt{165} = 13$ nearly. About half the group will be found between $45 - 6$ (*i.e.* 39) and $45 + 6$ (*i.e.* 51) since $.477 \sqrt{165} = 6$ nearly. A very small proportion of the group—less than a two-hundredth part—may be expected to occur outside the limits $45 \pm 26 \cdot (26 = 2 \times \sqrt{165} \text{ nearly})$. If the number of elements entering into each of the figures averaged had been greater than ten, *e.g.* twenty, the “probable” and the “improbable” error would have been greater *absolutely*, namely 10 and 36 respectively; but less *relatively* to the average, now 90. Similar consequences would follow if, instead of a simple *sum*, we had employed almost *any function*.

There is reason to believe that the condition which has been indicated is frequently fulfilled; and the law of error has been observed to prevail in extensive classes of phenomena, which may thus be summarised:—

1. Repeated observations of one and the same physical quantity.

2. Shots fired at the same object.

3. A series of numbers each of which is obtained by taking at random a batch of say n balls out of a bag containing white and black balls mixed up in a certain proportion, and noting the number of whites in each batch of n balls; or a series obtained by tossing coins or dies and noting the number of heads or aces; and similar series.

4. Measurements of the organs of numerous specimens of a natural species.

5. Statistics of social phenomena which do not present a *progressive* character, *e.g.* the number of births, deaths, or marriages or the *rates* of the same, or the ratios between the male and female rates; observed at places or times not materially distant from each other.

Illustrations of the third and fifth classes are given in the accompanying tables, the materials of which have been taken from Professor Westergaard's *Theorie der Statistik*. In Table I., column 1, was obtained from 100 batches of balls; each batch numbering 100 balls, which were taken at random from a bag containing black and white balls in equal proportions; the number of white balls in each batch having been noted, the number of these numbers comprised between two limits, which are defined by a multiple of the constant c , forms an entry in column 2. The corresponding limits are given in column 1. Thus twenty-five of the observations occurred between the

limits $50 - .3 \frac{c}{\sqrt{2}}$ and $50 + .3 \frac{c}{\sqrt{2}}$, or 47 and 53, since the value of c is here $\sqrt{2} \times 10$; 40

of the errors occurred between $50 - .5 \frac{c}{\sqrt{2}}$ and

$50 + .5 \frac{c}{\sqrt{2}}$, or 45 and 55; and so on. Column 3

similarly registers the arrangement of the statistics obtained from 750 batches of lottery tickets—each batch numbering 100—by noting the number of prizes in each batch (the average being 16, and the constant c being 5 nearly).

Table I.

Table showing the correspondence between fact and theory in the arrangement of the numbers of white balls in batches of 100 balls each drawn at random from a bag; and of prizes in batches of 100 tickets drawn at a lottery.¹

Limits above and below the average.	Percentage of errors within limits.		
	Observed.		Calculated.
	Balls drawn from bag.	Tickets drawn at lottery.	
1	2	3	4
$.3 \frac{c}{\sqrt{2}}$	25	23	23
.5 „	40	36	36
.7 „	50	48	49
1.1 „	70	67	69
1.5 „	85	83	82
2.1 „	95	95	93

These results of observation are to be compared with the predictions of theory which are contained in column 4.

1.1 „	12	12
1.5 „	16	14
2.1 „	17	16

¹ Westergaard, *op. cit.* p. 67.

² See Westergaard, *op. cit.* p. 39. The first column differs from his only in notation; the second column is the same as his; the third column is calculated from the second column of his table at p. 67.

In Table II., the first column gives limits defined by the constant c as before; the second column gives the arrangement of errors obtained by comparing the proportion of male births to all births, male and female, in Italy for each of nineteen years with the average proportion for the whole period; the third column gives the theoretical arrangement.

The applications of the law of error with which we are here concerned relate partly (I.) to practice, and partly (II.) to the investigation of causes.

(I.) It is useful, when employing an average obtained from statistics, *e.g.* a death-rate, or an index-number, to have the means of estimating the extent to which the figure in the case with which we are dealing is likely to differ from the average obtained in past experience. It is useless to calculate the average to a number of decimal places not warranted by the "probable error" to which the figure is liable.

(II.) Under the second head two cases may be distinguished: (*a*) where the analogy of simple games of chance holds good; the constant c being that which would be obtained if the statistics were of the sort which forms our *third* class of phenomena above; and (*b*) where the constant is not such.

(*a*) In the first case we have the advantage of knowing that the given group cannot be broken up into two, or more, with widely different averages; that the analysis which is a principal object of the scientific statistician has been already pushed almost up to its limit. Our statistics cannot be like batches of balls taken from bags in which the proportion of white to black is very different; but rather are analogous to the successive numbers of white balls occurring in batches of the same size taken at random from the same bag. It would appear hopeless therefore to trace by ordinary induction the causation of any particular event of this character. It is only crazy gamblers who pretend to predict the "runs" in games of pure chance. But we are not precluded from applying the law of error to detect delicate differences, such as may exist between a perfect and a slightly-loaded coin. Take for example the observation that the percentage of male compared with female births for more than a million *plural* births (of twins or triplets) in Prussia during a certain period of years was 104.447 (males to 100 females); whereas the corresponding ratio for all births (single as well as plural) was 106.305; the observation on which this average is based numbering several millions. Given these numbers, and knowing as we do that the phenomenon belongs to class (*a*), we are able to determine the constant c ; which proves to be nearly .3. Thus the difference between the two averages compared, *viz.* 1.858, is about six times the constant, and accordingly (see above par. 1) the odds against

the observed difference in the averages being due to accident and not to a real cause which may be expected to continue acting—are many times more than 50,000 to 1 (Duesing). We have obtained, at a stroke, a degree of evidence in favour of a law which otherwise could only be obtained by a laborious analysis of the returns. By parity of reasoning it is found that in times and places where the absolute number of births is large the proportion of males is small (*ibid.*).

(*b*) This summary method may be employed also in the second case (where the analogy with games of chance does not hold good); but not in such a clear light of foreknowledge as to the character of the causes under investigation.

Besides the exact and direct applications of the law of error, it also affords what may be called "regulative ideas" to the statistician; supplying the *rationale* of many received maxims: that *ceteris paribus* an average is more worth the greater the number, and the less the divergence, of the returns averaged; that a few accurate returns may be better than many loose ones.

[For a general exposition, at once simple and accurate, of the law of error, see Venn, *Logic of Chance*, third ed. 1888, chaps. xviii. and xix. See also Jevons, *Principles of Science*, chap. xvii.—Bertilhon, art. "Moyenne," *Dictionnaire Encyclopédique des Sciences Médicales*.—Quetelet, *Physique Sociale*. For the conditions under which the fulfilment of the law may be expected, Glaisher, *Memoirs of the Astronomical Society*, vol. xl. p. 104.—Galton, *Philosophical Magazine*, 1875, "Statistics by inter-comparison."—Edgeworth, *ibid.* 1892, "The Law of Error."—For the *a posteriori* proof, that the law is fulfilled, see Galton, *Natural Inheritance*.—Westergaard, *Grundzüge der Theorie der Statistik*, chap. iii.—Edgeworth, "Empirical proof of the law of Error," *Phil. Mag.*, 1887.—For the application of the law to practice, Dormoy, *Théorie mathématique des assurances sur la vie*. For the application of the law to induction, (*a*) where the analogy of games of chance holds good, Westergaard, *op. cit.*—Lexis, *Massenerscheinungen*.—Duesing, *Das Geschlechtsverhältniss in Preussen*; (*b*) in general, Edgeworth, *Journal of the Statistical Society*, Jubilee Volume, 1885, "Methods of Statistics," *ibid.* December 1885, "Methods of Determining Rates." Many of these writers throw light on other parts of the subject besides those with special reference to which they have been cited. Several other authors might have been cited. Merriman has published an immense list of writers on the cognate subject of the *Method of Least Squares*, many of whom have touched on the *law of error*, and some on its applications to social phenomena (see *PROBABILITIES; STATISTICS*).]

F. Y. E.

ESCHEAT (historical) was a feudal term introduced by the Normans into England, and applied to the reversion of land to the lord. The ordinary cause of such reversion was the failure of heirs, when the whole estate passed into the hands of the lord. If the heir was a

minor, the phrase was *escata cum herede*, when the necessities of the heir and other children were paid for out of the estate and the surplus only went to the lord, until the heir, on reaching his majority, paid a relief and obtained seisin. Escheat also took place in cases of treason or felony. If the criminal was a tenant-in-chief, the whole of his property reverted to the crown; but if he was a sub-tenant, his movables only fell to the crown, while the real estate passed to the immediate lord.

[*Dialogus de Scaccario*, ii. x.]

R. L.

Escheat (modern law), takes place where a person dies intestate and without an heir. The lands of such a person go to the feudal lord, but, as in the case of freehold land the right of mesne lords can in our days be established but rarely, such land generally goes to the sovereign as lord paramount. Copyhold land goes to the lord of the manor, and § 4 of the Copyhold Act provides that the right of escheat is to continue after enfranchisement; enfranchised copyhold land, though otherwise of the nature of freehold land, does not therefore escheat to the crown, but goes to a private person. Formerly the lands of felons were subject to the right of escheat, but an act passed in 1870 has repealed this rule. On the other hand the Intestate Estates Act of 1884 has made certain rights as to real property subject to escheat, which were not so subject before. The same act has enabled the crown to waive its right in certain cases. The procedure which takes place to inquire as to the right of the crown has been simplified by the Escheat (Procedure) Act of 1887.

The right of the state to acquire the property of a person dying without relations or a will exists in most countries independently of feudal rules, and seems justified by reason and convenience.

[Bentham, J. S. Mill, Godin, and other reformers, have proposed to narrow the rights of intestate succession (*i.e.* to extend escheat) in order to correct, to some extent, the unequal distribution of wealth.]

E. S.

ESCUDO. The name of the Spanish half dollar.

Gold and Silver Coins as follows:

Metal.	Denomination of Coin.	Finess.	Weight.	Value.	
				In gold 916·6 fine at £3:17:10½ an ounce.	In gold frances, 900 fine.
Gold	10 Escudos (or Doubloon)	900	grains. 129·44	£ s. d. 1 0 7½	frances. 26·0
	4 Escudos	900	51·78	0 8 3	10·4
	2 Escudos (or Dollar)	900	25·89	0 4 1½	5·2

Metal.	Denomination of Coin.	Finess.	Weight.	Value.	
				In silver 925 fine at 5/6 an oz.	In silver frances, 900 fine.
Silver	Escudo (or ½ Duro or Dollar)	900	grains. 200·30	s. d. 2 2½	frances. 2·6

These coins have not been struck for circulation in Spain since 1868, when the system of pesetas (frances) was introduced. Similar coins, including a doubloon of eight escudos, are current in the Philippine Islands (see DOUBLOON).

F. E. A.

ESCUSADO, the name of the portion of ecclesiastical tithes made over in 1567 by the Pope to the crown of Spain.

E. ca.

ESSART, EXART, sometimes also called ASSART. A mediæval term applied to a portion of forest land cleared and brought into cultivation. To make essarts was technically a breach of the forest law, punishable by fine. These fines, with the yearly rents levied on the essarted lands, which the maker of the essart was usually allowed to keep under cultivation, formed a considerable item in the revenues of the royal and other lords of forests in mediæval England. These rents would appear to have been fixed at the highest rate that could be maintained, a rate which will be found to be often several times as great as that paid by free or even customary tenants for other land in the same neighbourhood. In spite of these high rates, however, fresh essarts were made almost every year in England. The forest of Wirrall in Cheshire, for instance, was entirely under cultivation before the death of the Black Prince, who, in his capacity of Earl of Chester, by a formal charter of disafforestation, put his seal to the work of reclamation. The word *essart* has been variously derived from the old French *assortir*, to make smooth, or one of the low Latin terms, *exertum*, rooted up, *sarrire*, to weed, or *exarare*, to plough up.

[Manwood, *Forest Law*, London, 1596, etc.—Ducange, *Glossarium Mediæ et Infimæ Latinitatis*, ed. nova a L. Favre, Paris, 1884.—Forest accounts among the ancient records of the exchequer in the Public Record Office.]

A. H.

ESTATE. A so-called owner of land has, according to English law, no absolute right of ownership; all that he has is an interest varying in extent and duration, and known in technical language as an "estate" in the land. The largest estate known to the law is an "estate in fee" (fee simple), which gives the owner as complete rights of enjoyment and alienation as the nature of the property will admit; an estate tail (see ENTAIL), being convertible into an estate in fee—by the tenant alone, if in

possession, and otherwise by him jointly with the tenant for life—confers rights nearly as complete. An estate for the life of the tenant, or for the life or lives of another person or other persons, gives the tenant the privileges of ownership during his life or during the life or lives of such other person or persons; but a tenant for life—unless the estate is conferred upon him “without impeachment of waste”—is not allowed to pull down buildings, cut timber, or open mines. An estate for the life of another person is called an “estate pur autre vie.” Estates in fee or in tail, and estates for life, are called “freehold” estates, estates for a definite number of years, however large the number may be, are “leasehold,” also called “less than freehold” (see LEASEHOLDS). The word estate is also used as a comprehensive name for the assets of a bankrupt or of a deceased person. In the latter case a distinction is made between freehold land and houses (real estate) and other property (personal estate).

E. S.

ESTATE DUTY. See DEATH DUTIES.

ESTCOURT, THOMAS (end of 18th and early 19th century). Thomas Estcourt sat in parliament as member for Cricklade from 1784 to 1806. In 1804 he published *An account of an Effort to Better the Condition of the Poor in a Country Village (Long Newton) and some Regulations suggested by which the same might be extended to other parishes of a similar description*. The work was printed by the board of agriculture. Estcourt states that in 1800 arrangements were made for letting to any cottager a small quantity of land at a rent of £1:12s. an acre, the land to be forfeited if not properly cultivated, or on the receipt of parish relief other than medical. He states that the offer was largely accepted, and that the scheme greatly decreased the poor-rate in the village.

C. G. C.

ESTERNO, PHIL., COMTE D' (1805-1883), born at Dijon, died at Paris. Esterno's life was mainly devoted to agriculture and to political economy. The first work of his which caused him to be known as an economist was entitled, *Des banques départementales en France*, 1 vol. in 8vo, 1838. In this Esterno argued in favour of departmental banks, to be established in a good many towns, and at Dijon in particular. This was at a time when the government, urged on by a spirit of centralisation, were hostile to institutions of this description.

In 1840 Esterno took part in a discussion instituted by the Academy of Moral and Political Sciences, on the signs and causes of poverty in different countries. BURET (*q.v.*) won the prize. Esterno's paper was rejected because, according to the report, “it was not an economic essay which was wanted.” This work, printed in 1842, under the title of *La misère*;

de ses causes, de ses effets, in 8vo, reflected the ideas of Malthus, while Buret, on the other hand, had allowed sentiment to overpower reason.

During the same year (1842) Esterno assisted as secretary, in conjunction with P. Rossi, who was president, in founding at Paris a society for promoting political economy (*Société d'économie politique*), an association which only lasted a few months, but was a forerunner of the society now known under the same name.

In 1867-68 Esterno published another work, *Des privilèges de l'ancien régime en France et des privilèges du nouveau*, 2 vols. in 8vo. In this work the author argued, in a brisk and original style, in favour of agriculture, which was put too much on one side by the privileged persons under the new regime, the moneyed classes, as distinguished from the landed proprietors, notwithstanding the untrustworthy titles of some of their institutions, *Le Crédit agricole*, for example. Before this date (1867-1868), and later on, Esterno strove, on behalf of the agricultural interest, against those artificial monopolies which, even to this day, have arrested the development of agriculture in France. He thus became deeply interested in works of irrigation, and it is to him and to his energy, though he never allowed his name to appear, that the adoption of the regulations of 29th April 1845 and 11th July 1847 (*lois d'Angeville*) is due.

Esterno's mental activity led him to occupy himself with other subjects with which we are not concerned here. His intelligence, his energy, and his scientific devotion enabled him to render them interesting to others. He was a vice-president of the second *Société d'économie politique*.

A. C. F.

ESTIMO. The revenue of Florence in the flourishing days of the republic was mainly derived from indirect taxes, which produced some 300,000 florins a year. But in times of war, which became frequent in the 14th century, this income was insufficient, and it was supplemented either by direct taxes or by compulsory loans (*prestanze*). Both taxes and loans were supposed to be based upon an *estimo*, or government valuation of property, and hence the term *estimo* comes to be applied to the exactions themselves. The earliest *estimo* was formed in 1288, and seems to have referred only to real property. Another assessment took place in 1327, when a foreign judge was appointed to determine the wealth of each individual by the secret testimony of seven of his neighbours. But the attempt to provide a regular basis for direct taxation proved a failure in the 14th century. An *estimo* soon became obsolete as property rapidly changed hands, and a charge upon real property alone pressed heavily upon the noble families and the peasants of the country, while the wealthy burghers escaped.

For the most part the forced loans were arbitrarily assessed by the existing government, and one great reason for the Florentine greed for office, which introduced the system of lot, was the desire to escape taxation. When the CROMPI (*q.v.*) rose in revolt in 1378, one of their demands was that no loan should be levied without an *estimo*, but their subsequent defeat prevented any change being made. The discontent excited by arbitrary and unfair assessment forced the government in 1427 to introduce the CATASTO (*q.v.*), which was only a new name for a thorough *estimo* of real and personal property including income. But this great reform was abandoned by Cosimo de Medici in 1441, when the old arbitrary assessments, formerly maintained to favour the wealthy burghers, were revived to relieve and conciliate the poorer classes. The Medici from this time introduced the principle of progressive taxation, and, as Guicciardini says, used the taxes instead of the dagger to ruin their opponents.

[Canestrini, *La Scienza e l'Arte di Stato desunta dagli Atti ufficiali della Repubblica Fiorentina e dei Medici* (only one volume of this great work was published).—Napier, *Florentine History*, vol. iii. p. 117.—Perrens, *Histoire de Florence*.] R. L.

ESTOPPEL. A term used in connection with the rule of law, according to which a person who, by statements or conduct, causes another person to believe in the truth of a certain matter of fact, with the intention of inducing him to act upon it, cannot, in any dispute concerning the matter in question, be allowed to assert that the state of things which he represented to be in existence, did not, in fact, exist; thus, for instance, a person, by accepting a bill of exchange, induces the holders to assume that the drawer was of full age, and otherwise capable to draw a bill, and he is therefore "estopped" from denying the drawer's capacity (Bill of Exchange Act, § 54 [2]). Estoppel by conduct is in certain cases also called "estoppel by negligence," *e.g.* if a person by the careless filling in of a cheque enables a fraudulent holder to alter the amount, he is estopped from denying that he drew the cheque for the full amount, as by his negligence he has allowed the banker to think that he has done so. Estoppel by statement or conduct is in the older law books called "estoppel by matter in pais," and distinguished from "estoppel by deed" and "estoppel by record." "Estoppel by deed" prevents a party to a deed from denying any fact mentioned in the same by way of recital or otherwise. "Estoppel by record" precludes a party to an action, or his successor in title, from denying any fact established by the decision in the action. The fullest statement on the law of estoppel is contained in the notes to the Duchess of Kingston's case in Smith's *Leading Cases*, vol. ii. E. S.

ESTOVERS (derived from the same root as the old French word *estovoir* = to be necessary), also called "Bote," is the right of a tenant for life, unless restrained by agreement, to take the necessary wood from the estate for the use or furniture of a house or farm. "Common of Estovers" is the right of a commoner to cut wood (see COMMONS). E. S.

ÉTATS GÉNÉRAUX, THE, or States General of France, were, under the old monarchy, the national representative assembly of the kingdom, composed of elected members of the three orders, the noblesse, the clergy, and the third order or state (*Tiers État* or *bourgeoisie*), but no fixed rule was ever followed for their election and assembling. Their first authentic meeting was summoned, 1302, by King Philippe le Bel, to assist him in his struggle against Pope Bonifacius VIII.; after this date they were convoked at irregular and often very protracted intervals, whenever the royal finances were in a state of extreme distress. In 1357, during the captivity of King John in England, they vainly tried to give a constitution to the kingdom. The *États Généraux*, which must not be confounded with the *Assemblées des Notables*, were at all times steady and consistent upholders of the theory that no tax could be valid without their assent; the monarchy never contested this doctrine, but never followed it in practice. The *États Généraux* of 1614 were the last before the revolution of 1789.

ETHEL. See ALOD.

EVANS, DAVID MORIER (1819-1874), was born in Wales. He treated economic subjects from a journalistic point of view, aiming rather at giving an accurate narrative of the successive phases of economic crises and the like than at tracing their hidden causes. In his own words he was a man of "facts and figures."

Besides numerous contributions to the *Bankers' Magazine*, which he edited for some years, the *Bullionist*, and the *Stock Exchange Gazette*, Evans wrote *The Commercial Crisis, 1847-48*, London, 1848-49.—*The Annual Commercial Register*, London, 1850.—*Fortune's Epitome of the Public Funds*, London, 1851-56.—*Facts, Failures, and Frauds*, London, 1859.—*The History of the Commercial Crisis, 1857-58, and of the Stock Exchange*

Panic, 1859, London, 1859.—*Notes on Speculation*, London, 1864.

[See *Dictionary of National Biography*, London, 1888, *Times* for 2nd January 1874.] A. H.

EVANS, THOMAS (end of 18th and early 19th century). In 1798 Thomas Evans was acting as secretary to the London Corresponding Society, and was imprisoned for nearly three years on a charge of treasonable practices. He afterwards acted as librarian to the Spencean Society, and published the work whose title is given below. The book contains the usual Spencean doctrines, advocates the nationalisation of the land as the only remedy for the prevailing distress, and denounces Malthus as the "hiring of pagan landlords."

Christian Policy, the Salvation of this Empire, "being a clear and concise examination into the causes that have produced the impending national bankruptcy, and the effects that must ensue unless averted by the adoption of the only real and desirable remedy" (2nd ed., 1816).

C. G. C.

EVERETT, ALEXANDER HILL (1792-1847), was born at Boston, Massachusetts. He graduated with the highest honours at Harvard; engaged in the diplomatic service, and from 1825 to 1829 served as U.S. minister to Spain; returned to Boston and became editor and proprietor of the *North American Review*; from 1830 to 1835 was in the Massachusetts Legislature; in 1840 undertook a diplomatic mission to Cuba; and in 1847 was engaged in a similar errand in China, when he died at Macao. His writings cover a wide range in history and literature. Of economic interest is the following: *New Ideas on Population with Remarks upon the Theories of Malthus and Godwin*, Boston, 1823, pp. 125 (translated into French). In opposition to the Malthusian theory Everett argues that an increase of population is a cause of abundance and not of scarcity, since it develops the new elements of skill by which the same quantity of labour is applied with greater effect. Although the population of Great Britain doubled in the 18th century, improvements in the mode of applying labour increased its productiveness probably a thousand times. Everett, by travel and intercourse with eminent men in Europe, enjoyed opportunities possessed by few of the earlier American writers on economic subjects. He had an interview with Malthus, carefully discussing the points at issue. The latter suggested to Everett that his views were similar to those of Mr. S. Gray in the *Happiness of States* (1815). The Malthusian theory was also discussed in a correspondence between Everett and Prof. George Tucker in the *Democratic Review*, vol. xvii. pp. 297-310, 379-391, 438-444, and vol. xxi. pp. 397-410.

[For a summary of Everett's views, v. *Dem. Rev.*, vol. x. p. 466, where there is a sketch of his life until 1840. To the *North American Review* he

contributed many essays, among them "M'Culloch's Political Economy" (1827), xxv., 112; "Political Economy" (1829), xxviii., 368; "British Opinions on the Protecting System," xxx., 160; "American System," xxxii., 127; "Phillip's Manual of Political Economy," xxxii., 215; "The Laws of Population and Wages," xxxix., 68; "Rae's Political Economy," xl. 122. Everett was a protectionist; and in 1833, as chairman of a committee at the Tariff Convention in New York, prepared a memorial to Congress in reply to the memorial prepared by Gallatin for the Free Trade Convention at Philadelphia. He advocated reforms in the banking system in two articles on "The Currency" in *Boston Quarterly Review*, July 1839; January 1840.] D. R. D.

EVERETT, GEORGE (*d.* 1693-1698), Shipwright, appears to have occupied some position of importance in the government dockyards. He was also employed by the commissioners of customs in the detection of smuggling. He published (1) *The Pathway to Peace and Profit; or Truth in its Plain Dress*, etc., London, 1694, 8vo. (2) *Encouragement for Seamen and Mariners, in two parts*, etc., London, 1695, 4to. The first of these pamphlets embodies certain proposals, which Everett laid before the lords of the admiralty in February 1694, for securing greater economy and efficiency in the dockyards. If they were adopted he promised an annual saving of £100,000. The second pamphlet was directed against the abuses of the system of impressment for the sea service. His object appears to have been to devise a system which should at the same time secure a constant supply of sailors for the royal navy and get rid of the expense to the government, and "injury to the subject," of the system then in vogue. Amongst his suggestions may be noticed the registration of all seamen and mariners, fixed pay days, abolition of the sale of all offices in the navy, and a strict application of the principle of promotion by merit, an additional allowance for seamen disabled in the public service, the payment to the family of the sailor of six months' wages for every nine months he should be at sea, etc. Everett's pamphlets are of no theoretical interest, but they throw much light on the conditions of labour in the dockyards and the sea service at the end of the 17th century.

[Watt's *Bibl. Brit.*—*Cat. of Treasury Papers*, xxxvi. 38; liv. 29.] W. A. S. H.

EVELYN, JOHN, F.R.S. (1620-1706), the author of the famous *Diary*, published several works of economic interest. Amongst these may be mentioned (1) *Sylva, or a Discourse of Forest Trees and the Propagation of Timber*, etc., London, 1664, fol., 5th ed. 1729. A new edition with notes by A. Hunter was published in 1776; 4th ed. 1812. (2) *Navigation and Commerce, their Origin and Progress. Containing a Succinct Account of Trafficke in General: its Benefits*, etc., London, 1674, 8vo.

(3) *Terra: A Philosophical Discourse of Earth, Relating to the Culture and Improvement of it for Vegetation, and the Propagation of Plants*, etc., London, 1676. New edition, with notes by A. Hunter, 1778. (4) *Numismata: A Discourse of Medals, Ancient and Modern*, etc., London, 1697, fol. Evelyn also translated several French works on horticulture.

[M'Culloch's *Literature of Pol. Econ.*, 146, 212. For a full account of Evelyn's life and writings see *Dictionary of National Biography*.]

W. A. S. H.

EVELYN, JOHN (fl. 1830), of Edgbaston, Birmingham, was the author of *Co-operation: An Address to the Labouring Classes on the Plans to be pursued in Conducting Trading Unions*, 1830, 8vo. By "trading unions" Evelyn meant co-operative societies.

EVOLUTION. See DEVELOPMENT.

EVICION. The recovery of possession of land whether by simple re-entry or by legal process is often termed eviction. Eviction is substantially the same as EJECTMENT. The term is rather popular than technical. F. C. M.

EX. ALL. A well-known phrase on the stock exchange, used to signify that a security quoted or dealt in conveys to the buyer no rights in the shape of dividends or drawings or issue of new stock or other contingent advantages. The word ex. is simply short for excluding (see EX. DIVIDEND, EX. DRAWING, EX. NEW).

A. E.

EXAMPLES. Examples in economics, as elsewhere, are simply cases, real or fictitious, or partly both, supposed to embody a general principle. They may be classified as follows: (1) *Real but general*, as Ricardo's hunters (*Principles*, ch. i. § i.), and Ad. Smith's bricklayers, carpenters, and men of letters (*Wealth of Nations*, I. x.). The examples are taken from a known genus but not from known individuals. Where the genus is perfectly well known, no cavil is possible. Ad. Smith's illustration of division of labour could hardly have been improved by a reference to a particular pin-making establishment in a specified place. But, in exposition, the more concrete the genus the more telling the example; e.g. 'blacksmith' seems nearer life than 'workman.' (2) *Real and particular*, as in Cairnes's illustration of the theory of international trade from the Australian gold discoveries (see CAIRNES). Adam Smith, where he does not use the real and general, uses the real and particular, and falls back on fiction only for his similes (as "the highway," "the waggonway through the air," the "wings," and "the pond and the buckets," *W. of N.*, II. ii.), or his metaphors ("wheel of circulation," "channel of circulation.") Ricardo and his immediate followers have preferred, as a rule, (3) *Fictitious* examples. These may be illustrations of which the com-

ponent elements are generically well known, as even the favourite "man on the desert island," but the combining of the elements is the work of the writer, and is more or less arbitrary, as De Quincey's "man with the musical box on Lake Superior," and Bastiat's "plank and plane." There is also a risk that the construction of the example may involve a begging of the question to be proved. "Suppose that there are but two nations in the world living side by side, with a population of one million souls in each" (Barbour, *Bimetallism*). "My object was to elucidate principles, and to do this I imagined strong cases that I might show the operation of those principles" (Ricardo, *Letters*). There is no necessary fallacy in this method of exposition any more than in illustrating the law of gravitation by the action of bodies *in vacuo*. Concrete cases must necessarily exemplify much more than one principle, and, even if they suggested a particular generalisation, they may perhaps not clearly illustrate it without a fictitious simplification. The lawfulness of such a method of exposition or, it may be, of proof is discussed elsewhere (see DEDUCTIVE METHOD).

J. B.

EXCAMBION is the technical term used in Scotch law to designate the contract whereby one piece of land is exchanged for another. The persons effecting the exchange are known as excambers. Each party gives the other such a warranty of title that, if evicted from the land which he has received, he and his heirs can recover from the other party and his heirs the land which he originally gave. When lands burdened with debt are disposed in excambion, they are freed from that debt and are thenceforward burdened with the debts, if any, formerly affecting the land given in exchange. Tenants in tail have a statutory power of effecting such exchanges which now extends to one-fourth of the total value of the property entailed (see LAND).

[Bell's *Dictionary and Digest of the Law of Scotland*, edited by George Watson, Edinburgh, 1882, art. "Excambion," and the authorities therein cited.]

EXCHANGE.

Exchange, p. 758; Exchange, Value in, 759; Exchange, Value in (History of Theory), p. 762; Exchange, Usury (see Usury), p. 767; Exchange (as Bourse), p. 767; Exchange, Stock, p. 768; Exchange, Provincial Stock, p. 770; Exchange, Foreign, p. 770; Exchange, Foreign (Practical Working of), p. 772; Exchange between Holland and Dutch India, p. 773; Exchange between Great Britain and British India, p. 776; Exchange, Internal, p. 777; Exchange of Notes (Scotland), p. 778; Exchange Broker, p. 778; Exchanger, p. 778.

EXCHANGE, the voluntary giving of one commodity or service on condition of receiving another, is to a great extent the basis of the existing system of PRODUCTION and DISTRIBUTION (*q.v.*). If there were no exchanges, each article of separate property could be used only by its owner, and, excluding gifts, slaveholding, and

communistic arrangements, each man would have to subsist on what he could produce directly for himself, using his own and no one else's instruments of production. As things are, however, separate property is used in the main by those who are most capable of using it, whether they are its owners or not, and no one lives only on what he has himself produced but each lives on what has been produced by a vast number of other persons (see Adam Smith, *Wealth of Nations*, bk. i. ch. i. at end). This is the result of exchanges; owners of property allow others to use it because they can get commodities and services in exchange for the use of it, and men are able to devote themselves exclusively to one occupation because the products of that occupation can be exchanged for the products of other occupations. While production is thus largely dependent on exchanges, distribution, as the word is commonly understood, could not exist at all without them. The use of the word implies that the whole produce of all the workers is considered to be a joint or common produce which, after being produced, has to be divided or "distributed." If each man lived on his own patch of ground, using his own instruments, and receiving no help from any one either in commodities or services, each man's produce or income would obviously be quite distinct from that of every other person, and the conception of a joint produce requiring to be distributed would never have been formed. Individuals' incomes would vary, but the variations would be questions of production only, since each man's income would depend entirely on the amount he produced. Exchange being practised, questions of "distribution" arise because each man's income depends not only on how much he produces but also on the value of what he has to sell, *i.e.* on how much of certain other things he can get in exchange for a given quantity of his work or of the use of his property.

Adam Smith showed a very fair appreciation of the importance of exchange with regard both to production and distribution. He rightly attributed what he called the "division of labour," but what is now usually called the "division of employments," to the practice of exchange, and he did not treat of wages, profits, and rents, till he had discussed "the rules which men naturally observe in exchanging" goods (*Wealth of Nations*, bk. i. ch. iv.) Unfortunately, James Mill, to whom the common arrangement of English works on political economy is chiefly due, seems to have had no adequate conception of the importance of exchange. He spoke of it as if it were a mere incident which occasionally happens to commodities after they have been produced and distributed (*Elements of Political Economy*, Introduction), and when he endeavoured to improve upon J. B. Say's division of political

economy into Production, Distribution, and Consumption, by inserting Exchange, or "Interchange" as he called it, he placed it not only after production, but after distribution also. M'Culloch returned to Say's arrangement, but J. S. Mill followed in his father's footsteps, treating exchange after distribution, and declaring distinctly that "exchange and money make no difference in the law of wages, in the law of rent, nor in the law of profits" (*Principles*, bk. iii. ch. xxvi., Contents). But so far is this from being the case that the very existence of wages, rent, and profits, including interest, is dependent upon exchange. The payment of any particular sum of wages, rent, or profits is a case of exchange, and every variation in wages, rent, and profits is a variation of value, wages being the value of work done, rent the value of the use of land, and profits, the value of the use of capital and of the capitalist's services (see Sidgwick, *Principles of Political Economy*, bk. ii. ch. i. § 2). Of writers since J. S. Mill, most have so far deviated from his arrangement as to place "exchange" before "distribution," *e.g.* Walker, (*Political Economy*), or, with Profs. Sidgwick and Marshall, to treat exchange and distribution as too intimately connected to be treated separately (see DISTRIBUTION). E. C.

EXCHANGE, VALUE IN. Value in exchange, or exchangeable value, denotes a ratio of exchange—"the ratio of the number of units of one commodity to the number of units of another commodity for which it exchanges"; as Jevons particularly clearly points out (*Theory of Political Economy*, ch. iv.), and most authorities admit. The unsettled question is: What are the circumstances which cause the ratio to be what it is? "Utility and difficulty of attainment," answers Mill (bk. iii. ch. ii.), and similar terms are used by almost all economists, but in various shades of meaning, and with different emphasis on each of the two factors. The confusion is aggravated by the not sufficiently noticed circumstance that the operation of the two causes, utility and difficulty, is different in different classes of transactions. It is proposed here to discriminate those essentially distinct cases; mapping out and partially exploring the ground, which may be more fully investigated under the head VALUE.

A convenient tripartite division—Two-sided monopoly, one-sided monopoly (or one-sided competition), two-sided competition—is based upon the degree in which competition is present.

I. The action of competition is at a minimum where the dealers in two articles exchanged are single individuals, or bodies of persons actuated by one will, *e.g.* two governments negotiating a commercial treaty, or a trades-union coming to an agreement with a combination of masters about the rate of wages. The general principle in this case is that both parties will be gainers

by the bargain; in technical language the total utility (see CONSUMER'S RENT, DEMAND, DUPUIT, FINAL UTILITY), of each will be greater after than without the transaction. But to what extent each party will be gainers is not in general determinate; there is a sort of indefinite tract, a "spielraum" (Böhm-Bawerk), within which the point of equilibrium must be determined by other than purely economic considerations. Jevons well says: "the existence of combinations in trade disputes usually reduces them to a single contract bargain of the same [this] indeterminate kind. The men, for instance, ask for 15 per cent advance of wages all round. Rather than have a strike, it might be for the interest of the employers to give the advance, or for the men to withdraw their demand; *a fortiori*, any intermediate arrangement, would still more meet their views. But there may be absolutely no economic principle on which to decide the question. Mathematically speaking, the problem is an indeterminate one and must be decided by importing new conditions" (*State in Relation to Labour*, p. 154).

II. Where there is a monopolist, sole or corporate, on the one side, and on the other side an indefinite number of buyers, or sellers, competing with each other, the most general principle is that the monopolist will beat down the other parties to the point at which each of them is only just a gainer by his bargain; the addition to the total utility of each will be a minimum. The "law of indifference" that there should be one price in a market is not in general true of monopoly. The oppressiveness of the monopolist is modified by regard for his own future interests, as when an American railway company "builds up" a customer by giving him favourable terms, by fear of competition and of public opinion, and other considerations not here relevant (see MONOPOLY).

Mere convenience will often prompt the monopolist, instead of making separate terms in each transaction, as theoretically conceivable, to prescribe rates for classes of persons and goods. These charges are not in general proportioned to the cost incurred. Thus soldiers, in some foreign theatres, are admitted at a different rate from citizens; though the accommodation of the former may be as good as that of the latter. The differences between first and third class passenger fares, and between the rates for different kinds of goods, do not correspond to the outlay of the company in each case. For the object of the monopolist is to render his net profits a maximum; and this result will not in general be reached by apportioning charge to cost. True, if the cost changes, the arrangement most advantageous to the monopolist is apt thereby to be disturbed, and accordingly the charge will be in general altered, but not *proportionately* to the cost. Thus a tax on a mono-

polised article will in general increase the price, yet not equally with the tax, but, as it happens, by either more or less (Cournot, *Théorie Mathématique*, ch. vi.); the assertion which is often made that the charge will be unaffected by the tax is true only where the tax is a lump sum, not of a specific or an *ad valorem* tax.

In the case of monopoly then value is not measured by cost; but it is measured by utility: by total utility in case the monopolist takes the full advantage of his position; by final utility in the more usual case, where a rate is fixed for a class of commodities. In that case each consumer will go on purchasing up to the point at which it is just not worth his while to purchase another unit of commodity at the prevailing price.

III. The most general, or at least the most frequently treated, case is where there is unlimited competition on both sides of the market. This case may be subdivided into two: A, where value is not measured by cost of production, and B, where it is.

A, the first subdivision, corresponds to what Mill calls the "law of value anterior to cost of production, and more fundamental, the law of demand and supply" (see Mill, *Political Economy*, bk. iii. ch. xvi. § 1, and Prof. Marshall's criticism of the passage; *Principles*, p. 544, 2nd edition). This case may be subdivided into two: (1) where production, or at least reproduction is impossible, or may be left out of account; (2) where this abstraction is not admissible.

(A1). To this head belong market values—not only commodities which cannot be multiplied rapidly, but also those of which the quantity in existence cannot be diminished rapidly, namely the precious metals in circulation (Mill, bk. iii. ch. ii. § 5). Prof. Marshall gives an instructive general type of the "temporary equilibrium" of market value; unaffected by cost of production which requires a "long period" in order to influence value (*Principles*, bk. v. ch. ii.).

Other articles referred by Mill to this category are "ancient sculptures, pictures by old masters, rare books or coins, or other articles of antiquarian curiosity" (*Political Economy*, bk. iii. ch. ii. § 2). Compare Prof. Marshall's enumeration of articles in the case of which "there is no connection between cost of reproduction and price" (at the end of the chapter last referred to).

Mill adds to his list of such articles "building grounds in a town of definite extent (such as Venice), the most desirable sites in any town whatever . . . potentially all land whatever" (*loc. cit.*). It should seem that his limitation of the statement to the case of "countries fully occupied and cultivated," is unnecessary. But it is impossible here adequately to discuss all the difficulties which the subject presents.

It is a nice question whether it is proper to

include in this section (A1) the exchange of present goods for future (cp. Böhm-Bawerk, *Positive Theory*), the settling of the rate of interest. Mill says "this is evidently a question of demand and supply" used in the same as in the preceding cases (*Political Economy*, iii. ch. xxiii. § 1). It is usual, however, to regard the "sacrifice" incurred by postponing consumption as a mode of *cost*; and so not to be included in this section.

(A2) To this class belong "commodities of which, though capable of being increased or diminished to a great extent, the value never depends upon anything but demand and supply" in a sense opposed to determination by cost of production (Mill, bk. iii. ch. ii., last paragraph). Perhaps the most typical case under this head is international trade, where in Cairnes's phrase (*Leading Principles*, bk. iii. ch. iv. § 4), cost "controls" but does not "determine" value; in the terms above used with respect to monopoly affects, but does not *measure*, value. Thus suppose tea produced in China exchanges for cutlery made in England. There is no equation between the efforts and sacrifices of the Chinese and the British producer. For the *mobility* tending to produce that equation is wanting. As an additional verification that value is not proportioned to cost in this case, it may be observed that if the cost of production be altered, e.g. by an improvement or a tax, the value in the international market will be altered indeed, but not in proportion to the alteration of the cost (Mill, bk. iii. ch. xviii. § 5, and bk. v. ch. iv. § 6).

The cognate case of "non-competing groups" (Cairnes) is amenable to the same law. The labour-market (cp. Mill, bk. iii. ch. ii. last par.) forms a particularly important instance—so far as it is legitimate to abstract efforts and sacrifices incurred with a view to preparation for that market (see below, p. 762, col. 1, par. 3).

Throughout the whole class of transactions which have been considered (A) there is wanting that adjustment between remuneration and effort and sacrifice which is the essence of the classical doctrine that cost of production determines value. Up to this point those who have impugned or ignored that doctrine are correct.

(B) A transition from the *régime* of "non-competing groups," to "industrial competition" (Cairnes) is obtained by supposing removed the barriers which have prevented competition. There ensues with the mobility of industry the equation of "net advantages" (Marshall) in different occupations. It will be convenient to break up class B in two: (1) where abstraction is made of division of labour; (2) more concrete.

(B1) Suppose each worker free to apply his labour in *doses*, or increments, to any industry—the abstract supposition implicitly made by Jevons in his analysis of labour (*Theory*, ch. vi.).

No one will work in any branch beyond the point at which the trouble attending the last increment of product is just compensated by its remuneration. In this case then it becomes true that value is measured by the final disutility of the producer; while it does not cease to be true that, as in former cases, value is measured by the final utility of the consumer. There is no opposition between these verities; one need not be subordinated to the other.

In this case the relation between the two factors of value, utility and disutility, is almost as symmetrical as in what Prof. Marshall calls "the simplest case of equilibrium between desire and effort when a person satisfies one of his wants by his own direct action, as for instance when he picks blackberries. . . . After he has eaten a good deal the desire for more diminishes, while the task of picking begins to cause weariness which at last counterbalances the desire for eating, and equilibrium is reached." (*Principles*, bk. v. ch. iii. § 1). In such a case the question whether it was the desire, or the weariness, which "determined," or "regulated" the equilibrium would be insignificant.

The "fundamental symmetry" (Marshall) between the forces of demand and supply is aptly represented by mechanical illustrations. "Just in the same way, when several balls are lying in a bowl, they mutually determine one another's positions; and again, when a heavy weight is suspended by several elastic strings of different strengths and lengths, the equilibrium positions of all the strings and the weight mutually determine one another" (Marshall, *Principles*, bk. vi. ch. i.). The principle that water seeks its own level has been employed by Dr. Irving Fisher in his masterly *Investigations in the Theory of Value and Prices* (from *Transactions of Connecticut Academy*, vol. ix., July 1892) to construct a more elaborate illustration of the great principle thus enounced by Cournot, "Le système économique est un ensemble dont toutes les parties se tiennent et réagissent les unes sur les autres."

What has been said of the relation of disutility to value applies equally, or even better, to the "sacrifice" of postponing consumption. As Prof. J. B. Clark well says (*Yale Review*, No. 3), "the final act of abstinence is like the last act of labour, the costliest of all" . . . "the cost entailed on society by its final acts of abstinence is a second possible measure of value." It may be observed that the abstraction proper to this section (B1) is not so violent in the case of capital as labour. The idea of a capitalist distributing his outlay among different enterprises, from each of which *ceteris paribus* he will expect a similar return—is one that is partially realised in the "share" market. Compare Cournot, *Principes de la Théorie des Richesses*, 1863, Art. 45.

(B2) The "fundamental symmetry" between

utility and disutility as factors of value, continues to subsist when we restore the concrete circumstance of division of labour. But superficial differences arise. The individual may be conceived as seeking to maximise his total utility, *per saltum* by a change of occupations, rather than by doses distributed at different points of the industrial system. The equation of "net advantages" in different occupations, rather than of final disutilities, is now the condition. But the analogy of physical equilibrium is still appropriate. "The normal value of everything rests, like the keystone of an arch, balanced between the contending pressures on its two opposing sides. The forces of demand press on the one side, those of supply on the other" (Marshall). We must regard "the various elements of an economic problem—not as determining one another in a chain of causation—A determining B, B determining C, and so on—but as all mutually determining one another" (*ibid.* preface to 1st ed., p. xiv.).

To rightly apprehend the relation between value and cost of production it should be considered that one occupation may comprise several commodities. The production of different articles has been joined together by nature or custom. It would be idle to expect the value of beef and hides to be respectively proportioned to the quantity of labour "worked up" (Ricardo) or "congealed" (Marx) in each. A person who chooses a literary or academic career may hope to be, on the whole, as well off in that as in any other line open to him; but he must not expect the pay of each particular task—*e.g.* writing an article, or giving a lecture—to be proportioned to the trouble (*cp.* Mill on *Subsidiary Industries*, bk. ii. ch. xiv., and see JOINT PRODUCTION).

The sense in which value, in the case under consideration (B2), is determined by cost of production, as well as marginal utility, appears to the present writer to have been best stated by Prof. Marshall. Besides showing the interdependence of the two factors, as above mentioned, he also makes it clear that *time*, "a long period," is required in order that the forces of supply should work themselves out. Thus in the case of labour the adjustment between cost and value must be dated from the time when parents begin to make efforts and sacrifices with a view to the education and advancement of their children. There is presented the vast conception of trained industry put upon a future labour-market, by parental providence, for vicarious remuneration.

But perhaps no form of words devised by one person can be expected to recommend itself to all others as the best adapted to express the subtle relations of utility and cost to value. As in higher spheres of speculation, it may be hoped that differences of doctrine are less important than at first sight would appear.

The authorities on the more general case of value in exchange defy quotation by their number. Those to whom the present writer is most indebted have been mentioned in the text.] F. Y. E.

EXCHANGE, VALUE IN. HISTORY OF GROWTH OF THEORY. For the purpose of an elementary survey of the history of the theory of value we may roughly divide the various theorists into two "schools"—the "cost-of-production" school and the "utility" school. The "cost" school is the older; its sway over our science has only begun to be broken in the last few decades by the "utility" school, the earliest quite consistent representatives of which wrote in the middle of this century.

The "cost-of-production" school.—The first step towards an analysis of the economic phenomenon of value consisted in a discrimination between value in use and value in exchange. Aristotle makes this important distinction: "To take *e.g.* a shoe, there is its use as a covering of the foot, and also its use as an article of exchange" (*Polit.*, i. 9, p. 22 of Welldon's Transl.). His example is followed, among English economic thinkers, by Locke ("Considerations of the lowering of interest and raising the value of money," in *Works*, ed. 1714, ii. p. 21) in the end of the 17th, and by Hutcheson (*System of Moral Philosophy*, 1755, ii. p. 53) in the middle of the 18th century. Locke, *l.c.*, speaks of "the intrinsic natural worth of anything," as separate from its "value"; and Hutcheson, *l.c.*, observes that "the prices and values in commerce do not at all follow the real use or importance of goods for the support . . . of life." French physiocrats (*e.g.* Dupont and Quesnay), speak of *valeur usuelle* and *valeur vénale*; and Turgot distinguishes between *valeur estimative* and *valeur commercable* or *échangeable*, defining the first as a purely individual, the second as an essentially social mode of weighing the sacrifice, necessary in order to get possession of the commodity, against the enjoyment of possessing it. English economic treatises of the 18th century sometimes show an appreciation of the difference between use value and

exchange value by discriminating between the words "worth" and "value."

When Adam Smith wrote his *Wealth of Nations*, he made this old primary analysis of value the basis of further analysis. He first hints that "things" must have some "value in use" in order to have any "value in exchange," and then for a time entirely drops "value in use" out of the discussion, proceeding to investigate "what is the real measure of this exchangeable value; or, wherein consists the real price of all commodities," and "what are the different parts of which this real price is composed or made up" (bk. i. ch. iv. p. 42, ed. 1793). He does not explicitly treat the problem: How does value measure men's desires to possess, or consume, commodities? This significant feature is, however, to be found among the French physiocrats. Turgot—("Valeurs et Monnaies," in *Œuvres*, ed. Daire, vol. i. p. 83) says: "For an isolated individual, the *valeur estimative* of an object is precisely that portion of his total faculties (*la portion du total de ses facultés*), which corresponds to his desire for the object, or which he is willing to employ in order to satisfy this desire." Adam Smith proceeds (comp. bk. i. ch. iv. and ch. vii.) to discuss "the different circumstances which sometimes raise some or all of these different parts of price above, and sometimes sink them below their natural and ordinary rate," i.e. their cost of production—or "the whole value of the rent, labour, and profit, which must be paid in order to bring" the commodity to market. Here he looks at the problem chiefly from the point of view of the seller, as if exchange were regulated almost exclusively by estimates of labour or cost. In this connection he uses "worth" and "cost" as identical terms. The manner in which Adam Smith treated this question gave rise to that school of economic thinking which (to use the phrase of Professor Nicholson, art. "Value" in *Ency. Brit.*) regards utility "simply as a kind of entrance examination which every commodity must pass to enter the list of valuables, whilst the place in the list is determined by variations in the degree of the difficulty of attainment."

Ricardo states: "Utility then is not the measure of exchangeable value, although it is absolutely essential to it" (*Principles*, ed. Gonner, p. 5). Elsewhere (pp. 7, 8), Ricardo speaks of labour as the "foundation of the exchangeable value," and of "quantity of labour realised in commodities" as "regulating their exchangeable value."

Malthus (*Principles*, ed. 1820, p. 52) sees that value in exchange "does not depend merely upon the scarcity in which commodities exist . . . but upon the circumstance of their not being distributed . . . in such quantities to each as the wills and powers of individuals

will enable them ultimately to effect by means of exchanges." He does not, however, search further into the relation between "such quantities" and their value in use. This latter term he describes in his *Definitions* (ed. 1827, p. 234) as being "synonymous with utility. It rarely occurs in political economy, and is never implied by the word value when used alone."

J. S. Mill emphasises more strongly than his predecessors the importance of the play of supply and demand in determining exchange value. He, however, retains Ricardo's notion of two laws of value; one for commodities that "are susceptible of being multiplied at pleasure," and another for commodities that are not. These latter, "no doubt, are exceptions," and it is for these latter that he conceives his supply-and-demand theory of value (*Principles*, bk. iii. ch. ii.).

Karl Marx, the founder of German social democracy, seeks, on the lines of Hegelian dialectics, to separate value in use totally from value in exchange. The latter is "something quite independent" of value in use; and an investigation of value in use may be of some good in commercial education, as "die Disciplin der Waarenkunde," but does not belong to economic science, though "nothing can have exchange value without being a thing of utility" (*Das Kapital*, ed. 1883, pp. 2 and 8). Exchange value, Marx continues, is a ratio, and as where there is a ratio there must be homogeneity, he arrives at the conclusion that commodities can only be homogeneous as products of human labour. This, therefore, determines value. Marx's theories, though they have never been accepted by any economist of note, are worth consideration, partly because of their enormous influence on socialistic workmen in different parts of the world; partly because they undoubtedly display some of the worst consequences of consistently neglecting to analyse consumption or demand as carefully as production or supply.

Turning to the French, German, and other Continental theorists of the cost-of-production school, we find that, with few exceptions, they have been far more disposed to devote attention to the utility element of value in exchange than the "classic" English school from Smith to Fawcett. Though there are most important scientific divergences between the majority of 19th century German economists and the new "Austrian school," it is still by no means difficult to look upon the former as slowly and laboriously paving the way for the latter.

J. B. Say indicated (*Traité*, ed. 1803, ii. p. 58) that the fundamental elements of value in exchange were, the quantities offered and demanded, and the expense of production, which latter he called "the natural value" of the commodity. He set the example for later French

economists of treating the value problem as essentially dealing with the laws which determine when and how "utilities" exchange against one another. "No doubt what determines us to give up a commodity which we possess in order to get another is some quality in this other commodity which pleases us, and which quality is not to be found, or to be found only in less amount (*à moindre dose*) in the commodity which we give in exchange" (Coquelin and Guillaumin, *Dict. de l'Éc. Pol.*, 1853, vol. ii. p. 808)—this, and not the cost of production, is the starting point of most French discussions of value. J. Garnier's definition (*Traité d'Éc. Pol.*, ed. 1889, p. 280): "things have value in exchange when they are useful and, at the same time, transferable and scarce; that is to say, value in exchange is exchangeable utility, corresponding to the amount of labour which the thing saves, and, in most cases, owing its existence to labour and other expenses," is characteristic of the standpoint of many French economists. An exception from the general French attitude is F. Bastiat, notable not so much for solid scientific merits as for a widespread popularity. He defines value in exchange as "the proportion (*rapport*) between two services exchanged" (*Harmonies Économiques*, ed. 1851, p. 118).

Among most German economists of this century there is a tendency to treat utility as of at least equal importance with cost of production in the determination of exchange value, "The value in exchange of a commodity, or its suitability for the purpose of being exchanged against other commodities, depends upon that combination between use-value and cost-value which has its rise in the economic relations of men one with another," writes W. Roscher in his *System der Volkswirtschaft*, ed. 1882, i. p. 10. And Schäffle defines value in exchange as "a disguised comparison between the cost-values and the use-values of the two commodities which are to be exchanged against each other" (*Kapitalismus und Socialismus*, p. 35). In his *Bau und Leben des socialen Körpers*, ed. 1878, iii. p. 279, the same writer shows that exchange value is at the same time an individual and a social phenomenon. Adolph Wagner (*Allgem. od. theoret. Volksw.*, Thl. I., *Grundlegung*, ed. 1876, p. 47) says that "the exchange value of a commodity depends, for the individual who demands it, upon its degree of concrete utility for him, and upon the difficulty of getting it." Wagner is careful to observe that value in use is "the foundation of all the estimates" which determine exchange value, and that difficulty of attainment is an incident which, though in most cases present, can by no means be used exclusively for the definition of exchange value. The position of the majority of living German economists is also well represented by Professor Neumann in Schönberg's

Handb. d. Pol. Oek., ed. 1885, vol. i. p. 156, etc. He proposes to abandon the phrases "value in use" and "value in exchange" as not sufficiently emphasising the all-important personal element in value. The essential thing in all the varying meanings of value (*Werth*) is "the estimate (*Beurtheilung*) of the usefulness or fitness of a thing for human interests, wants, or aims." Neumann, however, does not enter into any far-reaching examination of the relations between his subjective and objective "categories of value." This intermediate position between the extreme cost-of-production school and the modern utility school is, however, not taken by Max Wirth, Prince Smith, and several other German "free traders." Their value theory is very closely related to that of BASTIAT (*q.v.*) and to that of the classic English school. Another notable dissenter from the majority of German economists is Eugen Dühring. He has adopted the value theory of H. C. Carey, according to whom value "results exclusively from labour." Value in exchange is "the measure of the resistance offered by nature, to the possession of the things desired," or "the measure of the power of nature over man" (*Principles of Social Science*, ed. 1877, ch. vi. § 88). The economic writers among the German social democrats continue to follow Karl Marx.

[In the following works are to be found references to the more important writers of the cost-of-production school both in England and on the Continent. W. Roscher, *System der Volkswirtschaft*, ed. 1882, vol. i. p. 10-12, footnotes.—Adolph Wagner, *Grundlegung*, ed. 1876, pp. 37-40, 43, footnotes.—Schönberg, *Handbuch*, ed. 1885, vol. i. p. 156, footnote; also footnotes to several of the following fifteen pages.—Coquelin et Guillaumin, *Dictionnaire de l'Éc. Pol.*, 1853, article "Valeur."—J. Garnier, *Traité d'Éc. Pol.*, ed. 1889, pp. 275-280, 692-694.—J. R. McCulloch, *Literature of Pol. Ec.*, ch. i.—J. K. Ingram, *History of Pol. Ec.*, 1888.—L. L. Price, *History of Engl. Pol. Ec.* since Adam Smith, 1890.—K. Marx, *Das Kapital*, vol. i., footnotes to ch. i.—E. von Böhm-Bawerk's *Kapital und Kapitalzins* (Engl. Transl. by W. Smart), contains in its historical part, vol. i., a great number of bibliographical references, which are very useful to a student of the history of the general theory of value, though the book deals only with the history of the theory of interest.—Specially for Italian theory: Augusto Graziani, *Storia critica della Teoria del Valore in Italia*, Milano, 1889.—Specially for early German theory: W. Roscher, *Geschichte der National-ökonomik in Deutschland*, 1874.]

The "Utility" School.—Though all economists insist that "utility is indispensable to value," and though many of the writers who have been classed as belonging to the cost-of-production school strongly emphasised the great importance of utility to value in exchange, they never succeeded in working out a consistent

quantitative theory of the general and necessary connection between utility and value in exchange. To have done this is the scientific characteristic of the "utility school." The principal achievements of this school, as far as they concern the general theory of value, consist (1) in the discovery of the connection between the variation of the utility to an individual of a unit of a commodity and the variation of the number of such units possessed or commanded by him; and (2) in the discovery of the law of the marginal determination of all forms of exchange value (see MARGIN). These discoveries led to the important distinction between total utility and degree of utility, and to the unravelling of the complicated connection between exchange value as determined in a market, under the influence of free competition between producers and consumers, and the marginal degree of utility of a unit of the commodity to individual dealers in the market. These deductions have led to the general theory that *value in exchange is a relative marginal degree of utility and a function of quantity possessed*. Hence it is concluded that variations in cost of production or difficulty of attainment can never directly affect or, strictly speaking, determine value in exchange, but only indirectly affect it, when and in so far as the variations in cost of production affect quantity possessed—such conditions as time and FRICTION (*q.v.*) being taken into account. What directly determines exchange value is not the desire to avoid work, the root idea of the "cost" school, but the desire to possess the commodity—not the production, the past history of the commodity, but the consumption, the future destiny of the commodity. This theory is the result of quantitative analyses of CONSUMPTION (*q.v.*). The "cost" school had in a very conspicuous manner neglected the theory of consumption—had indeed often denied that there could be such a thing. The "utility" school, on the contrary, looks upon the quantitative theory of consumption as the only sound basis of economic theory in general.

The root idea of the "utility" theory is to be found in economic treatises from the earliest time, *e.g.* Aristotle. "It follows," he wrote, "that such things as are the subjects of exchange must, in some sense, be comparable. . . . Money . . . measures everything, and consequently measures, among other things, excess or defect, *e.g.* the number of shoes which are equivalent to a house or a meal. . . . But this will be impossible unless the shoes and the house or meal are in some sense equalised. Hence arises the necessity of a single universal standard of measurement. . . . This standard is in truth the demand for mutual services, which holds society together; for if people had no wants, or their wants were dissimilar, there would be either no exchange, or it would not be

the same as it is now" (*Nic. Ethics*, v. 8, p. 152 of Welldon's transl.). Condillac (*Le Commerce et le Gouvernement*, ed. Daire, 1847, p. 250) observes: "We say that a thing is useful when it serves one of our wants. . . . According to this utility we estimate the thing more or less. . . . Or, it is this estimate which we call value. . . . The value of things is then founded upon their utility, or, what amounts to the same, upon our wants for them, or, what still amounts to the same, upon the use we can make of them." B. Hildebrand (*National-ökonomie d. Gegenwart u. Zukunft*, 1848, p. 318) foreshadows the theory that value is determined by marginal utility and is a function of quantity wanted. The French engineer Dupuit, when attempting to find a measure for the utility of public works, observed that the utility of a commodity is often not only different for different individuals, but that it will vary enormously for the same individual when the quantity possessed or commanded by him varies. "The utility for the same individual of a piece of bread can grow from zero to the amount of his whole fortune" ("De l'influence des péages sur l'utilité des voies de communication," in *Annales des ponts et chaussées*, 1849, p. 185; also "De la mesure de l'utilité des travaux publics," in *Annales*, 1844). Dupuit states (*Annales*, 1849, p. 172) that his theory is an elaboration of that of P. L. O. Rossi, who considered the theory of utility as the true basis of economics. Other more or less fragmentary attempts at building a value-theory upon an analysis of utility are to be found in writings of K. H. Rau, von Thünen, Friedländer, Knies, Schäffle, L. von Stein, A. Walras, Th. de Quincey, Samuel Bailey, R. Jennings, and others (see the bibliographical notes by Menger and Jevons referred to below).

The first economists who succeeded in establishing and elaborating a consistent theory of value by a thorough analysis of consumption or demand, were A. Cournot and H. H. Gossen. In his *Recherches sur les Principes mathématiques de la Théorie des Richesses* (Paris, 1838) Cournot observes (p. 22): "What is truly important is to know the laws which govern the variations of values, or, otherwise expressed, to have a theory of wealth. This theory alone will allow us to show to what absolute variations are due those relative variations" (in values) "which fall within the field of observation." In the chapter on "the law of demand" Cournot writes: "Let us then assume that the annual demand D for each commodity is a special function $F(p)$ of the price p of this commodity. To know the forms of this function would be to know what we call the law of demand. . . . The form of the function would evidently depend upon the nature of the utility of the commodity, upon the nature of the services which it can render, or upon the

enjoyments which it can procure, upon the habits and the customs of each people, upon the average wealth and upon the scale according to which this wealth is divided" (p. 50). Cournot proceeds to argue (p. 56) that "as the function $F(p)$ is continuous, the function $pF(p)$, which expresses the total value of the quantity annually demanded, must also be continuous." Further, it is possible to assign to p such a small value that $pF(p)$ becomes zero, and also to assign to p so high a value that the same happens. It is easily seen that these quantitative relations between price and quantity demanded at that price have their exact analogy in the subjective fact, not treated by Cournot, that the value in exchange of a commodity is the differential coefficient of its value in use.

The treatise by Gossen entitled *Entwicklung der Gesetze des menschlichen Verkehrs und der daraus fließenden Regeln für menschliches Handeln* (1st ed., Braunschweig, 1854), opens with the explicit assumption of economics being the theory of pleasure and pain—economic activity having for its aim the realising of a maximum of pleasure with a minimum of pain. He proceeds in a strictly logical sequence to expound the theories of utility, of labour, and of exchange. "The magnitude of the same desire," writes Gossen, "diminishes steadily, when we without interruption continue to administer to it, till at last a state of satiety is reached" (p. 4). He distinguishes between total utility, degree of utility, and marginal degree of utility.

The two early pioneers of the utility theory of value, Cournot and Gossen, failed to gain recognition. Their suggestive writings were practically unknown at the time when W. S. Jevons, Karl Menger, and Léon Walras, early in the seventies, published independently of each other their epoch-making treatises.

Jevons as early as 1860 thought out the outline of his theory, and had in 1862 published a preliminary notice of the same. His well-known *Theory of Political Economy* (1st ed. 1871, 3rd ed. 1888) has exercised a great reforming influence. Its most salient and enduring feature is the profoundly philosophical spirit in which its early chapters deal with the method and very foundation of the science. In his introduction (ch. i.) Jevons contends "that economics, if it is to be a science at all, must be a mathematical science . . . simply because it deals with quantities" (pp. 3, 4, 2nd ed., 1879). Having shown the mathematical connection between total utility, or value in use, and degrees of utility, having framed the law of variation of final or marginal degree of utility, and having shown how this law rules the distribution of a commodity in different uses, he only needs to define MARKET (*q.v.*) and to formulate the LAW OF INDIFFERENCE (*q.v.*) to lay the foundation of his theory of exchange (ch. iv.). This is expressed in the words:

"The ratio of exchange of any two commodities will be the reciprocal of the ratio of the final degrees of utility of the quantities of commodity available for consumption after the exchange is completed" (p. 103). Jevons continues: "There are two steps between labour and value. Labour affects supply, and supply affects the degree of utility, which governs value, or the ratio of exchange" (p. 179).

Léon Walras, in *Éléments d'Économie politique pure, ou Théorie de la Richesse sociale* (1874), and subsequent works supported the same theory of value as Jevons, the chief point of difference being one of terminology. Walras, for example, often using the highly concentrated and therefore rather ambiguous term rarity (*rareté*) instead of final or marginal degree of utility. Léon Walras developed the mathematical utility theory of value expounded by his father A. Walras, and he also utilised the work of A. Cournot above referred to.

Karl Menger published his *Grundsätze der Volkswirtschaftslehre* in the same year as Jevons his *Theory* (1871). In the preface he announces as his object to frame so general a theory of price that it accounts not only for price of commodities but also for interest, wages, rent, etc. (p. x.). He approaches his subject by way of an elaborate analysis of the economic significance of goods (*Güter* as distinct from *Waaren* or commodities), and he establishes in the very first chapter the doctrine of the different "orders" of goods—a very characteristic part of his theory, and valuable as an attempt to broach the special problems of the value of tools or of goods which only indirectly serve our life. Menger's theory of value (pp. 98-99 and 107-108) is in substance the same as that of Jevons and Walras though not formulated with the same amount of precision.

[During the last ten or fifteen years there has grown up in England, America, Austria, Germany, Holland, Italy, France, and Denmark, a "school" of economists engaged in developing the science on the lines of Jevons, Walras, or Menger. The well-known treatises of such Continental economists as E. von Böhm-Bawerk, Friedrich von Wieser, Wilhelm Launhardt, R. Auspitz, and R. Lieben, N. G. Pierson, Emil Sax, Harald Westergaard, are all founded upon the utility theory of value. The new theory has, besides, exercised a very marked influence on many prominent economists of the present day who, like Professor H. Sidgwick and Professor F. A. Walker, cannot be said actually to belong to this "utility school."

Among English treatises distinctly belonging to the "utility school," we can only mention a few. F. Y. Edgeworth's *Mathematical Psychics* (1881) is interesting as an attempt at utilising the new theory for establishing, on strictly mathematical lines, a science of social life. *The Alphabet of Economic Science*, by Ph. H. Wicksteed (1888), takes up the theory of value of Jevons, and gives a popular explanation of the fundamental

theorems of the higher mathematics upon which it rests. Professor A. Marshall, in his *Principles of Economics*, vol. i. (1890), shows the true organic connection between the modern theory and the doctrines of the leading economists of the past.

The most complete bibliography to the value theory of the utility school is found in the appendix to W. S. Jevons's *Theory of Political Economy*, ed. 1888. See also: Carl Menger, *Grundsätze der Volkswirtschaftslehre*, thl. i. 1872 (notes to pp. 78-80, 108-113, 215-216, are excellent as a guide to German writers on the subject); Léon Walras, *Théorie de la Monnaie*, 1886, pp. vii.-ix.—Auspitz and Lieben, *Untersuchungen über die Theorie des Preises*, 1889 (preface).—Graziani, *Storia critica della Teoria del Valore in Italia*.—R. Zuckerkandl, article "Preis" in Conrad's *Handb. d. d. Staatsw.*, also same writer's *Zur Theorie des Preises*, 1889.—E. Cannan, *History of the Theories of Production and Distribution in English Pol. Ec. 1776-1848*, 8vo, 1893.] a. r. s.

EXCHANGE (USURY). See USURY.

EXCHANGE, as BOURSE. (a) A place where merchants, bankers, brokers, etc., assemble at certain hours for the transaction of business; and (b) the assemblage itself. In both senses the word is commonly contracted into 'Change.

"The last yere, I shewyd your goode lordeshipe a platte, that was drawn howte for to make a goodely Burse in Lombert strette for marchaunts to repayer unto. I doo suppose yt wyll coste ii. M. li (£2000) and more, wyche shalbe very beautyfull to the citti, and allsoo for the honor of our soverayngne lord the Kinge." Thus wrote Lord Mayor Sir Richard Gresham in 1538 to Cromwell, the lord privy seal. He had recently seen and admired the new *Burse* at Antwerp, and was anxious that London merchants, whose custom it was to congregate twice a day in the open air in Lombard Street, should be provided with a similar house, or covered walk, to shelter them from the inclemency of the weather. But powerfully as he advocated the scheme, it did not find favour. Owners of property were difficult to treat with; and, as the merchants themselves appear to have been completely indifferent, the plan was suffered to fall through. After the lapse of a quarter of a century, it was however again brought forward by his public-spirited son, Sir Thomas Gresham. On the death of his only child in 1564, Sir Thomas appears to have conceived the idea of making his country his principal heir; he munificently offered, provided the city would furnish a suitable site, to erect the building at his own expense. His fellow-citizens gratefully accepted the offer; they raised a sufficient sum by subscription, purchased the piece of land on which the Royal Exchange now stands, and conveyed it over to him. By the end of 1568, merchants were able to hold their meetings within the building. It consisted of a quadrangular arcade, enclosing an open court, and bore a general resemblance

to the *Burse* at Antwerp, which had suggested the plan. After completion, it was inspected and formally opened (23rd January 1571) by Queen Elizabeth, who "caused the same *Burse* by an heralder and a trompet to be proclaimed the *Royal Exchange*, and so to be called from thenceforth, and not otherwise." Gresham had ordained in his will that, on the death of his wife, who was to enjoy the rents during her lifetime, the Royal Exchange should be vested in the hands of the Corporation of the City of London and of the Mercers' Company, conjointly, and to them it in due time reverted. Exactly 100 years after the laying of the foundation stone, the building was swept away in the great fire of 1666; and its successor, the second exchange, was also destroyed by fire in 1838. The present structure dates from 1844.

To the inquiring foreigner or stranger who nowadays visits the Royal Exchange, as many do, in the expectation of finding there the very heart and focus of the business of London, the silence and the deserted appearance of its interior are a constant source of wonderment; for with the exception of a short interval in the afternoon, when it is resorted to by dealers in some of the minor branches of commerce (paper, oil, drugs, etc.), and of an hour or so on Tuesdays and Thursdays, when foreign bills are dealt in, it appears to the observer to be entirely given over to loungers. As a matter of fact it has to a great extent outlived its object. In the time of Gresham, and for many years afterwards, the space afforded by the quadrangle and ambulatory was doubtless amply sufficient for all requirements, but to-day the building would hardly give standing-room to a tithe of those who every day come together in the city to discuss and transact affairs; long ago it became apparent, as the throng grew more and more dense, either that the exchange must be greatly enlarged, or that some of those who frequented it must forgo elsewhere. One after another, accordingly, the larger and wealthier sections of traders forsook the parent assembly and built homes for themselves in more convenient localities. The dealers in stocks and shares, the produce merchants, shipowners, insurance underwriters, coal, metal, corn, hop, wool-traders, and others, now possess their own separate exchanges. There is, however, one small but important group which still transacts business in the old parent centre, and which the mind more particularly associates with the word "Change." On Tuesdays and Thursdays, immediately after luncheon time, the principals of the great merchant-banking houses, and of the foreign and Anglo-foreign joint-stock banks, collect at the eastern end of the courtyard to discuss matters of common interest and to deal in foreign bills. The attendance is never very large—not more perhaps, including the brokers,

than five or six score ; but it comprises members of firms whose names are "household words" on every bourse throughout the world, and is eminently representative of the financial side of England's *Welthandel*. Hubbub and excitement, apparently necessary concomitants of the dealings in other commercial assemblies, are here entirely absent ; the negotiations are conducted in a quiet undertone, and with an air of non-chalance which might almost lead the onlooker to believe that the chief object of the meeting is conversation, and that business is quite a secondary consideration.

Formerly the foreign mails were despatched from London only twice a week, on Tuesdays and Fridays, and on these "post days" alone were foreign bills negotiable on "Change." Though times have changed, the custom of a bi-weekly meeting (since 1879 fixed for Tuesday and Thursday) still subsists, as it is found that two exchange-days are quite sufficient for all practical purposes, and are perhaps even more advantageous than a daily market would be, inasmuch as they collect on the same spot and at the same time all the important buyers, and therefore establish a genuine quotation.

Owing to the fact that the settlement of our mercantile transactions with other countries is effected almost entirely by means of bills drawn on London from abroad—the bills drawn on abroad from England forming only a very small fraction of the whole, that is to say, our exporters, instead of drawing against their sales, mostly arrange to have remittances sent them ; and our importers, instead of remitting against their purchases, mostly arrange to accept,—the traffic in "London" paper on the Continental bourses is on a far larger scale than that of the dealings in foreign bills on the Royal Exchange ; and the buying and selling of long or short "London," either for the portfolio—as stock-in-trade, investment, or speculation, as the case may be—or in execution of orders received from customers, is part of the regular round of a Continental banker's duties, and necessitates his daily attendance at the bourse. An English banker, on the contrary, is rarely or never seen on "Change," as he confines his bill-operations to paper payable at home, and immediately disposes through his broker of whatever foreign paper may be sent up to him from the provinces for negotiation. A notable consequence of this predominance of foreign-drawn over English-drawn paper in the various markets is that the course of most of the exchanges is controlled from abroad, and that the fluctuations registered here are mere reflections of the movements produced by forces operating on the other side. G. C.

EXCHANGE, STOCK. The largest stock exchange in the world is that of London, in which securities to the nominal value of £7,004,789,088 are marketable, or were so on

31st Dec. 1891. These securities are officially recognised, and there are besides numbers which have no official quotation, but are yet dealt in from time to time according to the speculative rage of the moment. There are also in the United Kingdom eleven other exchanges, viz. :—those of Manchester, Liverpool, Leeds, Sheffield, Newcastle, Birmingham, Bristol, Aberdeen, Edinburgh, Glasgow, Dublin. The whole of these do not include the attendance of as many persons, or turnover of so much money and securities, as the London stock exchange alone. Their business, however, presents some points worthy of notice (see EXCHANGE, STOCK, PROVINCIAL). The London stock exchange is not only the chief of the English stock markets ; it is also linked internationally with nearly all the financial centres of the world, and it would be difficult to name a security which could not find a market in London, either through the ordinary channels provided by *arbitrage* dealers (see ARBITRAGE), who buy in the cheaper and sell in the dearer markets, or through the agency of trusts which, by the aid of English investments, form funds applied to the purchase of a vast variety of securities in European, Asiatic, American, and Australian exchanges as well as those which are of native production. There has never been anything in history like the London stock exchange for magnitude and extent of financial resources. It is an immense business engine with certain unavoidable drawbacks which give it also the nature of an extensive gambling centre. On the whole, it has been found by experience that the advantages and merits of such an organisation outweigh altogether the drawbacks imposed by the too-speculative spirit of mankind. Members have been heard to assert that nine-tenths of the operations on which stockbrokers live by commission are gambling operations, and still it has been found by experience that, although the speculative public pay annually a heavy tax to the professional stock exchange element—it has been calculated that the annual revenue of members of the London stock exchange is £4,000,000,—yet the stock exchange provides a useful barometer ; and sometimes, by its extreme sensitiveness to events which have yet to happen, eases and mitigates the effects of disasters which would otherwise have assumed proportions of a national calamity. The stock exchange is always running ahead of anticipated events, and the events, when they happen, being so "discounted," have the less effect if any effect at all. This is by no means the only public service done by the stock exchange. The modern fashion of turning over growing private undertakings into joint-stock companies makes the stock exchange a necessity. It is also a means by which astute men of business can

insure, or hedge, against the worst results of what would otherwise be a hazardous operation. It is on record that a large financial house, which had undertaken to supply the Spanish monarchy with a sum of money, went to Lloyds and insured the life of the king of Spain, in order to provide a hedge, as sporting men would say, against the possible death of the Spanish monarch, who happened to be in ill-health at the time. Similarly the stock exchange is often used as a hedge against commercial contracts. For example, if a group or firm of contractors have undertaken to supply steel rails for a South American railway at an advantageous rate, the chief contingency to be guarded against is default or discredit on the part of the state. While undertaking to contract on the one hand, they find it advisable to acquire the option to deliver stock at fixed prices on the stock exchange; so that, whatever happens, there is no great or irreparable loss to be feared. Commercial operations which depend on the maintenance of peace in Europe can obviously be entered into with some sort of security when it is possible to hedge against disaster by recourse to the stock exchange. It is a two-edged tool, however, and cannot be used safely by others than men of the greatest discretion and experience. We may usefully put on record here an extract from the conclusions of the royal commission on the London stock exchange, which reported in the year 1878 as follows:

"The public are enabled to count upon a reasonable speed and certainty in the transaction of business, and the vast amount of business done secures to those who deal in the London stock exchange as small a difference between the buying and selling prices as can be obtained in any other market. We think, however, that if it were possible, it would be desirable that the exchange should be open to the public,—not so much because an investor would in the event have any real control over the bargain which his broker might make for him, as for the purpose of removing a certain amount of jealousy and suspicion which is created in some minds by the present system." The stock exchange has not found it practicable to throw open its doors to the public, and it remains what it was—a strictly regulated club.

The report of the royal commissioners also contained these words: "In the main the existence of such an association, and the coercive action of the rules which it enforces upon the transaction of business and upon the conduct of its members, has been salutary to the interests of the public." The stock exchange having, or rather being, a valuable monopoly, it is not surprising that the tone of its government is exclusive. It has a share capital of £240,000, the shares being reckoned as £12 paid. The £12 shares are (in the year 1893)

worth about £120 each, and none other than a member of the stock exchange is allowed to be a proprietor. For the year 1891-92, the dividend paid was £6 a share, or 50 per cent of the share capital, and the net revenue of the year had been £120,602:15:2, after payment of interest at $3\frac{1}{2}$ per cent on £250,000 debentures. The share and debenture capital together are more than balanced by freehold and leasehold property, which stands at £596,111:8:3 in the accounts, and may be worth more. The value of the connection of the stock exchange may then be reckoned at something between two and three millions sterling.

The management of the stock exchange has thus been good enough to stand the test of public opinion during the fast-working 19th century. About the year 1700, dealers in public securities found the accommodation in the Bank of England too small and migrated to 'Change Alley; thence to Sweetings Alley in 1773, where a room was engaged and kept up by subscription; and afterwards to Capel Court where, in the year 1802, a building was opened, but the public were excluded. There were at that time about 500 subscribers, and this was the formal beginning of the stock exchange, as it is now known. Fifty years ago the number of members was about 350, and now (1893) the number is 3332, besides 1923 clerks, who are admitted at reduced rates. The stock exchange included, as it still includes, a responsible body, a complete organisation, a local habitation, a public institution privately managed. Its Benevolent Fund is unique.

Mr. F. Levien, for many years secretary to the committee for general purposes, in his evidence before the royal commission in 1877, described the internal administration of the stock exchange in the following words: "The administration of the stock exchange is vested in two bodies, whose functions are distinct. First come the managers, who represent the proprietors or shareholders in the undertaking, under the deeds of 1802 and 1876, who are the executive of the landlords of the house and premises, have control over all monies paid for admission, fix annually the charge for admission of members for the year ensuing, appoint all officials, except the secretary to the committee for general purposes and the official assignees, and superintend all matters connected with the building, supplies, etc." He goes on to describe the functions of the committee for general purposes, who are the executive of the subscribers, and "have control over the business of the house; make and administer the rules and regulations for the conduct of the business of the stock exchange; adjudicate all questions between members and complaints against members by non-members, if desired to do so by the latter. They investigate the question whether their published requirements have been com-

plied with by governments and companies asking for settlements or official quotations, for loans or shares, and have vested in their hands the election by ballot of those who seek to become members of the stock exchange." This committee have been known to suspend or expel members for offences against the body, also for those against the public, seeing that such conduct would be calculated to bring the stock exchange into disrepute. On the whole, the management has been successful, and, again on the whole, is approved by public opinion. New members are elected and old members re-elected on the first Monday in March of each year. An applicant for membership must be recommended by three members of at least four years' standing, each of whom must pay £500 in case of default by the new member within four years of his admission. The full entrance fee is £500 and the annual subscription £31 : 10. A. E.

(See BROKER, DEALER, JOBBER.)

EXCHANGE, STOCK, PROVINCIAL, IN GREAT BRITAIN AND IRELAND. The best known of the provincial stock exchanges are Birmingham with 25 members, Dublin with 67, Edinburgh with 54, Glasgow with 141, Leeds with 14, Liverpool with 163, Manchester with 75, and Sheffield with 26 ; collectively 565 members.

All are organised associations managed by committees, and the aggregate of yearly business transacted by them is very great. It is to be noted that cases of dispute and litigation between provincial brokers and clients are extremely rare, and it is claimed on behalf of these institutions that no description of business in this country is carried on with greater rapidity and accuracy than that in which these exchanges are engaged.

Up to the year 1890 the provincial exchanges had no common understanding or organisation ; but in that year was established what has since become widely known as the council of associated stock exchanges,—that is to say of provincial stock exchanges,—a consultative body composed of delegates, generally the chairmen and deputy chairmen of the various exchanges. The council meets annually, or more frequently in cases of emergency ; the presidency and administration being undertaken by the larger exchanges in turn. The provincial exchanges have long been engaged in the revision and codification of stock exchange rules ; a task likely to result in the institution of numerous common rules and identical practices. The first public action of this body was their successful attempt, by securing the guarantee of share titles, to avert from shareholders, in future, the disastrous possibilities opened out by the North-Western Railway Company's now historical denial of their stock certificates. The London stock exchange declined to take action in the matter, until the principle of

indefeasible titles to securities had been accepted by public bodies and press opinion ; and the Forged Transfers' Acts, and the benefits resulting from them, will accordingly always be associated with the provincial exchanges, and more especially with that of Liverpool, upon a member of which institution devolved the labour and responsibility both of securing the passing of these acts and of putting them into operation.

The business of the provincial stock exchanges consists very largely of:—(1) Transactions for investment in British railway stocks—and with this distinction as regards the London stock exchange that, being practically brokers' markets, investors can there operate free from such profits as are absorbed by London dealers. (2) Speculative dealings in the above-mentioned securities. (3) Extensive dealings in shares of insurance, banking, shipping, and commercial undertakings. (4) Very extensive dealings in Canadian and American railway stocks. It is difficult to compute the extent of the yearly transactions upon the provincial stock exchanges named above ; they have been estimated in round figures at an average of £500,000,000. The number of public companies introduced in the provincial stock exchange centres, although at times considerable, bears but a small proportion to the total number annually brought before the public.

EXCHANGE, FOREIGN. The term foreign exchange denotes the value at which an amount quoted in the currency of the country where the transaction originates is interchangeable with that of a foreign country. The quotation of foreign exchange fixes the market value, for the time being, of foreign currency in the place wherein the quotation is made. For instance, if the French exchange is quoted in London to-day at 25 frs. 20 c. for cheques on Paris, it means that for every sovereign a London banker would buy or sell 25 frs. 20 c. in a cheque on Paris—one must say buy or sell, because it is most unlikely that he would do both, for there is always a difference between buying and selling, therefore the quotation is generally twofold—for instance 25 frs. 20 c. to 25 frs. 25 c., meaning that the London banker would give the public an order on Paris for 25 frs. 20 c. for each sovereign he receives, or would give a sovereign for every 25 frs. 25 c. offered to him in the shape of a cheque on Paris.

He thus leaves a margin of profit of, $2\frac{1}{2}$ centimes in each pound, either in buying or selling, the actual exchange being 25 frs. $22\frac{1}{2}$ c. This margin of profit pays for the trouble and outlay involved in the transaction, which the banker in London and his agent in Paris have to carry out.

It is necessary to point out that these quotations constantly fluctuate for various reasons, the principal cause being the balance of trade between different countries ; let us cite an instance :

If operators in France sell in England goods or securities of a greater value than what English operators sell in France, the balance of trade is said to be against England; consequently the quotation in Paris for pounds sterling declines. There are, however, indirect influences on the exchanges between different countries; for example, England may owe money to the United States for wheat, cotton, or other commodities, while the United States may owe money to France for silk or wine. In that case the American merchant would probably send to France bills drawn on England against the goods which English merchants have bought from him. These bills being sold in Paris would tend to depress the quotation of pounds sterling in Paris, just as if England owed the money to France. We thus see that foreign exchanges play an important part in facilitating the settlement of debts due by one country to another, thus avoiding the cumbrous mode of paying international indebtedness by the transmission of specie.

Another cause of variation in foreign exchanges is the inequality of the value of money in different commercial centres; money, like water, finds its level, it flows, unless some obstacle intervenes, to those countries where a better rate exists, until it equalises those differences. Those obstacles are the question of credit, and of the dissimilarity in the respective currencies; where these things are equal, a difference in discount rates will attract or repel money from one country to another. For instance, when the Baring crisis occurred in November 1890, the Bank of England raised its rate of discount to 7 per cent., which rate was maintained for some time, and was higher than the value of money in other commercial centres. The effect was immediately apparent; all foreign merchants and bankers who had confidence in their London agents remitted money to obtain a higher rate of discount than what obtained in their respective countries. These remittances acted on the foreign exchanges, causing them to advance to the gold export point (see GOLD POINT OF EXCHANGE), necessitating the shipment of gold to London.

Another effect of high discount rates is the depression in the value of merchandise and securities, such as bonds and shares held on borrowed money. These are sent to markets abroad where money is cheaper, and naturally money is sent to London in payment of the goods and securities received. Another cause of fluctuations in foreign exchange is internal disturbance, either social or financial, creating alarm and inducing the transference of money from one country to another for safe custody.

We have seen at intervals in Paris that disturbances have caused the exchange on London to advance very rapidly in consequence of large sums being sent to London for safe keeping.

The season when English people migrate to the Continent is generally marked by a decline in the value of sovereigns abroad, and the exchange is then said to move against this country. The quotation of exchange between countries using gold as the chief circulating medium can however only fluctuate between well-defined limits called the export or import gold points. Thus the exchange on London cannot for any length of time fall below 25 frs. 10 c., nor rise above 25 frs. 40 c.; because in the former case gold would be sent from London to Paris to purchase pounds sterling, and in the latter case the reverse operation would take place, and gold would be sent from Paris to London. The difference of 30 c. or 3d. per sovereign covers the freight and insurance, also the mint charges involved in converting the gold of one country into that of the other.

There is, however, considerable difficulty at times in fixing the exchange between this country and another which has a silver or paper currency. Sometimes the variations are great and rapid; sometimes it is difficult to fix a close ratio between buyers and sellers of exchange on countries having a basis of circulation different from our own. Let us take the exchange between this country and India, which is the largest silver using country in the world. The exchange in London on India varies materially and suddenly. On some occasions there has been no reasonable quotation for bills on our great dependency, because of the uncertain value of silver. The rupee declined from the rate of 2s. $\frac{3}{4}$ d. in 1864, to the rate of 1s. 2 $\frac{1}{2}$ d. in August 1892, and subsequently even lower. These enormous fluctuations arose from the variations in the gold price of silver in this country, but the fluctuations in the exchanges between India and other silver-using countries has been very slight.

Thus the exchange between Shanghai and Calcutta has not varied as much during the past year (1891) as the quotation between London and Paris; in fact, the fluctuations between China and India seldom exceed $\frac{1}{2}$ per cent, which represents the cost of freight and insurance on transmitting silver between those countries.

The greatest variations, however, arise in the exchanges between this country and those where there has been a suspension of specie payments. The most notable instances are with Russia, Spain, and Portugal in Europe; and with Brazil, Chili, and Argentine in America. There is hardly a limit to the possible depreciation of a paper currency. We have noticed, with regard to Argentine, a premium on gold of 300 per cent, or a reduction in the value of paper to one-fourth of its former gold value.

All depends in these cases upon the quantity of paper money issued, relatively to demand and to the absorbing power of the country con-

cerned and upon the credit of the government which is responsible for the ultimate redemption of the paper currency. We know that almost every country has passed through this critical financial stage; even in this country, at the beginning of the 19th century, gold has been quoted at a premium of over 50 per cent, as against Bank of England notes. At such a time the foreign exchanges were greatly adverse to this country, and all gold was exported. Thirty years ago the United States had a similar experience of a forced paper currency with foreign exchanges all against that country, causing the exportation of gold and silver to pay for war stores. We thus see that foreign exchange acts like a barometer giving indications of the financial aspect in every country, acting as a warning when a financial storm is impending, counselling those who have too many engagements afloat to take in sail; while in fair weather it gives an assurance of smooth water ahead, administering a well-founded impetus to all who embark in legitimate enterprises.

[See Goschen, *Foreign Exchanges*.] s. m.

EXCHANGE, FOREIGN, practical working of. If it be sought to apply the theory of the foreign exchanges to practical ends, or to draw trustworthy conclusions from their fluctuations, the following axioms should be noted.

Firstly, the current rate of exchange is the price of a bill of exchange. It is not necessarily the ratio at which the money of one country exchanges for the money of another. At a time when *e.g.* a cheque on Berlin is to be bought at 20·40 marks to the £, it may be necessary to pay 20·20 for German gold coin (because it must be assumed that the seller has been at the expense of importing it); but 20·40 would be called the rate of exchange, not 20·20.

Secondly, the price of bills is governed by the ordinary laws of supply and demand. When they grow scarce they grow dear, when they become plentiful they become cheap. If they become very dear, the would-be purchasers look round to see whether there is anything else they can remit to better advantage—produce, let us say, or some particular stock exchange security, or one of the precious metals—and, as soon as they discover such an article, they cease buying bills, and the price stops rising; if they become very cheap, the would-be sellers consider whether it might not pay better to employ the money standing at their credit abroad in the purchase of something—gold, say, or a foreign bond—which is saleable at home, and immediately this becomes feasible they cease offering bills, and the price stops falling.

Thirdly, the rate of exchange at A for cheques on B must correspond, or tend to correspond, with the rate of exchange at B for cheques on A. Thus if cheques on B stand at 1 per cent discount at A, cheques on A must be at 1 per

cent premium at B; or in other words, if 99 units of A currency are equal in value for the time being to 100 units of B currency, then 101 units of B currency will approximately equal 100 units of A currency. For, suppose cheques on A stand at par in B, then if a banker at A pays 99 for 100 units on B, and sends it to his agent there with orders to buy and remit 100 units on A, it is evident that he will gain 1 unit on his outlay. It is also evident that such purchases would not only tend to reduce the margin, but would continue until it disappeared. Or again, notice what the London manager of the Anglo-Gallic Bank, to imagine a name, does, if, just as the exchange on this side relapses from 25·25 frs. per £ to 25·24, his Paris colleague telephones that as bills over there are rather scarce this morning the rate has improved a point to 25·26. "Then draw, say, £5000," he instantly replies; and forthwith proceeds to do the like himself. The result is as follows—

London pays £5000 (amount of the Paris draft), and receives £5000 (proceeds of its draft on Paris for fr.126,200 at 25·24).

Paris pays fr.126,200 (amount of the London draft), but receives fr.126,300, proceeds of its draft on London for £5000 at 25·26; showing without any outlay whatsoever, a gain of 100 francs. This is called arbitrage-business, and illustrates the manner in which the exchanges are actually regulated, for it is of course obvious that under the influence of such transactions the rates in Paris and London will very speedily be brought to a level.

Fourthly, as it is the custom of trade to give credit to the buyer who buys to sell again, most bills are drawn at a usance, varying from thirty days to six months, according to custom, and the usual exchange quotation applies to bills at usance. Between the exchange for a bill at sight and that for a bill at usance, the difference depends on the rate of interest prevailing in the place upon which it is drawn. The usance, for example, of bills on Italy is three months, and if interest in Italy rules at 4 per cent, a bill at usance should cost 1 per cent less than a bill at sight.

Fifthly, as the bills drawn on London from abroad vastly outnumber the bills drawn on abroad from London, the demand and supply of the former exercises a proportionately greater influence over the course of the exchange than that of the latter. In other words, the actual rise or fall takes place on the foreign market, and London in most instances merely adjusts its rates according to the quotations telegraphed from abroad.

Lastly, in those countries where the value of the currency oscillates in relation to gold, the exchange is subject to two sets of fluctuations—to fluctuations of limited extent caused by changes in the ratio of supply to demand, and

to fluctuations of almost unlimited extent caused by changes in the value of the currency-medium. Thus, if the normal exchange with a paper currency country be 48d. per \$ gold, or \$5 to £1, a rise in the gold premium, which is illimitable, from 200 per cent to 300 per cent would cause the exchange to move from 16d. per \$ paper, or \$15 per £, to 12d. per \$ paper, or \$20 per £.

G. C.

EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA. (The guilder converted in this statement as 12=£1.) To explain the working of the exchange between Holland and Dutch India, it is necessary to describe the different currency systems in force in the mother country and the dependency. To begin with that of Holland. At the commencement of this century the state of the currency in the Netherlands was very unsatisfactory. From early times silver had been the only standard of value, but an almost unexampled variety of silver coin was in circulation, owing to the fact that, during the existence of the Republic of the United Netherlands, nearly every province had a separate mint. Gold coin had also been struck, and was a medium of exchange at rates officially fixed by the government; but silver alone was legal tender until the year 1816, when (Act of 28th September) dual legal tender was introduced at the ratio of 15·87, between the then current silver guilder of 200 aas weighing 9·61 grammes fine, and the ten guilder piece weighing 6·056 grammes fine gold.

Gold being thus over-valued, as compared with the bimetallic ratio of 15½ adopted by France in 1803, all the full weight silver coins were driven out of the country, and gold coin, struck according to the law of 1816, together with all the worn and clipped silver coin of earlier date, formed the only circulating medium.

To remedy this state of affairs it was enacted in 1839 (Act of 22nd March) that the historical guilder of the weight of 9·61 grammes fine silver should be reduced to the weight of 9·45 gram fine, thus raising the ratio from 15·87 to 15·60; but the clipping of the old coin continued on a most scandalous scale, so that often a premium of 5 to 7½ per cent had to be paid for full weight pieces. A thoroughly efficient reform of the currency became indispensable, and a general recoinage of all the old silver money, struck before 1839, was accordingly ordered by the Act of 22nd May 1845.

Within a couple of years a nominal amount of 85 millions of guilders old silver (£7,083,000) was withdrawn from circulation and converted into new coin, at a cost of some 8 millions (£666,600), the operation itself being to a great extent facilitated by the still existing double standard, gold coin being available for the use of the public in adequate quantities. At the same time, the question whether the

double standard system could be continued, became a matter of ample discussion in the press, and after lengthened debates in parliament the law of 26th September 1847 was enacted, by which the monetary system of the Netherlands was based on the silver standard only, with the silver guilder of 10 grammes and $\frac{1}{1000}$ fine as the unit, all the gold coins in the hands of the public being withdrawn from circulation and demonetised.

This decision was taken at a moment when nothing yet had transpired about the Californian and Australian gold-fields. That only became known to the world a couple of years later; nothing, therefore, can be more erroneous than the assertion, often made, that the final adoption of the silver standard as basis of the monetary system of the Netherlands originated in the fear of a probable fall in the value of gold. The greater convenience of silver for domestic purposes was the principal motive for a reform which at that time perfectly answered the purpose.

The recoinage of the old silver coins being completed in 1849, a beginning was made in the following year by withdrawing the gold ten and five guilder pieces from circulation. Of these g.172 millions (£14,333,300) had been coined and delivered to the public, but scarcely one-third of that amount, say g.50 millions (£4,166,600) was presented for exchange against the state notes (*munbiljetten*). These notes were intended to be issued as a temporary medium of exchange only, but as the public became accustomed to them they proved so convenient that they still form a part of the currency of the country to a limited extent, 10 millions originally, and 15 millions at the present moment (£833,300, and £1,250,000).

All the gold coins received from the public were sold on government account at a loss of 1 million of guilders (£83,300), and altogether the reform of the currency, including the recoinage of the old silver money, and the demonetisation of the former gold coin, has been effected at a cost of about 10 millions (£833,300).

Since that date, 1847, the state of the currency became most satisfactory in every respect, and certainly no new reform would have been thought of if the monetary policy of the neighbouring countries had remained unaltered. But in 1872 the rulers of Germany deemed it advisable to introduce gold as the standard of the newly-constituted Empire, and it soon became evident that Holland could not remain indifferent to the intended reform of the German currency.

In October 1872, therefore, the Dutch government appointed a special commission to consider the subject and to advise as to the measures necessary in the interests of the country, and in December the commission re-

ported that it would be impossible for Holland to retain the silver standard established by the Act of November 1847, were all her neighbours to adopt gold as their standard of value. According to their views the most desirable solution of the question for Europe in general would be the adoption by the leading monetary powers of the double standard—admitting the free coinage of both gold and silver as legal tender at the same fixed ratio of value. They considered that a great stability of value for both metals would be the result of the compensatory action of that system, if introduced throughout the whole of Europe; that Holland alone would be powerless in the matter, and therefore that it would be indispensable for Holland to adopt the single gold standard should Germany decide upon that line of action, and that, in the meantime, without abrogating the law of 1847, the further coinage of silver on private accounts should at once be restricted or stopped altogether.

In conformity with the recommendation of the commission, the closing of the Utrecht mint for private coinage of silver was ordered by the law of 21st May 1873, and on Germany establishing the gold standard by the law of 9th July 1873, a bill was submitted to the states general, proposing the introduction of a legal tender currency of ten and five guilder pieces in gold, and the withdrawal from circulation of the silver standard coins issued under the currency regulations of 1847. The bill, however, was rejected; matters remained as they were until the middle of the year 1875, when, according to the law of 6th June, the mint was opened to the public for the coinage of ten guilder pieces of 6·048 grammes fine gold, to be legal tender concurrently with the silver guilder, the further coinage of which remained prohibited.

Thus the system of the *étalon boiteux* was introduced in the Netherlands, and, though it is of course open to the greatest objections, it must be acknowledged that, up to this moment, it has caused no serious inconvenience or mischief whatever. As a rule, the balance of trade is in favour of Holland, and bullion accordingly flows in freely. But occasionally the tide turns, as was the case in 1882, when a strong demand for export set in and the bank's stock of gold, which about the middle of 1880 had amounted to 80,000,000 of guilders (£6,666,600), decreased to below 5,000,000 (£416,600). The defect of the system then became evident. If once the gold stock of the country were exhausted, silver would become the regulator of the currency without any other limit to the depreciation of the currency and a corresponding rise in the foreign exchanges than the price of bar silver in the London market.

To protect the general interests of the country against the serious dangers eventually certain to result from such an unsettled state of affairs, a bill was passed (Act of 27th April

1884) empowering the government, as soon as the state of the currency should render it necessary, to withdraw from circulation, and to sell in the open market, silver coin to the amount of 25,000,000 of guilders (£2,083,300, at 12 gs. = £1) and to buy gold with the proceeds. Up to this moment, however (February 1893), there has never been any need to put this measure—which in the full sense of the term may be considered as the safety valve of the present currency system of Holland—into force. The law of 1884 is the unequivocal acknowledgment of the principle that the state is responsible for the maintenance of the gold value of the silver currency, and that it is one of the first duties of every government that has imposed a standard of value upon its subjects to take every reasonable precaution in its power to prevent that standard from fluctuating.

The currency system which has now been in force in Holland for about eighteen years, though defective in principle, has fully answered the requirements of the country, and it may remain unaltered for many years more unless it breaks down through the immense profit to be made by unscrupulous persons in manufacturing illicit coins of exactly the same weight and standard as the legal ones. But if this becomes the case, it will not only be Holland but nearly the whole continent that will have to face a difficulty of the greatest magnitude, the solution of which will make an international understanding with respect to money matters more urgent than ever.

Having thus described the system of currency in force in Holland, we will now turn to that of her Indian possessions.

In Dutch India the state of the currency was for many years even worse than it was in the mother country before the reform of 1847 was effected, and even the government itself was instrumental in wilfully perverting the currency of the colony.

The erroneous idea prevailed that the wants of the native population were on too limited a scale to require the precious metals for a general medium of exchange, and that it was in the interest of "the good people of these countries to increase the circulation of copper coin as much as possible" (*Decree of the Governor-General of Dutch India*, of 25th June 1818). Hence the government continued for years to effect the bulk of its payments in copper money, the so-called *doits* (*duiten*), which were imported in large quantities from Holland with the unavoidable result that all the good money formerly issued was driven out of the country. Silver was still the legal standard, and the silver guilder the unit of account, but virtually only copper remained as the general circulating medium for the whole community. A general depreciation of the currency was the natural consequence of this

state of affairs, a loss of 25 to 30 per cent having to be incurred on every remittance to Holland or elsewhere.

The colony suffered severely for many years under this miserable and scandalous condition of the currency. At last the government became aware that measures of a most stringent character ought to be taken to resettle currency matters on a satisfactory basis. By the law of 1st May 1854 the monetary system of the mother country, as regulated by the law of 1847, was introduced in Dutch India, and since that time nothing has been left undone by the authorities to secure the colony the benefit of a thoroughly efficient currency. For some consecutive years large shipments of silver coin from Holland to Java were made on government account, between 1854 and 1860, 90 millions of guilders (£7,500,000). Everywhere an opportunity was offered to exchange silver for the circulating copper money, and thus a long-wished-for reform was effected at a cost to the state of about 20 millions of guilders (£1,666,600).

Ever since that date the condition of the currency in Dutch India has been as satisfactory, nay as perfect, as in the mother country itself; even the recent silver crisis leaving it altogether unaffected in consequence of the measures taken by the government to keep the currency at the standard value by closing the Utrecht mint, not only for the home, but also for the colonial coinage. Having no mint of its own, Dutch India has always been supplied with the money required for circulation by specie imports from Holland, the standard coin being exactly identical, and the stock of silver legal tender money available in Holland has till now been more than sufficient to meet the requirements of the circulation of the colony.

Thus a very close link exists between the currency of Dutch India and that of Holland. At first it was thought that silver might remain the standard in the eastern possessions of the kingdom, whatever reform might be introduced in the monetary system of the mother country; but gradually the conviction prevailed that, equally with the people of Holland, the Indian subjects were entitled to protection from the difficulties in which the action of a depreciating currency must necessarily involve them, and to remove all uncertainty as to the standard of value in the colony the law of 28th March 1877 decided that gold ten guilder pieces should from that date be legal tender in Dutch India,—thus establishing the monetary system of the colony on exactly the same basis as in Holland.

Meanwhile no gold whatever is to be found in circulation in Dutch India; but the lack of gold has never caused any inconvenience, and is in fact of no consequence so long as the

circulating silver money fetches the full value of gold for payments in Holland. Recently Dutch India has repeatedly had to face an unfavourable balance of trade, making the export of specie unavoidable (Table A), but the

rate of exchange never exceeded the bullion point of gold (see GOLD POINT of exchange), since silver could always be used as a remittance to Holland in order to effect payments there, or to purchase sterling bills in Amsterdam for payments in England.

In consequence rates of exchange at Batavia—the financial centre of Dutch India—have maintained a most remarkable steadiness during the last twenty years, as shown in table B, see page 775, to explain which it may be added that the way of quoting the rate of bills drawn on Amsterdam is exactly the reverse of the quotations for sterling paper. For the latter the Dutch Indian currency is the fluctuating term, the quotation consisting of a varying number of guilders and cents to be paid for the pound sterling. In the exchange between Batavia and Amsterdam, on the other hand, the latter place gives the “uncertain” a quotation of 101, meaning that g. 100 Dutch Indian currency gives claim to g. 101 Netherlands currency. Thus it is obvious that a rise in the quotation of bills on Amsterdam must correspond to a decline in sterling quotations. [See EXCHANGE, FOREIGN, practical working of.]

During the last twenty years in drawing from Java the extreme rates for Dutch bills have been $99\frac{1}{2}$ and $104\frac{1}{2}$, and for English bills g. 12·125 and g. 11·375, thus showing a fluctuation of only $5\frac{1}{4}$ per cent for the former, and 6 per cent for the latter bills. Since 1875, when the great fall in the price of bar silver set in, rates have not fluctuated more than $2\frac{1}{2}$ or 3 per cent. Thus Dutch India has been spared the disturbance in money and exchange matters which is causing so much inconvenience and loss in British India.

[A good insight into the present working of the currency of Dutch India may be obtained from a note by Mr. A. Kensington, deputy secretary to the government of British India in the financial department, dated 21st September 1892, and published by order of the governor-general of India. The conclusion of Mr. Kensington's inquiry during his stay in Java, was that the nominal gold standard introduced into the colony works well as regards the trade and the people of the country, and that it has on the whole also proved beneficial to the planters. But the fact is not to be overlooked that the whole structure must collapse in case Holland is forced by circumstances to complete its monetary reform by the demonetisation of the silver actually circulating as full legal tender money. Then the colony would be obliged to follow, and it is therefore not at all impossible that at some future period even the Eastern Archipelago may appear in the market for the sale of silver, and the purchase of gold, unless it may still be practicable to arrive at an international understanding about the free coinage of silver as proposed originally in the report of the Dutch currency commission of 1872.]

N. P. v. d. B.

[Ratio of silver to gold in Holland, taking mint charges into account, 15·625 to 1.]

EXCHANGE BETWEEN GREAT BRITAIN AND BRITISH INDIA.—As these pages are passing through the press (June 1893), it has been made public that the government of British India has made an arrangement for its remittances between India and London, similar

in many respects to that in existence between Holland and the Dutch Indies (see EXCHANGE BETWEEN HOLLAND AND DUTCH INDIA). The rate at which council bills are to be issued in London is to be separated from the price of silver. In order to effect this, the coinage of rupees in India on private account is to be suspended, with a view to the introduction of a gold standard. The Indian government had been anxious that this step should be taken; but the home government desired that a thorough examination into the whole matter should be previously made. A departmental committee was accordingly appointed, consisting of Lord Herschell, the present lord chancellor, as chairman, the other members being Mr. Leonard Courtney, Sir Thomas, now Lord, Farrer, Sir Reginald Welby of the treasury, Mr. Arthur Godley of the India office, Sir Richard Strachey, and Mr. B. W. Currie, who is a member of the council of India and of the firm of Glyn and Co. The committee considered the proposals of the Indian government, which aimed at fixing the exchange at the rate of 1s. 6d. per rupee. This rate the committee did not feel inclined to adopt; the market rate being at the time (June 1893) approximating to 1s. 2d. for the rupee. The general conclusions of the committee, in their report to the secretary of state for India, Lord Kimberley, were that “while conscious of the gravity of the suggestion, we cannot, in view of the serious evils with which the government of India may at any time be confronted if matters are left as they are, advise your lordship to over-rule the proposal for the closing of the mints and the adoption of a gold standard, which that government, with their responsibility and deep interest in the success of the measures suggested, have submitted to you. But we consider that the following modification of these proposals are advisable:—The closing of the mints against the free coinage of silver should be accompanied by an announcement that though closed to the public, they will be used by the government for the coinage of rupees in exchange for gold, at a ratio to be then fixed, say 1s. 4d. per rupee; and that in the government treasuries gold will be received in satisfaction of public dues at the same ratio.” The Indian government acted immediately on this recommendation, and an act was passed in the council at Calcutta (June 1893) carrying the report of the committee into effect, and fixing the rate at 1s. 4d.

We are still too close to the events to judge what the ultimate results of this measure may be. The action of the government was immediately followed by a rise in the selling rate of India council bills in London from about 1s. 2d. to 1s. 4d. for the rupee, and by a rather more than corresponding fall in the market price of silver. Suggestions have been made

to bring the rate for council bills upwards to 1s. 6d., and ultimately to about 2s. for the rupee. It remains to be seen whether the Indian government will have sufficient control over the market for bills to enable it to carry this into effect. Nor can the influence on the coinage legislation of other countries—as for example on the United States of America—or on the rate of exchange in the trade with other silver-using countries be stated at present, or the effect which may be produced on the trade of British India, or on the condition of the people. One result, if the measure continues to operate, will be the formation of the largest “token” circulation of coins that has been known in modern times, as the rupee will circulate at the rate which the government fixes it at relatively to gold, irrespective of the gold price of uncoined silver; while for the present, at all events, there will be no gold coin to represent the rupee. A further result will be the entire separation of the rate for the bills on India from the market value of the ordinary circulation of the country. The council bills would, it was hoped, be issued at the rate fixed for the time by the Indian government. The arrangements, in so far as they are based on an authoritative rate fixed by a government for monetary transactions, and a fixed ratio between gold and silver are similar in some points to those on which bi-metallic systems have been founded; but while this is the case, the leading principle of bi-metallism, namely, the power of the subject to have his bar silver or bar gold coined into money and to be able to pay his debts with either metal so coined, is entirely absent. The success of the plan depends solely on the power which the Indian Council may be able to exert over the London market and if other and cheaper methods of remittance can be obtained this will fail. Meanwhile from the point of view of the Indian government the rate for exchange should be fixed as high as possible, as in the example of Dutch India, because of the advantage hence resulting in the remittances to England.

No reference has been made in this statement to the other points, many of great weight, connected with this question, such as the possibility of the private coinage—in the vast region of India, much of which is not under the control of our government—of spurious silver rupees equally valuable with those issued by authority, an operation which would be very profitable to the coiner—of the effect on the Indian cultivator of the soil, who will now be deprived of the resource which silver, in the form of ornaments, has been to him in time of famine—or of the result on the trade on other silver-using countries.

The measure, as it stands, was stated to be designed to prevent the rate from dropping lower, but it will have the effect of stereotyping

the loss entailed by the fall in exchange both on the government and on private individuals at the point at present fixed.

[See *Report of the Committee appointed to inquire into the Indian Currency, 1893.—Correspondence between the Government of India and the Secretary of State, 1893. Comp. Econ. Journal, Sept. 1893.*]

[Ratio of silver to gold in India, with rupee at 1s. 4d., taking mint charge into acct., 22·37 to 1.]

EXCHANGE, INTERNAL. One factor in the calculation of all exchanges is the cost of the transmission of bullion, including therein the cost of actual transport and the risk and trouble involved. In the foreign exchanges these charges are in a general way concealed by the fact that the two sides are in terms of different currencies; and they are modified by the competition of bills of exchange, according to the supply and demand of which will be the proportion of such charges which a remitter will have to bear. The same expenses attach to the settlement of transactions between different parts of the same country, but they are rendered more apparent by being expressed in the form of a commission or premium. They are also usually more uniform, as they are not affected by momentary competition, but are governed by the condition of the banking system, tending gradually to diminish in proportion to the completeness of its development.

In this country the facilities for internal exchange are considerable, and its cost has been brought to a low point. The post-office system of money orders, and of postal notes and orders, furnishes the means of remitting small sums to almost every village, at a cost that has continually decreased as the facilities offered have increased. In the first quarter of the present century remittances could only be made to a few towns, and at a cost of about $2\frac{1}{2}$ per cent. At the present time the number of points to, or from, which remittances may be made has risen to upwards of 10,000, whilst the cost may not much exceed one-half per cent. For larger sums remittances were formerly made by bankers' drafts, or bank post bills, the charges on which were defrayed partly by a direct commission, and partly by deferred payment. At the present time, by means of the country cheque clearing (see CLEARING SYSTEM), remittance may be made throughout the whole of England and Wales absolutely without cost, whilst for the collection of drafts other than cheques, and for all collections in Scotland and Ireland, the cost has been brought generally to about $\frac{1}{10}$ of 1 per cent. This result is greatly due to the spread of branch banking (see BANKS, UNITED KINGDOM).

In the United States the development of the national banking system (see BANKS, NATIONAL, U.S.A.) has led to remarkable results in the same direction. This system was established in 1865, at which time the cost of southern and western exchange on New York was from 1 to

$1\frac{1}{2}$ per cent, and even for different parts of the state of New York it was $\frac{1}{2}$ per cent. The difficulty of obtaining reliable remittances was even more serious than its cost, as the notes or drafts of banks in any state were frequently quite useless but a few miles beyond its borders. In 1890 the rates of commission or premium, on internal exchange, had so far declined that they ranged from 1 cent per \$100 ($\frac{1}{100}$ of 1 per cent) in some small states, as Rhode Island and New Hampshire, up to 21 cents per \$100 ($\frac{1}{5}$ of 1 per cent), in Nevada, Texas, and some other states.

In France the Bank of France, through its numerous branches, has long afforded considerable facilities for internal exchange, which have been added to in recent years by the still more numerous branches of one or two other banking institutions.

R. W. B.

EXCHANGE OF NOTES (in reference to the note circulation in Scotland). All the banks now (1893) carrying on business in Scotland are banks of issue. They are ten in number, and there is a stringent system maintained of exchange of notes once a day in every town in which there are two or more banks. In the case of a bank holding the notes of another bank not represented in its town, these are remitted to the issuing banks at short intervals. On Saturdays there is an afternoon as well as a morning exchange, so that the returns of circulation made at the close of business on Saturdays, as required by the terms of the Bank Act of 1845, exhibit the amount of notes then in active circulation, *i.e.* in the pockets and tills of the people. No bank ever issues the notes of any one of the other banks.

The notes are, by the system described above, "cleared" to a great extent independently of the ordinary settlement of drafts and bills between the banks. The system is a very convenient one, and saves the banks concerned a great deal of labour.

All clearing-house balances, other than those arising at the Edinburgh clearing-house, are settled by drafts on Edinburgh, which pass through the clearing-house there, and the balances of the Edinburgh clearing-house are settled bi-weekly by transfers of cash made in London four days later. Interest at 3 per cent is paid by the debtor banks on balances until the date of final settlement in London.

EXCHANGE BROKER. Unlike the bill-broker (see BILL-BROKING), who in most cases is really a dealer in bills, which he buys and sells for his own account, the exchange or *foreign bill* broker is strictly what the title of his calling implies, namely, an intermediary or negotiator between the buyers and sellers of bills of exchange drawn on foreign countries.

Such bills fall into two classes; those drawn from the provinces, and those drawn from, or held in, London. As regards the former, all

practically pass through the country banker into the hands of his London agent for negotiation, and, as the latter does not attend 'Change, they are, without exception, sold through brokers. In the case, however, of London-drawn paper, or of such as is remitted to London houses, the seller is quite at liberty, if he so chooses, to go on 'Change and save the brokerage by offering the bill for sale himself; but he usually finds it to his advantage to employ a skilled agent.

The exchange broker must be sufficiently familiar with foreign law and custom to be able to point out and explain any irregularity of form, stamp, or endorsement, etc., in the bills that pass through his hands. He ought also to be competent, besides knowing the present state of the exchange, to form an opinion as to its probable course, in order to advise his client, if need be, when best to buy or sell. He is also expected, when executing a buying order, to protect his client's interest by exercising a due regard to the financial and moral standing of the parties to the bill.

On concluding a bargain, the broker makes it legally binding by passing a contract note to both parties, giving particulars of the bill and specifying the rate at which it has been sold. In the buyer's copy he also fills in the name of the party who has to deliver, and in the seller's that of the party who has to receive and pay. Payment, it may be added, is not effected through the broker, as in stock exchange transactions, but the principals settle direct on the following day. The charge for brokerage is nominally one per mille (2s. per cent), but is subject to modification. Brokerage accounts are rendered once a year.

The growing tendency to effect settlements by bill on London, instead of by bills drawn from England on abroad, is strikingly illustrated by the fact that, notwithstanding the enormous increase in our foreign-trade in the last half-century, the number of exchange brokers has only risen, according to the Post-Office Directory, from 13 in 1841 to 16 in 1893, as against an increase during that period in the number of London stock brokers from 343 to upwards of 3000.

G. C.

EXCHANGER, ROYAL. The chief functions of the king's or royal exchanger were as follows: to buy bullion for coin save where private mints existed, to exchange current coin of one metal or denomination for that of others, and to exchange foreign and English coins.

In the reign of Henry I. we find this office and that of moneyer united and vested in one person. But this union did not continue. Succeeding kings separated the office of exchanger and developed its constitution. Thus Edward I. had tables of Exchange set up in various places, as York, Dover, Canterbury, etc. In addition to the other and more ordinary ser-

vices which he performed, the exchanger and his subordinates were entrusted with the important duty of so discharging his office that the export of precious metals from the country might be prevented. He continued a royal functionary and in discharge of his duties till the reign of Henry VIII. Then the complaints of the goldsmiths and the advice of Sir Thomas Gresham were listened to, and in 1539 the office of the royal exchanger was abrogated on the ground that its charges and action impeded traffic. Despite a nominal restoration in 1546, the previous date may be regarded as marking the termination of this restraint on the exchange. Statesmen and theorists were, however, very much divided as to the expediency of this action, and the protests against the extinction of the office proceed from well-known men, as for instance, Sir Robert Cotton.

Its reconstitution was mooted at the very beginning of the reign of Charles I. (in 1626). The goldsmiths were heard in opposition in the privy council, but did not prevail. On 25th May 1627 the revival of the exchanger was announced, and the king appointed "Henry, Earl of Holland, and his deputies, to have the office of our changes, exchanges, and out-changes, whatsoever, in England, Wales, and Ireland," for a period of thirty-one years. The goldsmiths petitioned, and the House of Commons protested against this reconstituted office. The Earl of Holland offering to submit his office to the judgment of the latter body, a debate took place, and it was agreed that it was a "grievance." No steps seem to have been taken to exercise any jurisdiction, and no attempt was made subsequently to revive this ancient office.

EXCHEQUER.

Exchequer, Early History of, p. 779; Exchequer, present constitution of, p. 781; Exchequer, Scotland, p. 784; Exchequer Bill, p. 784; Exchequer Bill, History of, p. 784; Exchequer Bond, p. 785; Exchequer Bond, History of, p. 785; Exchequer, Closing of, 1672, p. 786.

EXCHEQUER, EARLY HISTORY OF. The Exchequer, *i.e.* the department of government which superintended and managed the king's revenues, and into which all dues were paid, appears as an organised part of the state system in Norman times. In Early English times there seems to have been a treasury, sometimes at Winchester, sometimes at Westminster, while a hoard was kept in the king's chamber, and local treasuries were found in some provincial towns (Hall, *Antiquities of the Exchequer*, p. 3), but there are no traces of a court of account so early. Richard, Bishop of London, the treasurer, son of Bishop Nigel of Ely, and

our chief authority for the early history of the exchequer, writing in 1178 (Liebermann, p. 11), states that it dates from the Norman Conquest, the arrangement being taken from the exchequer across the seas (*Dialogus de Scaccario*, i. iv.). Though this fact of a Norman origin for the English exchequer cannot be proved, it is probable that both came into existence about the same time; even if entirely independent, the English exchequer is certainly not much older than the Norman; while on the other hand, some of its peculiarities, such as the "blanch farm," show that the system was not borrowed in its entirety from Normandy.

In Henry I.'s time it is found as a distinctly organised department and as a court of law under the name "scaccarium," a name derived from the chequered cloth which covered the table at which the accounts were made up. All the financial business of the crown was carried on at the exchequer, and as in early times the regulation of finance and the administration of justice were intimately connected, much judicial work fell for a while under its control, until, with the elaboration of the judicial system, new courts arose, and until its authority was restrained by Magna Carta, by the statute of Rutland (12 Edw. I.) and by other statutes, to cases which directly affected the revenue. This close connection between justice and finance is indicated by the fact that the officials who sat as *justitiiarii* in the curia regis, the supreme judicial court, sat also in the exchequer as *barones scaccarii*. These were the great officers of the household and others specially named by the king, presided over by the king or by his representative, the chief justiciar, until the final disappearance of that official in Henry III.'s reign, when the treasurer, always an important functionary, took the foremost place. The treasurer, who was assisted in the performance of his duties by the chamberlains, had indeed the superintendence of every department, and was responsible for the compilation of the great roll, the annual record of the crown dues, while he also gave directions for the execution of the royal writs. The chancellor, the representative of the equitable jurisdiction, acted as nominal guardian of the great seal, and also as a check upon the treasurer, whose roll was copied by one of the chancellor's clerks. The constable, with clerical assistance, made payments to the royal officers and others upon receipt of the king's writ, for without such a warrant the issue of money was strictly forbidden. To cut the tallies (see TALLY), used as receipts, a cutter of the tallies was employed. Under these more important dignitaries were a large body of officials, sitting in the lower chamber, who prepared the summonses and other business, and acted as fiscal experts. Some of these offices were held in fee, and mention is found of a woman hold-

ing office as chamberlain and acting by deputy (Hall, p. 82).

Full sessions of the exchequer were held at Easter and at Michaelmas, generally at Westminster, although instances of its session elsewhere are found as late as the reign of Edward II. (Madox, ii. p. 7). Other sessions were held during the Hilary and Trinity terms, and whenever it was deemed necessary, not excepting Sunday (Thomas, p. 7).

Manifold were the duties of the officials in connection with the revenue; not only did they receive payments from the sheriffs and others responsible for debts to the crown after careful examination of the accounts, but they also directed payments to be made to meet the royal requirements, and met administrative expenses of all kinds.

Business was carried on in two departments.

(1) The upper chamber, known as the exchequer of account (*scaccarium majus*), where the reports of the sheriffs and of others were received, and where all legal negotiations were carried on.

(2) The lower chamber or exchequer of receipt (*scaccarium inferius*) where the money was paid down, weighed, and tested, and from whence it was issued when necessary. The proceedings in the case of a sheriff, the most important of all accountants, may be taken as typical of the method adopted in transactions with the customers, escheators, bailiffs, and others responsible for the collection of the revenue.

At Easter the sheriff having received a summons and a statement of the items for which he had to account, appeared in person at the exchequer, unless excused for special reasons, when an attorney of suitable rank might act as his representative. The view of his account was then taken, and a proffer was made by him, being generally an instalment of half the total amount for which he was responsible. In return he received a receipt, known as a *tally*, the counterfoil of which was retained at the exchequer. When summoned to the Michaelmas session, the sheriff was required to answer for the full annual dues "in money or in tallies"; he then presented the tally or the voucher which represented such payments or allowances as might already have been made, together with the remainder still due in cash, and received full quitance of his obligations. A simple expedient for balancing the liabilities and the actual payments of the sheriff was devised by means of counters placed upon the squares of the chequered table, those on the one side of the table representing the value of the tallies, warrants, and specie presented by the sheriff, and those on the other the amount for which he was liable, so that it was easy at a glance to see whether the sheriff had met his obligations or not. In Tudor times "pen and ink dots" took the place of counters, and are found

in use for the last time in 1676 (Hall, *Antiquities of the Exchequer*, p. 131).

Depreciation of the coinage through wear and the possibility of fraud led in early times to the adoption of precautionary measures. Thus when money was paid by tale a payment of sixpence on every pound was added to make good any possible deficiency; this was found to be inadequate, and in place of such a payment *ad scalam*, a payment *per pensum* was demanded, by which any deficiency in the actual weight had to be made up, or a composition of one shilling in the pound was exacted. In some cases the coin was submitted to a smelting test; this was generally done with the farm of the county, which was said to be blanched or dealbated, when such a test or a composition in lieu of it had been accepted. A regular staff of officials was employed in the exchequer of receipt to see that *real combustion*, i.e. the actual testing of bullion, or *nominal combustion*, i.e. the additional payment offered as a substitute, was not evaded by the king's debtors (see ASSAY).

Among the important records bearing on the work of this department, and carefully guarded by successive generations of officials, in hamper and chests, were the Domesday book, the most ancient record of the liabilities of crown tenants, the Red and Black Books of the exchequer, and other similar compilations; the most important for centuries was the great roll of the exchequer, commonly known as the Pipe Roll or *Rotulus Annalis*, the official register of all debts due to the crown arranged under the heads of counties, drawn up annually under the superintendence of the treasurer, and which served as the supreme authority by which the sheriffs and other accountants were judged. The first of these rolls still extant is that for 31 Henry I. (1130), but from the second year of Henry II. the series is complete. A duplicate of this roll was prepared for the chancellor, who closely checked any error on the part of the treasurer, while at the date of the compilation of the dialogus a third roll was transcribed for the king (*Dialogus*, I. vi.). In later times with the expansion of royal revenue a number of other rolls dealing with special parts of it became necessary (Thomas, *Ancient Exchequer*, p. 68). As attendance on the king and their duties in the various courts prevented the great officials from regular attendance at the exchequer, and as the sources from which the revenue was derived changed, various new officers were appointed to meet the demands in different directions. Thus as the chancellor and his subordinates became engrossed by the business of the chancery, their places were taken by the comptroller of the pipe and the chancellor of the exchequer (Thomas, p. 100), the latter official being often mentioned from the reign of Henry III. onwards, when the remembrancer

is also first heard of, keeping the memoranda roll, upon which were entered points left for consideration until the close of the audit, and acting in the capacity of solicitor to the treasury (see PIPE ROLLS). Towards the end of Elizabeth's reign the number of officials reached its highest point, and it is also noticeable as the time when the lord high treasurer, as he was now called, began to act less frequently in person at the exchequer and more by means of written instructions, and this gradually led to a new system for the conduct of business (Thomas, p. 21). Upon the death of the Earl of Salisbury in 1612 the treasury was for the first time put in commission, and since verbal orders could not be accepted at the exchequer from several persons, written instructions became a necessity, and led to the use of treasury warrants, which again paved the way for the modern department of the treasury. There is evidence that the lord high treasurer still acted in person until the removal of the exchequer to Oxford in 1643. Finance under the commonwealth was managed by committees of revenue until Cromwell revived the exchequer in 1654, and put the treasury in commission, which has been its normal condition since that time. During the Great Fire of 1666 the exchequer was moved for a while to Non-such (Hall, 76). In the course of George III.'s reign many of the old offices were gradually swept away, until in 1833 the ancient account and receipt departments of the exchequer were entirely abolished (3 & 4 Will. IV. c. 99; and 4 Will. IV. c. 15), the office of queen's remembrancer being the sole relic to-day of the early system, for the work of the exchequer is now undertaken by the modern departments of the paymaster-general and the treasury, while the Bank of England has taken the place of the old exchequer of receipt. See BUDGET; EXCHEQUER, PRESENT CONSTITUTION OF; JEWS, ECONOMIC INFLUENCE OF (for exchequer of the Jews); PIPE ROLLS; TALLY; TREASURY.

EXCHEQUER, PRESENT CONSTITUTION OF. The Exchequer is the national purse or re-

ceptacle into which (a) all the public revenues are paid, and out of which (b) all public expenditure is defrayed. The moneys paid into the exchequer constitute in the aggregate the consolidated fund of the United Kingdom (see CONSOLIDATED FUND), of which the local situation or receptacle is in practice at the Banks of England and Ireland, where all such moneys are carried to a general account, operated upon by the commissioners of the treasury, and known as the "Consolidated Fund Account," or Exchequer Account.

a. The following is the machinery by which the exchequer is supplied, viz.:

In the fiscal system of the United Kingdom the financial year does not coincide with the calendar year, but is reckoned from the 1st of April to the 31st of March. Towards the close of one financial year or beginning of the next—that is to say, in the month of March or April—the chancellor of the exchequer lays before the House of Commons his budget (see BUDGET), which is a statement of the revenue and expenditure of the outgoing, and the estimated revenue and expenditure of the incoming, year. He first estimates the revenue of the incoming year on the assumption that the existing scheme of taxation will be continued unaltered by parliament. If he considers that on this basis the revenue of the year will exceed the expenditure, he generally proposes to abolish or reduce certain taxes; if the contrary, to raise, increase, or extend them. It is not necessary that the scheme of the chancellor of the exchequer, so far as the revenue which he anticipates is founded upon the existing basis of taxation, should be sanctioned as a whole by parliament; for, in the absence of an enactment to the contrary, all taxes and imposts go on from year to year without express legislative renewal, except the tea-duty and the income-tax. If, therefore, the House of Commons approves of the budget proposals, all that is necessary, in the first instance, is that it should, by resolutions passed in committee of ways and means, sanction the levy of tea-duty and income-tax during the financial year, at the old rates, or at new rates proposed by the chancellor of the exchequer, as the case may be; and that it should also sanction by similar resolutions any changes which he proposes in other duties or taxes. These resolutions are subsequently confirmed, as soon as the exigencies of parliamentary business will allow, by acts of parliament. For example, see the customs and inland revenue act of 1892, 55 & 56 Vict. cap. 16. At this stage the arrangements for supplying the exchequer with the necessary revenue during the financial year are formally complete. The commissioners of customs and of inland revenue, acting under the directions of the commissioners of the treasury, levy the duties and taxes prescribed by statute; the post office continues from

year to year its profitable labours; and the moneys derived from these several sources are, together with the hereditary revenues of the crown, and certain other miscellaneous items, paid in by their collectors as they accrue to the exchequer account at the Banks of England and Ireland.

b. Such is the manner in which the exchequer is filled. It is now necessary to explain the procedure by which its treasures are disbursed. From the foregoing account it will be seen that the levying of the national revenue is completely under the control of parliament. The control of parliament over the national expenditure—or, in other words, over the disbursements of the exchequer—is no less, in fact if anything it is more complete. The expenditure of any given year is divided into two classes. 1. The first consists of charges, more or less permanent in their nature, which are authorised by act of parliament either for a given period or until the act authorising them has been repealed. These charges therefore do not form the subject of an annual vote of parliament, but are paid as they fall due under the authority of the act which grants them. They are called fixed charges on the CONSOLIDATED FUND (*q. v.*), and comprise the interest, sinking fund, and cost of management of the public debt; the civil list, or dotation of the crown; the allowances to members of the royal family; certain pensions granted for public services; the salaries of the judges; and of certain high officers whose independence is thought to be better guaranteed by permanent grant than by annual vote. It appears from the finance accounts of the United Kingdom for 1891-92 that the sums issued from the exchequer on account of fixed charges on the consolidated fund amounted in that year to £29,009,499, or rather less than one-third of the total expenditure of the state for the year. 2. The ordinary charges of the military, naval, and civil government, as well as the cost of collecting the revenue, form the second class of the public expenditure. They are annually granted by parliament, and as they are in the first instance voted by the House of Commons in committee of supply, they are called the supply services (see SUPPLY, PARLIAMENTARY). The amount issued from the exchequer in 1891-92 on account of expenditure on the supply services is returned at £60,918,273, being rather more than two-thirds of the total expenditure of the year.

Money to defray a fixed charge on the consolidated fund is taken out of the exchequer under the authority of the special act of parliament which fixes the charges. The following is the machinery by which money for supply services is obtained.

The government submits to the House of Commons estimates of the sums which it requires, under the several heads or denomina-

tions of service, known as votes (as the House of Commons votes them). Each of these votes is discussed at such length as the House thinks proper, and any item in a vote can be rejected, but the House cannot add a penny to a vote, it being a constitutional maxim that expenditure can only be voted on the recommendation of the crown. Nor has the House of Lords any share in the matter. It is a co-ordinate branch of the legislature; but the privilege of voting the money of the subject is exclusively reserved to the representative chamber.

Suppose now that the House of Commons has voted the proposed expenditure. This alone would not enable the government to act; for, although the exchequer is being daily filled with the produce of taxes, it cannot be availed of without further parliamentary authority for defraying the expenditure which the House of Commons has sanctioned.

The House of Commons alone criticises and sanctions the proposed expenditure, but the doors of the exchequer cannot be unlocked without the authority of an act of parliament. Accordingly, acts are passed from time to time, each parliamentary session, authorising certain sums to be taken out of the exchequer to defray expenditure sanctioned up to date. These acts are often referred to as "ways and means acts." Their parliamentary title is "consolidated fund acts," and the language in which they are couched is instructive, as summarising the procedure of parliamentary supply, viz.:—"Most Gracious Sovereign.—We, your Majesty's most dutiful and loyal subjects, the Commons of the United Kingdom of Great Britain and Ireland, in Parliament assembled, towards making good the supply which we have cheerfully granted to your Majesty in this Session of Parliament, have resolved to grant unto your Majesty the sums hereinafter mentioned, and do therefore most humbly beseech your Majesty that it may be enacted, and be it enacted by the Queen's Most Excellent Majesty, etc., etc." (Then follow, after the usual preamble of an act of parliament, provisions authorising the treasury to issue certain sums out of the exchequer.) Thus the House of Commons *grants* the money; but the three estates of the realm conjointly authorise, by statute, the taking of money out of the exchequer. In the parliamentary session of 1892 three such Consolidated Fund Acts were passed (55 Vict. c. 3; 55 & 56 Vict. c. 20; 55 & 56 Vict. c. 33). The last of these acts passed each session is called the "Appropriation Act"; it sets out in detail all the votes which the House of Commons has sanctioned in supply, and applies to them, and to them only, the required sums of money out of the exchequer, thus strengthening parliamentary control over administration by making it illegal for the executive to expend upon one service

money which has been voted for another. This practice of *appropriating the supplies*, as it is called, dates from the Revolution of 1688.

Thus it will be seen that the control of parliament over the exchequer is complete. A fixed charge on the consolidated fund can only be paid on the authority of a special act of parliament, and a supply service can only be paid after it has been voted by the House of Commons in committee of supply, and after the disbursement of the necessary funds has been authorised by a consolidated fund act or ways and means act. But it may be asked what practical security is there that these conditions are observed and that ministers do not take money from the exchequer for purposes which parliament has not approved? The answer is that money is only issued out of the exchequer with the permission of an independent officer, over whom the executive government has no control, who guards the exchequer on behalf of parliament. This officer, styled the comptroller of the exchequer and auditor-general, only obeys the directions of the treasury to make an issue out of the exchequer when he has satisfied himself that the demand is for a service authorised by parliament. It may next be asked how does parliament provide against ministers obtaining money from the exchequer for a purpose which parliament has authorised, but spending it upon some other purpose? This danger is guarded against by the fact that every department to which public money is issued is obliged, under the Exchequer and Audit Act (29 & 30 Vict. c. 39), to render an account of the disposal of such money to the officer above mentioned, the comptroller of the exchequer, etc.

It will here be proper to say a word as to the difference between the "committee of supply" and "committee of ways and means" in relation to public finance. In committee of supply the House of Commons determine how much money government shall be allowed to spend; in committee of ways and means it considers where the money thus authorised to spend is to come from. "The committee of supply considers what specific grants of money shall be voted as supplies demanded by the crown for the service of the current year, and explained by the estimates and accounts prepared by the executive government, and referred by the House to the committee. The committee of ways and means determines in what manner the necessary funds shall be raised to meet the grants which are voted by the committee of supply, and which are otherwise required for the public service. The former committee controls the public expenditure, the latter provides the public income. The one authorises the payment of money, the other sanctions the imposition of taxes and the application of public

revenue not otherwise applicable to the service of the year" (May's *Parliamentary Practice*, p. 616, ed. 1879).

The grants which have been described are made by parliament to the crown, and the sovereign, by royal order, places them at the disposal of her finance department, the treasury. The treasury from time to time, as money is wanted, calls upon the comptroller of the exchequer to issue out of the exchequer the sums required, and the money so issued is paid to the account of the paymaster-general, who holds it at the disposal of the departments, subject to the control of the treasury.

Careful distinction must be drawn between the exchequer and the treasury. The exchequer is the national purse, the treasury is the finance department of the state, which controls the exchequer, on behalf of the executive government, subject to the check and audit of the comptroller and auditor-general acting on behalf of parliament. The treasury is governed by a board of commissioners, of whom the chancellor of the exchequer is one. The treasury, through the chancellor of the exchequer, moves parliament at the commencement of the financial year to provide the means of carrying on the government. It is to the account of the treasury, the exchequer account, that all public moneys are paid into the banks of England and Ireland, and it is the treasury again which, when the supplies granted to the crown by parliament have been placed by the sovereign at the disposal of her finance department, the treasury, supervises and controls the expenditure of such supplies throughout every branch of the public service. The duties of the treasury, as the department responsible for the administration of the exchequer, are thus summarised by Mr. H. D. Traill in his *Central Government* (English Citizen Series, 1881), viz. :—

1. To provide the means of meeting the necessary yearly expenditure on the military, naval, and civil services of the nation.

2. To exercise a general control and supervision over the amount and details of that expenditure.

3. To revise and regulate the internal or domestic expenditure of the other public offices of the state, and generally to exercise such a superintendent authority over the financial management of such offices as is implied in these revisory and regulative powers.

4. To decide upon appeals from its own subordinate departments in all cases arising out of the receipt of revenue, and

5. To determine as to the remission of fines and forfeitures due to the crown.

The board of treasury consists of five commissioners, namely: the first commissioner or first lord of the treasury, an office which is generally held by the prime minister; the

chancellor of the exchequer; and three other commissioners, known as junior lords of the treasury. The financial powers of the treasury are in effect centred in the chancellor of the exchequer, who may therefore be described as the finance minister of the United Kingdom.

EXCHEQUER (SCOTLAND); originally a department or committee of the Scottish parliament, by the Treaty of Union, Art. 19, this court was to continue until a new revenue court should be established in Scotland. By 6 Anne c. 26, a new exchequer court was established in Scotland on the English model, the judges being the lord high treasurer of Great Britain, the lord chief baron, and four barons of exchequer. It was an attempt to establish a common judiciary for England and Scotland, and all members of the English or Scottish bars were entitled to plead before it, and the privileges of senators of the Scottish college of justice were conferred on the barons. It had exclusive jurisdiction over customs, excise, and other revenues of the crown, and all honours and estates accruing to the crown, and the gift of the office of tutor dative, or guardian appointed by the court. English forms of procedure were to be used. Other powers were the passing of sheriffs' accounts, superintending the administration of the sovereign's feudal superiorities, dues, and fines of crown vassals, etc. By 3 Will. IV. c. 13, all powers of this court bearing on revenue were transferred to commissioners of the treasury in London, but its legal jurisdiction was preserved. Other statutes modified and altered the court. Finally by the court of exchequer, Art. 1856 (19 & 20 Vict. c. 56) it was abolished as a separate court and all its former jurisdiction was transferred to the court of session, becoming the revenue department of that court. The English forms and terms were assimilated to those of the court of session, and one of the lords ordinary to be named by the crown was to act in exchequer causes.

[Clerk and Scrope's *Historical View of the Court of Exchequer in Scotland*; and Mackay's *Practice*, vol. i. 43, 192.]

J. W. B. I.

EXCHEQUER BILL. This is one of the securities on which the British exchequer customarily raises money for temporary purposes. The bills are usually dated March or September, occasionally June, and bear a specific rate of interest never known to exceed $5\frac{1}{2}$ per cent, or to fall below 2 per cent. The bills do not specify the date of redemption, but bear a sheet of coupons, payable half-yearly at the specified rate of interest. The rate of interest is variable from year to year, and if the holders of exchequer bills are not satisfied with the rate advertised by the exchequer, they have their remedy in the way of payment of exchequer bills instead of cash for customs, excise, or other duties due to the Government—

that is, supposing the bill is paid in during the latter part of any year from the original date; otherwise the holder has the option of renewing the bill, and often does so, supposing the interest to be satisfactory.

A. E.

EXCHEQUER BILL, HISTORY OF. Exchequer bills are a form of security on which the government, under the authority of parliament, may borrow money for the service of the state. They have been in use since the year 1696, and had their origin in the scarcity of the circulating medium during the great recoinage at that time. Their invention as a substitute for "money" is attributed to Charles Montague, the chancellor of the exchequer in William the Third's reign, and may be said to have been the first introduction of a paper currency organised by the state.

The first exchequer bills were issued under the authority of 7 Will. III. c. 31, and were to "pass in payments from any person or persons to any other person or persons that shall be willing to accept and take the same." They were made out in sums as low as £5 and £10, and were to bear a daily interest not exceeding 3d. per cent per diem. The object of the inventor of these bills, however, was not realised. They were received with so little favour that, out of £1,500,000 authorised to be issued, only about £160,000 got into circulation; an amount too limited to give any relief to the monetary difficulties of the time. In 1697, under Acts 8 & 9 Will. III. c. 8 and c. 20, their use was considerably extended by making them pass in payment of all taxes, duties, etc., and "in all payments at the exchequer due to the king." Originally exchequer bills were, like the ordinary loans at the exchequer, charged upon the produce of certain specified duties imposed or renewed by the act authorising the issue of the bills. As, however, it frequently happened that the duties so appropriated proved insufficient to pay off the loans raised thereon, it subsequently became the practice to make the bills payable out of the general supplies granted by parliament year by year. This practice did not extend to the bills charged on the annual malt duty and land-tax, which duties continued to be specially appropriated, although they often were deficient and had to be made good out of the supplies of the following year. In 1763-64 exchequer bills entirely superseded the old form of loans at the exchequer, and for a period of ninety years, *i.e.* until 1853, continued with one or two exceptions to be the only form of temporary security on which money was borrowed either to meet the ordinary service grants of parliament or for loans granted for purposes of a local character. Amongst the latter may be mentioned the building of churches, public works, poor relief, Irish tithes, Shannon navigation, relief of West India proprietors, etc. The

largest amount of exchequer bills issued in any one year was in 1813, when it reached the total of over £54,000,000. The amount of exchequer bills in circulation has at various times been reduced by a process called "funding," *i.e.* by the creation of "funded debt" in lieu thereof. The usual course was to offer government stock to the public at a given price to be subscribed for either in exchequer bills, or money, or both. The bills so subscribed were cancelled, and the money subscribed was applied in paying off other exchequer bills on their maturity. In cases where the bills required to be funded have been held entirely by the Bank of England or by the national debt commissioners, the exchange of bills for stock has been effected by arrangement, but always under statutory authority. The first instance of funding was in 1709, when exchequer bills with the accrued interest thereon, together amounting to £1,775,000, were funded. Until 1797 there were only two further fundings, *viz.* £2,000,000 in 1717 and £986,800 in 1746. From 1797 to 1858, when the last "funding" of exchequer bills took place, no less a sum than £143,000,000 was cancelled by the creation of funded debt, of which about £105,000,000 was cancelled during the period of twenty-five years, from 1797 to 1821 inclusive. The largest amount of exchequer bills funded at one time was £27,262,000 in 1818-19. In 1861, under the provisions of Act 24 Vict. c. 5, exchequer bills ceased to be issued annually and to bear a daily rate of interest. The issue of exchequer bills at the present time is regulated by the Act 29 Vict. c. 25. They are of the nominal value of £100, £200, £500, or £1000, and are current for a period of five years, but they may be sent in for payment, after due notice, at the expiration of each twelve months from the date of the bills during their legal currency, and may be paid in for customs or inland revenue duties at any time in the last six months of each year of their currency. The rate of interest is fixed and advertised by the Treasury every half-year, and varies with the rate of interest prevailing in the money market at the time. The bills are prepared and issued by the Bank of England who receive an allowance for the management of the same. There has been no new issue of exchequer bills, beyond the periodical renewals, since 1861. They have been gradually superseded by EXCHEQUER BONDS and TREASURY BILLS (*q.v.*).

The amount of exchequer bills outstanding on the 31st March 1892, as shown by the finance accounts of the United Kingdom for 1891-92, was £3,588,400, of which £1,492,700 were June bills and £2,065,700 March bills, so called on account of the date of their issue. G. H. H.

EXCHEQUER BOND. Unlike exchequer bills, these securities run for a specific period, say, two or three years from the date of issue. The bonds bear coupons, but may be registered

or inscribed in the books of the Bank of England, in which case no coupons would be available, and the half-yearly interest would have to be applied for personally. A. E.

EXCHEQUER BOND, HISTORY OF.—These are securities on which money may be borrowed by the government under the authority of parliament. They are regulated by the Exchequer Bills and Bonds Act (29 Vict. c. 25), but they differ from exchequer bills by being issued for fixed periods, generally for one to three years, and bearing a fixed rate of interest. In the absence of any special provision in an act authorising money to be raised by this security, the principal of exchequer bonds is repayable by votes of parliament. Formerly, when bonds had matured, and it was found necessary to replace them by new bonds, special statutory authority had to be obtained in each case. It is usual now to take power in the act authorising the issue of bonds to replace them on maturity by new bonds or other securities. Exchequer bonds may, under treasury warrant, be delivered up to be registered or inscribed in the books of the Bank of England, and transferable certificates issued in lieu thereof. This class of security has generally been made use of for special services only.

Exchequer bonds were first introduced in 1853 by Mr. Gladstone, in connection with his scheme for redeeming or commuting certain three per cent stocks and South Sea annuities. Under 16 Vict. c. 23, holders of these stocks were offered, as one alternative, the option of taking exchequer bonds in exchange for their stock. The bonds were to be payable to bearer, so as to be readily transferable; to bear interest at $2\frac{3}{4}$ per cent per annum payable half-yearly until 1864, and thenceforward at $2\frac{1}{2}$ per cent per annum until 1894. They were to be offered for sale, the proceeds to be applied in paying off dissentient holders of stock, and they could be issued in exchange for and in cancellation of exchequer bills; only £418,300, however, were issued, of which £408,900 were in cancellation of exchequer bills. Subsequent acts made these bonds repayable out of moneys voted by parliament, and until such time interest would continue to be paid at $2\frac{3}{4}$ per cent. Power was also taken to replace them in 1894 by new bonds, to be issued for any term not exceeding six years. There was an issue in 1854-55 of £6,000,000, for periods not exceeding six years, to defray expenses connected with the Russo-Turkish and South African wars. Between 1874-75 and 1879-80 £7,750,000 was borrowed from the National Debt Commissioners on exchequer bonds with three years' currency, for the purpose of granting loans to local authorities for public works. By 41 & 45 Vict. c. 55 they were converted into permanent funded debt. In 1876, under 39 Vict. c. 1, £4,000,000 was borrowed on

exchequer bonds, also from the National Debt Commissioners, for the purchase of 176,602 shares in the Suez Canal Company, and repayable at any time not later than 1912. An advance of £400,000 in 1885-86 to the government of the Cape of Good Hope for the construction of a railway was provided by the issue of exchequer bonds repayable by moneys voted by parliament. The colony repaid the advance in 1890, and the bonds were paid off as provided. The interest on the bonds was paid by the colony. Under the National Debt Redemption Act 1889 (52 Vict. c. 4) bonds to the amount of £18,100,000 were issued to pay off holders of three per cent stocks who had dissented from Mr. Goschen's conversion scheme of 1888. Of this amount, bonds for £12,800,000, which were held by the national debt commissioners, were, by the National Debt (Conversion of Exchequer Bonds) Act 1892, converted into permanent funded debt. A small issue was made in 1892 for money borrowed under the Naval Defence Act of 1889 (52 Vict. c. 8). The total amount of exchequer bonds now outstanding is about £6,500,000. G. H. H.

EXCHEQUER, CLOSING OF THE (1672). The only part of the public debt which was incurred before the revolution of 1688 originated in the closing of the exchequer on 2nd January 1672-73. Maladministration of the finances, the sale of Dunkirk, and the disastrous close of the first Dutch war, undermined the credit of Charles II., which had been good for some years following the restoration. In 1666 the Commons proposed to appoint commissioners to examine the accounts of those through whose hands the money granted for the war had passed. The bill was delayed in the Lords till the prorogation. Commissioners were appointed two years later, and in consequence of their report the treasurer of the navy was expelled the House of Commons. It was therefore impossible to apply to the Commons for further supplies to execute the secret treaty with Louis XIV. which Charles signed at Dover in May 1670. In the emergency it was suggested that the sum of £1,328,526, the total amount borrowed from the bankers and others on the security of the supplies, should be appropriated with a view to overcoming the financial difficulties of entering on the Dutch war. In 1667 Charles had published a declaration to secure inviolably the course of payments at the exchequer, both with regard to principal and interest. But, on 2nd January 1672-73, he issued a proclamation to the effect that all payments upon assignments at the exchequer would be suspended for one year. The consternation in the city was great; the bankers were unable to meet their engagements, and many people were ruined. To quiet the public mind, the king promised to pay 6 per cent while the money was detained, and in

1676 letters patent were issued, charging the king's hereditary revenue with the interest, which amounted to rather more than £79,000 per annum. This engagement was regularly kept until the year before Charles's death, when payment was stopped. The creditors tried for twelve years, without success, to get legal redress, until, in 1697, judgment was given against the government. Somers, the chancellor, afterwards set aside this decision, notwithstanding the fact that ten out of the twelve judges were opposed to him. The chancellor's decree was afterwards reversed by the House of Lords, and in 1699 it was enacted that after 25th December 1701 the hereditary excise should be charged with the interest of the principal sum, at 3 per cent, redeemable on payment of £664,263, or half the principal. The principal was never repaid, and in 1716 it was incorporated with other public debts in the general fund which was then established. It may therefore still be regarded as part of the national debt.

[Grellier, *History of the National Debt*, p. 12 seq.—Hamilton, *Inquiry concerning . . . the National Debt*, p. 66; *State Trials*, xiv. pp. 1-114.—Hewins, "Origin and Growth of the National Debt," *Co-operative Annual for 1889*, p. 228, 229.—Thorold Rogers, *The first nine years of the Bank of England*, 8vo, 1887.—Defoe, *Complete English Tradesman*, 3rd ed. i. 164, 188, 346, 347, ii. 94. There are several pamphlets dealing with the subject; amongst these may be mentioned, *The Joyful News of Opening the Exchequer to the Goldsmiths* (in a letter by the Author of the *Bankers' Case*, Thos. Twine), 1677.—*The Case of the Bankers and their Creditors, by a true Lover of his King*, 1674.—*Considerations on the Goldsmiths' Letters Patent*, 1678. "His Majesty's (Chas. II.) patent to the goldsmiths for payment and satisfaction of their debt," 1677 (patent granted to Sir Robert Vyner for £416,724, and to eleven other "persons hereafter named" for sums ranging from £295,994 down to £1784, the interest at 6 per cent to be paid by the quarter).] W. A. S. H.

EXCISE, THE, is the name given collectively to those duties which in the fiscal system of the United Kingdom are levied upon commodities produced within the kingdom itself, as distinguished from customs duties (see CUSTOMS) which are levied at the ports upon commodities imported from abroad. The word *excise* (Latin, *excido*) signifies etymologically *something cut off*; as an excise duty may in effect be considered something cut off or deducted, for the benefit of the state, from the price of the article as paid by the consumer. If there were no duty the consumer would pay a lower price for the article. The price, therefore, that he actually pays includes the duty; whence it follows that the duty itself is something deducted or subtracted from the actual price paid. The price in fact is divided into two parts, one part being

subtracted from the whole for the benefit of the state, and the remainder going to the vendor.

Duties of this character, whether levied on articles produced at home or imported from abroad, were at first equally known as excise duties, but in revenue parlance the word has long been restricted to duties on native commodities, those on foreign articles being known as the customs.

An excise duty properly so-called belongs to the category of indirect taxes, because though levied on the producer, its burden really falls on the consumer. It is, however, the practice to classify under the general head of excise the railway duty on passengers, a direct tax; of which the real as well as the apparent incidence generally falls on the railway companies; and a large group of *assessed taxes*, being license duties paid to the state in return for permission to practise or follow certain sports, trades, or occupations; e.g. the dog, game, and gun licenses and the licenses on brewers, auctioneers, and pawnbrokers. For a considerable period previous to their introduction into England excise duties formed part of the fiscal system of Holland. They were first imposed in this country in 1643 by the Long Parliament in order to raise funds for the war against King Charles the First. The principal articles first subjected to the duty were ale and beer, cider, perry, and strong waters, to which was soon afterwards added a long list of articles of food and clothing, e.g. flesh, victuals, and salt, alum, copperas, hats, saffron, starch, and all manner of silks and stuffs. The prime necessities of life—flesh and salt—were subsequently struck out of the list, but, nevertheless, the general tendency from the Restoration (1660) to the administration of Sir Robert Walpole was rather to extend than to restrict the operation of these imports.

Walpole, to whom the material progress of England is so deeply indebted, applied himself from the first to fiscal reform. His biographer, Archdeacon Coxe, boasts of him that "he found our tariff the worst in the world and left it the best." By economical administration and the maintenance of a strictly pacific policy in foreign affairs, he enabled himself to help forward the growing prosperity of the country by a substantial alleviation of the burden of taxation. One of the main objects to which he set himself was to make the exportation of our manufactures, and the importation of the principal articles used in them, as free as possible. The reforms which with this view he carried out belong rather to the history of customs than of excise; but in the department of excise proper his beneficent activity made itself felt in the abolition of some duties, the reduction of others, and the simplification of many more. The most famous and the greatest of all his schemes, though it ended in failure, was the bill for warehousing wine and tobacco,

generally known as the *Excise Scheme*, which occupies so important a place in our fiscal and parliamentary history that it deserves a separate notice (see EXCISE SCHEME).

The history of the excise since the administration of Walpole cannot here be written *in extenso*. It contains few features of salient interest, nor does it record any convulsion such as that which was excited by his unlucky Excise Scheme.

It will be observed on reference to the following list that the greater part of the excise revenue is derived from taxes on alcoholic drinks. This is no new fact; more than a hundred years ago Cowper drew attention to it in some indignant lines in "The Task."

"The Excise is fattened by the rich result
Of all this riot, and ten thousand casks
For ever dribbling out their base contents
Touched by the Midas finger of the State
Bleed gold for ministers to sport away."

Such indignation is perhaps misplaced; as it is obvious that taxation should be imposed on luxuries rather than on necessities; and whatever may be thought of the wisdom of consuming alcoholic drinks, they certainly cannot be classed among the necessities of life. The tendency of modern legislation has been to throw the largest possible burden of excise taxation on alcoholic drinks, and to exempt, as far as possible, other articles.

[The best authority on the history of excise is Dowell's *History of Taxation and Taxes in England* (Longmans, Green, and Co. 2nd ed., 1888, 4 vols. 8vo.)]

List of the chief heads of excise revenue, during the financial year 1891-92, taken from the published *Finance Accounts of the United Kingdom for 1891-92*, viz. (net receipts)—

Excisable Liquors, viz.—	£
Beer Duty	9,851,822
Spirit Duty	16,480,199
Railway Duty	324,984
License Duties, viz.—	
Brewers	15,478
Spirits—Distillers and Rectifiers	10,476
Tobacco Manufacturers	7,019
Patent Medicine Vendors	7,185
Beer and Cider, and Beer and Wine	186,167
Spirits—Dealers	129,579
Spirits—Publicans	1,527,074
Wine and Sweets	70,103
Refreshment Houses	7,755
Tobacco Dealers	78,509
Dogs	419,809
Gun Licenses	92,624
Game Licenses	181,740
Male Servants	113,019
Carriages	474,084
Armorial Bearings	75,393
Auctioneers, etc.	82,382
Hawkers and Pedlars	18,720
Plate-Dealers	51,858
Pawnbrokers	36,445
Miscellaneous	17,160
Total	£30,289,694

The whole of this sum is collected by imperial officers acting under the direction of the commissioners of inland revenue, who in turn are by statute subjected to the directions of the commissioners of the treasury; but since the new arrangements initiated by Mr. Goschen, when chancellor of the exchequer in 1888, the proceeds of certain specified portions of the beer and spirit duties and of certain licenses are handed over direct to the local authorities throughout the kingdom, in substitution for the grants formerly made by parliament in aid of local expenditure (see Mr. Goschen's statement in the House of Commons of 26th March 1888, Hansard's *Parliamentary Debates*, vol. cccxiv.). The amount thus payable to the local authorities out of the excise receipts of 1891-92 was £4,572,268, leaving (say) £25,717,425 payable to the exchequer.

The following are some of the duties that have been repealed, viz.—

Cider, 1830.	Paper, 1861.
Bricks, 1850.	Hops, 1862.
Soap, 1852-53.	

EXCISE SCHEME, THE, is the name by which history knows the proposal introduced into parliament by Sir Robert Walpole in 1733 for applying what is now known as the bonded or warehousing system to tobacco, and afterwards to wine. Instead of paying duty, or giving bonds, on landing the tobacco, from Maryland or Virginia on the quays of London or Bristol, the merchant was to lodge his hogsheads in warehouses under the control of excise officers, to pay duty only as he took it out for home consumption, and if he took it out not for the home market but for re-exportation abroad, no duty was to be paid. The same system was to be extended to wine. Various advantages were claimed for the change. First, it would put an end to sundry gross frauds upon the revenue, from smuggling on an immense scale down to abuses, petty and great, which the iniquity of dishonest merchants, practising on discounts, allowances, and drawbacks, and the rapacity of lightermen and watermen, carried out at every port in the island. Second, the prevention of these frauds and the decrease of smuggling would be a great gain to the honest trader. Third, accompanied as it was by a simplification of rates, this cheaper and easier collection would be a great advantage to the revenue. Fourth, and much the most important of all, it would tend to make London a free port, and by consequence the market of the world. Such were the advantages claimed for the change at the time. But another, and not the least important, may be added, viz. that it anticipated and fulfilled the principle of Adam Smith's fourth canon of taxation, by taking as little as possible out of the pockets of the people beyond what it yielded to the revenue. The merchant, relieved of the necessity of paying the duty on the importation of

the article, would have the use of his capital for a longer time, and would therefore be able to sell at a lower rate to the consumer. In fact the merchant would gain, and the state lose, the interest on the amount of the duty for the period between the importation and the sale of the article. The merchant's, and, through him, the consumer's gain would in practice be greater than the state's loss, as the rate of interest which he would require on his capital, in order to make his business remunerative, would greatly exceed the rate at which the state could borrow; and moreover the loss of the state was more than counterbalanced by the economy of the cost of collection, and the prevention of fraud, which the scheme involved.

Such was the famous excise scheme, which alone would suffice to establish Walpole's reputation as a finance minister far in advance of his age. But the public mind of the time was not sufficiently instructed to receive it; and the design had no sooner been bruited abroad than a popular outcry arose, one of the loudest and fiercest of which history makes mention, which shook his power to its foundations, and at no long distance of time compelled him to abandon the scheme. The parliamentary Opposition, whose motives need no explanation, used all their powers of misrepresentation against Walpole's plan, the object of which was to turn the customs duty on the importation of tobacco into an excise duty on its consumption, as a scheme for levying a general excise over the whole range of commodities. Food, clothing, and the other necessities of life were, they declared, to be loaded with a crushing tax. Every man's house might be invaded at any hour by the excise officer. Every man's goods and all his dealings would be exposed to minute and ceaseless inquisition. A great standing army of revenue officers would be created, which would overturn Magna Charta,—even undermine parliament. Such were the misrepresentations to which the credulity and factious spirit of the people, and the general unpopularity of the excise as a whole, made them an easy prey. The whole country resounded with shouts of "no slavery, no excise, no wooden shoes." The majority in the House of Commons in favour of the measure went down from sixty-one on the first resolution to seventeen on a subsequent issue; and this dwindling of his supporters, combined with the growing frenzy out of doors, determined Walpole to abandon a measure which in the inflamed temper of the nation could hardly be put into execution without an armed force. "I will not," he said, in announcing his resolution to his friends, "be a minister to enforce taxes at the expense of blood."

The abandonment of the scheme was celebrated throughout the country with rejoicings as for a national victory; the crisis was long remembered; and it is noteworthy that the

popular feeling, many years after the occasion had passed away, found an exponent in the tory prejudices of Dr. Johnson, who in his dictionary defined "excise" as a "hateful tax levied upon commodities, and adjudged not by common judges of property, but by wretches hired by those to whom excise is paid."

For a compact and trustworthy account of Walpole's excise scheme the reader is referred to Mr. John Morley's *Walpole* (series of English Statesmen, Macmillan and Co.), from which the foregoing description is mainly taken.

Writing more than forty years after Walpole's failure, Adam Smith had still to lament that so excellent a scheme had not been resumed by subsequent ministers (*The Wealth of Nations*, bk. v. ch. ii.). The credit of resuming it was reserved for William Pitt, who notwithstanding the inevitable parliamentary opposition, carried it into law in 1789 (29 Geo. III. c. 68).

[E. Leser, *Ein Accise-Streit* (Walpole's Scheme), 1879.]

The amounts raised by means of the excise have varied much since the first imposition of the tax levied under this name. As the articles subjected to it have differed very greatly, an exact comparison is scarcely possible. In the earlier periods the excise was farmed out, and "in 1657 an offer was made to give, for the farm of the excise and the port duties, no less than £1,100,000 per annum" (Dowell, 2nd ed. vol. ii. p. 13). Up to the end of the 17th century, the yield scarcely altered. Dowell writes (p. 62), "the revenue from inland duties had varied considerably in different years. In 1700 over a million, it was in 1702 nearly £1,400,000." During the later half of the 18th century great additions were made to the tax, though Walpole's proposals were not accepted (see EXCISE SCHEME).

In this century the gross produce of the tax has been in round figures at the following dates:

1835 . . .	£15,200,000
1855 . . .	£15,300,000
1875 . . .	£28,400,000
1892 . . .	£30,200,000

EX. DIVIDEND. A stock exchange phrase, shortened, as usual, to signify that the price at which a given security can be bought or sold is exclusive of dividend, which has been, or is about to be deducted. Unless so specified, the security in question is *cum dividend*, meaning that the dividend or interest accrued since the previous distribution is covered by the purchase money. Certain securities, including corporation bonds, exchequer bills, Indian deferred paper, English mortgage bonds, never carry interest in the prices, which are quoted net, the buyer being charged interest up to the date of the completion of purchase (see EX. ALL; EX. NEW).

EX. DRAWING. This phrase simply means that in case of the DRAWING (*q.v.*) of bonds at par, the bargain is not to be affected by the price obtained by the hazard of drawing, and

the buyer gets no benefit. Thus, a specific government bond might have been bought at 90 a week or two before the periodical drawing of such bonds, and the buyer would get £100 if his bond happens to be among the lucky numbers, unless the words "ex. drawing" formed part of the contract.

A. E.

EXECUTION is the name of the procedure by which the judgment or order of a court of law is enforced. This is generally done by "writs of execution," which, in the case of judgments of the high court, are issued in the central office or a district registry, and directed to the sheriff of the county in which they are to operate. The usual writs issued in the case of money claims are writs of *fiat facias* (cp. *FIAT FACIAS*, WRIT OF), commonly called *fi. fa.* and WRITS OF *ELEGIT* (*q.v.*); money claims may also be enforced by so-called "garnishee orders," viz. orders by virtue of which the judgment creditor obtains a charge on debts owing to the debtor, or "charging orders" which affect stocks or shares standing in the debtor's name, or, if the debtor has an equitable interest in the property out of which the judgment creditor seeks to obtain payment of his debt, by the appointment of a RECEIVER (*q.v.*) Judgments for the recovery of land are enforced by "writ of possession," and judgments for the recovery of any property other than land by "writ of delivery" or "writ of attachment"; in the case of judgments directing a person to do any act, other than the payment of money, the disobedient party is subject to imprisonment through the instrumentality of a "writ of attachment" or through "committal," which two means of execution differ in form only. Imprisonment on account of the non-payment of money has been nearly abolished, and where it occurs it is punitive in its nature, and not merely a means of enforcing payment (see DEBT, IMPRISONMENT FOR).

E. S.

EXECUTOR; the legal administrator of the personal estate of a deceased person. In Scotland if appointed by written nomination of the deceased he is called executor nominate, if by decree of the commissary court executor dative, the former answering to the English executor the latter to the English administrator. His title in either case is completed by *confirmation* (see CONFIRMATION OF EXECUTOR) which answers to the English taking out probate or letters of administration. A husband has in Scotland no absolute right to administer to his wife's movable or personal estate. In default of an executor nominate, a residuary legatee is preferred, then the next of kin, those in the same degree being entitled to be joined if they please, then the husband or wife of the deceased, then the creditors, and lastly a special legatee. An executor differs from a trustee in that an executor's duty is to distribute the fund, a trustee's to hold it.

[Currie on *Confirmation of Executors*.—M'Laren on *Wills*, ii. § 1657.—Dove Wilson, *Sheriff Court Practice*, 4th ed., 546.]

J. W. B. I.

EXECUTRY (Scottish); the subject of an executor's administration; the whole of the personal estate of a deceased person, equivalent both to legal and equitable *assets* in England.

J. W. B. I.

EXERCITOR (Scottish); a term derived from Roman law and implying one who employs a ship for his own profit in trade, and to whom the profits belong. It matters not whether he is the actual owner or only the freighter. He is liable for necessities ordered by the master. His obligations properly fall in the first instance under the jurisdiction of the admiralty court.

[Bell's Pr., § 450.]

J. W. B. I.

EXHEREDITATIO signifies, in Roman law, a testator's declaration in his will that he excludes from being his *heres* a member of his family belonging to the class of relations who cannot be passed over in the will in silence, but must either be appointed *heredes* or thus declared to be disinherited.

E. A. W.

EX. NEW. This refers to the quotation of prices on the stock exchange for shares or other security, the holders of which are about to receive an allotment of new stock at what may be considered an advantageous price of issue. When these words form part of the contract, the seller retains the advantage, if any, and the buyer's right to the security is exclusive of any right to subscribe to the new issue (see *EX. ALL*; *EX. DIV.*).

A. E.

EXPECTATION OF LIFE, a term introduced by De Moivre, denotes the number of years which persons of a certain class, *e.g.* English males, live on an average after a certain age, *e.g.* 20; the average being obtained as follows. The number of years which each of a great many, say *n*, specimens of the class under observation, lives after the assigned age having been observed, the sum of these numbers is divided by *n*. The Expectation is thus the arithmetic mean of the *n* observed numbers (see *AVERAGE*). It is contrasted with another average of the same numbers, *viz.* the *Median* (see *AVERAGE*), technically termed the "equation of life." The term "expectation" is objected to by Dr. Farr as suggesting the latter rather than the former sort of average. He prefers to say *mean after-lifetime*. Comparing the two kinds of average, Neison seems to think that the expectation of life is not so well suited "for medical and other purposes in which it is required to determine the relative value of an improvement or other change which may have taken place within a given period of life."

(See *DEATH-RATE*; *DE MOIVRE*; *INSURANCE*; *MEAN AFTERLIFETIME*; *STATISTICS*.)

[Walford's *Insurance Cyclopædia*, article "Expectation."—Farr, *Vital Statistics*, pp. 279, 309.]

—Neison, *Contributions to Vital Statistics*, p. 100.—Report of the Registrar-General for 1885, Supplement.—Humphreys, *Journal of the Statistical Society*, 1883.]

F. Y. E.

EXPEDITATION. By the **FOREST LAWS** (*q.v.*) all mastiffs or other large dogs kept within a forest had to be expeditated, *i.e.* maimed sufficiently to prevent them chasing the deer. According to the laws of Canute the dog was to be hamstrung, but by a charter of Henry II. a somewhat milder operation was allowed, three toes of one forefoot being cut off with a chisel, leaving the ball of the foot intact. For keeping an unexpeditated dog within a forest a fine of 3s., called "footgeld," was imposed, but before the end of the 15th century in many of the English forests this fine had become a customary payment, sometimes called "hound-silver," collected triennially, which formed no small item in the revenues of the forest owner.

[See Ducange, *Glossarium mediæ et infimæ Latinitatis*, Editio nova a L. Favre, Paris, 1884.—Manwood, *Forest Laws*, London, 1615.—Cowell's *Interpreter of Words and Phrases*, London, 1701.—Forest Accounts, some of which are quoted by Manwood.]

A. H.

EXPENDITURE or **SPENDING** has two distinct meanings which are often confused.

1. Expenditure may mean simply the payment out of money, that is, the exchange of money for other goods. In this sense it does not imply any consumption of wealth on the part of any one, and it cannot be opposed to "saving." A man who saves £100 a year ordinarily expends or spends those £100, *i.e.* exchanges them for other goods, just as much as if he did not save anything. The things on which he expends them will be different, but the expenditure, unless of course the money is hoarded, will be the same.

2. Expenditure may mean payment of money for personal consumption on the part of an individual, and consumption, pure and simple, on the part of the community. In this sense it is rightly opposed to "saving." The £100 a year saved by an individual is not in this sense of the word expended or spent either by himself or any one else. It is simply the value in money of a part of the community's income, which, instead of being consumed, has been added to the capital of the country (see *SAVING*, *PRODUCTIVE* and *UNPRODUCTIVE*).

E. C.

EXPENSES OF PRODUCTION (see *PRODUCTION*).

EXPERIENCE. Upon the value of experience in the study of political economy the most contradictory opinions have found adherents.

Some economists have expressed themselves as though political economy were a science similar in type to astronomy—as though all economic truths could be derived by strict deduction from one or two first principles,

such as "All men desire wealth," or "All men are averse to labour." Other economists have denounced general reasoning, and have laid exclusive stress on the accumulation of facts. They would apparently reduce political economy to the task of observing and recording particulars without any admixture of inference. These opposite opinions have rarely been held in their most extreme forms. But by stating them as forcibly as possible we may be assisted to detect the fallacies which they involve.

It will appear upon examination that neither of these principles can be carried out in its integrity. The attempt to carry out either would result in intellectual paralysis.

There has never yet existed an economist so rigorously deductive in his method as not to draw to some extent upon experience of economic phenomena. Many economists have indeed drawn upon a field of experience too restricted to justify dogmatic conclusions. Many economists have been too much influenced by the economic experience of their own time, or of their own country. Even this narrow experience they may not have studied exhaustively. They may have picked up their knowledge of it insensibly, here and there, bit by bit. It is thus that the man of business, as contrasted with the student, acquires his knowledge of economic phenomena. Ricardo, the greatest of those economists who are alleged to have been rigorously deductive in method, may be said to have acquired most of his knowledge in this way. Such knowledge, being very partial, may sometimes prove misleading. But even such knowledge has great influence upon the development of theory. Ricardo's economic theories would certainly have been different had he lived in another age than the nineteenth century, or in another country than England.

An economist strictly deductive in method could never get beyond his first premisses. The contrary seems possible because the economist who apparently deduces everything from first principles in reality weaves into his argument statements of fact and wide generalisations which have become so familiar that he and his readers forget how they were first acquired.

Nor has there ever yet existed an economist who merely observed and recorded. Those economists who aimed at this ideal have nevertheless written history. The writing of history involves processes of selection, comparison, and inference, in which the historian's mind is active. No two persons perform these processes in quite the same way, and it is extremely easy to make mistakes in performing them. It is not merely that historians often infuse their work with their own political or religious sentiments, with the prejudices of their own age or their own class. It is rather that the historian cannot construct a narrative out of

facts without interpreting those facts. But he cannot interpret the facts without using his mind, without adding to, or rather, without transforming, those facts.

The object of all science, including political economy, is not merely to amass facts but also to explain them. Facts are explained in so far as they are successfully brought under general laws. The general laws are always at first hypotheses, or in the vulgar tongue, guesses—guesses at truth. Hypotheses are suggested by facts, and facts are interpreted by hypotheses. He who forms a hypothesis with hardly any knowledge of the facts is pretty sure to throw away his trouble. He who clings to a hypothesis once formed, neglecting or rejecting new facts, does worse, for he is trying to confirm himself in error. But to refrain from forming hypotheses is impossible to a reasoning creature, and, if it were possible, would be suicidal. The value of experience is not absolute but varies directly as the power of the mind which has the experience. One glance at the field of battle will suggest a decisive movement to the great general. The vicissitudes of a short and obscure life will give the great poet a key to human nature in its infinite variety. The scientific genius, although less brilliant, is not essentially different from theirs.

Whether in physical or in political science the master mind is that to which facts suggest their own explanation.

[Cairnes, *Character and Logical Method of Political Economy*.—Bagehot, *Economic Studies*.]

EXPERIMENTAL METHODS IN ECONOMICS. Experiment in the scientific sense has been well described as "putting in action causes and agents over which we have control, and purposely varying their combinations and noticing what effects take place" (Herschel, *Study of Natural Philosophy*, p. 76). In sciences such as physics and chemistry, in which the phenomena are amenable to arrangement, it is by far the most potent instrument of discovery. Where, however, there is not the same facility for easy manipulation, the inquirer is compelled to fall back on the less effective method of simple observation. Instead of creating instances for himself, he has to find them in nature, or wait till they are presented spontaneously to his view.

Economics, in common with the other social sciences, clearly belongs to the latter class. The phenomena of wealth are closely inter-connected, and are besides affected by the other forms of social activity. Hardly any economic event can be said to be the result of a single cause, it is rather the product of several contributory causes. Nor are the total effects of any one agency easily separable: they are combined with those of others in a whole which cannot be analysed. In technical language "plurality of causes" and "intermixture of effects," the

two great hindrances to the use of experiment (Mill, *Logic*, bk. iii. ch. x.), are generally present in economic facts. To secure the requisite isolation of any phenomenon selected for study is rarely possible. The most rigorous form of inquiry, known as the "method of difference," the essence of which "is the comparison of two instances, which resemble one another in all material respects, except that in one a certain cause is present, while in the other it is absent" (Keynes, *Scope*, p. 170), is plainly excluded, since we cannot introduce a single cause that will have only a measurable effect, nor can we be sure that the surrounding conditions remain unaltered. The "method of agreement" in which the instances compared resemble each other in only one particular is not merely inferior as an experimental resource, but is inapplicable to social phenomena. Two countries or periods that had one common feature would have more than one. In two classes of cases, however, experiment may be sometimes used, viz. (1) in reference to the premises or *data* of economic science, thus the "law of diminishing returns" admits of experimental proof; (2) More important than the preceding exception, which is rather apparent than real, are those cases in which, by deductive reasoning, it can be shown that the action of an economic force is limited, and then its working within those limits can be experimentally ascertained.

These exceptions notwithstanding, it may be said that scientific experiments (*experimenta lucifera*) are a very slight resource in economics.

The case is somewhat different with regard to practical questions. Legislative measures and individual actions are, if so intended, so many experiments on the social system. Thus if several countries, widely differing in other respects, have established a system of peasant proprietary with good results, while several other countries, also widely differing *inter se*, are without that system and show inferiority, we may argue that peasant proprietary is experimentally justified. The same reasoning would be applicable to commercial policy, and has actually been used in reference to the case of Victoria and New South Wales, but illogically, as a number of cases are required to exclude other influences.

Again, by applying special legislation, *e.g.* a particular kind of land tenure, to one part of a country, we can ascribe to its influence the special effects noticed in that district. Practical experiments (*experimenta fructifera*) may also be employed by means of (1) permissive legislation, or (2) temporary legislation.

Private persons also carry out practical economic experiments, as in the cases of profit-sharing (Leclaire), and the recent eight hours day experiment at Sunderland (*Economic Journal*, ii. pp. 755, 756). A large accumulation

of instances may even give a very near approach to rigorous scientific proof.

A vaguer use of the term "experimental method" is common in continental and especially in French writers. J. B. Say, for example, declares that the true method of political economy is *La méthode expérimentale qui consiste essentiellement à n'admettre comme vrais que les faits dont l'observation et l'expérience ont démontré la réalité* (*Traité, Discours préliminaire*, p. x. 5th ed. 1826). Here "experiment" is used as synonymous with "experience"; it therefore includes observation and experiment in the strict sense.

Lewis, *Methods of Observation and Reasoning in Politics*, ch. vi.—Jevons, *Methods of Social Reform*, pp. 253 seq.—Léon Donnat, *La Politique Expérimentale*, 2nd ed. Paris, 1891]. C. F. B.

EXPERT. An expert may be defined as a person possessing special knowledge of any science or art. Art is here taken in its most comprehensive signification, to include the useful as well as the fine arts, cooking or carpentry as well as music or painting. The opinion of an expert on matters connected with his own subject is more likely to be correct than the opinion of a man to whom that subject is almost or altogether unknown. But the degree in which an expert's opinion outweighs the opinion of the ordinary man will vary according to the nature of the subject.

For, first, the subject may be one with which the ordinary man has no acquaintance, or it may be one with which he is acquainted, although not so fully as the expert. Thus every man in his senses knows to some extent what food is wholesome, although he may not know so much on this point as a qualified doctor. Every man who can write has some power of comparing hands, although not so much power as belongs to an expert in handwriting. But only an expert in navigation can determine the exact position of a ship out of sight of land. Only an expert in astronomy can determine the probable distance of a fixed star from our planet. In such matters the judgment of the ordinary man is absolutely worthless.

Secondly, the subject may be so complex that no expert has more than a very imperfect knowledge of it. Political and economic science are characterised by this complexity. Upon political or economic questions the opinion of a man who knows much is far more valuable than the opinion of a man who knows little or nothing; but even the opinion of the man who knows much affords a very imperfect security. Such complex questions often present different aspects to different classes of experts. Let us suppose that an opinion is required on the expediency of a law to regulate the hours of labour. At least five different classes of experts

are more or less entitled to be heard:—(a) The economist who has read and reflected upon the theory of economic phenomena; (b) the political philosopher who has read and reflected upon the theory of the state and of legislation; (c) the statesman who is familiar with the practice of government, and can judge what kind of laws it is usually expedient to make and possible to enforce; (d) the employer who has had the opportunity and the will if not the wisdom, to discover how production can be carried on to the greatest profit; (e) the workman who has had the opportunity and the will, if not the wisdom, to discover what are the best conditions of life which he can obtain for himself; all these men can bring to the determination of the problem a knowledge which other men do not possess, and are entitled in a greater or less degree to speak with the authority of experts. One person might, of course, combine more than one of these characters, and might, therefore, claim a higher degree of authority.

Thirdly, the subjects of knowledge differ in the degree in which they excite passions such as prevent the expert from employing his intellectual superiority to its fullest advantage. On any subject, indeed, were it astronomy or textual criticism, the judgment of an expert may be disabled by vanity or love of contention. But on those subjects which immediately touch the interests of mankind, notably theological, political, and economical subjects, the judgment of the expert is more likely to be disturbed by his passions. These passions are at least as ungovernable in ignorant men. But wherever they prevail they lessen the interval between the ignorant man and the expert. For the finer the intellectual instrument the more it is disturbed by acute emotion.

F. C. M.

EXPERTISE (FRENCH) is the legal process by which judges, when called on to decide special or technical cases, may appoint, on their own authority, or on the demand of one or both of the litigants, persons possessing the necessary knowledge or experience, called experts, to examine, and report on, the points at issue. The conditions under which those operations are conducted are laid down in Arts. 303-323 of the Code of Civil Procedure. One of the most frequent applications of the law is in the settlement of disputes between foreign importers and the French customs authorities relative to the class, quality, origin, or value of merchandise subject to duty. The first supplementary convention to the Anglo-French treaty of commerce of 1860 conferred on British importers in France the right to demand an *expertise*. When the Customs propose to exercise the right of pre-emption, the importer and the customs each nominates one of the experts. In case of disagreement the two experts choose an umpire, and if they cannot agree on the choice, the umpire is appointed by the president of the

nearest tribunal of commerce. Objections were frequently made that the persons named as experts did not possess the necessary qualifications, and on the renewal of the treaty of commerce, in 1873, a protocol was signed, stipulating that they should be chosen from a list of merchants or manufacturers drawn up by the chambers of commerce in each locality having a customs bureau. A British chamber of commerce had just been founded in Paris, and that body submitted to the Paris chamber (French) the names of the principal British merchants in Paris, for them to be comprised in the list of experts; but the French chamber of commerce refused to nominate them on the ground of their foreign nationality, although British traders had previously been accepted as experts. The British chamber appealed to the Foreign Office, and on the intervention of the British ambassador the French minister of foreign affairs considered the claim a just one, and some of the names proposed were added to the list of experts in Paris. Those names were, however, subsequently removed from the list on the expiration of the treaty of commerce in 1881, and British importers who now have disputes with the French customs can only be represented in an *expertise* by a French merchant or manufacturer, who is naturally disposed to impede rather than to facilitate foreign competition in his own trade. There is no appeal from the decision of the experts in commercial affairs, when they agree, but civil *expertises* are still governed by Art. 323 of the Code of Civil Procedure, under which judges are not bound to adopt the opinion of experts if they are not convinced by it.

[*Lois du 27 Juillet 1822 et du 7 Mai 1881; arrêts de la Cour de Cassation, 30 Avril 1838, et 30 Janvier 1839.*]

EXPLOIT. The French verb *exploiter* primarily means simply to use in such a way as to make a profit out of. It is applied to such actions as working a mine or a railway, cultivating a farm, or publishing a newspaper. There are some things which it is admittedly improper to use in such a way as to make a profit out of them; it is disgraceful, for instance, to *exploiter* any one's credulity, ignorance, or good nature. Hence the word comes to have sometimes a bad sense. The socialists who teach that the capitalist obtains an illegitimate gain by employing men for wages have applied the term to his action in this bad sense. To *exploiter* men or labourers thus means to use them in such a way as to make a profit out of them, it being at the same time implied by the use of the word that this, though not perhaps disgraceful to an individual who does it under present circumstances, is fundamentally improper, and would not be allowed in an improved state of society.

It is almost exclusively in this bad sense that

the word "exploit" has been introduced into English. E. C.

EXPORTS AND IMPORTS, see IMPORTS AND EXPORTS.

EXPORTS, DUTIES ON. Duties on exports have been generally condemned by modern economists, but they survive in many of the British possessions as well as in some foreign countries. The history of these duties in Great Britain is merged in that of the customs revenue. The original customs duties were, in fact, duties on exportation. They appear to have been levied by prerogative of the crown from early times, but the first statute which imposed them was one of 3 Edward I.

Two somewhat diverse theories have been suggested as explanatory of the origin of these duties in England. One, which we find first indicated by Sir W. Petty, is adopted by Mr. Dowell (*History of Taxation*). It holds that the sovereign power simply levied a toll on all merchandise, whether inward or outward, as a reward for its protection of the merchant. The duties "were in the nature of a premium paid to the king for insurance." The analogy of the customs duties levied at Athens and at Rome (*portoria*) may be held to favour this view. The other theory is on the whole the more probable, and is that adopted by Mr. Hubert Hall (*History of the Customs*); the king's chief concern was to see that he got as much revenue as he could. He was from ancient times entitled to a purveyance or prise on certain classes of commodities—"if then these were conveyed beyond the kingdom the crown would suffer a possible loss to its state or dignity." When it was found that the wools and hides on which the king was entitled to the internal toll or prise were being exported and escaping taxation, he at once put on a countervailing export duty in order to secure his revenue (see PRISAGE).

It seems probable that these duties were adjusted at the discretion of the crown according to its necessities, and Mr. Hall thinks that immediately before the statute 3 Edw. I. "it is probable that the commuted prise on staple exports, such as wool, hides, and minerals, was taken at an average rate of half a mark per sack of wool or an equivalent bulk of woolfells, a mark per last of hides, and an *ad valorem* duty of 8d. on every librate or twenty solidi of lead or tin."

The Act of 3 Edw. I. (1275), which is the first instance of levying taxation by act of parliament, placed the export duty at

$\frac{1}{2}$ mark per sack (26 stone) of wool,
" " per 300 woolfells.
1 " per last of leather.

These are the *custuma antiqua sive magna*, and the chief contributor to the revenue was

the wool. In the thirty-second year of this reign the produce was as follows:

Wool at 6s. 8d.	£1501	0	9 $\frac{1}{4}$
Woolfells at 6s. 8d.	57	15	1
Leather at 13s. 4d.	0	8	7 $\frac{1}{2}$

Total of the great customs £1559 4 5 $\frac{3}{4}$

In February 1303 an agreement was made with the alien merchants, whereby they undertook, in consideration of the king's protection, to pay 50 per cent beyond the ancient customs on wool and leather, and certain fresh rates on other commodities whether exported or imported. Rates were specified for wax, cloth, and wine, and all other articles were to be charged 3d. in the pound of 20 shillings. These were the *custuma nova sive parva*.

The next development of the exports (as part of the customs) duties was by the statute of 49 Edw. III., which levied the due of tunnage and poundage, afterwards known technically as a subsidy. The poundage was a duty of 6d. on the pound-weight of all articles exported and imported.

With variations in the rate these two forms of export, and import, duty were continued on the same basis down to the Restoration in 1660. They were granted by the Commons for periods of years as a rule; sometimes for the life of the reigning sovereign. After Agincourt in 1415, such a life grant was made to Henry V., and the duties had gone up considerably, as follows:—

	From denizens.			From strangers.		
On wool per sack	£2	3	4	£3	0	0
On woolfells	2	3	4	3	0	0
On leather per last	2	3	4	5	6	8

and in the following reign the rate for wools, etc., was raised to £5 for strangers, and that for leather to £5 for natives. The subsidy of poundage had already been raised to 1s. on the pound-weight, and there was a special duty of double that amount on tin exported by strangers. In 1421 the yield of all the customs was £40,687, of which the great custom on wools, export duty, produced £26,036; in 1431 the total was £34,851, of which the greater proportion was derived from export duties. But the revenue appears to have been a falling one; the customs regulations were anything but complete, as is shown by the act of 27 Hen. VIII. c. 14, to regulate the exportation of leather from other ports besides Southampton and London; and there were constant interferences with the export trade by way of partial or complete prohibition, as late as Mary's reign. In 1570 the value of woollen goods and cloth exported from England amounted to £26,665, and from this was obtained £2388:10:11, viz. customs £1523, and subsidy £865:10:11; gradually the revenue from imports was becoming the more considerable.

The Long Parliament, after declaring in 1640 that "no subsidy, custom, etc., may be imposed upon any merchandise exported or imported without common consent in parliament," proceeded to levy heavy duties on the old lines. The year 1660 marks the beginning of a transition stage. In the Book of Rates for this year, 212 articles were subject to export duty "rated for duty outwards." The duties granted to Charles II. were levied with some modifications in the ninth and tenth years of William III. as the "new subsidy" and continued by 9 & 10 Anne, c. vi. (1710) by the act "for reviving, continuing, and apportioning certain duties upon several commodities to be exported and certain duties on coal, etc., etc." But in 1721 the export duties on corn, woollen fabrics, linen manufactures, and other staples were repealed; the mercantile theory with its mania for exportation had found these duties obstructive. Nevertheless in Saxby's manual of the Customs (dated 1757) some twenty-five pages are occupied with the enumeration of the goods rated for duty outwards, and the directions for paying the proper duties, and in Pitt's consolidating Customs Act of 1787 there are fifty articles subjected to export duty, many of them being of foreign origin. These duties were increased during the great war, and at the beginning of the century, under the act of 1809 (49 Geo. III. c. 98) Sched. A "Outwards," which rated for permanent duty, and in a parallel column for temporary or war duty:—

(a) Foreign commodities to the number of sixty-three at varying, chiefly specific duties.

(b) British goods, of which coals, skins, and other articles were subject to specific duty; all other goods, wares, etc., to an *ad valorem* duty—excepting cotton, linen, sugar, woollen goods, and certain special exemptions with reference to the port of destination.

By an act of 1810 linen goods were subjected to an *ad valorem* duty of 15 per cent on exports. But with the close of the war and the progress of the new economy the backward policy was reversed. In 1815 the export duties produced £365,598, and in 1826, £102,255. Under Mr. Huskisson, in the latter year, the schedule of articles left subject to export duty was as follows:—

Coals, per chald. 1s. 6d. to 30s. 3d., according to destination, etc.

Culm, per ton, 1s. to 10s., according to destination, etc.

Skins, per 100, 1s.

Wool, per lb., 1d.

Woollen manufacture, per lb., 1d.

All produce of the United Kingdom, except certain articles definitely exempted, *ad valorem*, 10s. per £100, i.e. $\frac{1}{10}$ per cent.

and with Peel's reformed tariff of 1842 these disappeared altogether.

One of the few accidental gains to be placed to the credit of the old mercantile theory was that it tended to discourage duties on exportation. Sir W. Petty (1679) shews a consciousness that such duties required careful watching. Sir John Sinclair (1790), who had imbibed the doctrines of Adam Smith, is the first writer apparently who distinctly expresses a doubt as to the propriety of their imposition. Formerly, he writes, almost every commodity sent out of the kingdom was subject to such a duty; it was supposed that the duty came out of the pockets of foreigners, but "such ideas are now exploded." He referred to the principal export duties at that time, under Pitt's recent act, as being those on coals and lead, with certain duties on raw produce intended to give our manufacturers "an advantage over rivals." McCulloch (*Taxation and the Funding System*) has a full discussion of the economic propriety of export duties, and suggests the grounds on which they have generally been condemned. His statement of the arguments for and against the retention of such a duty on coals, published just at the time when that duty was finally removed, is of special interest; it embodies the argument in which economists have for the most part summed up the whole discussion on these duties, viz. that they should not be levied except in the case of a country which has a monopoly of supply of the commodity taxed, or such an advantage in its production as to approximate to a monopoly.

Turning to the British possessions it is natural to find that in those which were acquired during the 17th century, when export duties were an unchallenged feature in the fiscal system of this country, the export duty is, so to speak, bred in the grain; in the colonies established towards the close of the 18th century such a duty practically had no place.

The notorious $4\frac{1}{2}$ per cent *ad valorem* duty which created such squabbles between the crown and the West Indian islands was the progenitor of colonial revenues. At the time of the Restoration, when all the revenues of the crown were being revised, plantation enterprise was at the height of its activity, and it occurred to the crown advisers that the new dominions beyond the seas ought to contribute their share. Thus the origin of colonial customs was precisely the same as that of the English customs. The patent of 1663, constituting the office of commissioners of customs, empowered them to levy and collect a duty of $4\frac{1}{2}$ per cent *ad valorem* on all dead produce exported from Barbados and certain other sugar colonies, and from the plantations in America. In respect of the latter no such duty was ever actually levied. In the West Indies it was the cause of much grumbling; already, in 1689, it was urged that "moreover this four and a half is collected in such manner that in the judgment of all that have

tryed it, the attendance and slavery is a greater burthen than the duty" (*Groans of the Planters*); it was found to be "the same thing in effect as a tax on lands." It was the subject of a great action in 1763 in a case arising on the island of Grenada, *Campbell v. Hall*, where payment of the duty was refused on the ground that the island was ceded by France on the condition that the privileges of the former *régime* should be secured to the inhabitants. This led to the exception of "the Ceded Islands," and Jamaica, from the operation of the duty. It was for many years paid in kind, and in 1778 the right so to pay it was successfully contested (*Macpherson's Annals*, iii. 625). This is not remarkable in an age when sugar was the current money of account. For the better collection of this and other duties the customs department had branch establishments in the colonies, and they continued to levy the $4\frac{1}{2}$ per cent till it was abolished with slavery in 1838.

Of the other colonies the only ones in which duties on exports were levied in the first quarter of this century, were the Mauritius (certain rates on sugar, coffee, cotton, indigo, and one or two other articles), the Cape (on all produce shipped, half the amount of the import duties on similar articles), and Ceylon (on cinnamon, etc.). These were relics from foreign rule in each case, and disappeared gradually under British rule. The export duty on cinnamon from Ceylon had an instructive history, as it was exceedingly profitable when Ceylon had almost a monopoly of that spice, it was a chief element in driving other tropical countries to compete with Ceylon, and was dropped, in 1833, too late to save the colony's pre-eminence in that export.

In India export duties were a relic of the old system: when the imperial government took over the provinces in 1857 there were export duties levied in all the presidencies, and chiefly on grain, rice, indigo, lac, opium, silk, tobacco, and native manufactures of all sorts. An act of 1860 abolished those on manufacture of wool, flax, hemp, jute, etc. At the present day those on rice, opium, and certain other commodities remain. The Indian export duty on rice has been quoted by Fawcett and others as an instance where the duty was probably justified owing to the great advantages possessed by the exporting country in the production of the commodity.

The most striking modern recrudescence of export duties was in connection with the immigration of Indian coolies to the sugar-growing colonies. One of the conditions of government aid in importing coolies was that the planters should pay their fair share; and after much discussion an export duty on sugar and the other produce of the plantations was settled as the best method of obtaining the necessary contributions. Hardly therefore were many of the West Indian colonies freed from the ancient $4\frac{1}{2}$ per cent duty than they undertook a new specific

duty on exportation of sugar and other produce. The St. Lucia Schedule was a fair sample, imposing duties on—

Sugar	Charcoal	Hides
Rum	Logwood	Cocoa
Molasses	Firewood	Coffee

From a return given to parliament in 1854 it would appear that then the only British colonies which levied a duty on exports were the West Indian islands of St. Lucia, St. Christopher, Nevis, Montserrat, and the Virgin Islands, and the Mauritius which exacted 9d. the 100 lbs. on sugar. The Turk's Islands imposed a $\frac{1}{2}$ d. per bushel on salt. But it was inevitable that a principle admitted in the case of a special service should sometimes extend itself; and in later years there has been an increased tendency to levy export duties in the West Indies; while in New Brunswick, for a time, there were certain export duties on lumber, and in Prince Edward Island in 1861 a special duty was provisionally authorised to be collected for a special purpose on all agricultural produce exported. In the Bahamas so lately as 1870 and 1873 a general export duty on all produce was imposed; but that has now been dispensed with; the Virgin Islands being now the only instance of the survival of general export duties, which are almost entirely evaded, upon all the commodities which nature will allow those islands to produce. Such duties were distinctly condemned by the royal commission which inquired into the finances of various West Indian colonies in 1883-84 (*v.* their report, pt. iv.).

At the present time export duties are levied, usually for purposes of immigration, in many of the West Indian colonies, but not British Guiana. In one or two cases they are levied under a delusive name, *e.g.* "statistical tax," in others they are indirectly increased by wharfage duties for outward goods. In Trinidad, besides the duties on products of the cane, there is an export duty on pitch. In Turk's Islands that on salt remains a chief source of revenue. New South Wales, Western Australia, and Natal levy one on gold. The Fiji Islands, for purposes of regulating the trade, levied one in 1877 on silver coin and sandalwood, and in 1887 on *bêche de mer*. The duties on pitch, gold, and salt are generally looked on as royalties and in the nature rather of a rent than a tax.

The plantations on the mainland of America appear never to have paid an export duty, and the United States maintained the tradition, which also fell in with their policy of encouraging exportation as much as possible. One feature in the recent commercial policy of the United States deserves special mention. In the many treaties or agreements which they have been negotiating with the Central American and other states, they have carefully guarded themselves against the possibility of an export duty

being levied in the contracting state; apparently arguing that the imposition of such a duty is an attempt to raise the price to the United States consumer, and must, therefore, be treated as an unfriendly act to be punished by a countervailing duty.

In foreign countries duties on the exportation of commodities are still prevalent, levied sometimes on the chief product of the country, as on the charcoal and olive oil of Italy, in other cases as protective of home manufactures, as in the case of Swedish iron.

The views which have prevailed as to the incidence of export duties have been indicated in several passages above. The accepted view that the duty operates as a restriction to exportation, except where the exporting country has a monopoly of production, appears to be correct. If all countries levied export duties in exporting the same commodity the price of the commodity would be raised to cover the amount of the duty, and the foreign consumer would eventually pay the duty or the greater part of it. But as the facts are contrary to this hypothesis, it will be found in almost all cases, e.g. sugar exported from the West Indies—that the price paid by the foreign consumer is determined by stronger considerations: the exporter cannot control it; the duty falls on him and enhances his expenses in production, or perhaps more accurately it lessens his profits. In any special case the factors which determine price are important in deciding the incidence. The case of monopoly is nowadays hardly of practical importance.

C. A. H.

EXPROPRIATION. Expropriation may be defined as the compulsory sale of private property either to the state or to private parties who have received specific authority from the state.

That such compulsory sale is sometimes indispensable to the public welfare is too obvious to need demonstration. The necessity for expropriation can rarely arise in the case of movable property. Such articles can almost always be obtained by a voluntary transaction, if not from one owner, then from another. The acquisition of a particular movable can hardly ever be matter of necessity to the state. Even a unique picture or statue is a luxury which it is not advisable for the state to acquire at the cost of infringing upon the

general freedom of an owner to dispose of his property at his pleasure. In some countries the finder of antiquities is obliged to transfer them to the state on receiving compensation. But this exceptional rule is of no economic importance. With reference to immovable property the case is different. Not only is land necessary as the basis of human industry and limited in extent, but the land suitable for a specific public purpose is often very narrowly limited indeed. In order to lay out a street or a railway, to construct a public building, a fortress, or a harbour, particular pieces of land must be obtained, even although their owners do not desire to part with them. If no compulsion were to be used in such cases the state would be reduced to offer a preposterous price or to forego a necessary improvement.

But expropriation is allowable only in order to effect an appreciable public good. All compulsion is painful, and pain should not be inflicted without a rational object. The presumption is in favour of letting every man do as he likes with his own. Therefore the burden of proof lies upon those who advocate expropriation in any particular instance.

To what extent expropriation should be carried is a wider question than that to which these remarks must be limited. We need not inquire whether the state would be justified in expropriating certain species of property on the ground that it could manage them more advantageously to the whole community than private owners could or would do. Such an inquiry belongs rather to the head of STATE INTERFERENCE (*q.v.*). Nor need we inquire here into the kindred question whether it would be right to expropriate, say, large estates in order to break them up and sell the land in small parcels so as to multiply peasant proprietors. Nor need we determine whether the state would do well to acquire certain species of property on the ground that they tend to increase in value merely through the general progress of society, and that this increase should go to enrich the community rather than individuals (see INCREMENT, THE UNEARNED). It is enough for us that the necessity of expropriation in certain cases is admitted by the great majority of persons who have considered the subject. We have only to consider upon what principles expropriation, when necessary, should be conducted.

In case of expropriation the owner should receive at least the price which he could obtain in the open market, if he were disposed to sell. The market price is the only impartial and trustworthy measure of the value of property. It represents the value of property under all the actual circumstances, including the reasonable expectations to which the laws and policy of the state have given rise. It is unworthy of a civilised government to pursue a certain class

of owners with covert hostility, to burthen them with overwhelming taxes, or to deny them effectual protection, in order to make their property worthless, and then to buy it at so many years' purchase of zero. Yet these expedients are occasionally recommended in our time by persons who profess to have a special sense of political justice. Even in the case where the state interferes to suppress a form of property distinctly condemned by the improved morality of the general public, it still owes compensation to the proprietors affected. When the British parliament compensated the West Indian slave-owners it acted on the sound principle that the state, which for many generations had recognised and maintained the lawfulness of slavery, was *particeps criminis*, and ought to take its share of the loss. But in cases of this kind the right amount of the compensation may be more doubtful than in others.

Where the owner of property expropriated has increased its returns by a violation of the law the case is different. If the owner of a house permits it to be over-crowded with lodgers, he has no right to compensation for the extra rent which he has thus received. If he lessens his outgoings by allowing the house to fall out of repair, the cost of the repairs necessary to make it habitable should be deducted from the compensation paid. If the house is so ruinous that no repair can make it habitable, he is entitled to compensation only for the site and the materials. In other words the market value, which forms the basis of compensation, must be understood as the *market value obtainable without a breach of the law*. It would be monstrous that a man should obtain compensation for relinquishing a profit which is illegal.

Subject to these qualifications, then, the amount of the compensation should not be less than the market value. But it may justifiably be somewhat more. Over and above the loss of his property, he who sells against his will suffers the pain of compulsion, and for this a reasonable allowance should be made. Distinction may be made between objects which have and objects which have not "a value of affection." Thus one acre of arable land differs from another acre of arable land only in its capacity of producing wealth. He who is compelled to sell one field is usually able to buy another field which will do just as well. But the house where a man has lived all his life may be much more to him than any other house of equal value. If compelled to sell it, he cannot buy another which will be the same to him. *Prima facie*, therefore, the indemnity for constraint put upon an owner to sell should be

more liberal in this case than in the other. Compensation, however, must be assessed on general rules, and fine gradations of feeling cannot always be taken into account.

Yet another difficulty remains. The owner who is compelled to sell part of his property may have the value of the remainder greatly augmented by the public works for which the land was taken. Whether this prospective improvement should be taken into account in assessing the compensation due to him is a much-disputed question (see BETTERMENT).

The principles of compensation will be the same whether the party taking by compulsion be the national government or a municipal authority or a private joint-stock company or individual. But, when the state confers the power of expropriation upon its subordinates or upon private parties, it is entitled to determine the objects for which this power shall be exercised, the extent to which it shall be exercised, and the service which shall be rendered to the public by those who are invested with it. These, however, are points which must be determined by common sense in each case as it arises.

EXTENSIVE CULTIVATION (see INTENSIVE CULTIVATION).

EXTENTS (see COURT ROLLS, MANORIAL ACCOUNTS, and EXTENTS).

EXTRANEUS. A freeman by birth coming into a manor from outside, and so opposed to *nativus*, but holding land on it by villein tenure. He could not, however, be ejected as long as he performed the services due from his holding, and he could surrender the holding at will. Vinogradoff shows (*Villainage in England*, 1891, p. 63), against Britton's theory, that the descendants of an *extraneus* might lapse into villainage in the fifth generation.

[Vinogradoff, pp. 77-82, 142.]

E. G. P.

EYTON, ROBERT WILLIAM (1815-1881), was born at Wellington (Salop); graduated from Christ Church, Oxford, in 1839. He is best known as an antiquary, but his works are of value to the economist for the information they contain on the economics of the Middle Ages, and especially on the fiscal systems of the Anglo-Norman kings.

Such of his works are: *Domesday Studies* (Somerset), London, 1881.—*Domesday Studies* (Stafford), London, 1881.—*Key to Domesday*, London, 1878.—*Notes on Domesday*, London, 1880.—*The Staffordshire Pipe Rolls*, vol. i., London, 1880.
